INTRODUCTION

NOTE: Ford Motor Company reserves the right to discontinue models at any time, or change specifications or design without notice and without incurring any obligation.

IMPORTANT SAFETY NOTICE

Appropriate service methods and procedures are essential for the safe, reliable operation of all motor vehicles as well as the personal safety of the individual doing the work. This manual provides general directions for performing service with tested, effective techniques. Following them will help assure reliability.

There are numerous variations in procedure, techniques, tools and parts for servicing vehicles, as well as in the skill of the individual doing the work. This manual cannot possibly anticipate all such variations and provide advice or cautions as to each. Accordingly, anyone who departs from the instructions provided in this manual must first establish that they compromise neither their personal safety nor the vehicle integrity by their choice of methods, tools or parts.

NOTES, CAUTIONS AND WARNINGS

As you read through the procedures, you will come across **NOTES**, **CAUTIONS**, and **WARNINGS**. Each one is there for a specific purpose. **NOTES** give you added information that will help you to perform a particular procedure. **CAUTIONS** are given to prevent you from making an error that could damage the vehicle. **WARNINGS** remind you to be especially careful in those areas where carelessness can cause yourself and others personal injury. The following list contains some general **WARNINGS** that you should follow when you work on a vehicle.

- **ALWAYS WEAR SAFETY GLASSES FOR EYE PROTECTION.**
- **KEEP SOLVENTS AWAY FROM IGNITION SOURCES. SOLVENTS MAY BE FLAMMABLE AND COULD IGNITE OR EXPLODE IF NOT HANDLED CORRECTLY.**
- **USE SAFETY STANDS WHENEVER A PROCEDURE REQUIRES YOU TO BE UNDER THE VEHICLE.**
- **MAKE SURE THAT THE IGNITION SWITCH IS ALWAYS IN THE OFF POSITION, UNLESS OTHERWISE REQUIRED BY THE PROCEDURE.**
- **SET THE PARKING BRAKE WHEN WORKING ON THE VEHICLE. IF YOU HAVE AN AUTOMATIC TRANSMISSION, SET IN PARK UNLESS INSTRUCTED OTHERWISE FOR A SPECIFIC OPERATION. IF YOU HAVE A MANUAL TRANSMISSION, IT SHOULD BE IN REVERSE (ENGINE OFF) OR NEUTRAL (ENGINE ON) UNLESS INSTRUCTED OTHERWISE FOR A SPECIFIC OPERATION. PLACE WOOD BLOCKS (4" X 4" OR LARGER) OR WHEEL CHOCKS AGAINST THE FRONT AND REAR SURFACES OF THE TIRES TO HELP PREVENT THE VEHICLE FROM MOVING.**
- **OPERATE THE ENGINE ONLY IN A WELL-VENTILATED AREA TO AVOID THE DANGER OF CARBON MONOXIDE POISONING.**
- **KEEP YOURSELF AND YOUR CLOTHING AWAY FROM MOVING PARTS WHEN THE ENGINE IS RUNNING, ESPECIALLY THE DRIVE BELTS.**
- **TO PREVENT SERIOUS BURNS, AVOID CONTACT WITH HOT METAL PARTS SUCH AS THE RADIATOR, EXHAUST MANIFOLD, TAIL PIPE, THREE-WAY CATALYTIC CONVERTER AND MUFFLER.**
- **DO NOT SMOKE WHILE WORKING ON A VEHICLE.**
- **TO AVOID INJURY, ALWAYS REMOVE RINGS, WATCHES, LOOSE HANGING JEWELRY AND LOOSE CLOTHING BEFORE BEGINNING TO WORK ON A VEHICLE.**
- **WHEN IT IS NECESSARY TO WORK UNDER THE HOOD, KEEP HANDS AND OTHER OBJECTS CLEAR OF THE COOLING FAN BLADES!**

TOOLS

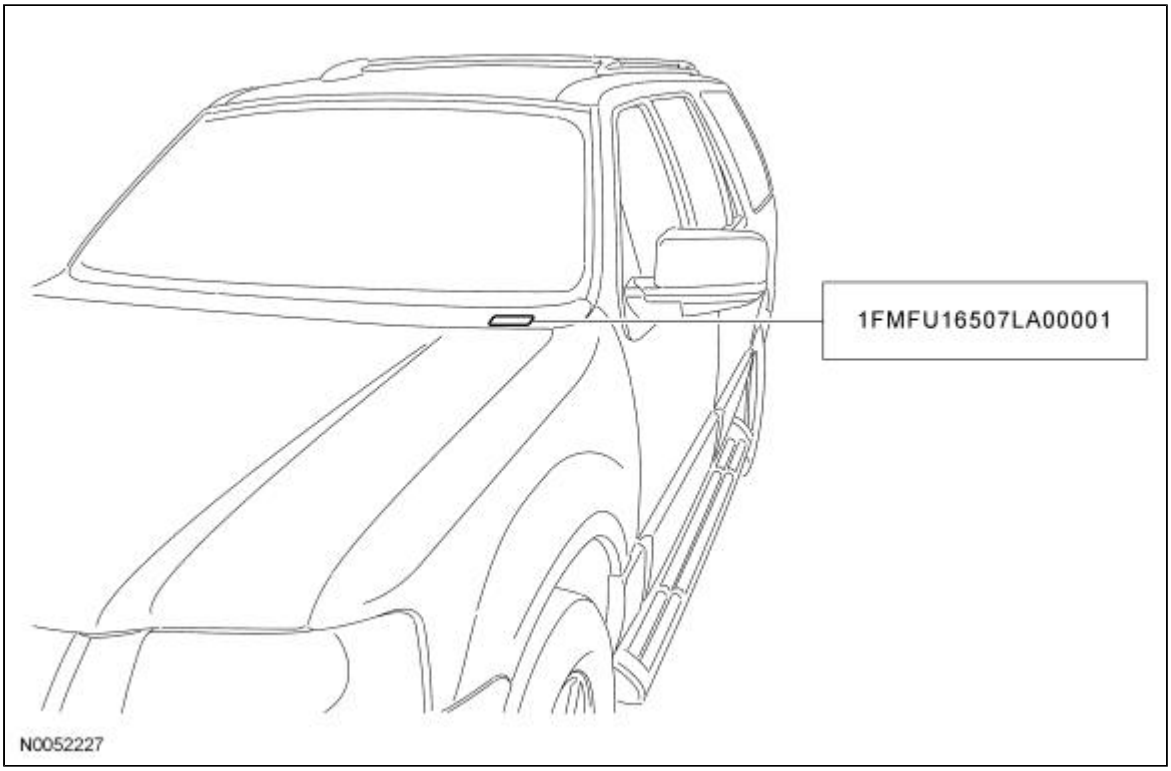
Commercially available hand tools and equipment are used along with Essential Special Service Tools (ESST) and Rotunda equipment. Power tools have become the acceptable industry standard and are used for disassembly only where applicable, unless specified otherwise in the Workshop Manual. The only exception to this policy is installing wheels in conjunction with the use of torque sticks, when possible.

Identification Codes

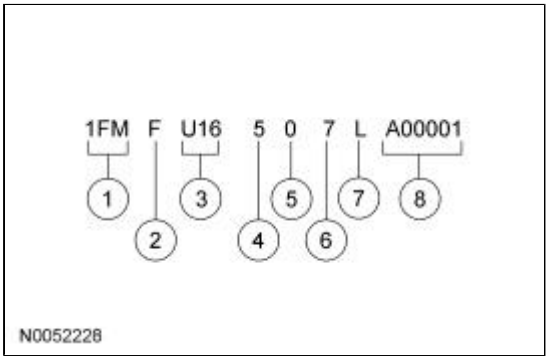
Printable View (623 KB)

Vehicle Identification Number (VIN)

Vehicle Identification Number (VIN) Locator



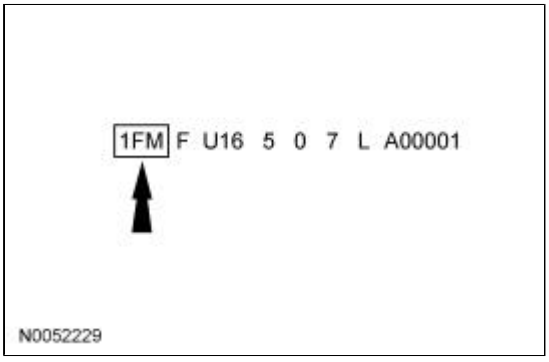
The vehicle identification number (VIN) is a 17-digit combination of letters and numbers. The VIN is stamped on a metal tab riveted to the instrument panel, top upper left of the dash. The VIN number is also found on the vehicle certification (VC) label.



Item	Description
1	World manufacturer identifier (WMI)
2	Brake type and gross vehicle weight rating (GVWR)

3	Vehicle line and series
4	Engine type
5	Computer-generated check digit
6	Model year
7	Assembly plant
8	Production sequence number

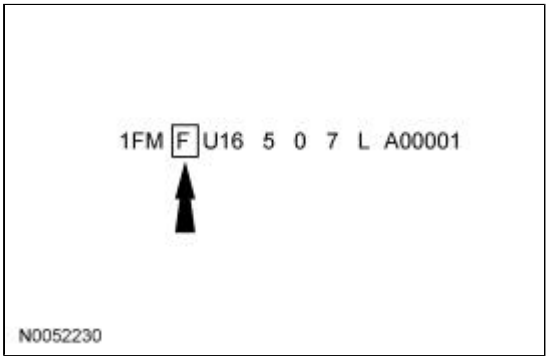
World Manufacturer Identifier (WMI)



The first 3 vehicle identification number (VIN) positions are the world manufacturer identifier.

- 1FM — Ford Motor Company, USA, multi-purpose vehicle
- 5LM — Lincoln, USA, multi-purpose vehicle
- 5L1 — Lincoln, USA, multi-purpose vehicle (limousine)

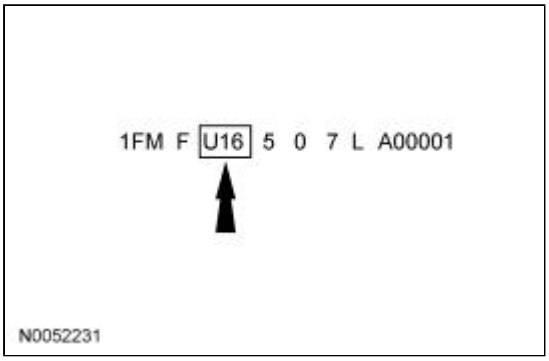
Brake Type and Gross Vehicle Weight Rating (GVWR)



The fourth VIN position is the vehicles brake type and gross vehicle weight rating (GVWR) code. All vehicles use hydraulic brakes.

- F — 7,001-8,000 pounds GVWR with driver and front passenger air bags and driver and front passenger side impact air curtains
- P — 7,001-8,000 pounds GVWR with driver and front passenger air bags

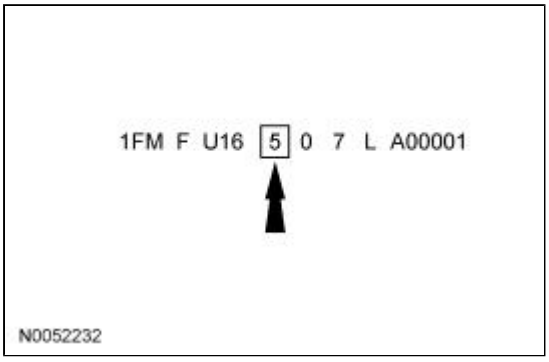
Vehicle Line and Series



Positions 5 through 7 indicate vehicle line and series.

- K15 — Expedition EL, 4x2, XLT
- K16 — Expedition EL, 4x4, XLT
- K17 — Expedition EL, 4x2, Eddie Bauer
- K18 — Expedition EL, 4x4, Eddie Bauer
- K19 — Expedition EL, 4x2, Limited
- K20 — Expedition EL, 4x4, Limited
- U15 — Expedition, 4x2, XLT
- U16 — Expedition, 4x4, XLT
- U17 — Expedition, 4x2, Eddie Bauer
- U18 — Expedition, 4x4, Eddie Bauer
- U19 — Expedition, 4x2, Limited
- U20 — Expedition, 4x4, Limited
- U27 — Navigator, 4x2
- U28 — Navigator, 4x4

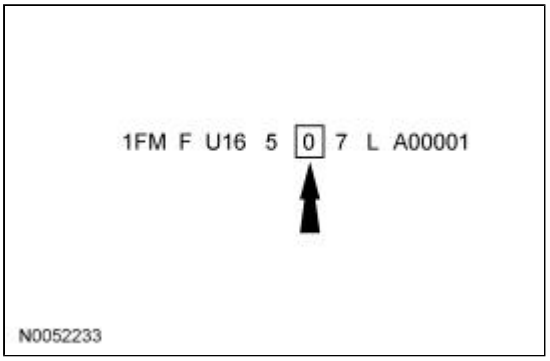
Engine Type



The eighth VIN position is the engine displacement and number of cylinders.

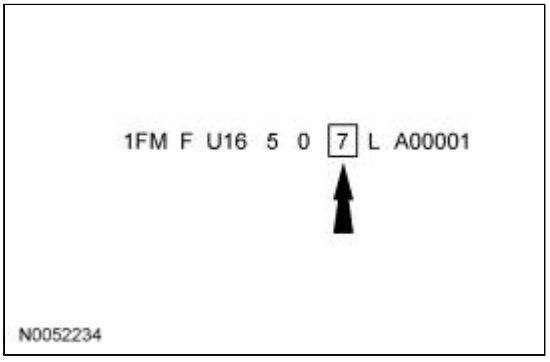
- 5 — 5.4L, SOHC, EFI, 3V, V-8, gas

Computer-Generated Check Digit



The ninth VIN position is a government-assigned, computer-generated check digit.

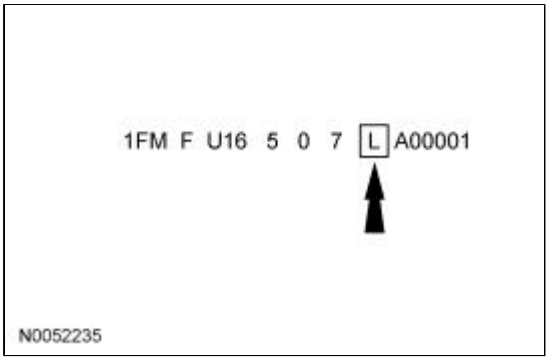
Model Year



The tenth VIN position is the model year code.

- 7 — 2007

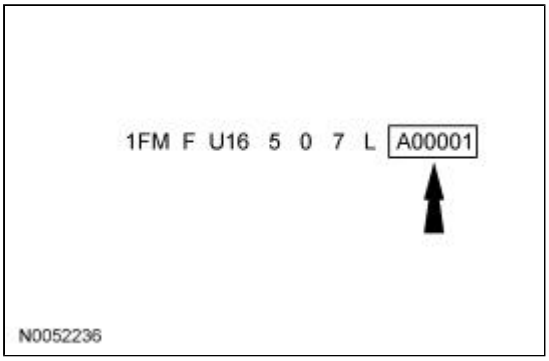
Assembly Plant



The eleventh VIN position is the assembly plant code.

- L — Michigan Truck (Wayne, Michigan)

Vehicle Build Sequence

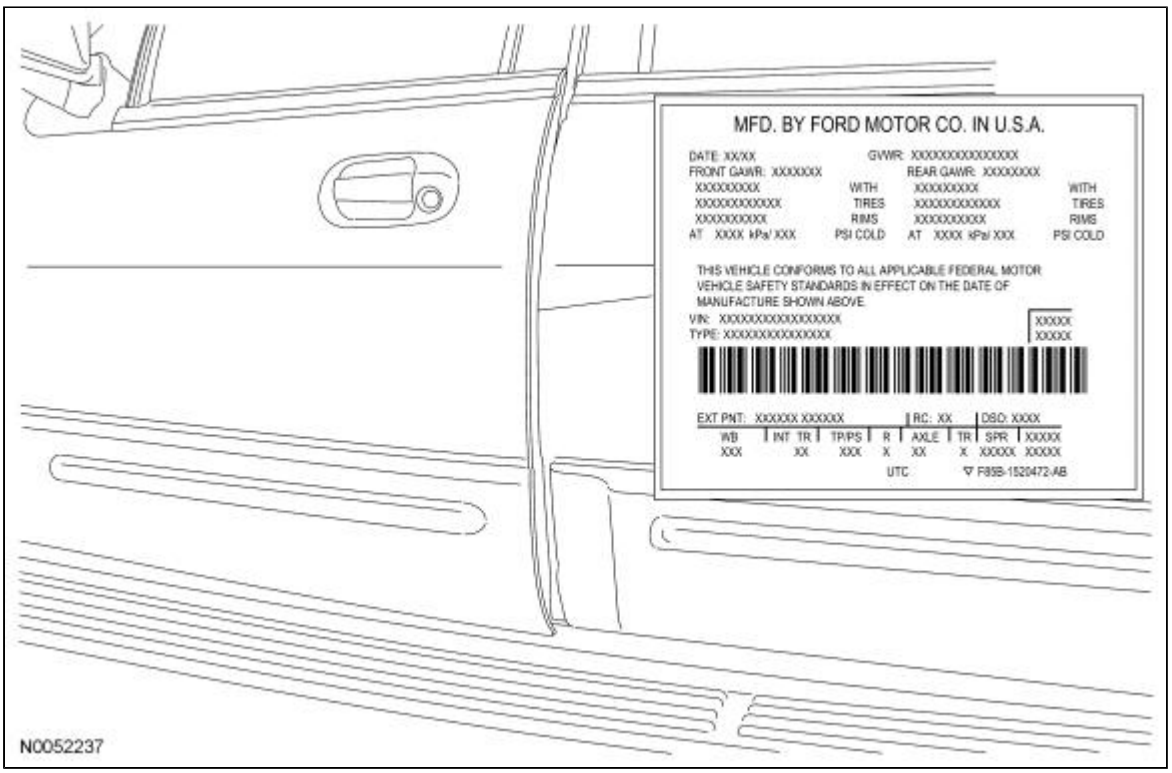


The last 6 VIN positions are an alphanumeric code for the vehicle build sequence. This is also the vehicle serial and warranty number.

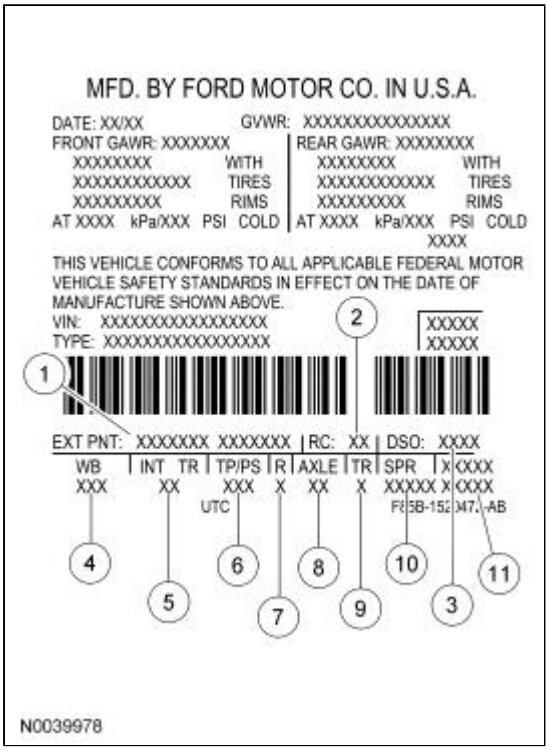
- A00001-F99999 — Ford Division
- J00001-L99999 — Lincoln Division

Vehicle Certification (VC) Label

Vehicle Certification (VC) Label Locator



The vehicle certification (VC) label contains the manufacturer name, the month and year of manufacture, the certification statement and the VIN. It also includes gross vehicle weight ratings (GVWR).



Item	Description
1	Exterior paint code
2	Region code
3	Domestic special order code
4	Wheelbase code
5	Interior trim code
6	Tape/paint pinstripe code
7	Radio code
8	Axle code
9	Transmission code
10	Spring code
11	Powertrain calibration information

Exterior Paint Code

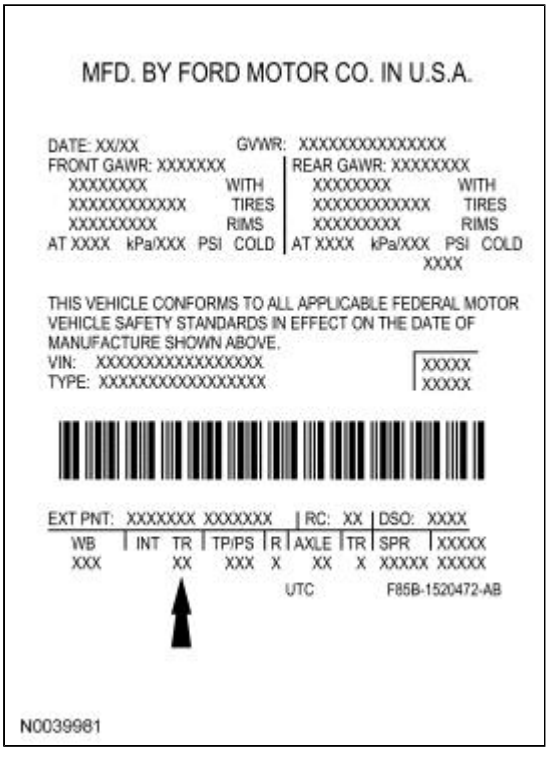
Paint codes may be listed as a 2-part code. The first set of characters listed indicate the vehicle primary body color. The second set of characters listed (if applicable) indicate a 2-tone or accent body color. All colors are base coat/clear coat.

- DX — Dark Blue Pearl
- G2 — Redfire
- G3 — Pueblo Gold
- G5 — Alloy Gray
- JP — Silver Birch Metallic
- PG — Dark Amethyst
- PV — White Chocolate (tri-coat)
- T5 — Dark Copper
- UA — Ebony
- YZ — Oxford White

Wheelbase

- 119 — 119 inch (3,023 mm) wheelbase
- 131 — 131 inch (3,327 mm) wheelbase

Interior Trim



Interior trim codes are listed as a 2-part code. The first character identifies the trim type. The second character identifies the interior trim color.

Trim Type

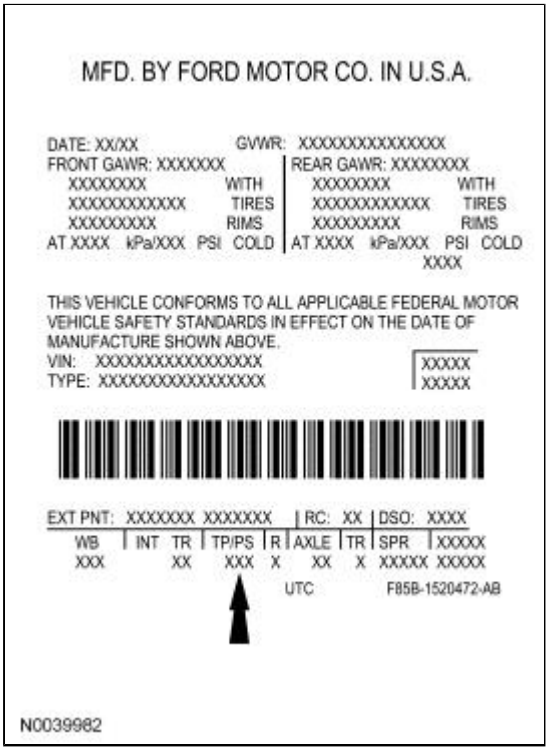
- 1 — Verona leather, 40/40 captain's chairs — Expedition

- 2 — Verona leather, 40/40 captain's chairs — Expedition
- 3 — Verona leather, 40/40 captain's chairs with accent — Expedition
- F — Beck cloth captain's chairs — Expedition
- M — Adobe/Beck cloth, 40/60 split bench seat — Expedition
- T — Premium/Soho leather, 40/40 captain's chairs — Navigator

Interior Trim Color

- C — Camel Tan
- L — Medium Light Stone
- W — Charcoal Black

Tape/Paint Stripe



Tape and paint stripe codes do not apply.

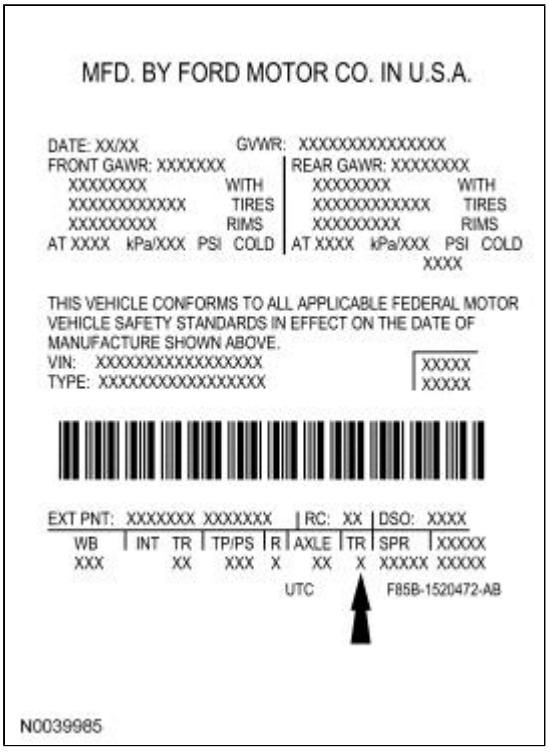
Radio Type

- 1 — Premium AM/FM stereo with in-dash compact 6-disc (CD) changer and clock
- F — AM/FM stereo with CD player, navigation system and clock
- S — Premium electronic AM/FM stereo CD player
- T — Premium AM/FM stereo with in-dash CD changer and clock
- U — Audiophile AM/FM stereo with in-dash, 6-disc CD changer and THX speaker system
- W — Navigation radio
- X — AM/FM stereo with in-dash, CD changer and navigation system

Axle Code

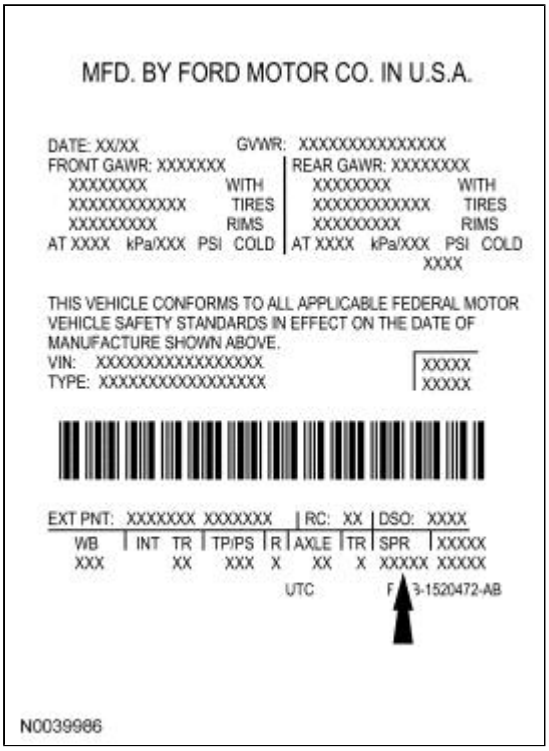
- 15 — 3.31 ratio, non-limited slip
- 16 — 3.73 ratio, non-limited slip
- H5 — 3.31 ratio, limited slip
- H6 — 3.73 ratio, limited slip

Transmission Code



- C — 6-speed automatic (6R75)
- G — 6-speed automatic (ZF 6HP26)

Spring Codes



Spring codes are listed as a 2-part code. The first character listed identifies the front spring code. The second character listed identifies the rear spring code.

Air Suspension

- L — Rear load-leveling air suspension

Front Springs

- AA — 7L14-18B036-AAD
- BB — 7L14-18B036-ABA
- CC — 7L14-18B036-ACD
- DD — 7L14-18B036-AED
- EE — 7L14-18B036-BAE
- FF — 7L14-18B036-AFA
- GG — 7L14-18B036-AGD
- HH — 7L14-18B036-BBA
- JJ — 7L14-18B036-BCE
- KK — 7L14-18B036-BED
- LL — 7L14-18B036-BFA
- MM — 7L14-18B036-BGD

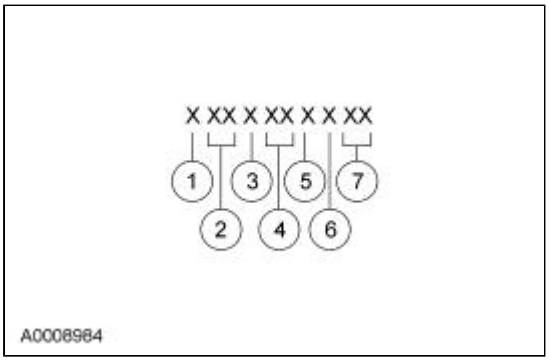
Rear Springs

- AA — 7L14-18W002-BAE
- BB — 7L14-18W004-BBA
- CC — 7L14-5A980/1-BCF
- DD — 7L14-18W002-BEA
- EE — 7L14-18W004-BFA
- FF — 7L14-5A980/1-BGA
- 11 — 7L14-5A980/1-ACF
- 33 — 7L14-5A980/1-AGA
- 55 — 7L14-18W004-ABA
- 77 — 7L14-18W004-AFA
- 88 — 7L14-18W004-AAE

Powertrain Calibration Information

NOTE: Powertrain calibration information is limited to a maximum of 5 characters per line on the Vehicle Certification (VC) label. Because of this, calibration identification consisting of more than 5 characters will wrap to the second line on the VC label.

Powertrain calibration information is printed in the lower right corner of the VC label. Only the base calibration information is printed. Revision levels will not appear, however, they can be found in On Line Automotive Service Information System (OASIS).



Item	Description
1	Model year (model year in which calibration strategy was first introduced)
2	Vehicle code
3	Transmission code
4	Unique calibration (designates different hardware to similar vehicles). Example: tires, drive ratios, etc.
5	Fleet code (describes fleet to which the vehicle belongs). Example: 6 - evaporative emissions
6	Certification region (lead region where multiple regions are included in one calibration). Example: A - U.S. federal

7	Revision level (will advance as revisions occur). Not printed on label

Model Year

- 0 — 2000
- 1 — 2001
- 2 — 2002
- 3 — 2003
- 4 — 2004
- 5 — 2005
- 6 — 2006
- 7 — 2007

Vehicle Line

- TB7 — Expedition
- TB5 — Navigator

Transmission

- 1 — Automatic transmission

Unique Calibration

The Emissions/CAFE/CO2 Compliance Department is responsible for assigning these calibration numbers. Unique calibration identifications are assigned to cover similar vehicles to differentiate between tires, drive configurations, final drive ratios and other calibration-significant factors.

These 2 characters are chosen by the analyst to provide identifiable information unique to each calibration. For example, using the number 2 to denote a 2-valve engine versus using the number 4 to denote a 4-valve engine provides an easily identifiable difference.

Fleet Code

- 1 — HDGE/Dyno
- 2 — Fast AMA, U.S.
- 3 — ADP, U.S.
- 4 — Not assigned
- 5 — Not assigned
- 6 — Evaporative emissions
- 7 — MACAA
- 8 — On-board diagnostics (OBD)
- 9 — Not assigned

Certification Region

- Where multiple regions are included in one calibration, only the lead region will appear.
- 5 — U.S. 50 states
- A — U.S. Federal, including altitude, may include Canada and/or Mexico
- B — U.S. California Standard, includes U.S. green states
- C — Canada
- D — China
- E — European Community (Austria, Belgium, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, Netherlands, Portugal, Spain, Sweden and United Kingdom)
- F — Extended European Community (E plus Croatia, Czech Republic, Estonia, Hungary, Norway, Poland, Romania, Russian Federation, Slovakia, Slovenia, Switzerland and Yugoslavia)
- G — Gulf Cooperative Council (Bahrain, Kuwait, Oman, Qatar, Saudi Arabia and UAE)
- H — Hong Kong
- J — Japan
- K — Korea

- L — Malaysia
- M — Mexico
- N — New Zealand
- P — Australia
- Q — South America (Brazil)
- S — Singapore
- T — Taiwan
- U — South America (unleaded fuel regions)
- V — Vietnam
- X — ROW (rest of world)
- Y — Military
- Z — Israel

Revision Level (not printed on label)

- 91-99 — Hardware certification levels
- 01-04 — Preliminary levels
- 00 — Job 1 production (initial calibration)
- 05-09 — Pre-job 1 revisions to calibrations
- 10-89 — Post-job 1 revisions to calibrations
- 0B — Durability test level
- BD — On-board diagnostics (OBD) intermediate level (pre-05)

Jacking

Printable View (216 KB)

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting or jacking an air suspension equipped vehicle. Failure to do so may result in unexpected inflation or deflation of the air springs which may result in shifting of the vehicle during these operations. Failure to follow these instructions may result in personal injury.

WARNING: Do not run the engine when jacking the vehicle. The wheels contacting the ground could cause the vehicle to move.

WARNING: Support the vehicle prior to carrying out any procedure requiring the vehicle to be jacked off the ground.

WARNING: Make sure the jack and jack stands are correctly located to prevent the vehicle from falling.

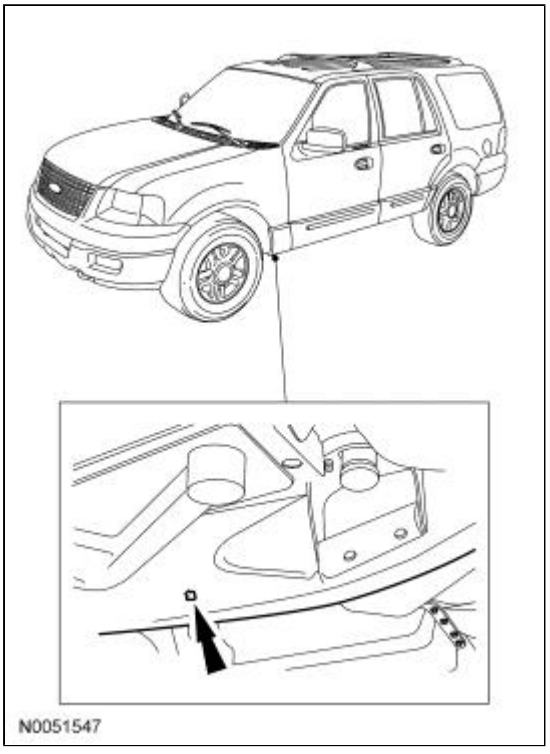
WARNING: Wheel chocks should be used to prevent the vehicle from rolling and falling off the jack.

CAUTION: Never use a halfshaft as a lifting point.

CAUTION: If equipped with retractable running board, disable the system through the instrument cluster controls.

Disable the air suspension system. Refer to Section 204-05 .

Jacking Points — Front

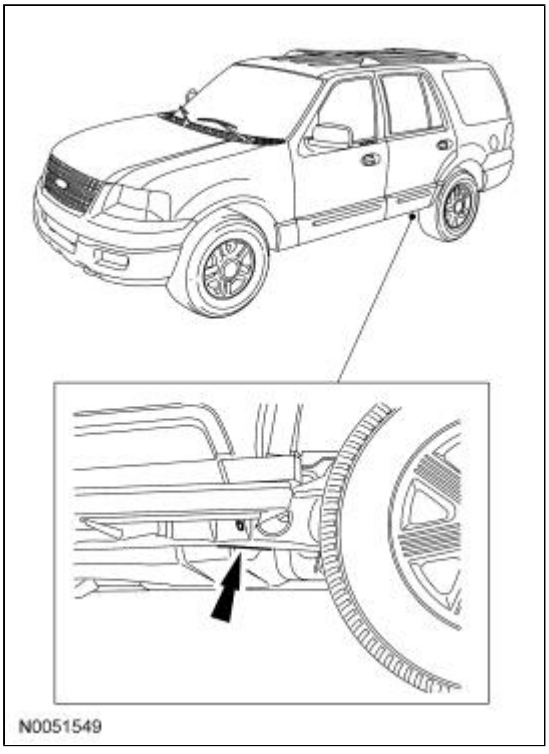


The front jacking point is indicated by an arrow cutout in the frame, located behind the front tire and wheel assembly.

After the vehicle has been lowered, enable the air suspension system. Refer to Section 204-05 .

Jacking Points — Rear

CAUTION: Do not use the differential housing as a lift point. Leaks or damage to the rear axle cover and adjoining differential housing surface can occur if a floor jack or any lifting device is allowed to contact the cover at any point where the cover joins the housing.



CAUTION: Do not use the rear control arms as a lifting point.

The rear jacking point is indicated by an arrow cutout in the frame, located in front of the rear tire and wheel assembly.

After the vehicle has been lowered, enable the air suspension system. Refer to Section 204-05 .

Lifting

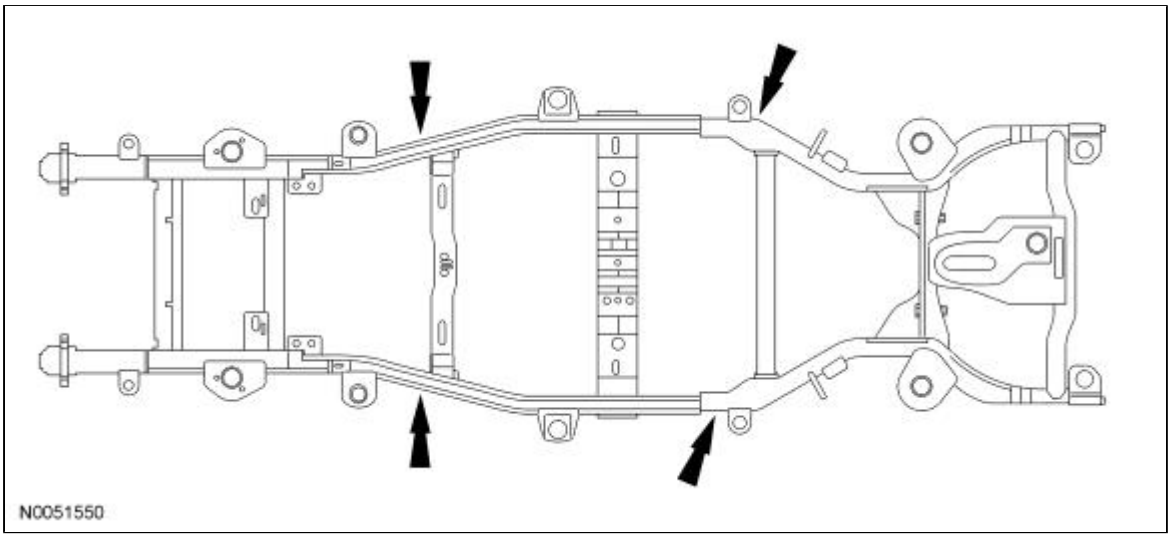
Printable View (149 KB)

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting or jacking an air suspension equipped vehicle. Failure to do so may result in unexpected inflation or deflation of the air springs which may result in shifting of the vehicle during these operations. Failure to follow these instructions may result in personal injury.

CAUTION: Damage to suspension, exhaust and steering linkage components can occur if care is not exercised when positioning the hoist adapters prior to lifting the vehicle.

Disable the air suspension sytem. Refer to Section 204-05 .

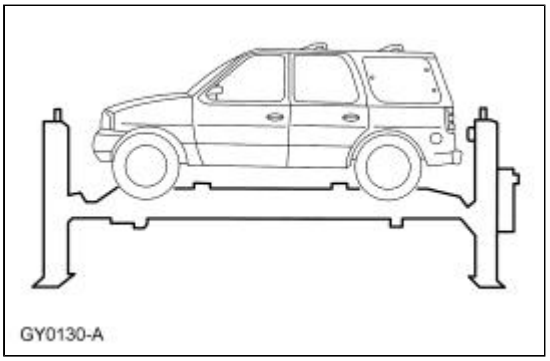
Lifting Points — Twin Post Hoist



Locate the front hoist adapters and rear hoist adapters (top of frame arc) as indicated.

After the vehicle has been lowered, enable the air suspension system. Refer to Section 204-05 .

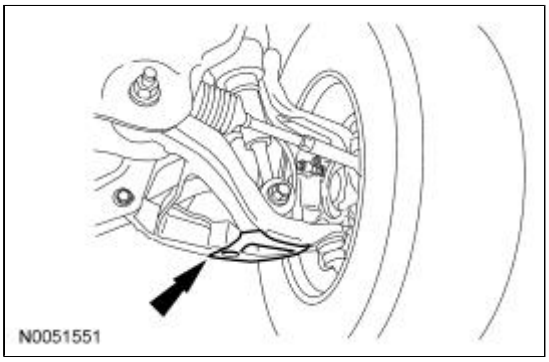
Lifting Points — Drive On Hoist



The vehicle is supported by tires and suspension components.

After the vehicle has been lowered, enable the air suspension system. Refer to Section 204-05 .

Lifting Points — Floor Jack, Front



The front can be lifted using a floor jack under the front control arm directly below the shock.

After the vehicle has been lowered, enable the air suspension system. Refer to Section 204-05 .

Maintenance Schedule — Gasoline Engines

Printable View (108 KB)

The maintenance schedule is designed to protect against major repairs resulting from neglect or inadequate maintenance and to prolong the life of the vehicle.

General Maintenance Information

NOTE: This is a generic maintenance schedule for all Ford, Lincoln and Mercury vehicles. There may be items listed that do not apply to all vehicles.

The Normal Schedule applies to operation of the vehicle under typical, everyday driving conditions. The maintenance frequency in this schedule typifies what the vast majority of vehicles will require. The listed services should be carried out at specified mileage intervals. There are, however, additional services required that only the noted vehicles require.

If the vehicle is operated in one or more of the following special operating conditions, those additional services will be required. The special operating conditions are:

- towing or carrying heavy loads.
- extensive idling and/or driving at low speeds for long distances.
- driving in dusty conditions.
- off-road operation.
- use of E85 fuel 50% of the time or greater (flex fuel vehicles only).

There are also exceptions to the Normal Operating Schedule which will require more frequent maintenance for some components. Those exceptions are:

- standard vehicle axle — maintenance and lubrication.
- police and taxi vehicles — maintenance and lubrication.
- engine oil and Motorcraft Premium Gold coolant — time-based and mileage-based intervals.
- change brake fluid every 2 years (Class A Motorhome).

Special Operating Condition Requirements

When towing a trailer or using a camper or car-top carrier:

- Change engine oil and install a new oil filter every 4,800 km (3,000 miles) or 3 months.
- Inspect and rotate tires every 4,800 km (3,000 miles).
- Change automatic transmission fluid (not required on 6R60 transmission), lubricate rear wheel drive (RWD) front wheel bearings, install new grease seals and adjust bearings every 48,000 km (30,000 miles). If equipped, change the in-line service installed transmission fluid filter.
- Change transfer case fluid every 96,000 km (60,000 miles).
- Change manual transmission fluid as required.
- Inspect and lubricate U-joints and halfshafts as required.

During extensive idling and/or low speed driving for long distances, as in heavy commercial use such as delivery, taxi, patrol car or livery:

- Change engine oil and install a new oil filter every 4,800 km (3,000 miles) or 3 months or 200 hours of engine operation.
- Inspect and rotate tires every 4,800 km (3,000 miles).
- Lube front lower control arm and steering linkage ball joints with zerk fittings (if equipped) every 4,800 km (3,000 miles) or 3 months.
- Inspect brake system and check battery electrolyte level every 8,000 km (5,000 miles).
- Install a new fuel filter every 24,000 km (15,000 miles) (not required for Fusion and Milan).
- Change automatic transmission fluid (not required on 6R60 transmission), lubricate RWD front wheel bearings, install new grease seals and adjust bearings every 48,000 km (30,000 miles). If equipped, change the in-line service installed transmission fluid filter.
- Install new spark plugs and change transfer case fluid every 96,000 km (60,000 miles).
- Install a new cabin air filter as required (if equipped).

When operating in dusty conditions such as unpaved or dusty roads:

- Change engine oil and install a new oil filter every 4,800 km (3,000 miles) or 3 months.
- Install a new fuel filter every 24,000 km (15,000 miles) (not required for Fusion and Milan).
- Change automatic transmission fluid (not required on 6R60 transmission), check air filter restriction gauge and install a new filter as required (Focus engine only) every 48,000 km (30,000 miles). If equipped, change the in-line service installed transmission fluid filter.
- Change rear axle lubricant every 80,000 km (50,000 miles) (E-450 and F-450/550 only).
- Change transfer case fluid every 96,000 km (60,000 miles).
- Install a new engine air filter as required.
- Install a new cabin air filter as required (if equipped).

When operating in off-road conditions:

- Change engine oil and install a new oil filter every 4,800 km (3,000 miles) or 3 months.
- Inspect and rotate tires every 4,800 km (3,000 miles).
- Change automatic transmission fluid every 48,000 km (30,000 miles). If equipped, change the in-line service-installed transmission fluid filter.
- Change rear axle lubricant every 80,000 km (50,000 miles) (E-450 and F-450/550 only).
- Change transfer case fluid every 96,000 km (60,000 miles).
- Install a new cabin air filter as required (if equipped).
- Inspect and lubricate U-joints and halfshafts.
- Inspect and lubricate steering linkage ball joints with zerk fittings.

Use of E85 fuel 50% of the time or greater (flex fuel vehicles only):

- Change engine oil and install a new oil filter every 4,800 km (3,000 miles), 3 months or 200 hours of engine operation (whichever occurs first).
- Fill the fuel tank with regular gasoline (non E85) once every 3,000 miles.

Checks and Services

Certain basic maintenance checks and inspections should be carried out at specified intervals. Any recognized adverse condition should be corrected as soon as possible.

Multi-Point Inspection

The following inspections are recommended at every service interval:

- Check and top off brake, coolant, manual and automatic transmission (if equipped with a underhood fluid level indicator), power steering and window washer fluids.
- Inspect tires for wear and correct air pressure, including spare tire.
- Check exhaust system for leaks, damage, loose parts and foreign material.
- Check battery performance.
- Check operation of horn, exterior lamps, turn signals and hazard warning lights.
- Check radiator, coolers, heater and air conditioning hoses.
- Inspect windshield wiper spray and wiper operation.
- Check windshield for cracks, chips and pitting.
- Inspect for oil and fluid leaks.
- Inspect air cleaner filter.
- Inspect halfshaft dust boots (if equipped).
- Check shocks, struts and other suspension components for leaks and damage.
- Inspect steering and linkage.
- Inspect accessory drive belt(s).
- Inspect clutch operation (if equipped).

In-Line, Service-Installed Transmission Fluid Filter

Some vehicles may be equipped with an in-line, service-installed transmission fluid filter. This filter is installed in the transmission fluid cooler return line. If equipped, install a new in-line filter during transmission fluid change intervals.

Maximum Oil Change Interval (Normal Schedule)

- 8,000 km (5,000 miles) or 6 months (whichever occurs first).

Maximum Oil Change Interval (Special Operating Conditions)

- 4,800 km (3,000 miles), 3 months or 200 hours of engine operation (whichever occurs first).

Monthly Checks

Check each of the following items every month:

- All interior and exterior lights for correct operation.
- Tires for wear and correct air pressure, including spare tire.
- Engine oil fluid level.
- Windshield washer solvent fluid level.

Six Month Checks

Check each of the following items at least every 6 months:

- Lap/shoulder belts and seat latches for wear and function.
- External mounted spare tire is stowed correctly (tight to body).
- Power steering fluid level.
- Washer spray, wiper operation and clean all wiper blades (install new wiper blades as necessary).
- Parking brake for correct operation.
- Lubricate all hinges, latches, door check straps and outside locks.
- Lubricate upper and lower sliding door tracks (if equipped).
- Clean sliding door contact switches (if equipped).
- Lubricate door rubber weatherstrips.
- Clean body and door drain holes.

- Safety warning lamps (brake, ABS, air bag, safety belt) for correct operation.
- Coolant system fluid level and correct strength.
- Battery connections. Clean if necessary.
- Clutch fluid level, if equipped.

Normal Schedule

NOTE: Rotate tires and inspect for wear at 5,000 miles, 15,000 miles and every 15,000 miles is required thereafter. At other 5,000-mile intervals, rotation is recommended for optimal life.

The following check procedures should be carried out for all cars, minivans, light trucks, sport utilities, vans, four wheel drive (4WD) and natural gas vehicles.

- Retighten the wheel nuts to the specified torque at 800 km (500 miles) after any wheel disturbance (tire rotation, changing a flat tire or wheel removal).
- On vehicles equipped with dual rear wheels, retighten the wheel nuts to the specified torque at 160 km (100 miles) and again at 800 km (500 miles) of new vehicle operation or after any wheel disturbance (tire rotation, changing a flat tire or wheel removal).
- Carry-out multi-point inspection (recommended).

8,000 Km (5,000 Miles)

- Change engine oil and install a new oil filter.
- Rotate tires and inspect for wear.
- Carry-out multi-point inspection (recommended).

16,000 Km (10,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.
- Carry-out multi-point inspection (recommended).

24,000 Km (15,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system (adjust parking brake if required).
- Inspect wheel ends for end play and noise.
- Inspect engine cooling system and hoses.
- Inspect steering linkage, ball joints, suspension and if equipped, halfshafts, driveshaft and U-joints.
- Lubricate steering linkage, suspension and ball joints (if equipped with zerk fittings).
- Lubricate halfshafts, driveshaft and U-joints.
- Rotate tires and inspect for wear.
- Install a new cabin air filter (if equipped).
- Inspect and lubricate 4WD front axle shaft U-joints (F-250/350/450/550).
- Carry-out multi-point inspection (recommended).

32,000 Km (20,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.

- Carry-out multi-point inspection (recommended).

40,000 Km (25,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.
- Carry-out multi-point inspection (recommended).

48,000 Km (30,000 Miles)

- Change engine oil and install a new oil filter.
- Rotate tires and inspect for wear.
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system (adjust parking brake if required).
- Inspect wheel ends for end play and noise.
- Inspect engine cooling system and hoses.
- Inspect exhaust system and heat shields.
- Inspect steering linkage, suspension and ball joints and, if equipped, halfshafts, driveshaft and U-joints.
- Install a new engine air filter (not required for Focus).
- Install a new fuel filter (not required for Fusion and Milan).
- Install a new cabin air filter (if equipped).
- Change automatic transmission/transaxle fluid on all vehicles equipped with the TorqShift transmission. Install a new remote filter if equipped with a TorqShift transmission. Inspect automatic transmission fluid level using the fluid level on all other vehicles (if equipped with an underhood fluid level indicator). Change the in-line service-installed transmission fluid filter (if equipped).
- Install new climate controlled seat cushion filters (if equipped) (Navigator, Freestar, Monterey and Expedition).
- Lubricate steering linkage, suspension and ball joints (if equipped with zerk fittings).
- Lubricate the 4WD front axle shaft U-joints (if equipped) (F-250/350/450/550).
- Carry-out multi-point inspection (recommended).

56,000 Km (35,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.
- Carry-out multi-point inspection (recommended).

64,000 Km (40,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.
- Carry-out multi-point inspection (recommended).

72,000 Km (45,000 Miles)

- Change engine oil and install a new oil filter.
- Rotate tires and inspect for wear.
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system (adjust parking brake if required).
- Inspect wheel ends for end play and noise.
- Inspect engine cooling system and hoses.
- Inspect steering linkage, suspension and ball joints.

- Inspect halfshafts, driveshaft and U-joints (if equipped).
- Install a new cabin air filter (if equipped).
- Lubricate steering linkage, suspension and ball joints (if equipped with zerk fittings).
- Lubricate the 4WD front axle shaft U-joints (if equipped) (F-250/350/450/550).
- Carry-out multi-point inspection (recommended).

80,000 Km (50,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.
- Change rear axle fluid (Class A Motorhome).
- Carry-out multi-point inspection (recommended).

88,000 Km (55,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.
- Carry-out multi-point inspection (recommended).

96,000 Km (60,000 Miles)

- Change engine oil and install a new oil filter.
- Rotate tires and inspect for wear.
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system (adjust parking brake if required).
- Inspect wheel ends for end play and noise.
- Inspect engine cooling system and hoses.
- Inspect exhaust system and heat shields.
- Inspect steering linkage, suspension and ball joints.
- Inspect halfshafts, driveshaft and U-joints (if equipped).
- Install a new engine air filter (not required for Focus).
- Install a new fuel filter (not required for Fusion and Milan).
- Install a new cabin air filter (if equipped).
- Change automatic transmission/transaxle fluid on all vehicles equipped with the TorqShift or 4F27E transmissions. Install a new remote filter if equipped with a TorqShift transmission. Inspect automatic transmission fluid level on all other vehicles (if equipped with an underhood fluid level indicator). Change the in-line service-installed transmission fluid filter (if equipped).
- Change automatic transmission fluid on all vehicles equipped with a CVT transmission and install a new high-pressure case filter and O-rings.
- Install new climate controlled seat cushion filters (if equipped) (Navigator, Freestar, Monterey and Expedition).
- Lubricate steering linkage, suspension and ball joints (if equipped with zerk fittings).
- Lubricate rear wheel drive (RWD) front wheel bearings, install new grease seals and adjust bearings (if equipped with serviceable bearings).
- Lubricate the four wheel drive (4WD) front axle shaft U-joints (if equipped) (F-250/350/450/550).
- Carry-out multi-point inspection (recommended).

104,000 Km (65,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.
- Carry-out multi-point inspection (recommended).

112,000 Km (70,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.
- Carry-out multi-point inspection (recommended).

120,000 Km (75,000 Miles)

- Change engine oil and install a new oil filter.
- Rotate tires and inspect for wear.
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system (adjust parking brake if required).
- Inspect wheel ends for end play and noise.
- Inspect engine cooling system and hoses.
- Inspect steering linkage, suspension and ball joints.
- Inspect halfshafts, driveshaft and U-joints (if equipped).
- Install a new cabin air filter (if equipped).
- Check air filter restriction gauge, install a new filter as necessary (Focus only).
- Lubricate steering linkage, suspension and ball joints (if equipped zerk fittings).
- Lubricate the 4WD front axle shaft U-joints (if equipped) (F-250/350/450/550).
- Carry-out multi-point inspection (recommended).

128,000 Km (80,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.
- Carry-out multi-point inspection (recommended).

136,000 Km (85,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.
- Carry-out multi-point inspection (recommended).

144,000 Km (90,000 Miles)

- Change engine oil and install a new oil filter.
- Rotate tires and inspect for wear.
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect wheel ends for end play and noise.
- Inspect engine cooling system and hoses.
- Inspect exhaust system and heat shields.
- Inspect steering linkage, suspension and ball joints.
- Inspect halfshafts, driveshaft and U-joints (if equipped).
- Install a new engine air filter (not required for Focus).
- Install a new fuel filter (not required for Fusion and Milan).
- Install a new cabin air filter (if equipped).
- Change automatic transmission/transaxle fluid on all vehicles equipped with TorqShift transmissions. Install a new remote filter element on vehicles equipped with the TorqShift transmission. Inspect automatic transmission fluid level on all other vehicles (if equipped with an underhood fluid level indicator). If equipped, change the in-line service-installed transmission fluid filter.
- Install new climate controlled seat cushion filters (if equipped) (Navigator, Freestar, Monterey and Expedition).
- Lubricate steering linkage, suspension and ball joints (if equipped with zerk fittings).

- Lubricate the 4WD front axle shaft U-joints (if equipped) (F-250/350/450/550).
- Carry-out multi-point inspection (recommended).

152,000 Km (95,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.
- Carry-out multi-point inspection (recommended).

160,000 Km (100,000 Miles)

- Change engine oil and install a new oil filter.
- Rotate tires and inspect for wear.
- Inspect accessory drive belt(s).
- Install new spark plugs.
- Change rear axle fluid (F-450/550, E-450 and Class A Motorhome).
- Change Premium Gold coolant or change at 6 years, whichever comes first.
- Install a new external PCV on all cars and light trucks under 6,000 lb Gross Vehicle Weight (GVW) (except 3V engines).
- Change manual transmission fluid (if equipped) (except Escape).
- Carry-out multi-point inspection (recommended).

168,000 Km (105,000 Miles)

- Change engine oil and install a new oil filter.
- Rotate tires and inspect for wear.
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system (adjust parking brake if required).
- Inspect wheel ends for end play and noise.
- Inspect engine coolant system and hoses.
- Inspect steering linkage, suspension and ball joints.
- Inspect halfshafts, driveshaft and U-joints (if equipped).
- Install a new cabin air filter (if equipped).
- Lubricate steering linkage, suspension and ball joints (if equipped with zerk fittings).
- Lubricate the 4WD front axle shaft U-joints (if equipped) (F-250/350/450/550).
- Carry-out multi-point inspection (recommended).

176,000 Km (110,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.
- Carry-out multi-point inspection (recommended).

184,000 Km (115,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.
- Carry-out multi-point inspection (recommended).

192,000 Km (120,000 Miles)

- Change engine oil and install a new oil filter.
- Rotate tires and inspect for wear.

- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect wheel ends for end play and noise.
- Inspect engine cooling system and hoses.
- Inspect exhaust system and heat shields.
- Inspect steering linkage, suspension and ball joints.
- Inspect halfshafts, driveshaft and U-joints (if equipped).
- Install a new engine air filter (not required for Focus).
- Install a new fuel filter (not required for Fusion and Milan).
- Install a new cabin air filter (if equipped).
- Install a new external PCV valve on all cars and light trucks over 6,000 lb GVW (except 3V engines).
- Change automatic transmission/transaxle fluid on all vehicles equipped with TorqShift or 4F27E transmissions. Install a new remote filter element on the vehicles equipped with the TorqShift transmission. Inspect automatic transmission fluid level on all other vehicles (if equipped with an underhood fluid level indicator). If equipped, change the in-line service-installed transmission fluid filter.
- Change automatic transmission fluid on all vehicles equipped with a CVT transmission and install a new high-pressure case filter and O-rings.
- Install new climate controlled seat cushion filters (if equipped) (Navigator, Freestar, Monterey and Expedition).
- Lubricate RWD front wheel bearings, install new grease seals and adjust bearings (if equipped with serviceable bearings).
- Lubricate steering linkage, suspension and ball joints (if equipped with zerk fittings).
- Lubricate the 4WD front axle shaft U-joints (if equipped) (F-250/350/450/550).
- Carry-out multi-point inspection (recommended).

200,000 Km (125,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.
- Carry-out multi-point inspection (recommended).

208,000 Km (130,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.
- Carry-out multi-point inspection (recommended).

216,000 Km (135,000 Miles)

- Change engine oil and install a new oil filter.
- Rotate tires and inspect for wear.
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system (adjust parking brake if required).
- Inspect wheel ends for end play and noise.
- Inspect engine cooling system and hoses.
- Inspect steering linkage, suspension and ball joints.
- Inspect halfshafts, driveshaft and U-joints (if equipped).
- Install a new cabin air filter (if equipped).
- Lubricate steering linkage, suspension and ball joints (if equipped with zerk fittings).
- Lubricate the 4WD front axle shaft U-joints (if equipped) (F-250/350/450/550).
- Carry-out multi-point inspection (recommended).

224,000 Km (140,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.
- Carry-out multi-point inspection (recommended).

232,000 Km (145,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.
- Carry-out multi-point inspection (recommended).

240,000 Km (150,000 Miles)

- Change engine oil and install a new oil filter.
- Rotate tires and inspect for wear.
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect wheel ends for end play and noise.
- Inspect engine cooling system and hoses.
- Change Motorcraft Premium Gold coolant (see Exceptions To Normal Schedule and Mileage Base).
- Inspect exhaust system and heat shields.
- Inspect steering linkage, suspension and ball joints.
- Inspect halfshafts, driveshaft and U-joints (if equipped).
- Install a new fuel filter (not required for Fusion and Milan).
- Install a new engine air filter (not required on Focus).
- Check air filter restriction gauge, install a new air filter as necessary (Focus only).
- Install a new cabin air filter (if equipped).
- Change automatic transmission/transaxle fluid (except CVT transmission).
- Change automatic transaxle filter (except CVT, Five Hundred and Montego equipped with a 6-speed automatic transaxle).
- Change rear axle lubricant on all RWD vehicles.
- Change rear axle fluid (Class A Motorhome).
- Install a new accessory drive belt(s) (if a new belt has not been installed within the last 100,000 miles).
- Install new climate controlled seat cushion filters (if equipped) (Navigator, Freestar, Monterey and Expedition).
- Install a new climate controlled seat back filter (MKZ only).
- Inspect PVC for flow (3V engines).
- Lubricate steering linkage, suspension and ball joints (if equipped with zerk fittings).
- Install new non-sealed RWD front wheel bearings and seals (if new bearings and seals have not been installed in the last 100,000 miles).
- Lubricate the 4WD front axle shaft U-joints (if equipped) (F-250/350/450/550).
- Change front axle lubricant (4WD only).
- Change transfer case fluid (4WD only).
- Change automatic transmission/transaxle fluid on all vehicles equipped with a 4F50N, 5R44E, 5R55E, 5R555, TorqShift and CD4E transmission/transaxle. Install a new remote filter if equipped with a TorqShift transmission. Inspect automatic transmission fluid level using the fluid level indicator on all other vehicles (if equipped with an underhood fluid level indicator). Change the in-line service-installed transmission fluid filter (if equipped).
- Carry-out multi-point inspection (recommended).

Exceptions To Normal Schedule

Maximum Oil Change Interval

- Normal schedule: 8,000 km (5,000 miles) or 6 months, whichever occurs first.
- Special operating conditions: 4,800 km (3,000 miles), 3 months or 200 hours of operation, whichever occurs first.

Motorcraft Premium Gold Coolant

- Change Motorcraft Premium Gold coolant at 6 years or 160,000 km (100,000 miles) of the vehicle's life, whichever occurs first.
- After the initial change, change coolant every 3 years or 80,000 km (50,000 miles) thereafter.

Normal Vehicle Axle Maintenance

Rear axles and transfer case/power transfer unit (PTU) units containing synthetic lubricant and light duty trucks equipped with Ford-design axles are lubricated for life. These lubricants are not to be checked or changed unless service is required, or if a leak is suspected or the axle assembly has been submerged in water.

The axle and transfer case/PTU fluid should be changed anytime they have been submerged in water. Non-synthetic rear axle lubricants should be replaced every 4,800 km (3,000 miles) or 3 months, whichever occurs first, during extended trailer tow operation above 21°C (70°F) ambient and wide open throttle for extended periods above 45 mph.

The 3,000 mile lube change interval may be waived if the axle was filled with 75W-140 synthetic gear lubricant. Add 4 ounces of additive friction modifier for complete refill of Traction-Lok® rear axles.

The axle lubricant should be changed anytime an axle has been submerged in water.

Police and Taxi Vehicle Axle Maintenance

Replace rear axle lubricant every 160,000 km (100,000 miles). Rear axle lubricant change may be waived if the axle was filled with 75W-140 synthetic gear lubricant. Add 4 ounces of additive friction modifier for complete refill of Traction-Lok® rear axles.

The axle lubricant should be changed anytime an axle has been submerged in water.

E and F-450 and 550 Series Axle Maintenance

Replace rear axle lubricant every 100,000 miles under normal driving conditions on all E and F-450 and 550 series applications. For E and F-450 and 550 series vehicles operated at or near maximum Gross Vehicle Weights, the rear axle lubricant should be replaced every 50,000 miles.

In addition, the 50,000 mile schedule should be observed when the vehicles are operated under the Special Operating Conditions.

Class A Motorhome

- Every 2 years — change brake fluid.
- Every 48,000 km (30,000 miles) — change the automatic transmission fluid and the transmission remote filter element.
- Change rear axle fluid at 80,000 km (50,000 miles), 160,000 km (100,000 miles) and 240,000 km (150,000 miles).

Noise, Vibration and Harshness (NVH)

Printable View (228 KB)

Noise is any undesirable sound, usually unpleasant in nature. Vibration is any motion, shaking or trembling, that can be felt or seen when an object moves back and forth or up and down. Harshness is a ride quality issue where the vehicle's response to the road transmits sharply to the customer. Harshness normally describes a firmer than usual response from the suspension system. Noise, vibration and harshness (NVH) is a term used to describe these conditions, which result in varying degrees of dissatisfaction. Although, a certain level of NVH caused by road and environmental conditions is normal. This section is designed to aid in the diagnosis, testing and repair of NVH concerns.

Acceptable Noise, Vibration and Harshness

All internal combustion engines and drivelines produce some noise and vibration; operating in a real world environment adds noise that is not subject to control. Vibration isolators, mufflers and dampers reduce these to acceptable levels. A driver who is unfamiliar with a vehicle can think that some sounds are abnormal when actually the sounds are normal for the vehicle type. For example, Traction-Lok® differentials produce a slight noise on slow turns after extended highway driving. This is acceptable and has no detrimental effect on the locking axle function. As a technician, it is very important to be familiar with vehicle features and know how they relate to NVH concerns and their diagnosis. For example, if the vehicle has automatic overdrive, it is important to test drive the vehicle both in and out of overdrive mode.

Diagnostic Theory

The shortest route to an accurate diagnosis results from:

- system knowledge, including comparison with a known good system.
- system history, including repair history and usage patterns.
- condition history, especially any relationship to repairs or sudden change.
- knowledge of possible sources.
- using a systematic diagnostic method that divides the system into related areas.

The diagnosis and correction of noise, vibration and harshness concerns requires:

- a road or system test to determine the exact nature of the concern.
- an analysis of the possible causes.
- testing to verify the cause.
- repairing any concerns found.
- a road test or system test to make sure the concern has been corrected or brought back to within an acceptable range.

Glossary of Terms

Acceleration — Light

An increase in speed at less than 1/2 throttle.

Acceleration — Medium

An increase in speed at 1/2 to nearly full throttle, such as 0-97 km/h (0-60 mph) in approximately 30 seconds.

Acceleration — Heavy

An increase in speed at 1/2 to full throttle, such as 0-97 km/h (0-60 mph) in approximately 20 seconds.

Ambient Temperature

The surrounding or prevailing temperature.

Amplitude

The quantity or amount of energy produced by a vibrating component (G force). An extreme vibration has a high amplitude. A mild vibration has a low amplitude.

Backlash

Gear teeth clearance.

Boom

Low frequency or low pitched noise often accompanied by a vibration. Also refer to drumming.

Bound Up

An overstressed isolation (rubber) mount that transmits vibration/noise instead of absorbing it.

Brakes Applied

When the service brakes are applied with enough force to hold the vehicle against movement with the transmission in gear.

Buffet/Buffeting

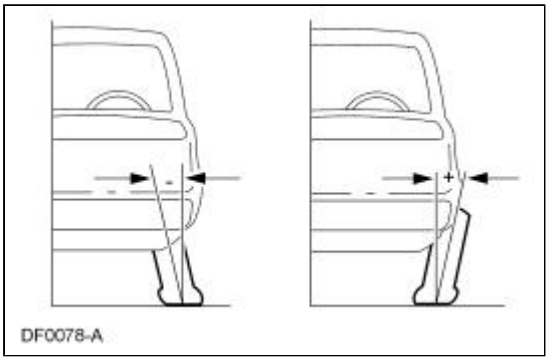
Strong noise fluctuations (less than 1000 Hz) caused by gusting winds. An example would be wind gusts against the side glass.

Buzz

A low-pitched sound (200-5000 Hz) like that from a bee. Often a metallic or hard plastic humming sound. Also describes a high frequency (200-800 Hz) vibration. Vibration feels similar to an electric razor.

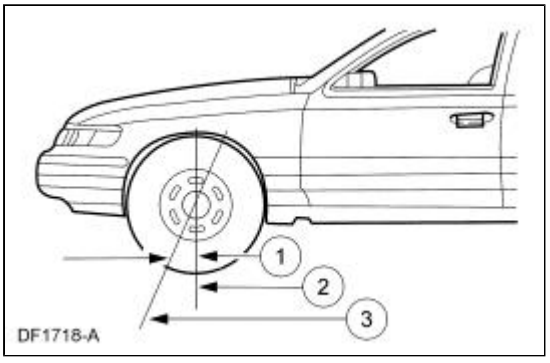
Camber

The angle of the wheel in relation to the true vertical as measured looking from the front of the vehicle. Camber is positive when the wheel angle is offset so that the top of the wheel is positioned away from the vehicle.



Caster

The angle of the steering knuckle in relation to the true vertical as measured looking from the side of the vehicle.



Item	Description
1	Positive caster
2	True vertical
3	Steering axis

Chatter

A pronounced series of rapidly repeating rattling or clicking sounds.

Chirp

A short-duration high-pitched noise associated with a slipping drive belt.

Chuckle

A repetitious low-pitched sound. A loud chuckle is usually described as a knock.

Click

A sharp, brief, non-resonant sound, similar to actuating a ball point pen.

Clonk

A hydraulic knocking sound. Sound occurs with air pockets in a hydraulic system. Also described as hammering.

Clunk/Driveline Clunk

A heavy or dull, short-duration, low-frequency sound. Occurs mostly on a vehicle that is accelerating or decelerating abruptly. Also described as a thunk.

Coast/Deceleration

Releasing the accelerator pedal at cruise, allowing the engine to reduce vehicle speed without applying the brakes.

Coast/Neutral Coast

Placing the transmission range selector in NEUTRAL (N) or depressing the clutch pedal while at cruise.

Constant Velocity (CV) Joint

A joint used to absorb vibrations caused by driving power being transmitted at an angle.

Controlled Rear Suspension Height

The height at which a designated vehicle element must be when driveline angle measurements are made.

Coupling Shaft

The shaft between the transfer case and the front drive axle or, in a 2-piece rear driveshaft, the front section.

CPS

Cycles per second. Same as hertz (Hz).

Cracks

A mid-frequency sound, related to squeak. Sound varies with temperature conditions.

Creak

A metallic squeak.

Cruise

Constant speed on level ground; neither accelerating nor decelerating.

Cycle

The process of a vibrating component going through a complete range of motion and returning to the starting point.

Decibel

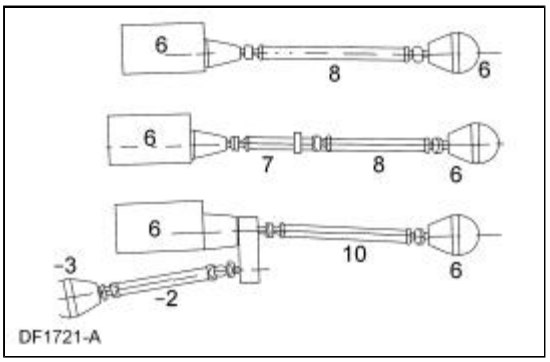
A unit of measurement, referring to sound pressure level, abbreviated dB.

Drive Engine Run-Up (DERU) Test

The operation of the engine through the normal rpm range with the vehicle standing still, the brakes applied and the transmission engaged. This test is used for noise and vibration checks.

Driveline Angles

The differences of alignment between the transmission output shaft, the driveshaft and the rear axle pinion centerline.



Driveshaft

The shaft that transmits power to the rear axle input shaft (pinion shaft). In a 2-piece driveshaft, it is the rearmost shaft.

Drivetrain

All power transmitting components from the engine to the wheels; includes the clutch or torque converter, the transmission, the transfer case, the driveshaft and the front or rear drive axle.

Drivetrain Damper

A weight attached to the engine, the transmission, the transfer case or the axle. It is tuned by weight and placement to absorb vibration.

Drone

A low frequency (100-200 Hz) steady sound, like a freezer compressor. Also described as a moan.

Drumming

A cycling, low-frequency (20-100 Hz), rhythmic noise often accompanied by a sensation of pressure on the ear drums. Also described as a low rumble, boom or rolling thunder.

Dynamic Balance

The equal distribution of weight on each side of the centerline, so that when the wheel and tire assembly spins, there is no tendency for the assembly to move from side-to-side (wobble). Dynamically unbalanced wheel and tire assemblies can cause wheel shimmy.

Engine Imbalance

A condition in which an engine's center mass is not concentric to the rotation center, causing excessive motion.

Engine Misfire

When combustion in one or more cylinders does not occur or occurs at the wrong time.

Engine Shake

An exaggerated engine movement or vibration that directly increases in frequency as the engine speed increases. It is caused by non-equal distribution of mass in the rotating or reciprocating components.

Flexible Coupling

A flexible joint.

Float

A drive mode on the dividing line between cruise and coast where the throttle setting matches the engine speed with the road speed.

Flutter

Mid to high (100-2000 Hz) intermittent sound due to air flow. Similar to a flag flapping in the wind.

Frequency

The rate at which a cycle occurs within a given time.

Gravelly Feel

A grinding or growl in a component, similar to the feel experienced when driving on gravel.

Grind

An abrasive sound, similar to using a grinding wheel, or rubbing sand paper against wood.

Hiss

Steady high frequency (200-800 Hz) noise. Vacuum leak sound.

Hoot

A steady low frequency tone (50-500 Hz), sounds like blowing over a long neck bottle.

Howl

A mid-range frequency (200-800 Hz) noise between drumming and whine. Also described as a hum.

Hum

Mid-frequency (200-800 Hz) steady sound, like a small fan motor. Also described as a howl.

Hz

Hertz; a frequency measured in cycles per second.

Imbalance

Out of balance; heavier on one side than the other. In a rotating component, imbalance often causes vibration.

Inboard

Toward the centerline of the vehicle.

Intensity

The physical quality of sound that relates to the strength of the vibration (measured in decibels). The

higher the sound's amplitude, the higher the intensity and vice versa.

Isolate

To separate the influence of one component to another.

Knock

A heavy, loud, repetitious sound, like a knock on the door.

Moan

A constant, low-frequency (100-200 Hz) tone. Also described as a hum.

Neutral Engine Run-Up (NERU) Test

The operation of the engine through the normal rpm range with the vehicle standing still and the transmission disengaged. This test is used to identify engine related vibrations.

Neutralize/Normalize

To return to an unstressed position. Used to describe mounts. Also refer to bound up.

Outboard

Away from the centerline of the vehicle.

Ping

A short duration, high-frequency sound, which has a slight echo.

Pinion Shaft

The input shaft in a driving axle that is usually a part of the smaller driving or input hypoid gear of a ring and pinion gearset.

Pitch

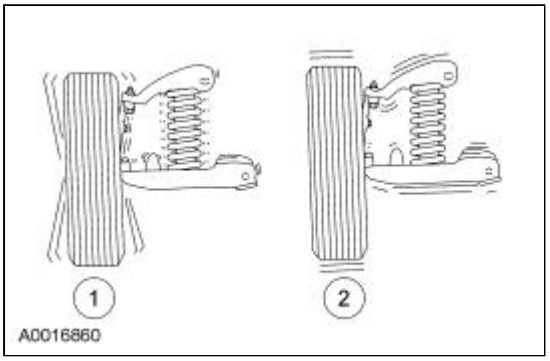
The physical quality of sound that relates to its frequency. Pitch increases as frequency increases and vice versa.

Pumping Feel

A slow, pulsing movement.

Radial/Lateral

Radial is in the plane of rotation; lateral is at 90 degrees to the plane of rotation.



Item	Description
1	Lateral runout
2	Radial runout

Rattle

A random and momentary or short duration noise.

Ring Gear

The large, circular, driven gear in a ring and pinion gearset.

Road Test

The operation of the vehicle under conditions intended to produce the concern under investigation.

Roughness

A medium-frequency vibration. A slightly higher frequency (20 to 50 Hz) than a shake. This type of vibration is usually related to drivetrain components.

Runout

Lateral runout means measuring the movement or "wobble" of a wheel or tire at the sidewall. Radial runout means measuring the out-of-round at the tread surface.

Rustling

Intermittent sound of varying frequency (100-2000 Hz), sounds similar to shuffling through leaves.

Shake

A low-frequency vibration (5-20 Hz), usually with visible component movement. Usually relates to tires, wheels, brake drums or brake discs if it is vehicle speed sensitive, or engine if it is engine speed sensitive. Also referred to as a shimmy or wobble.

Shimmy

An abnormal vibration or wobbling, felt as a side-to-side motion of the steering wheel in the driveshaft rotation. Also described as waddle.

Shudder

A low-frequency vibration that is felt through the steering wheel or seat during light brake application.

Slap

A resonance from flat surfaces, such as safety belt webbing or door trim panels.

Slip Yoke/Slip Spline

The driveshaft coupling that allows length changes to occur while the suspension articulates and while the driveshaft rotates.

Squeak

A high-pitched transient sound, similar to rubbing fingers against a clean window.

Squeal

A long-duration, high-pitched noise.

Static Balance

The equal distribution of weight around the wheel. Statically unbalanced wheel and tire assemblies can cause a bouncing action called wheel tramp. This condition will eventually cause uneven tire wear.

Tap

A light, rhythmic, or intermittent hammering sound, similar to tapping a pencil on a table edge.

Thump

A dull beat caused by 2 items striking together.

Tick

A rhythmic tap, similar to a clock noise.

Tip-In Moan

A light moaning noise heard during light vehicle acceleration, usually between 40-100 km/h (25-65 mph).

TIR

The acronym for total indicated runout is TIR.

Tire Deflection

The change in tire diameter in the area where the tire contacts the ground.

Tire Flat Spots

A condition commonly caused by letting the vehicle stand while the tires cool off. This condition can be corrected by driving the vehicle until the tires are warm. Also, irregular tire wear patterns in the tire tread resulting from wheel-locked skids.

Tire Force Vibration

A tire vibration caused by variations in the construction of the tire that is noticeable when the tire rotates against the pavement. This condition can be present on perfectly round tires because of variations in the inner tire construction. This condition can occur at wheel rotation frequency or twice rotation frequency.

Transient

A noise or vibration that is momentary, a short duration.

Two-Plane Balance

Radial and lateral balance.

Vibration

Any motion, shaking or trembling, that can be felt or seen when an object moves back and forth or up and down.

Whine

A constant, high-pitched noise. Also described as a screech.

Whistle

High-pitched noise (above 500 Hz) with a very narrow frequency band. Examples of whistle noises are a turbocharger or airflow around an antenna.

Wind Noise

Any noise caused by air movement in, out or around the vehicle.

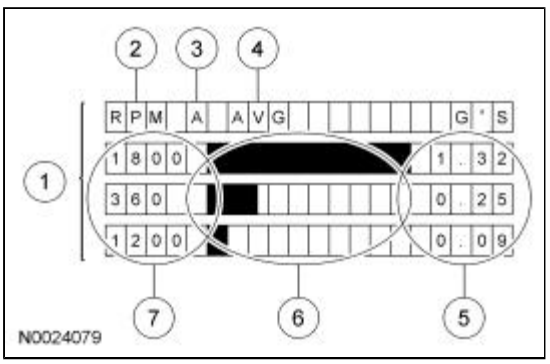
WOT

The acronym for wide open throttle is WOT.

Tools and Techniques

Vibration Analyzer (EVA)

The vibration analyzer (EVA) is a hand-held electronic scan tool which will assist in locating the source of unacceptable vibrations. The vibration sensor can be remotely mounted anywhere in the vehicle for testing purposes. The unit displays the 3 most common vibration frequencies and their corresponding amplitudes simultaneously. A bar graph provides a visual reference of the relative signal strength (amplitude) of each vibration being displayed and its relative G force. The keypad is arranged to make the EVA simple to program and use. Some of the functions include the ability to average readings as well as record, play back and freeze readings. The EVA has a strobe balancing function that can be used to detect imbalance on rotating components such as a driveshaft or engine accessories.



Item	Description
1	EVA screen
2	Frequency mode displayed in rpm or Hz
3	Active sensor input (A or B)
4	Current active mode
5	G force indicators or the strongest frequencies in descending strength of each vibration
6	Strength of each vibration
7	Frequency in rpm/Hz of each vibration

The EVA allows for a systematic collection of information that is necessary to accurately diagnose and repair NVH problems. For the best results, carry out the test as follows:

a. Test drive the vehicle with the vibration sensor inside the vehicle.
b. Place the sensor in the vehicle according to feel.
    - If the condition is felt through the steering wheel, the source is most likely in the front of the vehicle.
    - A vibration that is felt in the seat or floor only will most likely be found in the driveline, drive axle or rear wheels and tires.
c. Record the readings. Also note when the condition begins, when it reaches maximum intensity and if it tends to diminish above/below a certain speed.
    - Frequencies should be read in the "average" mode.
    - Frequencies have a range of plus or minus 2. A reading of 10 Hz can be displayed as an 8 Hz through 12 Hz.
    - Frequencies with a reading of 0.06 Gs or less, are barely perceptible NVH levels. No corrective action is necessary.
d. Place the vibration sensor on or near the suspect area outside the vehicle.
e. Continue the road test, driving the vehicle at the speed the symptom occurs, and take another reading.
f. Compare the readings.
    - A match in frequency indicates the problem component or area.
    - Example: A vibration is felt in the seat. Place the sensor on the console. Record the readings. Place the vibration sensor on the rear axle. Compare the readings. If the frequencies are the same, the axle is the problem component.
    - If the 2 readings are not the same frequency, then diagnose the frequency with the most significant amplitude (Gs) first.

NVH Analyzer (Vetronix)

The MTS 4000 and the MTS 4100 NVH analyzers are tools to aid in the identification and isolation of a noise, vibration or harshness concern in a vehicle. They measures noise and vibration data and compare it with data obtained from the vehicle's powertrain control module (PCM) in order to provide possible sources. The MTS 4000 and the 4100 have the following characteristics:

- Interfaces with the vehicle's computer system
- Support and store vibration data input from 1 or 2 accelerometers
- Support and store noise data input from 2 microphones
- Provide a photo-tachometer for operation of the driveshaft balancing function
- Provide a strobe output capable of driving a standard timing light
- Contain a real time clock circuit that provides time and date information which is used for tagging test data
- Have the capability to print to an external printer and interface with a PC
- Can be powered from a variety of power sources: cigarette lighter, AC power or the internal battery pack

The MTS 4000 and the 4100 NVH analyzers have 4 main operating modes. The first is for vibration

diagnosis. This mode measures data from 1 or 2 accelerometers simultaneously while obtaining data from the vehicle's computer system about the operation of the vehicle. Then it does a frequency analysis on the accelerometer information and compares the vibration frequencies with the frequencies associated with various rotating components within the vehicle. The data can be presented in 4 different display modes: principle component, bar chart, frequency spectrum or waterfall. All display mode formats contain the same common elements, such as amplitude.

The second is for noise diagnosis. This mode measures noise from 1 or 2 microphones simultaneously. All noise measurements are in db's. All frequency bands used for noise measurements are the same as for the vibration measurements, up to 1000 Hz.

The third is driveshaft balancing. Driveshaft balancing is done using 1 or 2 accelerometers and a photo-tachometer. The accelerometers measure the vibrations at both ends of the driveshaft, while the photo-tachometer measures the rotation speed and position reference.

The fourth mode is the strobe. A strobe or standard timing light can be connected to an analyzer, to provide a means for measuring rotational speed. The strobe function is used for isolating the source of a vibration.

Vibrate Software®

Vibrate Software® (Rotunda tool number 215-00003) is a diagnostic aid which will assist in pinpointing the source of unacceptable vibrations. The engine's crankshaft is the point of reference for vibration diagnosis. Every rotating component will have an angular velocity that is faster, slower or the same as the engine's crankshaft. Vibrate Software® calculates the angular velocity of each component and graphically represents these velocities on a computer screen and on a printed vibration worksheet. The following steps outline how Vibrate Software® helps diagnose a vibration concern:

- Enter the vehicle information. Vibrate will do all the calculations and display a graph showing tire, driveshaft and engine vibrations.
- Print a Vibration Worksheet graph. The printed graph is to be used during the road test.
- Road test the vehicle at the speed where the vibration is most noticeable. Record the vibration frequency (rpm) and the engine rpm on the worksheet graph. The point on the graph where the vibration frequency (rpm) reading and the engine rpm reading intersect indicates the specific component group causing the concern.
    - A EVA or equivalent tool capable of measuring vibration frequency and engine rpm will be needed.
- Provide pictures of diagnostic procedures to aid in testing components.

Combination EngineEAR/ChassisEAR

An electronic listening device used to quickly identify noise and the location under the chassis while the vehicle is being road tested. The ChassisEARs can identify the noise and location of damaged/worn wheel bearings, CV joints, brakes, springs, axle bearings or driveshaft carrier bearings.

EngineEAR Basic Unit

An electronic listening device used to detect even the faintest noises, the EngineEARs can detect the noise of damaged/worn bearings in generators, coolant pumps, A/C compressors and power steering pumps. They are also used to identify noisy lifters, exhaust manifold leaks, chipped gear teeth and for detecting wind noise. The EngineEAR has a sensing tip, amplifier and headphones. The directional sensing tip is used to listen to the various components. Point the sensing tip at the suspect component and adjust the volume with the amplifier. Placing the tip in direct contact with a component will reveal structure-borne noise and vibrations, generated by or passing through, the component. Various volume levels can reveal different sounds.

Ultrasonic Leak Detector

The Ultrasonic Leak Detector is used to detect wind noises caused by leaks and gaps in areas where there is weatherstripping or other sealing material. It is also used to identify A/C leaks, vacuum leaks

and evaporative emission noises. The Ultrasonic Leak Detector includes a multi-directional transmitter (operating in the ultrasonic range) and a hand-held detector. The transmitter is placed inside the vehicle. On the outside of the vehicle, the hand-held detector is used to sweep the area of the suspected leak. As the source of the leak is approached, a beeping sound is produced which increases in both speed and frequency.

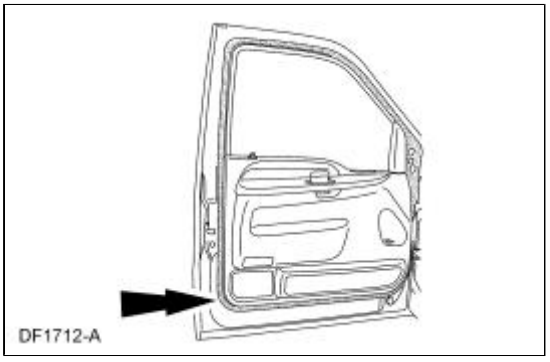
Squeak and Rattle Repair Kit

The Squeak and Rattle Repair Kit (Rotunda tool number 164-R4900) contains lubricants and self-adhesive materials that can be used to eliminate interior and exterior squeaks and rattles. The kit consists of the following materials:

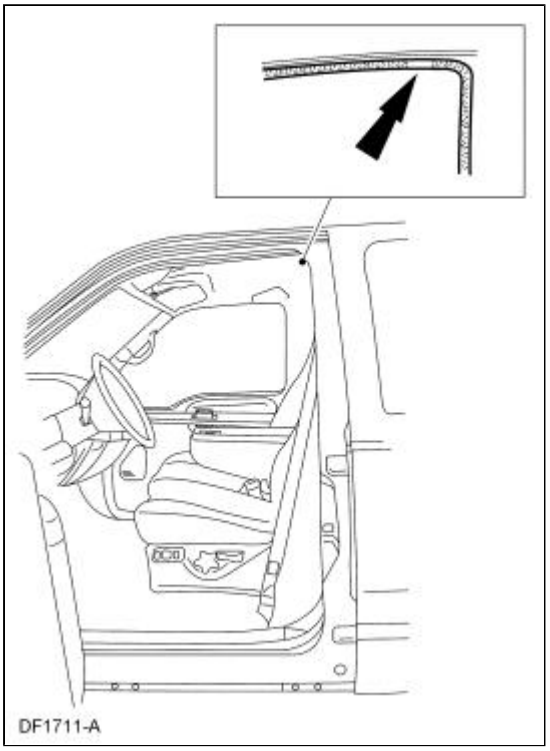
- PVC (soft foam) tape
- Urethane (hard foam) tape
- Flocked (black fuzzy) tape
- UHMW (frosted) tape
- Squeak and rattle oil tube
- Squeak and rattle grease tube

Tracing Powder

Tracing powder is used to check both the uniformity of contact and the tension of a seal against its sealing surface. These tests are usually done when a suspected air leak/noise appears to originate from the seal area or during the alignment and adjustment of a component to a weatherstrip. Tracing powder can be ordered from Crest Industries as ATR Leak Trace. Carry out the tracing powder test as follows:

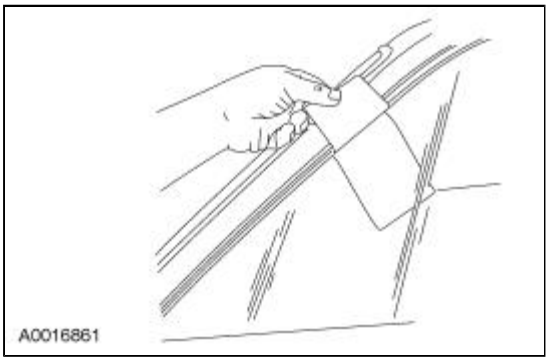


a. Clean the weatherstrip.
b. Spray the tracing powder on the mating surface only.
c. Close the door completely. Do not slam the door.
d. Open the door. An imprint is made where the weatherstrip contacted the mating surface seal. Gaps or a faint imprint will show where there is poor contact with the weatherstrip.



Index Card

Place an index card or a piece of paper between the weatherstrip and the sealing surface, then close the door. Slowly withdraw the index card or paper after the door is closed and check the amount of pressure on the weatherstrip. There should be a medium amount of resistance as it is withdrawn. Continue around the entire seal area. If there is little or no resistance, this indicates insufficient contact to form a good seal. At these points, the door, the glass or the weatherstrip is out of alignment.



Noise, Vibration and Harshness (NVH)

To assist the service advisor and the technician, a Write-up Job Aid and an NVH Diagnostic Guide are included with this material. The Write-up Job Aid serves as a place to record all important symptom information. The NVH Diagnostic Guide serves as a place to record information reported on the Write-up Job Aid as well as data from the testing to be carried out.

To begin a successful diagnosis, fill out the NVH Diagnostic Guide, record the reported findings, then proceed to each of the numbered process steps to complete the diagnosis.

"WRITE-UP" JOB AID

REPAIR ORDER # _____

CUSTOMER CONCERN # _____

SPECIFIC SENSE IDENTIFICATION AND LOCATION ON VEHICLE OF CUSTOMER SYMPTOM(S)

INSTRUCTIONS: Check below sense affected and location of concern on the generic vehicle illustration (darken the vehicle area). Plus circle appropriate responses to the right.

NOTE: Shaded backgrounds indicate caution areas. Selection of two or more caution areas "flag" difficult repairs. In general, shaded areas are the more difficult to verify and repair, and require all applicable columns to be completed.

Comments: _____

A0008914

1: Customer Interview

The diagnostic process starts with the customer interview. The service advisor must obtain as much information as possible about the problem and take a test drive with the customer. There are many ways a customer will describe NVH concerns and this will help minimize confusion arising from descriptive language differences. It is important that the concern is correctly interpreted and the customer descriptions are recorded. During the interview, ask the following questions:

- When was it first noticed?
- Did it appear suddenly or gradually?
- Did any abnormal occurrence coincide with or proceed its appearance?

Use the information gained from the customer to accurately begin the diagnostic process.

2: Pre-Drive Check

It is important to do a pre-drive check before road testing the vehicle. A pre-drive check verifies that the vehicle is relatively safe to drive and eliminates any obvious faults on the vehicle.

The pre-drive check consists of a brief visual inspection. During this brief inspection, take note of anything that will compromise safety during the road test and make those repairs/adjustments before taking the vehicle on the road.

3: Preparing for the Road Test

Observe the following when preparing for the road test:

- Review the information recorded on the NVH Diagnostic Guide. It is important to know the specific concern the customer has with the vehicle.
- Do not be misled by the reported location of the noise/vibration. The cause can actually be some distance away.
- Remember that the vibrating source component (originator) may only generate a small vibration. This small vibration can in turn cause a larger vibration/noise to emanate from another receiving component (reactor), due to contact with other components (transfer path).
- Conduct the road test on a quiet street where it is safe to duplicate the vibration/noise. The ideal testing route is an open, low-traffic area where it is possible to operate the vehicle at the speed in which the condition occurs.
- If possible, lower the radio antenna in order to minimize turbulence. Identify anything that could potentially make noise or be a source of wind noise. Inspect the vehicle for add-on items that create vibration/noise. Turn off the radio and the heating and cooling system blower.
- The engine speed is an important factor in arriving at a final conclusion. Therefore, connect an accurate tachometer to the engine, even if the vehicle has a tachometer. Use a tachometer that has clearly defined increments of less than 50 rpm. This ensures an exact engine speed reading.

4: Verify the Customer Concern

Verify the customer concern by carrying out a road test, an engine run-up test, or both.

The decision to carry out a road test, an engine run-up test, or both depends on the type of NVH concern. A road test may be necessary if the symptom relates to the suspension system or is sensitive to torque. A drive engine run-up (DERU) or a neutral engine run-up (NERU) test identifies noises and vibrations relating to engine and drivetrain rpm. Remember, a condition will not always be identifiable by carrying out these tests, however, they will eliminate many possibilities if carried out correctly.

5: Road Test

NOTE: It may be necessary to have the customer ride along or drive the vehicle to point out the concern. During the road test, take into consideration the customer's driving habits and the driving conditions. The customer's concern just may be an acceptable operating condition for that vehicle.

The following is a brief overview of each test in the order in which it appears. A review of this information helps to quickly identify the most appropriate process necessary to make a successful diagnosis. After

reviewing this information, select and carry out the appropriate test(s), proceeding to the next step of this process.

- The Slow Acceleration Test is normally the first test to carry out when identifying an NVH concern, especially when a road test with the customer is not possible.
- The Heavy Acceleration Test helps to determine if the concern is torque-related.
- The Neutral Coast Down Speed Test helps to determine if the concern is vehicle speed-related.
- The Downshift Speed Test helps to determine if the concern is engine speed-related.
- The Steering Input Test helps to determine how the wheel bearings and other suspension components contribute to a vehicle speed-related concern.
- The Brake Test helps to identify vibrations or noise that are brake related.
- The Road Test Over Bumps helps isolate a noise that occurs when driving over a rough or bumpy surface.
- The Engine Run-Up Tests consist of the Neutral Run-up Test and the Engine Load Test. These tests help to determine if the concern is engine speed-related.
- The Neutral Run-up Test is used as a follow-up test to the Downshift Speed Test when the concern occurs at idle.
- The Engine Load Test helps to identify vibration/noise sensitive to engine load or torque. It also helps to reproduce engine speed-related concerns that cannot be duplicated when carrying out the Neutral Run-up Test or the Neutral Coast Down Test.
- The Engine Accessory Test helps to locate faulty belts and accessories that cause engine speed-related concerns.
- The Vehicle Cold Soak Procedure helps to identify concerns occurring during initial start-up and when an extended time lapse occurs between vehicle usage.

Slow Acceleration Test

To carry out this test, proceed as follows:

- Slowly accelerate to the speed where the reported concern occurs. Note the vehicle speed, the engine rpm and, if possible, determine the vibration frequency.
- Attempt to identify from what part of the vehicle the concern is coming.
- Attempt to identify the source of the concern.
- Proceed as necessary.

Heavy Acceleration Test

To carry out this test, proceed as follows:

- Accelerate hard from 0-64 km/h (0-40 mph).
- Decelerate in a lower gear.
- The concern is torque related if duplicated while carrying out this test.
- Proceed as necessary.

Neutral Coast Down Speed Test

To carry out this test, proceed as follows:

- Drive at a higher rate of speed than where the concern occurred when carrying out the Slow Acceleration Test.

- Place the transmission in NEUTRAL and coast down past the speed where the concern occurs.
- The concern is vehicle speed-related if duplicated while carrying out this test. This eliminates the engine and the torque converter as sources.
- If the concern was not duplicated while carrying out this test, carry out the Downshift Speed Test to verify if the concern is engine speed related.
- Proceed as necessary.

Downshift Speed Test

To carry out this test, proceed as follows:

- Shift into a lower gear than the gear used when carrying out the Slow Acceleration Test.
- Drive at the engine rpm where the concern occurs.
- The concern is engine speed related if duplicated while carrying out this test. This eliminates the tires, wheels, brakes and the suspension components as sources.
- If necessary, repeat this test using other gears and NEUTRAL to verify the results.
- Proceed as necessary.

Steering Input Test

To carry out this test, proceed as follows:

- Drive at the speed where the concern occurs, while making sweeping turns in both directions.
- If the concern goes away or gets worse, the wheel bearings, hubs, U-joints (contained in the axles of four wheel drive [4WD] applications), and tire tread wear are all possible sources.
- Proceed as necessary.

Brake Test

To carry out this test, proceed as follows:

- Warm the brakes by slowing the vehicle a few times from 80–32 km/h (50–20 mph) using light braking applications. At highway speeds of 89–97 km/h (50–60 mph), apply the brake using a light pedal force.
- Accelerate to 89–97 km/h (55–60 mph).
- Lightly apply the brakes and slow the vehicle to 30 km/h (20 mph).
- A brake vibration noise can be felt in the steering wheel, seat or brake pedal. A brake noise can be heard upon brake application and diminish when the brake is released.

Road Test Over Bumps

To carry out this test, proceed as follows:

- Drive the vehicle over a bump or rough surface one wheel at a time to determine if the noise is coming from the front or the back and the left or the right side of the vehicle.
- Proceed as necessary.

Neutral Engine Run-Up (NERU) Test

To carry out this test, proceed as follows:

- Install a tachometer.
- Increase the engine rpm up from an idle to approximately 4000 rpm while in PARK on front wheel drive vehicles with automatic transmissions, or NEUTRAL for all other vehicles. Note the engine rpm and, if possible, determine the vibration frequency.
- Attempt to identify what part of the vehicle the concern is coming from.
- Attempt to identify the source of the concern.
- Proceed as necessary.

Drive Engine Run-Up (DERU) Load Test

To carry out this test, proceed as follows:

- **WARNING: Block the front and rear wheels, and apply the parking brake and the service brake, or injury to personnel can result.**

  CAUTION: Do not carry out the Engine Load Test for more than 5 seconds or damage to the transmission or transaxle can result.

  Block the front and rear wheels.
- Apply the parking brake and the service brake.
- Install a tachometer.
- Shift the transmission into DRIVE, and increase and decrease the engine rpm between an idle to approximately 2000 rpm. Note the engine rpm and, if possible, determine the vibration frequency.
- Repeat the test in REVERSE.
- If the vibration/noise is duplicated when carrying out this test, inspect the engine and transmission or transaxle mounts.
- If the concern is definitely engine speed-related, carry out the Engine Accessory Test to narrow down the source.
- Proceed as necessary.

Engine Accessory Test

To carry out this test, proceed as follows:

- **WARNING: Block the front and rear wheels, and apply the parking brake and the service brake, or injury to personnel can result.**

  CAUTION: Limit engine running time to one minute or less with belts removed or serious engine damage will result.

  NOTE: A serpentine drive belt decreases the usefulness of this test. In these cases, use a vibration analyzer (VA), to pinpoint accessory vibrations. An electronic listening device, such as an EngineEAR, will also help to identify noises from specific accessories.

  Remove the accessory drive belts.
- Increase the engine rpm to where the concern occurs.

- If the vibration/noise is duplicated when carrying out this test, the belts and accessories are not sources.
- If the vibration/noise was not duplicated when carrying out this test, install each accessory belt, one at a time, to locate the source.

Vehicle Cold Soak Procedure

To carry out this procedure, proceed as follows:

- Test preparations include matching customer conditions (if known). If not known, document the test conditions: gear selection and engine rpm. Monitor the vibration/noise duration with a watch for up to 3 minutes.
- Park the vehicle where testing will occur. The vehicle must remain at or below the concern temperature (if known) for 6-8 hours.
- Before starting the engine, conduct a visual inspection under the hood.
- Turn the key on, but do not start the engine. Listen for the fuel pump, anti-lock brake system (ABS) and air suspension system noises.
- Start the engine.
- **CAUTION: Never probe moving parts.**

  Isolate the vibration/noise by carefully listening. Move around the vehicle while listening to find the general location of the vibration/noise. Then, search for a more precise location by using a stethoscope or EngineEAR.
- Refer to Idle Noise/Vibration in the Symptom Chart to assist with the diagnosis.

6: Check OASIS/TSBs/Repair History

After verifying the customer concern, check for OASIS reports, TSBs and the vehicle repair history for related concerns. If information relating to a diagnosis/repair is found, carry out the procedure(s) specified in that information.

If no information is available from these sources, carry out the vehicle preliminary inspection to eliminate any obvious faults.

7: Diagnostic Procedure

Qualifying the concern by the particular sensation present can help narrow down the concern. Always use the "symptom" to "system" to "component" to "cause" diagnosis technique. This diagnostic method divides the problem into related areas to correct the customer concern.

- Verify the "symptom".
- Determine which "system(s)" can cause the "symptom".
  - If a vibration concern is vehicle speed related, the tire and wheel rpm/frequency or driveshaft frequency should be calculated.
  - If a vibration concern is engine speed related, the engine, engine accessory or engine firing frequencies should be calculated.
- After determining the "system", use the diagnostic tools to identify the worn or damaged "components".
- After identifying the "components", try to find the "cause" of the failure.

Once the concern is narrowed down to a symptom/condition, proceed to NVH Condition and Symptom

Categories.

NVH Condition and Symptom Categories

A good diagnostic process is a logical sequence of steps that lead to the identification of a causal system. Use the condition and symptom categories as follows:

- Identify the operating condition that the vehicle is exhibiting.
- Match the operating condition to the symptom.
- Verify the symptom.
- Identify which category or system could cause the symptom.
- Refer to the diagnostic symptom chart that is referred to.

Operating Condition — Vehicle is Not Moving

1. Static operation
    - Noise occurs during component/system functioning. GO to Symptom Chart - Squeak and Rattle .

2. While cranking
    1. Grinding or whine, differential ring gear or starter motor pinion noise. GO to Symptom Chart - Engine Noise/Vibration .
    2. Rattle. Exhaust hanger, exhaust heat shield or A/C line noise. GO to Symptom Chart - Squeak and Rattle .
    3. Vibration. Acceptable condition.

3. At idle
    - Idle noise. GO to Symptom Chart - Idle Noise/Vibration .
    - Idle vibration or shake. GO to Symptom Chart - Idle Noise/Vibration .

4. During Gear Selection
    1. Vehicle parked on a steep incline. Acceptable noise.
    2. Vehicle parked on a flat surface. GO to Symptom Chart - Driveline Noise/Vibration .
    3. Vehicle with a manual transmission. GO to Symptom Chart - Transmission (Manual) and Transfer Case Noise/Vibration .

Operating Condition — Vehicle is Moving

1. Depends more on how the vehicle is operated
    1. Speed related
        - Related to vehicle speed
            - Pitch increases with vehicle speed. GO to Symptom Chart - Tire Noise/Vibration .
            - Noise occurs at specific vehicle speed. A high-pitched noise (whine). GO to Symptom Chart - Driveline Noise/Vibration .
            - Loudness proportional to vehicle speed. Low-frequency noise at high speeds, noise and loudness increase with speed. GO to Symptom Chart - Driveline Noise/Vibration .
            - A low-pitched noise (drumming). GO to Symptom Chart - Engine Noise/Vibration .
            - Vibration occurs at a particular speed (mph) regardless of acceleration or deceleration. GO to Symptom Chart - Tire Noise/Vibration .
            - Noise varies with wind/vehicle speed and direction. GO to Symptom Chart - Air Leak and Wind Noise .
        - Related to engine speed.
            - Noise varies with engine rpm. GO to Symptom Chart - Engine

Noise/Vibration .
        - Vibration occurs at a particular speed (mph) regardless of engine speed (rpm).
    2. Acceleration
        - Wide open throttle (WOT)
            - Engine induced contact between components. Inspect and repair as necessary.
            - Noise is continuous throughout WOT. Exhaust system or engine ground out. GO to Symptom Chart - Engine Noise/Vibration .
        - Light/moderate acceleration
            - Tip-in moan. Engine/exhaust noise. GO to Symptom Chart - Engine Noise/Vibration .
            - Knock-type noise. GO to Symptom Chart - Engine Noise/Vibration .
            - Driveline shudder. GO to Symptom Chart - Driveline Noise/Vibration .
            - Engine vibration. GO to Symptom Chart - Engine Noise/Vibration .
    3. Turning noise. GO to Symptom Chart - Steering Noise/Vibration .
    4. Braking
        - Clicking sound is signaling ABS is active. Acceptable ABS sound.
        - A continuous grinding/squeal. GO to Symptom Chart - Brake Noise/Vibration .
        - Brake vibration/shudder. GO to Symptom Chart - Brake Noise/Vibration .
    5. Clutching
        - A noise occurring during clutch operation. GO to Symptom Chart - Transmission (Manual) and Transfer Case Noise/Vibration .
        - Vibration. GO to Symptom Chart - Transmission (Manual) and Transfer Case Noise/Vibration .
    6. Shifting
        - Noise or vibration condition related to the transmission (automatic). GO to Symptom Chart - Transmission (Automatic) Noise/Vibration .
        - Noise or vibration related to the transmission (manual). GO to Symptom Chart - Transmission (Manual) and Transfer Case Noise/Vibration .
    7. Engaged in 4WD. GO to Symptom Chart - Transmission (Manual) and Transfer Case Noise/Vibration .
    8. Cruising speeds
        - Accelerator pedal vibration. GO to Symptom Chart - Engine Noise/Vibration .
        - Driveline vibration. GO to Symptom Chart - Driveline Noise/Vibration .
        - A shimmy or shake. GO to Symptom Chart - Tire Noise/Vibration .
    9. Driving at low/medium speeds
        - A wobble or shudder. GO to Symptom Chart - Tire Noise/Vibration .

2. Depends more on where the vehicle is operated
    1. Bump/pothole, rough road or smooth road. GO to Symptom Chart - Suspension Noise/Vibration .
        - Noise is random or intermittent occurring from road irregularities. GO to Symptom Chart - Squeak and Rattle .
        - Noise or vibration changes from one road surface to another. Normal sound changes.
        - Noise or vibration associated with a hard/firm ride. GO to Symptom Chart - Suspension Noise/Vibration .

Symptom Charts

Symptom Chart — Air Leak and Wind Noise

Condition	Possible Sources	Action
• Air leak around	• Loose fit seal	• PINCH the seal carrier to

door perimeter		improve retention on the seal flange.
	• Seal installed incorrectly	• REINSTALL the seal.
	• Door misaligned	• REALIGN the door. CHECK door gaps and fit in the door opening and ADJUST as necessary.
	• Scuff plate installed incorrectly	• REINSTALL the scuff plate.
	• Seal or seal pushpins damaged	• INSTALL a new seal.
• Air leak around glass run	• Door glass misaligned	• ADJUST the door glass.
	• Glass run installed incorrectly	• ADJUST the glass run. INSERT foam in the glass run carrier.
	• Leak path behind glass run	• INSTALL foam rope behind the glass run.
	• Glass run channel spread wide	• PINCH the glass run channel to reduce the size of the opening.
	• Blow-out clip bent or contacting door glass	• ADJUST the blow-out clip or INSTALL a new glass run/blow-out clip molding assembly.
	• Glass run damaged	• INSTALL a new glass run.
• Air leak at inner belt line	• Belt line seal installed incorrectly on flange	• ADJUST the seal. (Do not bend the flange.)
	• Belt line seal integrated with door trim installed incorrectly (no glass contact)	• REINSTALL the door trim.
	• No contact with side glass	• ADJUST the door glass.
	• No contact with glass runs at both ends of belt line seal	• ADJUST the belt line seal or ADD foam at the seal ends.
	• Belt line seal damaged	• INSTALL a new seal.
• Air leak at outer belt line	• Belt line seal installed incorrectly on flange (no glass contact)	• ADJUST the seal.
	• Belt line seal does not contact the glass	• ADJUST the door glass.
	• No contact with glass runs at both ends of belt line seal	• ADJUST the belt line seal/ADD foam at the seal ends.
	• Belt line seal damaged	• INSTALL a new seal.
• Draft at inner door handle/speaker opening	• Hole in watershield	• SEAL the hole with a suitable tape.
	• Watershield misaligned	• REALIGN the watershield.

		INSTALL a new watershield if the pressure sensitive adhesive fails.
	• Exterior door handle seal misaligned/damaged	• REALIGN or INSTALL a new seal as necessary.
• Wind noise from side view mirror	• Outside mirror housing misaligned	• REALIGN with the edges shingled correctly and no gaps.
	• Mirror sail gasket folded/misaligned	• REINSTALL with the gasket unfolded and aligned correctly.
	• Mirror housing trim cap installed incorrectly	• REINSTALL with the edges shingled to the air flow.
	• Air leak through mirror housing hinge	• Fully ENGAGE the mirror into its operating position/USE foam to block the air path through the hinge.
	• Inner sail trim installed incorrectly	• REINSTALL the sail trim/ADJUST the door trim.
	• Inner sail gasket/barrier installed incorrectly	• REINSTALL the trim cover with the gasket/barrier aligned correctly.
	• Air path through wiring bundle/fastener access holes	• BLOCK the air path(s) with foam/tape.
	• Exposed fastener access hole on mirror housing/sail	• INSTALL a new cap if it is missing.
• Air leak around perimeter of fixed glass	• Gaps in the sealant bead	• APPLY approved sealant.
	• Air traveling up windshield molding along A-pillar	• INSTALL foam rope the full length of the A-pillar.
	• Windshield/backlite misaligned or not installed correctly	• REINSTALL the windshield/backlite.
	• Rear hood seal at base of windshield misaligned/damaged	• REALIGN or INSTALL a new seal as necessary.
• Air leak at cowl	• Cowl gasket misaligned/damaged	• REALIGN or INSTALL a new seal as necessary.
• Air leak around liftgate perimeter	• Loose fit seal	• PINCH the seal carrier to improve retention on the seal flange or INSERT foam in the carrier.
	• Seal misaligned	• REINSTALL the seal.
	• Liftgate misaligned	• REALIGN the liftgate. CHECK the liftgate fit in the body opening and ADJUST as necessary.
	• Scuff plate misaligned	• REINSTALL the scuff plate.
	• Seal or seal pushpins	• INSTALL a new seal.

	damaged	
• Air leak around the liftgate flip window perimeter	• Loose fit seal	• PINCH the seal carrier to improve the retention to the seal flange.
	• Seal misaligned	• REINSTALL the seal.
	• Glass misaligned	• REALIGN the glass.
	• Seal damaged	• INSTALL a new seal.
• Wind noise from antenna	• Shape of antenna	• INSTALL an antenna boot or a spiral antenna.
	• Air leak around antenna cable access hole	• INSPECT the antenna access hole grommet. REPAIR as necessary.
• Air leak from closed roof opening panel	• Seal installed incorrectly	• REINSTALL the seal.
	• Roof opening panel glass/door misaligned	• REALIGN the roof opening panel glass/door.
	• Roof opening panel damaged	• INSTALL a new roof opening panel.
• Buffeting from an open roof opening panel	• Wind deflector inoperative/damaged	• REPAIR or INSTALL a new wind deflector as necessary.
	• Wind deflector height incorrect	• ADJUST the wind deflector higher.
• Wind noise created by airflow over or behind body panels	• Fender splash shield misaligned	• REALIGN the fender splash shield.
	• Body panel misaligned (exposed edge)	• REALIGN the appropriate body panel.
	• Hood misaligned (front margin)	• CHECK hood gaps and fit. ADJUST the hood as necessary.
	• Front grille edge noise	• APPLY foam in the hollow areas behind the louvers.
• Wind noise created by grille opening panel	• Grille relationship to leading edge on hood	• ADJUST the grille opening panel forward to eliminate wind noise.
	• Sharp edges due to material imperfections	• REMOVE the sharp edges (no damage to visible surface).
• Wind noise from air extractor	• Air extractor housing seated incorrectly	• REINSTALL the air extractor housing.
	• Air extractor housing or flaps damaged	• INSTALL a new air extractor.
• Air leak at top of A-pillar — vehicles with a convertible top	• Seal at windshield header installed incorrectly	• REINSTALL the seal.
	• Seal pinched	• FILL the seal with foam to reshape it.
	• Gap between side rail and header seal at A-pillar	• ADJUST the J-hook/vinyl top.

• Air leak at rear quarter glass (division bar) — vehicles with a convertible top	• No contact between front side glass and quarter glass division bar	• ADJUST the front side glass regulator and the rear quarter glass regulator.
• Air leak or wind noise from top of side glass — vehicles with a convertible top	• Gap between side rail and vinyl top	• ADD additional foam tape to seal between the side rail and the vinyl top.
	• Seal at windshield header installed incorrectly	• REINSTALL the seal.
	• Seal damaged between side rail and vinyl top	• INSTALL a new seal.
	• Vinyl top damaged	• INSPECT the vinyl top. INSTALL a new vinyl top as necessary.
• Air leak or wind noise at windshield header — vehicles with a convertible top	• Vinyl top not flush with header	• ADJUST the J-hook to lower the top to achieve a flush condition.
	• Seal at windshield header installed incorrectly	• REINSTALL the seal.
	• Header seal not flush with header	• REINSTALL the seal.
• Convertible top flapping with the top up	• Vinyl top contacting interior headliner	• Working from front to back, INSTALL a 6.35 mm (0.25 in) foam sheet between the headliner and the vinyl top at the suspected area. Allow a clearance of 50 mm (2 in) - 75 mm (3 in) away from the roof bows and the side rails.
• Noise from roof rack	• Roof rack rails or crossbars loose	• TIGHTEN the fasteners.
	• Roof rack fasteners missing	• INSTALL the approved fasteners.
	• Roof rack crossbars installed backward	• REINSTALL the crossbars.
	• Roof rack rub strips partially lifting from roof	• REAPPLY adhesive or fasteners or INSTALL new rub strips as necessary.
	• Roof rack gaskets loose or misaligned	• REINSTALL the gasket.
• Wind noise from bug shield/exterior windshield sun visor	• Turbulence created by location and shape	• REMOVE per customer direction if it is a dealer installed option.

Symptom Chart — Brake Noise/Vibration

Condition	Possible Sources	Action
• Rattling noise	• Caliper mounting bolts loose	• CHECK the caliper bolts. TIGHTEN to specifications. REFER to Section 206-03 for the front disc brakes or Section 206-04 for the rear disc brakes.
	• Damaged or worn caliper pins or retainers	• CHECK the caliper pins and retainers for lubrication and correct fit. LUBRICATE or INSTALL new components as necessary. REFER to Section 206-03 for the front disc brakes or Section 206-04 for the rear disc brakes.
	• Missing or damaged anti-rattle clips or springs	• CHECK the brake pads for missing clips or broken springs. INSTALL new components as necessary. REFER to Section 206-03 for the front disc brakes or Section 206-04 for the rear disc brakes.
	• Loose brake disc shield	• TIGHTEN the brake disc shield bolts to specification. REFER to Section 206-03 .
• Clicking noise — with brakes applied with ABS brakes	• ABS hydraulic control unit	• Acceptable condition.
• Squealing noise — occurs on first (morning) brake application	• Disc brake pads	• Acceptable condition. Caused by humidity and low disc brake pad temperature.
• Squealing noise — a continuous squeal	• Disc brake pads or linings worn below minimum thickness	• INSTALL new disc brake pads. REFER to Section 206-03 for the front disc brakes or Section 206-04 for the rear disc brakes.
• Squealing noise — an intermittent squeal brought on by cold, heat, water, mud or snow	• Disc brake pad	• Acceptable condition.
• Groaning noise — occurs at low speeds with brake lightly applied (creeping)	• Disc brake pads	• Acceptable condition.
• Grinding noise — continuous	• Disc brake pads or linings worn below minimum thickness	• INSPECT the disc brake pads, brake discs/drums and attaching hardware for damage. REPAIR or INSTALL new components as necessary. REFER to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
• Moaning noise	• Brake linings contaminated	• INSPECT the brake pads and shoes for contamination.

	with grease or oil	REPAIR or INSTALL new components as necessary.
• Brake vibration/shudder — occurs when brakes are applied	• Uneven disc or drum wear • Uneven disc brake pad or lining transfer • Suspension components	• Go To Pinpoint Test A .
• Brake vibration/shudder — occurs when the brake pedal is released	• Brake drag	• INSPECT the disc brake pads or linings for premature wear. REPAIR or INSTALL a new caliper or wheel cylinder as necessary. REFER to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.

Symptom Chart — Driveline Noise/Vibration

Condition	Possible Sources	Action
• Axle howling or whine — front or rear axle	• Axle lubricant low	• CHECK the lubricant level. FILL the axle to specification.
	• Axle housing damage	• INSPECT the axle housing for damage. REPAIR or INSTALL a new axle as necessary. REFER to Section 205-02 for the rear axle or Section 205-03 for the front axle.
	• Damaged or worn wheel bearings or axle bearings	• CHECK for abnormal wheel bearing play or roughness. REFER to Wheel Bearing Check in this section. ADJUST or INSTALL new wheel bearings as necessary.
	• Damaged or worn differential ring and pinion	• INSPECT the ring and pinion ring for abnormal wear patterns or broken teeth. INSTALL a new ring and pinion as necessary. REFER to Section 205-02 for the rear axle or Section 205-03 for the front axle.
	• Damaged or worn differential side or pinion bearings	• CHECK for abnormal bearing play or roughness. INSTALL new bearings as necessary. REFER to Section 205-02 for the rear axle or Section 205-03 for the front axle.
	• Damaged or worn differential side gears and pinion gears	• DISASSEMBLE the differential carrier. INSPECT the side and pinion gears for abnormal wear patterns or broken teeth. INSTALL new gears as necessary. REFER to Section 205-02 for the rear axle or Section 205-03 for the front axle.

• Driveline clunk — loud clunk when shifting from reverse to drive	• Incorrect axle lubricant level	• CHECK the lubricant level. FILL the axle to specification.
	• Excessive backlash in the axle or transmission	• CARRY OUT a total backlash check. REFER to Section 205-00 .
	• Damaged or worn pinion bearings	• CHECK for abnormal bearing play or roughness. INSTALL new bearings as necessary
	• Damaged or worn universal joints (U-joints)	• INSPECT the U-joints for wear or damage. INSTALL new U-joints as necessary. REFER to Section 205-01 .
	• Loose suspension components	• INSPECT the suspension for damage or wear. REPAIR or INSTALL new components as necessary.
	• Broken powertrain mounts	• INSPECT the powertrain mounts. REFER to Section 303-01 . INSTALL new mounts as necessary.
	• Idle speed too high	• CHECK for the correct idle speed.
• Driveline clunk — occurs as the vehicle starts to move forward following a stop	• Worn or galled driveshaft slip-yoke splines	• CLEAN and INSPECT the splines of the yoke for a worn or galled condition. INSTALL a new yoke as necessary. REFER to Section 205-01 .
	• Worn or galled driveshaft and coupling shaft splines	• CLEAN and INSPECT the splines of the driveshaft and coupling shaft for a worn or galled condition. INSTALL a new driveshaft assembly as necessary. REFER to Section 205-01 .
	• Loose rear leaf spring U-bolts	• CHECK the U-bolts for loose nuts. TIGHTEN to specification. REFER to Section 204-02 .
• Driveline clunk four wheel drive (4WD) vehicles — occurs during shift-on-the-fly engagement	• Clutch relay • Shift motor • Transfer case • GEM	• CHECK the 4WD engagement system. REPAIR or INSTALL new components as necessary. REFER to Section 308-07A and Section 308-07B .
• Clicking, popping or grinding — occurs while vehicle is turning	• Inadequate or contaminated lubrication in the (CV) joints	• CHECK the CV boots and joints for wear or damage. REPAIR or INSTALL new components as necessary. REFER to Section 205-04 .
	• Another component contacting the halfshaft	• CHECK the halfshafts and the area around the halfshafts. REPAIR as necessary.
	• Brake components	• INSPECT the front brakes for wear or damage. REPAIR as necessary. REFER to

		Section 206-03 .
	• Steering components	• INSPECT the drag link, inner and outer tie-rods or idler arm for wear or damage. REPAIR as necessary.
	• Suspension components	• INSPECT the upper and lower ball joints for wear or damage. REPAIR as necessary. REFER to Section 204-01A for rear wheel drive (RWD) vehicles or Section 204-01B for four wheel drive (4WD) vehicles.
	• Damaged or worn wheel bearings	• CHECK for abnormal wheel bearing play or roughness. REFER to Wheel Bearing Check in this section. ADJUST or INSTALL new wheel bearings as necessary.
• Clicking or snapping — occurs when accelerating around a corner	• Damaged or worn outboard CV joint	• INSPECT the outboard CV joint and boot. REPAIR or INSTALL a new CV joint as necessary. REFER to Section 205-04 .
• High pitched chattering — noise from the rear axle when the vehicle is turning	• Incorrect or contaminated lubricant	• CHECK the vehicle by driving in tight circles (5 clockwise, 5 counterclockwise). FLUSH and REFILL with the specified rear axle lubricant and friction modifier as necessary.
	• Damaged or worn differential (differential side gears and pinion gears)	• DISASSEMBLE the differential assembly. INSPECT the differential case, pin and gears for wear or damage. REPAIR or INSTALL a new differential as necessary. REFER to Section 205-02 for the rear axle.
• Buzz — buzzing noise is the same at cruise or coast/deceleration	• Damaged or worn tires	• CHECK for abnormal tire wear or damage. INSTALL new tire(s) as necessary. REFER to Section 204-04 .
	• Incorrect driveline angles	• CHECK for correct driveline angles. REPAIR as necessary.
• Rumble or boom — noise occurs at coast/deceleration, usually driveshaft speed related and noticeable over a wide range of speeds	• Driveshaft is out-of-balance	• CHECK the driveshaft for damage, missing balance weights or undercoating. REPAIR or INSTALL a new driveshaft as necessary.
	• U-joints binding or seized	• ROTATE the driveshaft and CHECK for rough operation or seized U-joints. INSTALL new U-joints as necessary. REFER to Section 205-01 .

	• Excessive pinion flange runout	• CARRY OUT a runout check. REPAIR as necessary. REFER to Section 205-00 .
• Grunting — normally associated with a shudder experienced during acceleration from a dead stop	• Driveshaft slip yoke binding	• CLEAN and LUBRICATE the male and female splines.
	• Loose rear spring U-bolts	• INSPECT the rear suspension. TIGHTEN the U-bolt nuts to specification. REFER to Section 204-02 .
• Howl — can occur at various speeds and driving conditions. Affected by acceleration and deceleration	• Incorrect ring and pinion contact, incorrect bearing preload or gear damage	• CHECK the ring and pinion and bearings for damage. INSPECT the ring and pinion wear pattern. REFER to Checking Tooth Contact Pattern and Condition of the Ring and Pinion component test in this section. ADJUST or INSTALL new components as necessary. REFER to Section 205-02 for the rear axle or Section 205-03 for the front axle.
• Chuckle — heard at coast/deceleration. Also described as a knock	• Incorrect ring and pinion contact or by damaged teeth on the coast side of the ring and pinion	• CHECK the ring and pinion for damage. INSPECT the ring and pinion wear pattern. REFER to Checking Tooth Contact Pattern and Condition of the Ring and Pinion component test in this section. ADJUST or INSTALL new components as necessary. REFER to Section 205-02 for the rear axle or Section 205-03 for the front axle.
• Knock — noise occurs at various speeds. Not affected by acceleration or deceleration	• Gear tooth damage to the drive side of the ring and pinion	• CHECK the differential case and ring and pinion for damage. INSTALL new components as necessary. REFER to Section 205-02 for the rear axle or Section 205-03 for the front axle.
	• Excessive axle shaft end play (vehicles with integral axles)	• CHECK the axle end play using a dial indicator. INSTALL a new axle shaft or side gears as necessary. REFER to Section 205-02 for the rear axle or Section 205-03 for the front axle.
• Scraping noise — a continuous low pitched noise starting at low speeds	• Worn or damaged pinion bearings	• CHECK the pinion bearings. INSTALL new pinion bearings as necessary. REFER to Section 205-02 for the rear axle or Section 205-03 for the front axle.
• Driveline shudder — occurs during	• Rear drive axle assembly	• CHECK the axle mounts and the rear suspension for

acceleration from a slow speed or stop	mispositioned	damage or wear. REPAIR as necessary.
	• Loose rear spring U-bolts	• INSPECT the U-bolts. TIGHTEN the U-bolt nuts to specification. REFER to Section 204-02 .
	• Incorrect or high CV joint operating angle	• CHECK vehicle ride height is within limits. REPAIR as necessary.
	• Damaged or worn front suspension components	• CHECK for a loose stabilizer bar, damaged or loose strut/strut bushings or loose or worn ball joints. INSPECT the steering linkage for wear or damage. REPAIR or INSTALL new components as necessary. REFER to the appropriate section for the service procedure.
	• Driveline angles out of specification	• CHECK for correct driveline angles. REPAIR as necessary. REFER to Driveline Angles in this section.
	• U-joints binding or seized	• ROTATE the driveshaft and CHECK for rough operation or seized U-joints. INSTALL new U-joints as necessary. REFER to Section 205-01 .
	• Binding, damaged or galled splines on the driveshaft slip-yoke	• CLEAN and INSPECT the splines of the slip-yoke, driveshaft and coupling shaft for a worn, damaged or galled condition. INSTALL a new slip-yoke or driveshaft assembly as necessary. REPAIR as necessary. REFER to Section 205-01 .
• Driveline vibration — occurs at cruising speeds	• U-joints are worn	• CHECK for wear or incorrect seating. INSTALL new U-joints as necessary. REFER to Section 205-01 .
	• Worn or damaged driveshaft center bearing support	• CHECK the insulator for damage or wear. ROTATE the driveshaft and CHECK for rough operation. INSTALL a new center bearing support as necessary. REFER to Section 205-01 .
	• Loose axle pinion flange bolts	• INSPECT the axle pinion flange. TIGHTEN the pinion flange bolts to specification. REFER to Section 205-01 .
	• Excessive axle pinion flange runout	• CARRY OUT a Runout Check. REPAIR as necessary.
	• Driveshaft is out-of-balance	• CHECK the driveshaft for damage, missing balance weights or undercoating.

		REPAIR as necessary.
	• Binding or damaged splines on the driveshaft slip-yoke	• CLEAN and INSPECT the splines of the slip-yoke, driveshaft and coupling shaft for wear or damage. INSTALL a new slip-yoke or driveshaft assembly as necessary. REFER to Section 205-01 . REPAIR as necessary.
	• Driveshaft runout	• REPAIR as necessary.
	• Incorrect lateral and radial tire/wheel runout	• INSPECT the tire and wheels. MEASURE tire runouts. REPAIR or INSTALL new components as necessary. REFER to Section 204-04 .
	• Driveline angles out of specification	• CHECK for correct driveline angles. REPAIR as necessary.
	• Incorrectly seated CV joint in the front wheel hub	• CHECK the outer CV joint for correct seating into the hub. REPAIR as necessary. REFER to Section 205-04 .

Symptom Chart — Engine Noise/Vibration

Condition	Possible Sources	Action
• Grinding noise — occurs during engine cranking	• Incorrect starter motor mounting	• INSPECT the starter motor for correct mounting. REPAIR as necessary. REFER to Section 303-06 .
	• Starter motor	• CHECK the starter motor. REPAIR or INSTALL a new starter motor as necessary. REFER to Section 303-06 .
	• Incorrect starter motor drive engagement	• INSPECT the starter motor drive and flexplate/flywheel for wear or damage. INSTALL a new starter motor drive or flexplate/flywheel as necessary. REFER to Section 303-06 .
• Engine ticking noise	• Fuel injector • Fuel line • Oil pump • Valve lifter • Belt tensioner • Water pump • Obstruction of cooling fan	• Go To Pinpoint Test B .
• Engine drumming noise — normally accompanied by vibration	• Powertrain mount	• CARRY OUT Powertrain/Drivetrain Mount Neutralizing in this section.
	• Damaged or misaligned exhaust	• INSPECT the exhaust system for loose or broken

	system	clamps and brackets. CARRY OUT Exhaust System Neutralizing in this section.
• Whistling noise — normally accompanied with poor idle condition	• Air intake system	• CHECK the air intake ducts, air cleaner, throttle body and vacuum hoses for leaks and correct fit. REPAIR or ADJUST as necessary. REFER to Section 303-12 .
• Clunking noise	• Water pump has excessive end play or imbalance	• CHECK the water pump for excessive end play. INSPECT the water pump with the drive belt off for imbalance. INSTALL a new water pump as necessary. REFER to Section 303-03 .
	• Generator has excessive end play	• CHECK the generator for excessive end play. REPAIR or INSTALL a new generator. REFER to Section 414-02 .
• Pinging noise	• Exhaust system leak	• INSPECT the exhaust system for leaks. REPAIR as necessary.
	• Gasoline octane too low	• VERIFY with customer the type of gasoline used. CORRECT as necessary.
	• Knock sensor operation	• CHECK the knock sensor. INSTALL a new knock sensor as necessary. REFER to Section 303-14 .
	• Incorrect spark timing	• CHECK the spark timing. REPAIR as necessary.
	• High operating temperature	• INSPECT cooling system for leaks. CHECK the coolant level. REFILL as necessary. CHECK the coolant for the correct mix ratio. DRAIN and REFILL as needed. CHECK engine operating temperature is within specifications. REPAIR as necessary.
	• Foul-out spark plug	• CHECK the spark plugs. REPAIR or INSTALL new spark plugs as necessary.
	• Catalytic converter	• Acceptable noise.
• Knocking noise — light knocking noise, also described as piston slap. Noise is most noticeable when engine is cold with light to medium acceleration. Noise disappears	• Excessive clearance between the piston and the cylinder wall	• Engine cold and at high idle. Using an EngineEAR, pull a spark plug or fuel injector connector until the noise goes away. CARRY OUT a cylinder bore clearance to piston check. INSTALL a new piston. REFER to Section 303-01 .

as engine warms		
• Knocking noise — light double knock or sharp rap sound. Occurs mostly with warm engine at idle or low speeds in DRIVE. Increases in relation to engine load. Associated with poor lubrication history	• Excessive clearance between the piston and the piston pin	• INSTALL a new piston or piston pin. REFER to Section 303-01 .
• Knocking noise — light knocking noise is most noticeable when engine is warm. Noise tends to decrease when vehicle is coasting or in neutral	• Excessive clearance between the connecting rod bearings and the crankshaft	• Engine warm and at idle. Using an EngineEAR, PULL a spark plug or fuel injector connector until the noise goes away. INSTALL new bearings. REFER to Section 303-01 .
• Knocking — deep knocking noise. Noise is most noticeable when engine is warm, at lower rpm and under a light load and then at float	• Worn or damaged crankshaft main bearings	• CARRY OUT Drive Engine Run-Up (DERU) Test. CHECK for noise with vehicle at operating temperature, during medium to heavy acceleration. CHECK at idle with injector disconnected, noise does not change. INSTALL new main bearings. REFER to Section 303-01 .
• Knocking noise — occurs mostly with warm engine at light/medium acceleration	• Spark plugs • Carbon accumulation in combustion chamber	• CHECK the spark plug for damage or wear. INSTALL new spark plugs as necessary. • REMOVE carbon from combustion chamber.
• Whine or moaning noise	• Air intake system • Generator electrical field or bearings	• CHECK the air cleaner and ducts for correct fit. INSPECT the air intake system for leaks or damage. REPAIR as necessary. • CARRY OUT generator load test. REPAIR or INSTALL a new generator as necessary. REFER to Section 414-02 .
• Drone type noise	• Exhaust system • A/C compressor	• CARRY OUT Exhaust System Neutralizing in this section. REPAIR as necessary. • CHECK for noise with vehicle at constant speeds. CYCLE the compressor on

		and off and listen for a change in pitch. REPAIR as necessary. REFER to Section 412-01 .
	• Powertrain mounts	• CARRY OUT Powertrain/Drivetrain Mount Neutralizing in this section.
• Sputter type noise — noise worse when cold, lessens or disappears when vehicle is at operating temperature	• Damaged or worn exhaust system components	• INSPECT the exhaust system for leaks or damage. REPAIR as necessary. REFER to Section 309-00 .
• Rattling noise — noise from the upper engine (valve train). Worse when engine is cold	• Low oil level	• CHECK oil level. FILL as necessary.
	• Thin or diluted oil	• INSPECT the oil for contamination. If oil is contaminated, CHECK for the source. REPAIR as necessary. CHANGE the oil and filter.
	• Low oil pressure	• CARRY OUT an oil pressure test. If not within specifications, REPAIR as necessary. REFER to Section 303-00 .
	• Worn rocker arms/fulcrums or followers	• CARRY OUT a valve train analysis. INSTALL new valve train components as necessary. REFER to Section 303-01 .
	• Worn valve guides	• CARRY OUT a valve train analysis. INSTALL new valve guides as necessary. REFER to Section 303-01 .
	• Excessive runout of valve seats on the valve face	• CARRY OUT a valve seat runout test. INSPECT the valve face and seat. INSTALL new valves as necessary. REFER to Section 303-01 .
• Rattling noise — from the bottom of the vehicle	• Loose muffler shields or catalytic converter shields	• CHECK the exhaust system for loose exhaust shields. REPAIR as necessary.
• Thumping noise — from the bottom of the vehicle, worse at acceleration	• Exhaust pipe/muffler grounded to chassis	• CHECK the exhaust system to chassis clearance. CHECK the exhaust system hangers for damage. REPAIR as necessary. REFER to Section 309-00 .
• Whoosh — occurs during light	• Throttling late, creating turbulence	• CHECK for leaks or missing seal in the dash panel.

vehicle acceleration. Heard inside the vehicle	transmitted through the plastic manifold	
• Engine vibration — increases intensity as engine rpm is increased	• Engine out-of-balance	• CARRY OUT Neutral Engine Run-Up (NERU) Test. ROTATE the torque converter, 120 degrees for 3 bolt and 180 degrees for 4 bolt. INSPECT the torque converter pilot outer diameter to crankshaft pilot inner diameter. REPAIR as necessary. REFER to Section 307-01A or Section 307-01B .
• Engine vibration — is felt with increases and decreases in engine rpm	• Strain on exhaust mounts	• CARRY OUT Exhaust System Neutralizing in this section. REPAIR as necessary.
	• Damaged or worn powertrain/drivetrain mounts	• CHECK the powertrain/drivetrain mounts for damage. CARRY OUT the Powertrain/Drivetrain Mount Neutralizing in this section. REPAIR as necessary.
	• Engine or transmission grounded to chassis	• INSPECT the powertrain/drivetrain for correct clearances. REPAIR as necessary.
• Engine vibration — vibration felt at all times	• Excessive engine pulley runout	• CARRY OUT Engine Accessory Test. INSTALL a new engine pulley as necessary. REFER to Section 303-01 .
	• Damaged or worn accessory component	• CARRY OUT Engine Accessory Test. REPAIR or INSTALL a new component as necessary.
• Accelerator pedal vibration — felt through the pedal as a buzz	• Throttle cable loose or misrouted	• INSPECT the throttle cable. REPAIR as necessary. REFER to Section 310-02 .
• Engine vibration — mostly at coast/neutral coast. Condition improves with vehicle accelerating	• Combustion instability	• CHECK the ignition system. INSTALL new components as necessary.
• Engine vibration or shudder — occurs with light to medium acceleration above 56 km/h (35 mph)	• Worn or damaged spark plugs	• INSPECT the spark plugs for cracks, high resistance or broken insulator. INSTALL a new spark plug (s) as necessary.

	• Plugged fuel injector • Damaged spark plug wire • Contaminated fuel • Worn or damaged torque converter	• REPAIR or INSTALL a new injector as necessary. • INSPECT the spark plug wires for damage. INSTALL a new spark plug wire(s) as necessary. • INSPECT the fuel for contamination. DRAIN the fuel system and refill. • CHECK the torque converter. INSTALL a new torque converter as necessary. REFER to Section 307-01A or Section 307-01B .

Symptom Chart — Idle Noise/Vibration

Condition	Possible Sources	Action
• Idle air control (IAC) valve moan — occurs on throttle tip-out	• IAC valve is contaminated with oil	• GO to Component Tests in this section.
• Accessory drive belt chirp — occurs at idle or high idle, cold or hot. Most common occurrence is during humid weather	• Accessory drive belt worn, or pulley is misaligned or loose	• INSPECT for loose or misaligned pulleys. CHECK the drive belt for wear or damage. INSTALL new pulley(s)/accessory drive component or drive belt, as necessary. REFER to Section 303-05 .
• Accessory drive bearing hoot — occurs at idle or high idle in cold temperatures of approximately +4°C (+40°F) or colder at first start of the day	• Accessory drive idler or tensioner pulley bearing is experiencing stick/slip between ball bearings and bearing race	• Go To Pinpoint Test C .
• Power steering moan — occurs at high idle and possibly at idle during the first cold start of the day in temperatures of approximately -18°C (0°F) or colder. Noise can even be a severe screech for less than one minute in very cold temperatures of approximately -29°C (-20°F) or colder	• High fluid viscosity, or plugged reservoir screen in power steering reservoir starves pump causing cavitation	• Go To Pinpoint Test D .
• Generator whine — during high electrical loads at idle or high idle, a high pitch whine or moan is emitted from the generator	• Generator electrical field noise	• Using an EngineEAR, PROBE near the generator housing. LISTEN for changes in the noise level while changing electrical loads (such as rear defrost,

		headlamps, etc.). CARRY OUT a generator load test. If the system passes the load test, the noise is from the generator bearings, INSTALL new bearings. If the system fails the load test, INSTALL a new generator. REFER to Section 414-02 .
• Engine-driven cooling fan moan — occurs during the first start of the day. It is most objectionable near idle speeds up to 2000 rpm. The noise increases with rpm	• The viscous cooling fan clutch engages until the fluid in the clutch reaches normal operating temperature, causing the fan to fully engage	• Go To Pinpoint Test E .
• Drumming noise — occurs inside the vehicle during idle or high idle, hot or cold. Very low-frequency drumming is very rpm dependent	• Exhaust system vibration excites the body resonances inducing interior noise • Engine vibration excites the body resonances inducing interior noise	• Go To Pinpoint Test F .
• Hissing noise — occurs during idle or high idle that is apparent with the hood open	• Vacuum leak or idle air control (IAC) valve flow noise	• Use the Ultrasonic Leak Detector/EngineEAR to locate the source. Scan the air intake system from the inlet to each cylinder intake port. DISCARD the leaking parts, and INSTALL a new component.
	• Vehicles with a plastic intake manifold	• Acceptable condition. Some plastic manifolds exhibit this noise, which is the effect of the plastic manifold.
• Automatic transmission buzz or hiss	• Incorrect driveline angles	• CHECK for correct driveline angles. REPAIR as necessary. REFER to Section 205-00 .
	• Worn or damaged main control solenoids or valves	• Using a transmission tester, activate the solenoids to duplicate sound. INSTALL new components as necessary. REFER to Section 307-01A or Section 307-01B .
• Manual Transmission Clutch throw-out bearing whine. A change in noise pitch or loudness while depressing the clutch pedal	• Worn throw-out bearing	• INSTALL a new throw-out bearing.

• Heating, vacuum and air conditioning (HVAC) system chirp — most audible inside the vehicle. Listen for a change in noise pitch or loudness while changing the HVAC system blower speed	• Damaged or worn HVAC blower bearing	• INSTALL a new blower motor. REFER to Section 412-02 .
• Air conditioning (A/C) clutch ticking — occurs when the compressor clutch engages	• Acceptable noise • Incorrect air gap	• LISTEN to the clutch to determine if the noise occurs with clutch engagement. A small amount of noise is acceptable. If the noise is excessive, CHECK the A/C clutch air gap. INSPECT the A/C clutch for wear or damage. INSTALL a new clutch as necessary. REFER to Section 412-01 .
• Intermittent rattle, or scraping/rubbing noise	• Loose exhaust heat shield(s) • Wiring, hose or other part interfering with accessory drive belt or pulley	• INSPECT the exhaust system for loose parts using a glove or clamps to verify cause. REPAIR as necessary. REFER to Section 309-00 . • INSPECT accessory drive system closely verifying there is adequate clearance to all rotating components. REPAIR as necessary.
• Engine ticking or knocking noise — occurs during idle or high idle during the first cold start of the day	• Piston noise or valvetrain noise (bled down lifter/lash adjuster)	• Go To Pinpoint Test G .
• A continuous, speed-dependent rattle from the engine — occurs during idle or high idle during the first cold start of the day and disappears as the engine warms up	• Piston noise or valvetrain noise (bled down lifter/lash adjuster)	• Go To Pinpoint Test G .
• Idle vibration — a low-frequency vibration (5-20 Hz) or mild shake that is felt through the seat/floorpan	• Cylinder misfire • Engine or torque converter out of balance	• Using a diagnostic tool, CHECK the ignition system. CARRY OUT a cylinder power test. REFER to Section 303-00 . • VERIFY the torque converter to crankshaft pilot clearance is correct, REPAIR as necessary. RE-INDEX the torque converter on the flex plate by 120 degrees on a 3 bolt converter or 180 degrees for a 4 bolt converter. REFER to Section 307-01A or Section 307-01B . RETEST

		the vehicle.
• Idle vibration — a high-frequency vibration (20–80 Hz) or buzz, that is felt through the steering wheel or seat	• Exhaust system mounts bound up	• VERIFY concern occurs at engine firing frequency. CHECK that the exhaust system vibrates at the same frequency as the engine. ADD 9–14 Kg (20–30 lb) to the tail pipe to test, CARRY OUT Exhaust System Neutralizing in this section.
	• Body mounts loose	• INSPECT the body mounts. CARRY OUT a Neutral Engine Run-Up (NERU) Test. REPAIR as necessary
	• Power steering lines grounded out	• INSPECT that the power steering lines are not contacting the chassis or each other. REPAIR as necessary.

Symptom Chart — Squeak and Rattle

Condition	Possible Sources	Action
• Squeak — heard inside the vehicle when closing/opening the door	• Insufficient lubrication on the door hinge or check strap	• LUBRICATE the hinge or check strap.
	• Internal door components loose, rubbing or misaligned	• CHECK the inside of the door. TIGHTEN or ALIGN as necessary. USE the Rotunda Squeak and Rattle Kit to isolate any rubbing components.
• Squeak — heard inside the vehicle when closing/opening the window	• Worn or damaged glass run/channel	• REPAIR or INSTALL a new glass run/channel. REFER to Section 501-11 .
• Squeak — heard outside of vehicle when closing/opening the door	• Exhaust shield rubbing against the chassis or exhaust pipe	• CHECK the exhaust system. REPAIR as necessary. Section 309-00 .
• Squeak — occurs with initial brake pedal application	• Disc brake pads	• Under certain conditions, asbestos free pads can generate a squeak noise. This noise is normal and does not indicate a concern.
• Squeak — a constant noise that occurs with brake pedal applications	• Damaged or worn disc brake pads	• INSPECT the pads for oil, grease or brake fluid contamination. CHECK for glazed linings. A brake disc with hard spots will also cause a squeak type noise. REPAIR or INSTALL new pads as necessary. REFER to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
• Squeak — noise	• Worn control	• INSPECT the control arm

occurs over bumps or when turning	arm bushings	bushings. Spray with lubricant and CARRY OUT a "bounce test" to determine which bushing. REPAIR as necessary. REFER to Section 204-01A for rear wheel drive (RWD) vehicles or Section 204-01B for four wheel drive (4WD) vehicles.
	• Worn or damaged shock absorber/strut	• INSPECT the shock absorber for damage. CARRY OUT a "bounce test" to isolate the noise. INSTALL a new shock absorber/strut as necessary. REFER to Section 204-01A for rear wheel drive (RWD) vehicles and Section 204-01B for four wheel drive (4WD) vehicles for the front shock absorber/strut or Section 204-02 for the rear shock absorber/strut.
• Rattle — heard when closing/opening the door or window	• Loose internal door mechanism, bracket or attachment	• REPEAT the motion or CARRY OUT a "tap test" to duplicate the noise. INSPECT the door for loose components. TIGHTEN loose components or USE the Rotunda Squeak and Rattle Kit to isolate any rattling components.
• Squeak or rattle — heard inside the vehicle over rough roads/bumps	• Misaligned glove compartment door/hinge	• ALIGN the glove compartment door.
	• Instrument panel trim loose or misaligned	• INSPECT the instrument panel trim for missing or loose clips or screws. REPAIR as necessary.
	• Loose interior component or trim	• CARRY OUT a "touch test". ELIMINATE the noise by pressing or pulling on interior trim and components. USE the Rotunda Squeak and Rattle Kit to isolate any rattling/squeaking components.
• Squeak or rattle — noise with a vibration concern	• Damaged or worn body mounts	• INSPECT the upper and lower absorbers and washers for damage or wear. CHECK the body mount brackets for damage. CHECK the nuts and bolts are tightened to specifications. TIGHTEN as necessary.
	• Damaged or worn sub-frame mounts	• INSPECT the upper and lower absorbers for damage or wear. CHECK the sub-frame for damage. CHECK the nuts and bolts are tightened to specifications. TIGHTEN as necessary.

Symptom Chart — Steering Noise/Vibration

Condition	Possible Sources	Action
• Steering grunt or	• Steering gear or power	• GO to Steering Gear

shudder — occurs when turning into or out of a turn at low speeds (temperature sensitive)	steering hoses	Grunt/Shudder Test component test in this section.
• Steering System clonk — hydraulic knocking sound	• Air in the steering hydraulic system	• CHECK for leaks in the system. PURGE the air from the system. REFER to Section 211-00 .
• Power steering pump moan — loud humming noise occurs when the steering wheel is rotated to the stop position. Produces a 120-600 Hz frequency that changes with rpm	• Power steering hose grounded out to chassis	• INSPECT the power steering hoses. REPAIR as necessary.
	• Aerated fluid	• PURGE the air from the system. REFER to Section 211-00 . CHECK for leaks in the system.
	• Steering gear isolators	• INSPECT the isolators for wear or damage. REPAIR as necessary.
	• Low fluid	• CHECK the fluid level. REFILL as necessary.
	• Power steering pump brackets loose or misaligned	• CHECK bolts, brackets and bracket alignment. TIGHTEN bolts to specification. REPAIR or INSTALL new brackets as necessary. REFER to Section 211-02 .
• Steering gear clunk — occurs only while cornering over a bump (can be temperature sensitive)	• Steering gear	• INSPECT the steering gear for loose mounting bolts. TIGHTEN as necessary. REFER to Section 211-02 .
• Feedback (rattle, chuckle or knocking noise in the steering gear) — a condition where roughness is felt in the steering wheel when the vehicle is driven over rough surfaces	• Column intermediate/flexible shaft joints damaged or worn	• INSTALL a new intermediate/flexible shaft. REFER to Section 211-04 .
	• Loose, damaged or worn tie-rod ends	• TIGHTEN the nuts to specification or INSTALL new tie-rod ends as necessary.

	• Steering gear insulators or mounting bolts loose or damaged • Steering column intermediate shaft bolts are loose • Steering column damaged or worn • Loose suspension bushings, bolts or ball joints	• TIGHTEN the bolts or INSTALL new bolts as necessary. REFER to Section 211-02 . • TIGHTEN the bolts to specification. REFER to Section 211-04 . • REPAIR or INSTALL a new steering column as necessary. REFER to Section 211-04 . • INSPECT the suspension system. TIGHTEN or INSTALL new components as necessary. REFER to Section 204-01A for rear wheel drive (RWD) vehicles or Section 204-01B for four wheel drive (4WD) vehicles.
• Feedback (nibble at the steering wheel) — a condition where slight rotational movement is felt in the steering wheel when the vehicle is driven over rough or grooved surfaces	• Lateral runout in the tire or wheel • Yoke spring in the steering gear	• Go To Pinpoint Test H . • CHECK TSBs for revised yoke spring for applicable vehicles.
• Accessory drive belt squeal/chirp — when rotating the steering wheel from stop to stop	• Loose or worn accessory drive belt	• ADJUST or INSTALL a new accessory drive belt as necessary. REFER to Section 303-05 .
• Power steering gear hiss	• Steering column intermediate/flexible shaft-to-steering gear is binding or misaligned • Grounded or loose steering column boot at the dash panel • Damaged or worn steering gear input shaft and valve	• REPAIR or INSTALL a new intermediate/flexible shaft as necessary. REFER to Section 211-04 . • REPAIR as necessary. • REPAIR or INSTALL a new steering gear as necessary. REFER to Section 211-02 .
• Steering column rattle	• Loose bolts or attaching brackets • Loose, worn or insufficiently lubricated column bearings	• TIGHTEN the bolts to specifications. • LUBRICATE or INSTALL new steering column bearings as necessary. REFER to Section 211-04 .

	• Steering shaft insulators damaged or worn • Intermediate/flexible shaft compressed or extended	• INSTALL new insulators. REFER to Section 211-04 . • INSPECT the rubber spider coupling for damage. INSTALL a new intermediate/flexible shaft. REFER to Section 211-04 .
• Steering column squeak or cracks	• Insufficient lubricated steering shaft bushings • Loose or misaligned steering column shrouds • Steering wheel rubbing against steering column shrouds • Insufficient lubricated speed control slip ring • Upper or lower bearing sleeve out of position	• LUBRICATE the steering shaft and shaft tube seals. • TIGHTEN or ALIGN the steering column shrouds. • REPOSITION the steering column shrouds. • LUBRICATE the speed control slip ring. • REPOSITION the bearing sleeves.
• Power steering pump noisy	• Incorrect assembly of components • Imperfections on the outside diameter or end surface of the power steering pump rotor • Damaged or worn power steering pump rotor splines • A crack on the inner surface of the power steering pump cam • Interference between the power steering pump rotor and cam • Damaged or worn power steering pump rotor and pressure plates	• REPAIR or INSTALL a new power steering pump as necessary. REFER to Section 211-02 .
• Power steering pump swish noise	• Power steering fluid flow into the bypass valve of the pump valve housing with fluid temperature below 54° C (130°F)	• Acceptable condition.
• Power steering pump whine noise	• Aerated fluid • Damaged power steering pump cam • Damaged valve cover O-ring seal	• CHECK for a leak in the system. PURGE the air from the system. REFER to Section 211-00 . • REPAIR or INSTALL a new power steering pump as necessary. REFER to Section 211-02 . • REPAIR or INSTALL a new power steering pump as necessary. REFER to Section 211-02 .

• Power steering pump clicking (mechanical) noise	• Power steering pump rotor slippers too long, excessive rotor slipper-to-slot clearance or damaged or worn rotor assembly	• REPAIR or INSTALL a new power steering pump as necessary. REFER to Section 211-02 .
• Power steering pump clatter noise	• Damaged corners on the outside diameter or the power steering rotor or distorted rotor slipper ring	• REPAIR or INSTALL a new power steering pump as necessary. REFER to Section 211-02 .

Symptom Chart — Suspension Noise/Vibration

Condition	Possible Sources	Action
• Squeak or grunt — noise from the front suspension, occurs more in cold ambient temperatures. More noticeable over rough roads or when turning	• Front stabilizer bar insulators	• Under these conditions, the noise is acceptable. CHECK TSBs for applicable vehicle.
• Clunk — noise from the front suspension, occurs in and out of turns	• Loose front struts or shocks	• INSPECT for loose nuts or bolts. TIGHTEN to specifications. REFER to Section 204-01A for rear wheel drive (RWD) vehicles or Section 204-01B for four wheel drive (4WD) vehicles.
• Clunk — noise from the rear suspension, occurs when shifting from reverse to drive	• Loose rear suspension components	• INSPECT for loose or damaged rear suspension components. REPAIR or INSTALL new components as necessary. REFER to Section 204-02 .
• Click or pop — noise from the front suspension. More noticeable over rough roads or over bumps	• Worn or damaged ball joints	• CARRY OUT a ball joint inspection. INSTALL new ball joints or control arms as necessary. REFER to Section 204-01A for rear wheel drive (RWD) vehicles or Section 204-01B for four wheel drive (4WD) vehicles.
• Click or pop (FWD vehicles) — noise occurs when vehicle is turning	• Worn or damaged ball joints	• CARRY OUT a ball joint inspection. INSTALL new ball joints or control arms as necessary.
• Click or snap — occurs when accelerating around a corner	• Damaged or worn outboard CV joint	• INSPECT the outboard CV joint and boot. REPAIR or INSTALL a new CV joint as necessary. REFER to Section 205-04 .
• Front suspension noise — a squeak, creak or rattle noise. Occurs mostly over	• Steering components • Loose or bent	• Go To Pinpoint Test H .

bumps or rough roads	front struts or shock absorbers • Damaged spring or spring mounts • Damaged or worn control/radius arm bushings • Worn or damaged stabilizer bar bushings or links	
• Rear suspension noise — a squeak, creak or rattle noise. Occurs mostly over bumps or rough roads	• Loose or bent rear shock absorbers • Damaged spring or spring mounts • Damaged or worn control arm bushings • Worn or damaged stabilizer bar bushings or links	• Go To Pinpoint Test I .
• Shudder — occurs during acceleration from a slow speed or stop	• Rear drive axle assembly mispositioned • Incorrect or high CV joint operating angle • Damaged or worn front suspension components	• CHECK the axle mounts and the rear suspension for damage or wear. REPAIR as necessary. • CHECK vehicle ride height is within limits. REPAIR as necessary. • CHECK for a loose stabilizer bar, damaged or loose strut/strut bushings or loose or worn ball joints. INSPECT the steering linkage for wear or damage. REPAIR or INSTALL new components as necessary.
• Shimmy — most noticeable on coast/deceleration. Also hard steering condition	• Excessive positive caster	• CHECK the caster alignment angle. CORRECT as necessary. REFER to Section 204-00 .

Symptom Chart — Tire Noise/Vibration

Condition	Possible Sources	Action
• Tire noise — hum/moan at constant speeds	• Abnormal wear patterns	• SPIN the tire and CHECK for tire wear. INSTALL a new tire as necessary. INSPECT for damaged/worn suspension components. CARRY OUT

		wheel alignment.
• Tire noise — noise tone lowers as the vehicle speed is lowered	• Out-of-balance tire	• BALANCE the tire and road test. INSTALL a new tire as necessary. REFER to Section 204-04 .
• Tire noise — ticking noise, changes with speed	• Nail puncture or stone in tire tread	• INSPECT the tire. REPAIR as necessary.
• Wheel and tire — vibration and noise concern is directly related to vehicle speed and is not affected by acceleration, coasting or decelerating	• Damaged or worn tire	• Go To Pinpoint Test J .
• Tire wobble or shudder — occurs at lower speeds	• Damaged wheel bearings	• SPIN the tire and CHECK for abnormal wheel bearing play or roughness. ADJUST or INSTALL new wheel bearings as necessary. REFER to Section 204-01A for rear wheel drive (RWD) vehicles or Section 204-01B for four wheel drive (4WD) vehicles.
	• Damaged wheel	• INSPECT the wheel for damage. INSTALL a new wheel as necessary. REFER to Section 204-04 .
	• Damaged or worn suspension components	• INSPECT the suspension components for wear or damage. REPAIR as necessary.
	• Loose wheel nuts	• CHECK the wheel nuts. TIGHTEN to specification. REFER to Section 204-04 .
	• Damaged or uneven tire wear	• SPIN the tire and CHECK for abnormal tire wear or damage. INSTALL a new tire as necessary. REFER to Section 204-04 .
• Tire shimmy or shake — occurs at lower speeds	• Wheel/tire out of balance	• BALANCE the wheel/tire assembly.
	• Uneven tire wear	• CHECK for abnormal tire wear. INSTALL a new tire as necessary. REFER to Section 204-04 .
	• Excessive radial runout of wheel or tire	• CARRY OUT a radial runout test of the wheel and tire. INSTALL a new tire as necessary. REFER to Section 204-04 .
	• Worn or damaged wheel studs or elongated stud	• INSPECT the wheel studs and wheels. INSTALL new components as necessary. REFER to Section 204-01A for

	holes	rear wheel drive (RWD) vehicles or Section 204-01B for four wheel drive (4WD) vehicles for the front wheels or Section 204-02 for the rear wheels.
	• Excessive lateral runout of the wheel or tire	• CARRY OUT a lateral runout test of the wheel and tire. REFER to Section 204-04. CHECK the wheel, tire and hub. REPAIR or INSTALL new components as necessary.
	• Foreign material between the brake disc and hub or in the brake disc fins	• CLEAN the mounting surfaces of the brake disc and hub. CHECK the brake disc fins for material.
• High speed shake or shimmy — occurs at high speeds	• Excessive wheel hub runout • Damaged or worn tires • Damaged or worn wheel bearings • Worn or damaged suspension or steering linkage components • Brake disc or drum imbalance	• Go To Pinpoint Test K.

Symptom Chart — Manual Transmission and Transfer Case Noise/Vibration

Condition	Possible Sources	Action
• Clutch rattling noise — occurs with clutch engaged, noise changes/disappears with clutch pedal depressed	• Flywheel bolts, clutch housing bolts or clutch pressure plate bolts loose	• TIGHTEN the bolts to specifications. CHECK the bolts for damage.
• Clutch squeaking noise — noise is heard when the clutch is operated. Vehicle moves slowly or creeps when the clutch is disengaged. Can also be difficult to shift into 1st and REVERSE gear	• Pilot bearing seized or damaged	• INSTALL a new pilot bearing.
• Clutch squeaking noise — occurs with clutch pedal depressed/released	• Worn clutch pedal shaft or bushings	• INSPECT the clutch pedal for wear or damage. REPAIR as necessary.
• Clutch whirring/rattle noise — occurs when clutch pedal is depressed	• Worn, damaged or misaligned clutch release bearing	• INSTALL a new clutch release bearing.

• Clutch grating/grinding noise — occurs when clutch pedal is depressed	• Clutch pressure plate fingers bent or worn	• INSPECT the clutch pressure plate release fingers. INSTALL a new pressure plate as necessary.
	• Contact surface of clutch release bearing worn or damaged	• INSTALL a new clutch release bearing.
• Clutch chatter — a small amount of noise when clutch pedal is released at initial take-off	• Clutch engagement	• Acceptable operating condition.
• Clutch chatter/grabs — in some cases a shudder is felt. Occurs with clutch pedal depressed/released	• Damaged or worn powertrain/driveline mounts	• INSPECT the powertrain/drivetrain mounts. CARRY OUT Powertrain/Drivetrain Mount Neutralizing in this section. INSTALL new mounts as necessary.
	• Binding or dragging plunger of the clutch master cylinder or slave cylinder	• CHECK the master and slave cylinder operation. INSPECT the components for damage or wear. INSTALL a new master or slave cylinder as necessary.
	• Grease or oil on the clutch disc facing	• CHECK the input shaft seal and rear main oil seal. REPAIR as necessary. INSTALL a new clutch disc.
	• Clutch disc surface glazed or damaged	• INSPECT the clutch disc surface for a glazed, hardened or damaged condition. CARRY OUT a disc check. INSTALL a new clutch disc as necessary.
	• Damaged or worn clutch pressure plate	• INSPECT the clutch pressure plate for wear or damage. INSTALL a new clutch pressure plate as necessary.
	• Flywheel surface damaged or glazed	• INSPECT the flywheel for damage or wear. CARRY OUT a flywheel runout check. INSTALL a new flywheel as necessary.
• Clutch chatter noise — noise when clutch pedal is released at initial take-off. Clutch is hard to engage and disengage	• Pilot bearing worn, damaged or not correctly aligned in bore	• INSPECT the clutch pressure plate release fingers for uneven wear, clutch components burnt or a seized pilot bearing. INSTALL a new pilot

		bearing as necessary.
• Clutch vibration	• Loose flywheel bolts • Damaged or loose clutch pressure plate • Excessive flywheel runout	• Go To Pinpoint Test L .
• Transmission rattling/clattering noise — noise at idle or on light acceleration from a stop. Gear selection difficult	• Gearshift lever joint worn or damaged	• INSTALL a new gearshift lever.
	• Gearshift lever loose	• TIGHTEN the bolts to specification.
	• Gearshift linkage rods worn or damaged	• CHECK the linkage bushings for wear. INSTALL new linkage rods as necessary.
• Transmission rattling/clattering noise — occurs in neutral or in gear, at idle	• Incorrect fluid level or fluid quality	• CHECK that the transmission is filled to the correct level and with the specified fluid.
• Transmission rattling/clattering noise — noise at idle in neutral	• Worn or rough reverse idler gear	• CHECK the reverse idler gear. REPAIR as necessary.
	• Rough running engine, cylinder misfire	• CHECK the ignition system. CARRY OUT a cylinder power test.
	• Excessive backlash in gears	• CHECK the gear backlash. ADJUST as necessary.
	• Worn countershaft gears	• REPAIR as necessary.
• Transmission whine — a mild whine at extreme speeds or high rpm	• Rotating gears/geartrain	• Acceptable noise.
• Transmission whine — a high pitched whine, also described as a squeal	• Transmission gears are worn (high mileage vehicle)	• Result of normal gear wear. REPAIR as necessary.
	• Mismatched gear sets	• INSPECT the gear sets for an uneven wear pattern on the face of the gear teeth. REPAIR as necessary.
	• Damaged or worn transmission bearing	• INSPECT the transmission bearings. INSTALL new bearings as necessary.
• Transmission growling/humming — noise occurs in the forward gears. The noise is more prominent when the	• Gear is cracked, chipped or rough	• INSPECT the transmission gears for damage or wear. INSTALL new gears as necessary.

gear is loaded. The problem gear can be located as the noise occurs in a specific gear position		
• Transmission hissing — noise in neutral or in forward gears. As bearings wear or break up, the noise changes to a thumping noise	• Damaged or worn bearings	• INSPECT the transmission bearings. INSTALL new bearings as necessary.
• Transmission knocking/thudding — noise at low speeds in forward gears	• Bearings with damaged balls or rollers or with pitted and spalled races	• INSPECT the transmission bearings. INSTALL new bearings as necessary.
• Transmission rumble/growl — noise at higher speeds in forward gears, more pronounced in a coast/deceleration condition	• Incorrect driveline angle	• CHECK the driveline angle. REPAIR as necessary.
	• Driveshaft out of balance or damaged	• CHECK the driveshaft for damage, missing balance weights or undercoating. Using a vibration analyzer (VA), CHECK the driveshaft balance. CARRY OUT a driveline vibration test. REPAIR as necessary.
• Transmission rumble/growl — noise at all speeds in forward gears, more pronounced in a heavy acceleration condition	• Damaged or worn transmission bearing or gears (high mileage vehicles)	• CHECK transmission fluid for excessive metal particles. REPAIR as necessary.
• Transfer case whine — noise at all ranges	• Incorrect fluid level or fluid quality	• CHECK that the transfer case is filled to the correct level and with the specified fluid. REFER to Section 308-07B .
	• Worn oil pump	• DISASSEMBLE the transfer case. CHECK the oil pump for wear or damage. REPAIR as necessary. REFER to Section 308-07B .
	• Under-inflated or oversized tires	• CONFIRM that the tires and wheels are correct for the vehicle. CHECK that the tire inflation pressures are correct.
• Transfer case growl/rumble — noise at all ranges (A small amount of planetary noise can be heard	• Damaged or worn bearings or planetary gear	• DISASSEMBLE the transfer case. CHECK the bearings or planetary gear for wear or damage. REPAIR as

when the transfer case is operated in low range.)		necessary. REFER to Section 308-07B .
• Transfer case scraping/grating — noise at all ranges	• Excessively stretched drive chain hitting the case	• DISASSEMBLE the transfer case. CHECK the drive chain for wear or damage. REPAIR as necessary. REFER to Section 308-07B .
• Transfer case howl/hum — noise at all ranges or high range only	• Worn or damaged sun (input) gear, clutch pack (intermediate) gear or output shaft gear	• DISASSEMBLE the transfer case. CHECK the gears for wear or damage. REPAIR as necessary. REFER to Section 308-07B .
• Transfer case howl/hum — noise at low range only	• Worn or damaged intermediate gear and sliding gears (clutch pack)	• DISASSEMBLE the transfer case. CHECK the gears for wear or damage. REPAIR as necessary. REFER to Section 308-07B .
• Transfer case vibration — vibration felt with vehicle in 4WD	• Transfer case mounting • Driveshaft out of balance • Excessive pinion flange runout	• Go To Pinpoint Test M .

Symptom Chart — Automatic Transmission Noise/Vibration

Condition	Possible Sources	Action
• Rattle — occurs at idle or at light acceleration from a stop	• Damaged engine or transmission mounts	• CHECK the powertrain/drivetrain mounts for damage. REFER to Section 303-01 .
	• A loose front exhaust pipe heat shield	• REPAIR or INSTALL a new heat shield as necessary.
	• Loose inspection plate or dust cover plate	• CHECK for loose bolts. TIGHTEN to specifications. REFER to Section 307-01A or Section 307-01B .
	• Loose flexplate to converter nuts	• CHECK for loose nuts. TIGHTEN to specifications. REFER to Section 307-01A or Section 307-01B .
• Whine — pitch increases with vehicle speed. Starts in 1st and 2nd gear, decreases or goes away at higher gears	• Damaged or worn low one-way clutch • Damaged or worn intermediate one-way clutch • Friction elements • Damaged or worn planetary or sun gear	• INSPECT the transmission for wear or damage. REPAIR or INSTALL new components as necessary. REFER to Section 307-01A or Section 307-01B .
• Whine — the pitch changes with engine speed	• A worn or damaged accessory drive component	• CARRY OUT the Engine Accessory Test. REPAIR or INSTALL new components as necessary.

	• Incorrect fluid level	• CHECK that the transmission is filled to the correct level. ADD fluid as necessary. REFER to Section 307-01A or Section 307-01B .
	• Partially blocked filter	• INSPECT the filter. CLEAN or INSTALL a new filter as necessary. REFER to Section 307-01A or Section 307-01B .
	• Worn or damaged torque converter	• CARRY OUT the torque converter service and replacement check. REFER to Section 307-01A or Section 307-01B .
	• Worn or damaged front pump	• INSPECT the front pump. INSTALL a new front pump as necessary. REFER to Section 307-01A or Section 307-01B .
• Whine — pitch changes with vehicle speed	• Speedometer cable or gears	• REPAIR or INSTALL new cables or gears as necessary.
• Whine/moan type noise — pitch increases or changes with vehicle speed	• Damaged engine or transmission mount	• CHECK the powertrain/drivetrain mounts for damage. REFER to Section 303-01 .
	• U-joints worn or damaged	• INSPECT the U-joints for wear or damage. INSTALL new U-joints as necessary. REFER to Section 205-01 .
	• Damaged or worn differential ring and pinion	• INSPECT the differential ring and pinion for damage. CARRY OUT the Checking Tooth Contact Pattern and Condition of the Ring and Pinion component test in this section. REPAIR or INSTALL a new differential ring and pinion as necessary. REFER to Section 205-02 for the rear axle or Section 205-03 for the front axle.
	• Planetary gears nicked or chipped	• CHECK the planetary gears for damage. INSTALL new components as necessary. REFER to Section 307-01A or Section 307-01B .
• Whistle — noise is high pitched, constant. Changes in pitch with throttle position	• Hydraulic pressure in the main control	• INSPECT the main control. REPAIR or INSTALL new components as necessary. REFER to Section 307-01A or Section 307-01B .
	• Incorrect band/clutch apply pressure	• CARRY OUT the line pressure tests. REPAIR or INSTALL components as necessary. REFER to Section 307-01A or Section 307-01B .

	• Worn or damaged torque converter	• CARRY OUT the torque converter service and replacement check. REFER to Section 307-01A or Section 307-01B .
• Clunk — occurs when shifting from PARK to a drive or reverse position	• Damaged powertrain mounts	• INSPECT the powertrain mounts for damage. INSTALL new mounts as necessary. REFER to Section 307-01A or Section 307-01B .
	• Damaged or worn pinion bearings	• CHECK for abnormal bearing play or roughness. INSTALL new bearings as necessary. REFER to Section 205-02 for the rear axle or Section 205-03 for the front axle.
	• Worn or galled driveshaft slip yoke splines	• CLEAN and INSPECT the splines of the yoke. INSTALL a new slip yoke as necessary. REFER to Section 205-01 .
	• Worn friction elements or excessive clutch pack end plate play	• INSPECT the transmission for wear. CHECK that all end play and clearances are within specification. REPAIR or INSTALL new components as necessary. REFER to Section 307-01A or Section 307-01B .
• Bump — occurs when shifting from PARK to a drive or reverse position. Similar to Clunk but with no sound	• Initial gear engagement	• Acceptable condition.
• Buzz or hiss	• Incorrect driveline angles	• CHECK for correct driveline angles. REPAIR as necessary. REFER to Section 205-00 .
	• Worn or damaged main control solenoids or valves	• Using a transmission tester, ACTIVATE the solenoids to duplicate sound. INSTALL new components as necessary. REFER to Section 307-01A or Section 307-01B .
• Vibration — a high frequency (20–80 Hz) that is felt through the seat or gear shifter. Changes with engine speed	• Transmission cooler lines grounded out	• CHECK the transmission cooler lines. REPAIR as necessary.
	• Flexplate to torque converter nuts loose	• CHECK the flexplate nuts. TIGHTEN to specification. REFER to Section 307-01A or Section 307-01B .
	• Fluid filler tube grounded out	• CHECK the fluid filler tube. REPAIR as necessary.

	• Shift cable incorrectly routed, grounded out or loose	• CHECK the shift cable. REPAIR as necessary. REFER to Section 307-05 .
• Shutter or chatter — occurs with light to medium acceleration from low speeds or a stop	• Electrical inputs/outputs • Vehicle wiring harness • Incorrect inputs/outputs from the powertrain control module (PCM), digital transmission range (TR) sensor, brake pedal position (BPP) sensor, throttle position (TP) sensor, transmission speed sensor (TSS), output speed shaft (OSS) sensor or the torque converter clutch (TCC)	• CARRY OUT a Torque Converter Clutch Operation Test. RUN on-board diagnostics or self-test. REFER to Section 307-01A or Section 307-01B . CLEAR the DTC's, road test and rerun on-board diagnostics or self–test.

Pinpoint Tests

The pinpoint tests are a step-by-step diagnostic process designed to determine the cause of a condition. It may not always be necessary to follow a pinpoint test to its conclusion. Carry out only the steps necessary to correct the condition. Then, test the system for normal operation. Sometimes, it is necessary to remove various vehicle components to gain access to the component requiring testing. REFER to the appropriate Workshop Manual section for removal and installation procedures. Reinstall all components after verifying system operation is normal.

PINPOINT TEST A: BRAKE VIBRATION/SHUDDER

Test Step	Result / Action to Take
A1 ROAD TEST THE VEHICLE — LIGHT BRAKING	
• Check that the wheel and tires are correct for the vehicle. Inspect the tires for abnormal wear patterns. • Road test the vehicle. Warm the brakes by slowing the vehicle a few times from 80–32 km/h (50 to 20 mph) using light braking applications. At highway speeds of 89–97 km/h (55-60 mph), apply the brake using a light pedal force. • **Is there a vibration/shudder felt in the steering wheel, seat or brake pedal?**	**Yes** GO to A4 . **No** GO to A2 .
A2 ROAD TEST THE VEHICLE — MODERATE TO HEAVY BRAKING	
• Road test the vehicle. At highway speeds of 89–97 km/h (55-60 mph), apply the brake using a moderate to heavy pedal force. • **Is there a vibration/shudder?**	**Yes** For vehicles with ABS, GO to A3 . For vehicles with standard brakes, GO to A4 . **No** Vehicle is OK. VERIFY condition with customer. TEST the vehicle for normal operation.

A3 NORMAL ACTUATION OF THE ABS SYSTEM DIAGNOSIS	
• During moderate to heavy braking, noise from the hydraulic control unit (HCU) and pulsation in the brake pedal can be observed. Pedal pulsation coupled with noise during heavy braking or on loose gravel, bumps, wet or snowy surfaces is acceptable and indicates correct functioning of the ABS system. Pedal pulsation or steering wheel nibble (frequency is proportioned to the vehicle speed) indicates a concern with a brake or suspension component. • **Is the vibration/shudder vehicle speed sensitive?**	**Yes** GO to A5 . **No** The brake system is operating correctly.
A4 APPLICATION OF THE PARKING BRAKE	
• **NOTE:** Begin at the front of the vehicle unless the vibration or shudder has been isolated to the rear. • This test is not applicable to vehicles with drum-in-hat type parking brakes. For vehicles with drum-in-hat parking brakes, proceed to the next test. For all other vehicles, apply the parking brake to identify if the problem is in the front or rear brake. At highway speeds of 89–97 km/h (55-60 mph), lightly apply the parking brake until the vehicle slows down. Release the parking brake immediately after the test. • **Is there a vibration/shudder?**	**Yes** GO to A8 . **No** GO to A5 .
A5 CHECK THE FRONT WHEEL BEARINGS	
• Check the front wheel bearings. Refer to Wheel Bearing Check in this section. • **Are the wheel bearings OK?**	**Yes** GO to A6 . **No** INSPECT the wheel bearings. ADJUST or REPAIR as necessary. TEST the system for normal operation.
A6 CHECK THE FRONT SUSPENSION	
• Check the front suspension for: ▪ broken or loose bolts. ▪ damaged springs. ▪ worn or damaged upper and lower control arm bushings. ▪ loose or rough front bearings. ▪ uneven tire wear. • **Are all the suspension components in satisfactory condition?**	**Yes** GO to A7 . **No** REPAIR or INSTALL new components as necessary. TEST the system for normal operation.
A7 RESURFACE THE FRONT BRAKE DISCS	
• **CAUTION: Do not use a bench lathe to machine brake discs.** • **NOTE:** Follow the manufacturer's instructions to machine the brake discs. After machining, make sure the brake disc meets the thickness specification. • Resurface the front brake discs. Road test the vehicle. • **Is the vibration/shudder present?**	**Yes** GO to A8 . **No** Vehicle is OK.
A8 CHECK THE REAR SUSPENSION	
• Check the rear suspension for: ▪ broken or loose bolts. ▪ damaged or worn springs or spring bushings. ▪ worn or damaged upper and lower control arm bushings. ▪ worn or damaged trailing arms. ▪ loose or rough rear bearings. ▪ uneven tire wear.	**Yes** GO to A9 . **No** REPAIR or INSTALL new components as necessary. TEST the

• **Are all the suspension components in satisfactory condition?**	system for normal operation.
A9 RESURFACE THE REAR BRAKE DISC OR DRUM	
• **CAUTION: Do not use a bench lathe to machine brake discs.** • **NOTE:** Follow the manufacturers instructions to machine the brake discs. After machining, make sure the brake disc meets the thickness specification. • Resurface the rear brake discs or drums. Road test the vehicle. • **Is the vibration/shudder present?**	**Yes** CHECK the front suspension for wear or damage, RESURFACE the front brake discs. TEST the system for normal operation. **No** Vehicle is OK.

PINPOINT TEST B: ENGINE TICKING NOISE

Test Step	Result / Action to Take
B1 CHECK FOR TICKING NOISE AT THE FUEL RAIL	
• Disconnect the first fuel line clip. • **Is the ticking noise gone?**	**Yes** CHECK for TSB for applicable vehicle. REPAIR as necessary. TEST the system for normal operation. **No** GO to B2 .
B2 CHECK FOR TICKING NOISE AT THE FUEL INJECTOR	
• Using an EngineEAR, listen at the fuel injectors by placing a probe on each injector. To isolate the faulty injector, disconnect the injector electrical connector and listen for the noise. • **Is the fuel injector the source of the ticking noise?**	**Yes** INSTALL a new fuel injector. REFER to Section 303-04 . TEST the system for normal operation. **No** GO to B3 .
B3 CHECK THE BELT TENSIONER FOR TICKING NOISE	
• Inspect the accessory drive. Check for the belt tensioner bottoming at end of travel or not at end of stroke. • Using an EngineEAR, listen at the belt tensioner. • **Is the belt tensioner the source of the noise?**	**Yes** INSTALL a new belt tensioner. TEST the system for normal operation. **No** GO to B4 .
B4 CHECK THE WATER PUMP FOR TICKING NOISE	
• Using an EngineEAR, listen at the water pump for ticking noise. • **Is the water pump the source of the noise?**	**Yes** INSTALL a new water pump. REFER to Section 303-03 . TEST the system for normal operation. **No** GO to B5 .
B5 CHECK FOR AN OBSTRUCTION OF THE COOLING FAN	
• Inspect the cooling fan for obstructions.	**Yes**

• Check the cooling fan and shroud for wear or damage. • **Was there an obstruction or does the cooling fan show signs of damage?**	REPAIR or INSTALL a new cooling fan. TEST the system for normal operation. REFER to Section 303-03 . **No** GO to B6 .
B6 CHECK THE OIL PUMP FOR TICKING NOISE	
• Check the oil pump using EngineEARs and probe at the oil filter adapter to verify the oil pump as a source. • **Is the oil pump the source of the noise?**	**Yes** INSTALL a new oil pump. REFER to Section 303-01 . TEST the system for normal operation. **No** GO to B7 .
B7 CHECK VALVE LIFTERS OR LASH ADJUSTERS FOR CORRECT OPERATION	
• Check valve lifter/lash adjuster for correct operation, using EngineEARs. • **Are the valve lifters/lash adjusters operating correctly?**	**Yes** VERIFY customer concern. CONDUCT a diagnosis of other suspect components. **No** INSTALL a new valve lifter/lash adjuster(s). REFER to Section 303-01 . TEST the system for normal operation.

PINPOINT TEST C: ACCESSORY DRIVE BEARING HOOT

Test Step	Result / Action to Take
C1 CHECK THE ACCESSORY DRIVE IDLER AND TENSIONER PULLEY BEARINGS	
• Carry out the Vehicle Cold Soak Procedure in this section. • Key in START position. • Place an EngineEAR probe directly on the pulley center post or bolt to verify which bearing is making the noise. • Key in OFF position. • **Is either bearing making the noise?**	**Yes** INSTALL a new pulley/idler. CARRY OUT the Vehicle Cold Soak Procedure and TEST the system for normal operation. **No** CONDUCT a diagnosis on other suspect accessory drive components.

PINPOINT TEST D: POWER STEERING MOAN

Test Step	Result / Action to Take
D1 CHECK THE POWER STEERING SYSTEM	
• Carry out the Vehicle Cold Soak Procedure in this section. • Key in START position. • Turn the steering wheel while the noise is occurring and listen for changes in sound pitch or loudness. • Key in OFF position. • **Does the sound pitch or loudness**	**Yes** GO to D2 . **No** CONDUCT a diagnosis on other suspect accessory drive components.

change while turning the steering wheel?	
D2 VERIFY THE SOURCE • Key in START position. • Place an EngineEAR probe near the power steering pump/reservoir while the noise is occurring. While an assistant turns the steering wheel, listen for changes in sound pitch or loudness. • Key in OFF position. • **Does the sound pitch or loudness change while turning the steering wheel?**	**Yes** VERIFY that the supply tube to the pump is unobstructed. CHECK the fluid condition and level. DRAIN the fluid and REFILL. REFER to Section 211-02 . CARRY OUT the Vehicle Cold Soak Procedure and TEST the system for normal operation. **No** Normal system operation.

PINPOINT TEST E: ENGINE DRIVEN COOLING FAN MOAN

Test Step	Result / Action to Take
E1 CHECK THE ENGINE DRIVEN COOLING FAN AFTER A COLD SOAK • Carry out the Vehicle Cold Soak Procedure in this section. • Key in START position. • Assess the airflow. • Raise the engine speed to 1500 rpm while listening for the moan to increase in proportion to the airflow. • Key in OFF position. • **Does the moan increase in proportion to the airflow?**	**Yes** TEST the fan for normal operation. If the fan tests normal, GO to E2 . Otherwise, REPAIR as necessary. **No** Normal system operation.
E2 CHECK THE ENGINE DRIVEN COOLING FAN AT NORMAL OPERATING TEMPERATURE • Key in START position. • Run the engine to normal operating temperature while listening for the moan to stop. • Key in OFF position. • **Does the moan stop?**	**Yes** Normal clutch operation. **No** INSTALL a new fan clutch. TEST the system for normal operation.

PINPOINT TEST F: DRUMMING NOISE

Test Step	Result / Action to Take
F1 CHECK THE EXHAUST SYSTEM • Key in START position. • Increase the engine rpm until the noise is the loudest. Note the engine rpm. • Key in OFF position. • Add approximately 9 kg (20 lb) of weight to the exhaust system. First place the weight at the tail pipe and test, then at the front pipe.	**Yes** CARRY OUT Exhaust System Neutralizing in this section. TEST the system for normal operation. **No** GO to F2 .

 DF1768-A • Key in START position. • Increase the engine rpm and listen for the drumming noise. Note the engine rpm if the noise occurs. • Key in OFF position. • Using a vibration analyzer (VA), determine the amount of vibration that occurs with the drumming noise. • **Is the noise/vibration reduced or eliminated, or does the noise/vibration occur at a different rpm?**	
F2 POWERTRAIN/DRIVETRAIN MOUNT NEUTRALIZING	
• Carry out Powertrain/Drivetrain Mount Neutralizing in this section. Test the system for normal operation. • **Is the noise reduced or eliminated?**	**Yes** Vehicle OK. TEST the system for normal operation. **No** CONDUCT diagnosis of other suspect components.

PINPOINT TEST G: ENGINE TICKING, KNOCKING OR CONTINUOUS RATTLE

Test Step	Result / Action to Take
G1 CHECK FOR NOISE AT THE VALVE COVERS AND THE FRONT COVERS (OHC ENGINES)	
• Carry out the Vehicle Cold Soak Procedure in this section. • Key in START position. • **NOTE:** For a short-duration ticking noise, multiple engine starts may be necessary. • Using an EngineEAR, listen closely at the valve covers and the front covers (OHC engines) by placing the probe near the surface of the valve cover and then on the surface front cover. • Key in OFF position. • **Is the noise source apparent?**	**Yes** REMOVE the appropriate cover and INSPECT for loose, worn/broken components. REPAIR as necessary. TEST the system for normal operation. **No** GO to G2 .
G2 CHECK FOR NOISE AT THE CYLINDER BLOCK	
• Key in START position. • Using an EngineEAR, listen closely at the cylinder block by placing a probe on or near each freeze plug. • Key in OFF position. • **Is the noise source apparent?**	**Yes** REPAIR or INSTALL new components as necessary. **No** GO to G3 .
G3 CHECK FOR NOISE WHILE DISCONNECTING EACH FUEL INJECTOR ELECTRICAL CONNECTOR, ONE AT A TIME	
• Key in START position.	**Yes**

• Disconnect each fuel injector electrical connector, one at a time, to decrease piston force and listen for the noise. • Key in OFF position. • **Is the noise reduced or eliminated?**	INSTALL a new fuel injector. TEST the system for normal operation. **No** INSPECT accessory drive or the transmission as a possible source.

PINPOINT TEST H: FRONT SUSPENSION NOISE

Test Step	Result / Action to Take
H1 ROAD TEST THE VEHICLE	
• Test drive the vehicle. • **NOTE:** An assistant will be needed for this road test. • During the road test, drive the vehicle over a rough road. Using ChassisEARs, determine from which area/component the noise is originating. • **Is there a squeak, creak or rattle noise?**	**Yes** GO to H2 . **No** The suspension system is OK. CONDUCT a diagnosis on other suspect systems.
H2 INSPECT THE STEERING SYSTEM	
• **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.** • Raise and support the vehicle. • Check the steering system for wear or damage. Carry out a steering linkage test. Refer Section 211-00 . • Inspect the tire wear pattern. Refer to Tire Wear Patterns chart in this section. • **Are the steering components worn or damaged?**	**Yes** REPAIR the steering system. INSTALL new components as necessary. TEST the system for normal operation. **No** GO to H3 .
H3 FRONT SHOCK ABSORBER/STRUT CHECK	
• Check the front shock absorber/strut mounts for loose bolts or nuts. • Check the front shock absorbers/struts for wear or damage. Carry out a "bounce test". • **Are the front shock absorbers/struts loose or damaged?**	**Yes** TIGHTEN to specifications if loose. INSTALL new front shock absorbers/struts if damaged. TEST the system for normal operation. **No** GO to H4 .
H4 CHECK THE FRONT SPRINGS	
• Check the front spring and front spring mounts/brackets for wear or damage. • **Are the front springs or spring mounts/brackets worn or damaged?**	**Yes** REPAIR or INSTALL new components as necessary. TEST the system for normal operation. **No** GO to H5 .
H5 CHECK THE CONTROL ARMS/RADIUS ARMS	
• Inspect the control arm bushings for wear or damage. • Inspect for twisted or bent control arm/radius arm. • **Are the control arms/radius arms damaged or worn?**	**Yes** REPAIR or INSTALL new components as necessary.

	TEST the system for normal operation. **No** GO to H6 .
H6 CHECK THE STABILIZER BAR/TRACK BAR	
• Check the stabilizer bar/track bar bushings and links for damage or wear. • Check the stabilizer bar/track bar for damage. • Check for loose or damaged stabilizer bar isolators or brackets. • **Are the stabilizer bar/track bar components loose, worn or damaged?**	**Yes** REPAIR or INSTALL new components as necessary. TEST the system for normal operation. **No** Suspension system OK. CONDUCT diagnosis on other suspect systems.

PINPOINT TEST I: REAR SUSPENSION NOISE

Test Step	Result / Action to Take
I1 ROAD TEST THE VEHICLE	
• Test drive the vehicle. • **NOTE:** An assistant will be needed for this road test. • During the road test, drive the vehicle over a rough road. Using ChassisEARs, determine from which area/component the noise is originating. • **Is there a squeak, creak or rattle noise?**	**Yes** GO to I2 . **No** The suspension system is OK. CONDUCT a diagnosis on other suspect systems.
I2 REAR SHOCK ABSORBER/STRUT CHECK	
• **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.** • Raise and support the vehicle. • Check the rear shock absorber/strut mounts for loose bolts or nuts. • Check the rear shock absorbers/struts for damage. Carry out a shock absorber check. • **Are the rear shock absorbers/struts loose or damaged?**	**Yes** TIGHTEN to specifications if loose. INSTALL new rear shock absorbers/struts if damaged. TEST the system for normal operation. **No** GO to I3 .
I3 CHECK THE REAR SPRINGS	
• Check the rear springs and rear spring mounts/brackets for wear or damage. • **Are the rear springs or spring mounts/brackets worn or damaged?**	**Yes** REPAIR or INSTALL new components as necessary. TEST the system for normal operation. **No** GO to I4 .
I4 CHECK THE CONTROL ARMS/TRAILING ARMS	
• Inspect the control arm/trailing arm bushings for wear or damage. Check for loose control arm/trailing arm bolts. • Inspect for twisted or bent control arms/trailing arms.	**Yes** REPAIR or INSTALL new components as necessary.

• **Are the control arms/trailing arms loose, damaged or worn?**	TEST the system for normal operation. **No** GO to I5 .
I5 CHECK THE STABILIZER BAR/TRACK BAR	
• Check the stabilizer bar/track bar bushings and links for damage or wear. • Check the stabilizer bar/track bar for damage. • Check for loose or damaged stabilizer bar isolators or brackets. • **Are the stabilizer bar/track bar components loose, worn or damaged?**	**Yes** REPAIR or INSTALL new components as necessary. Test the system for normal operation. **No** Suspension system OK. CONDUCT diagnosis on other suspect systems.

PINPOINT TEST J: WHEEL AND TIRE

Test Step	Result / Action to Take
J1 ROAD TEST THE VEHICLE	
• **NOTE:** Wheel or tire vibrations felt in the steering wheel are most likely related to the front wheel or tire. Vibration felt through the seat are most likely related to the rear wheel or tire. This may not always be true, but it can help to isolate the problem to the front or rear of the vehicle. • Test drive the vehicle at different speed ranges. • During the road test, if the vibration can be eliminated by placing the vehicle in neutral or is affected by the speed of the engine, the cause is not the wheels or tires. • **Is there a vibration and noise?**	**Yes** GO to J2 . **No** The wheel and tires are OK. CONDUCT a diagnosis on other suspect systems.
J2 CHECK THE FRONT WHEEL BEARINGS	
• Check the front wheel bearings. Refer to Wheel Bearing Check in this section. • **Are the wheel bearings OK?**	**Yes** GO to J3 . **No** INSPECT the wheel bearings. ADJUST or REPAIR as necessary. TEST the system for normal operation.
J3 INSPECT THE TIRES	
• Check the tires for missing weights. • Check the wheels for damage. • Inspect the tire wear pattern. Refer to the Tire Wear Patterns chart in this section. • **Do the tires have an abnormal wear pattern?**	**Yes** CORRECT the condition that caused the abnormal wear. INSTALL new tire(s). TEST the system for normal operation. **No** GO to J4 .
J4 TIRE ROTATION DIAGNOSIS	
• Spin the tires slowly and watch for signs of lateral runout.	**Yes** GO to J5 . **No**

 DF1713-A • Spin the tires slowly and watch for signs of radial runout. DF1714-A • **Are there signs of visual runout?**	CHECK the wheel and tire balance. CORRECT as necessary. TEST the system for normal operation.
J5 RADIAL RUNOUT CHECK ON THE TIRE • Measure the radial runout of the wheel and tire assembly. A typical specification for total radial runout is 1.14 mm (0.045 in).  DF1715-A • **Is the radial runout within specifications?**	**Yes** GO to J8 . **No** GO to J6 .
J6 RADIAL RUNOUT CHECK ON THE WHEEL • Measure the radial runout of the wheel. A typical specification for total radial runout is 1.14 mm (0.045 in). • **Is the radial runout within specifications?**	**Yes** INSTALL a new tire. TEST the system for normal operation. **No** GO to J7 .
J7 CHECK THE HUB/BRAKE DISC OR DRUM PILOT RUNOUT OR BOLT CIRCLE RUNOUT • Measure the pilot or bolt circle runout. A typical specification for radial runout is: ▪ pilot runout — less than 0.15 mm (0.006 in). ▪ bolt circle runout — less than 0.38 mm (0.015 in). • **Is the radial runout within specifications?**	**Yes** INSTALL a new wheel. TEST the system for normal operation. **No** REPAIR or INSTALL new components as necessary.

	REFER to Section 204-01A for rear wheel drive (RWD) vehicles and Section 204-01B for four wheel drive (4WD) vehicles for the front wheels or Section 204-02 for the rear wheels.
J8 LATERAL RUNOUT CHECK ON THE TIRE • Measure the lateral runout of the wheel and tire assembly. A typical specification for total lateral runout is 1.14 mm (0.045 in).  A0011804 • **Is the lateral runout within specifications?**	**Yes** Wheel and tires OK. CONDUCT diagnosis on other suspect systems. **No** GO to J9.
J9 LATERAL RUNOUT CHECK ON THE WHEEL • Measure the lateral runout of the wheel. A typical specification for total radial runout is 1.14 mm (0.045 in). • **Is the lateral runout within specifications?**	**Yes** INSTALL a new tire. TEST the system for normal operation. **No** GO to J10.
J10 CHECK THE FLANGE FACE LATERAL RUNOUT • Measure the flange face lateral runout. A typical specification for lateral runout is: ▪ hub/brake disc — less than 0.13 mm (0.005 in). ▪ axle shaft — less than 0.25 mm (0.010 in). • **Is the lateral runout within specifications?**	**Yes** INSTALL a new wheel. TEST the system for normal operation. **No** REPAIR or INSTALL new components as necessary. REFER to Section 204-01A for rear wheel drive (RWD) vehicles and Section 204-01B for four wheel drive (4WD) vehicles for the front wheels or Section 204-02 for the rear wheels.

PINPOINT TEST K: HIGH SPEED SHAKE OR SHIMMY

Test Step	Result / Action to Take
K1 CHECK FOR FRONT WHEEL BEARING ROUGHNESS • Chock the rear wheels. • Raise and support the front end of the vehicle so that the front wheel and tire assemblies can spin. • Spin the front tires by hand. Refer to Wheel Bearing Check in	**Yes** INSPECT the wheel bearings. REPAIR as necessary. TEST the

this section. • **Do the wheel bearings feel rough?**	system for normal operation. **No** GO to K2 .
K2 CHECK THE END PLAY OF THE FRONT WHEEL BEARINGS • Check the end play of the front wheel bearings. Refer to Section 204-00 . • **Is the end play OK?**	**Yes** GO to K3 . **No** ADJUST or REPAIR as necessary. TEST the system for normal operation.
K3 MEASURE THE LATERAL RUNOUT AND THE RADIAL RUNOUT OF THE FRONT WHEELS ON THE VEHICLE • Measure the lateral runout and the radial runout of the front wheels on the vehicle. Refer to Pinpoint Test J. • **Are the measurements within specifications?**	**Yes** GO to K4 . **No** INSTALL new wheels as necessary and BALANCE the assembly. TEST the system for normal operation.
K4 MEASURE THE LATERAL RUNOUT OF THE FRONT TIRES ON THE VEHICLE • Measure the lateral runout of the front tires on the vehicle. Refer to Pinpoint Test J. • **Is the runout within specifications?**	**Yes** GO to K5 . **No** INSTALL new tires as necessary and BALANCE the assembly. TEST the system for normal operation.
K5 MEASURE THE RADIAL RUNOUT OF THE FRONT TIRES ON THE VEHICLE • Measure the radial runout of the front tires on the vehicle. Refer to Pinpoint Test J. • **Is the runout within specifications?**	**Yes** BALANCE the front wheel and tire assemblies. If any tire cannot be balanced, INSTALL a new tire. TEST the system for normal operation. **No** GO to K6 .
K6 MATCH MOUNT THE TIRE AND WHEEL ASSEMBLY • Mark the high runout location on the tire and also on the wheel. Break the assembly down and rotate the tire 180 degrees (halfway around) on the wheel. Inflate the tire and measure the radial runout. • **Is the runout within specifications?**	**Yes** BALANCE the assembly. TEST the system for normal operation. **No** If the high spot is not within 101.6 mm (4 inches) of the first high spot on the

	tire, GO to K7 .
K7 MEASURE THE WHEEL FLANGE RUNOUT	
• Dismount the tire and mount the wheel on a wheel balancer. Measure the runout on both wheel flanges. Refer to Section 204-04 .  DG0199-A • **Is the runout within specifications?**	**Yes** LOCATE and MARK the low spot on the wheel. INSTALL the tire, matching the high spot on the tire with the low spot on the wheel. BALANCE the assembly. TEST the system for normal operation. If the condition persists, GO to K8 . **No** INSTALL a new wheel. CHECK the runout on the new wheel. If the new wheel is within limits, LOCATE and MARK the low spot. INSTALL the tire, matching the high spot on the tire with the low spot on the wheel. BALANCE the assembly. TEST the system for normal operation. If the condition persists, GO to K8 .
K8 CHECK FOR VIBRATION FROM THE FRONT OF THE VEHICLE	
WARNING: If only one drive wheel is allowed to rotate, speed must be limited to 55 km/h (34 mph) using the speedometer reading, since actual wheel speed will be twice that indicated on the speedometer. Exceeding a speed of 55 km/h (34 mph) or allowing the drive wheel to hang unsupported can result in tire disintegration or differential failure, which can cause serious personal injury and extensive vehicle damage. • Spin the front wheel and tire assemblies with a wheel balancer while the vehicle is raised on a hoist. Feel for vibration in the front fender or while seated in the vehicle. • **Is the vibration present?**	**Yes** SUBSTITUTE known good wheel and tire assemblies as necessary. TEST the system for normal operation. **No** GO to K9 .
K9 CHECK FOR VIBRATION FROM THE REAR OF THE VEHICLE	
WARNING: If only one drive wheel is allowed to rotate, speed must be limited to 55 km/h (34 mph) using the speedometer reading, since actual wheel speed will be twice that indicated on the speedometer. Exceeding a speed of 55 km/h (34 mph) or allowing the drive wheel to hang unsupported can result in tire disintegration or differential failure, which can cause serious personal injury and extensive vehicle damage. • Chock the front wheels. • Raise and support the rear end of the vehicle so that the rear wheel and tire assemblies can spin. • Engage the drivetrain and carefully accelerate the drive wheels while checking for vibration. • **Is the vibration present?**	**Yes** GO to K10 . **No** TEST the system for normal operation.
K10 CHECK THE DRIVETRAIN	

WARNING: If only one drive wheel is allowed to rotate, speed must be limited to 55 km/h (34 mph) using the speedometer reading, since actual wheel speed will be twice that indicated on the speedometer. Exceeding a speed of 55 km/h (34 mph) or allowing the drive wheel to hang unsupported can result in tire disintegration or differential failure, which can cause serious personal injury and extensive vehicle damage. • Remove the rear wheel and tire assemblies. Refer to Section 204-04 . • Secure the brake drums (if so equipped), by installing wheel hub bolt nuts, reversed. • Carefully accelerate the drivetrain while checking for vibration. • **Is the vibration present?**	**Yes** CHECK/TEST the drivetrain and driveline components. TEST the system for normal operation. **No** SUBSTITUTE known good wheel and tire assemblies as necessary. TEST the system for normal operation.

PINPOINT TEST L: CLUTCH VIBRATION

Test Step	Result / Action to Take
L1 CHECK ENGINE COMPONENTS FOR GROUNDING	
• **NOTE:** Make sure the clutch is the cause of the vibration concern. The vibration should occur during clutch operation. The clutch can also be difficult to engage or disengage. Eliminate all related systems before checking the clutch components. • **NOTE:** Check the driveline angles and driveshaft runout before disassembling the clutch system. Refer to Section 205-00 . • Check the powertrain/drivetrain mounts, exhaust manifolds or other engine components for grounding on the chassis. • **Are any mounts or engine components grounded?**	**Yes** REPAIR as necessary. TEST the system for normal operation. **No** GO to L2 .
L2 CHECK THE ACCESSORY DRIVE BELT	
• Remove the accessory drive belt. • **Does the vibration stop with the accessory drive belt removed?**	**Yes** DIAGNOSE the accessory drive components. **No** GO to L3 .
L3 CHECK FOR LOOSE CLUTCH PRESSURE PLATE BOLTS	
• Check for loose clutch pressure plate bolts. Inspect the clutch pressure plate for damage or for material between the pressure plate and flywheel. • **Are there any loose bolts or damage?**	**Yes** TIGHTEN the bolts to specifications or if damaged, INSTALL a new clutch pressure plate. **No** GO to L4 .
L4 CHECK THE CLUTCH DISC SPRINGS	
• Check for worn, broken or loose clutch disc springs. • **Are the clutch springs worn, broken or loose?**	**Yes** INSTALL a new clutch disc. TEST the system for normal operation. **No** GO to L5 .
L5 CHECK THE CLUTCH DISC SPLINES	

• Inspect the clutch disc splines for damage or wear. • **Is there damage or wear?**	**Yes** INSTALL a new clutch disc. TEST the system for normal operation. **No** GO to L6 .
L6 CHECK THE FLYWHEEL BOLTS	
• Check for loose flywheel bolts. • **Are the bolts loose?**	**Yes** TIGHTEN the bolts to specifications. TEST the system for normal operation. **No** GO to L7 .
L7 CHECK THE FLYWHEEL SURFACE	
• Inspect the flywheel surface for wear or damage. Check the flywheel runout. • **Is there any damage or excessive wear?**	**Yes** INSTALL a new flywheel. TEST the system for normal operation. **No** Clutch system normal. CONDUCT a diagnosis on other suspect systems.

PINPOINT TEST M: TRANSFER CASE VIBRATION

Test Step	Result / Action to Take
M1 INSPECT THE TRANSFER CASE	
• **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.** • Inspect the transfer case for loose or missing mounting bolts. Check for fluid seepage between the transfer case and the transmission. • **Are the mounting bolts missing or loose?**	**Yes** TIGHTEN to specifications or INSTALL new bolts as necessary. TEST the system for normal operation. **No** GO to M2 .
M2 INSPECT THE REAR DRIVESHAFT	
• **NOTE:** Verify that the driveshaft and pinion flange index marks are aligned. • Inspect the driveshaft for missing weights, damage or undercoating. • Inspect the U-joints for freedom of movement. • Check driveshaft runout and, if necessary, check the pinion flange runout. • **Is the driveshaft or U-joints worn or damaged or misaligned?**	**Yes** REPAIR or INSTALL a new driveshaft as necessary. TEST the system for normal operation. **No** GO to M3 .
M3 CHECK THE DRIVELINE ANGLES	
• Measure the rear driveshaft and pinion angles. Refer to Section 205-00 .	**Yes** REPAIR as necessary.

• Measure the front driveshaft and pinion angles. Refer to the appropriate workshop manual for the service procedures. • **Are the driveline angles incorrect?**	TEST the system for normal operation. **No** GO to M4 .
M4 INSPECT THE FRONT DRIVESHAFT	
• **NOTE:** Verify that the driveshaft and pinion flange index marks are aligned. • Inspect the front driveshaft for missing weights, damage or undercoating. • Inspect the U-joints and slip yoke for freedom of movement. • Check driveshaft runout and, if necessary, check the pinion flange runout. Refer to Section 206-00 . • **Is the driveshaft or U-joints worn or damaged?**	**Yes** REPAIR or INSTALL a new driveshaft as necessary. TEST the system for normal operation. **No** GO to M5 .
M5 ROAD TEST WITH THE FRONT DRIVESHAFT ONLY	
• **NOTE:** Index mark the driveshaft to the pinion flange and to the output shaft before removal. • Remove the rear driveshaft. • Plug the transfer case with an output shaft seal plug. • **NOTE:** Shift the transfer case into 4WD high so the vehicle is driven by the front driveshaft only. • Test drive the vehicle. • **Is the vibration gone?**	**Yes** INSTALL and BALANCE the rear driveshaft. TEST the system for normal operation. **No** GO to M6 .
M6 ROAD TEST WITH THE REAR DRIVESHAFT ONLY	
• **NOTE:** Index mark the front driveshaft to the pinion flange. • Remove the front driveshaft. • Test drive the vehicle. • **Is the vibration gone?**	**Yes** INSTALL and BALANCE the front driveshaft. TEST the system for normal operation. **No** GO to M7 .
M7 TRANSFER CASE TAIL SHAFT INSPECTION	
• Inspect the splines of the output shaft for wear or damage. • Inspect the splines of the driveshaft slip yoke for wear or damage. • **Are the splines worn or damaged?**	**Yes** REPAIR or INSTALL new components as necessary. TEST the system for normal operation. **No** The transfer case is OK. CONDUCT a diagnosis on other suspect systems.

Component Tests

Idle Air Control (IAC) Valve

1. Open the hood.

2. **NOTE:** Key symptom is elevated idle speed while noise is occurring.

   NOTE: "Snapping" the throttle can induce the noise.

Verify the condition by operating the vehicle for a short time.

3. Inspect the IAC valve. If physical evidence of contamination exists, install a new IAC valve.

4. While the noise is occurring, either place an EngineEAR probe near the IAC valve and the inlet tube, or create a 6.35 - 12.7 mm (0.25 - 0.50 in) air gap between the inlet tube and the clean air tube. If the IAC valve is making the noise, install a new IAC valve.

5. Test the vehicle for normal operation.

Steering Gear Grunt/Shudder Test

1. Start and run the vehicle to operating temperature.

2. Set engine idle speed to 1200 rpm.

3. **CAUTION: Do not hold the steering wheel against the stops for more than 3 to 5 seconds at a time. Damage to the power steering pump will occur.**

   Rotate the steering wheel to the RH stop, then turn the steering wheel 90 degrees back from that position. Turn the steering wheel slowly in a 15 degree to 30 degree arc.

4. Turn the steering wheel another 90 degrees. Turn the steering wheel slowly in a 15 degree to 30 degree arc.

5. Repeat the test with power steering fluid at different temperatures.

6. If a light grunt is heard or a low (50-200 Hz) shudder is present, this is a normal steering system condition.

7. If a loud grunt is heard or a strong shudder is felt, fill and purge the power steering system.

Tire Wear Patterns and frequency calculations

Tire Wear Chart

TIRE WEAR	CONDITION	POSSIBLE CAUSES
	•Rapid wear at both shoulders.	•Tires underinflated. •Worn suspension components. •Excessive cornering speeds. •Lack of rotation.
	•Rapid wear at the center.	•Tires overinflated. •Lack of rotation. •Excessive toe on drive wheels. •Heavy acceleration on drive wheels.
	•Wear at one shoulder.	•Toe adjustment out of specification. •Camber out of specification. •Damaged strut. •Damaged lower control arm.
	•Feather edges.	•Toe adjustment out of specification. •Damaged or worn tie rods. •Damaged spindle or knuckle.
	•Bald spots or cupping.	•Unbalanced wheel. •Excessive radial runout. •Worn strut or shock absorber.
	•Tire scalloped.	•Toe adjustment out of specification. •Camber out of specification. •Worn or damaged suspension components.
	•Wear pattern - FWD vehicles.	•Excessive toe on non-drive wheels. •Lack of rotation.
	•Wear pattern - FWD vehicles. Edge of thread blocks worn.	•Excessive toe on non-drive wheels. •Lack of rotation.

DF1717-A

Wheel and tire NVH concerns are directly related to vehicle speed and are not generally affected by acceleration, coasting or decelerating. Also, out-of-balance wheel and tires can vibrate at more than one speed. A vibration that is affected by the engine rpm, or is eliminated by placing the transmission in NEUTRAL is not related to the tire and wheel. As a general rule, tire and wheel vibrations felt in the steering wheel are related to the front tire and wheel assemblies. Vibrations felt in the seat or floor are related to the rear tire and wheel assemblies. This can initially isolate a concern to the front or rear.

Careful attention must be paid to the tire and wheels. There are several symptoms that can be caused by damaged or worn tire and wheels. Carry out a careful visual inspection of the tires and wheel assemblies. Spin the tires slowly and watch for signs of lateral or radial runout. Refer to the tire wear chart to determine the tire wear conditions and actions.

For a vibration concern, use the vehicle speed to determine tire/wheel frequency and rpm. Calculate tire

and wheel rpm and frequency by carrying out and following:

- Measure the diameter of the tire.
- Record the speed at which the vibration occurs.
- Obtain the corresponding tire and wheel rpm and frequency from the Tire Speed and Frequency Chart.
    - If the vehicle speed is not listed, divide the vehicle speed at which the vibration occurs by 16 km/h (10 mph). Multiply that number by 16 km/h (10 mph) tire rpm listed for that tire diameter in the chart. Then divide that number by 60. For example: a 40 mph vibration with 835 mm (33 in) tires. 40 ÷10 = 4. Multiply 4 by 105 = 420 rpm. Divide 420 rpm by 60 seconds = 7 Hz at 40 mph.

Tire Speed and Frequency Chart

Tire Diameter	**Tire RPM/Hz**	**Tire RPM/Hz**	**Tire RPM/Hz**	**Tire RPM/Hz**
mm (inch)	@ 16 km/h (10 mph)	@ 80 km/h (50 mph)	@ 97 km/h (60 mph)	@ 113 km/h (70 mph)

Powertrain/Drivetrain Mount Neutralizing

Printable View (80 KB)

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Loosen, but do not remove, the powertrain/drivetrain mount fasteners.
3. Lower the vehicle.
4. **CAUTION: Do not twist or strain the powertrain/drivetrain mounts.**

   Move the vehicle in forward and reverse 0.6-1.2 meters (2-4 ft).
5. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
6. Tighten the powertrain/drivetrain mount fasteners.
7. Lower the vehicle.
8. Test the system for normal operation.

Exhaust System Neutralizing

Printable View (80 KB)

WARNING: Exhaust gases contain carbon monoxide, which is harmful to health and potentially lethal. Repair exhaust system leaks immediately. Never operate the engine in an enclosed area.

WARNING: Exhaust system components are hot.

NOTE: Neutralize the exhaust system to relieve strain on mounts which can be sufficiently bound up to transmit vibration as if grounded.

1. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.**

   CAUTION: Make sure the system is warmed up to normal operating temperature, as thermal expansion can be the cause of a strain problem.

   Raise and support the vehicle.

2. Loosen all exhaust hanger attachments and reposition the hangers until they hang free and straight.

3. Loosen all exhaust flange joints.

4. Place a stand to support the muffler parallel to the vehicle frame with the muffler pipe bracket free of stress.

5. Verify there is adequate clearance to prevent grounding at any point in the system. Make sure that the catalytic converter and heat shield do not contact the frame rails.

6. Begin at the front of the vehicle. Tighten all the fasteners in the following order.
   - Tighten the RH lower catalytic converter-to-exhaust manifold nut.
   - Tighten the LH upper catalytic converter-to-exhaust manifold nut.
   - Tighten the transmission mount hanger bolt.
   - Tighten the exhaust clamp nut.
   - Tighten the LH outer catalytic converter-to-exhaust manifold nut.
   - Tighten the LH inner catalytic converter-to-exhaust manifold nut.
   - Tighten the catalytic converter-to-muffler bolts.
   - Tighten the exhaust hanger-to-frame bolts.

7. After neutralization, the rubber in the exhaust hangers should show some flexibility when movement is applied to the exhaust system. With the exhaust system installed securely and cooled, the rear hanger should be angled forward.

8. Lower the vehicle.

9. Test the exhaust system for normal operation.

Wheel Bearing Check

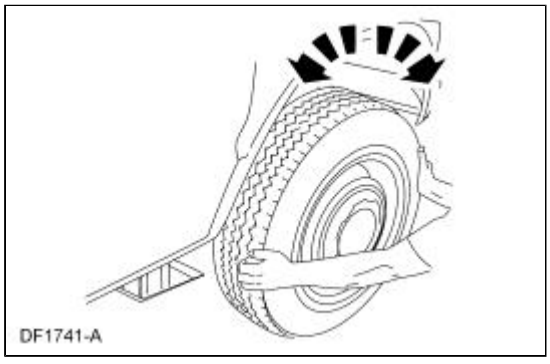
Printable View (153 KB)

1. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.**

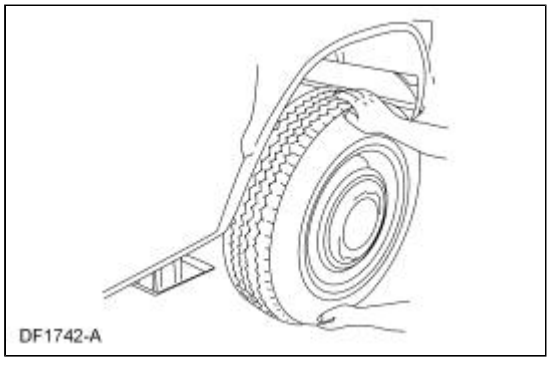
   Raise the vehicle until the front tires are off the floor.
   - Make sure the wheels are in a straight forward position.

2. **NOTE:** Make sure the wheel rotates freely and that the brake pads are retraced sufficiently to allow free movement of the tire and wheel assembly.

   Spin the tire by hand to check the wheel bearings for roughness.



3. Grip each front tire at the top and bottom and move the wheel inward and outward while lifting the weight of the tire off the front wheel bearing.



4. If the tire and wheel (hub) is loose on the spindle, does not rotate freely, or has a rough feeling when spun, carry out one of the following:
   1. On vehicles with inner and outer bearings, inspect the bearings and cups for wear or damage. Adjust or install new bearings and cups as necessary.
   2. On vehicles with one sealed bearing, install a new wheel hub.

Expedition with rear air suspension	108 mm (4.25 in) ± 12 mm (0.31 in)
Expedition EL with rear air suspension	110 mm (4.33 in) ± 12 mm (0.31 in)
RWD Navigator L with rear air suspension	98 mm (4.21 in) ± 12 mm (0.31 in)
4WD Navigator L with rear air suspension	101 mm (4.29 in) ± 12 mm (0.31 in)
Rear Ride Height (Full Fluids, Including Fuel)	
RWD Expedition with rear coil spring suspension	101 mm (3.97 in) ± 8 mm (0.31 in)
4WD Expedition with rear coil spring suspension	100 mm (3.93 in) ± 8 mm (0.31 in)
RWD Expedition EL with rear coil spring suspension	103 mm (3.97 in) ± 8 mm (0.31 in)
4WD Expedition EL with rear coil spring suspension	101 mm (3.97 in) ± 8 mm (0.31 in)
4WD Navigator with rear coil spring suspension	98 mm (3.85 in) ± 8 mm (0.31 in)
RWD Navigator with rear coil spring suspension	99 mm (3.89 in) ± 8 mm (0.31 in)
4WD Navigator L with rear coil spring suspension	100 mm (3.93 in) ± 8 mm (0.31 in)
RWD Navigator L with rear coil spring suspension	101 mm (3.97 in) ± 8 mm (0.31 in)
Expedition with rear air suspension	99 mm (3.89 in) ± 8 mm (0.31 in)
Expedition EL with rear air suspension	99 mm (3.89 in) ± 8 mm (0.31 in)
Navigator with rear air suspension	99 mm (3.89 in) ± 8 mm (0.31 in)
Navigator L with rear air suspension	99 mm (3.89 in) ± 8 mm (0.31 in)
Vehicle Lean (Side-to-Side Differences)	
Front ride height — maximum (with coil spring suspension)	12 mm (0.28 in)
Vehicle Lean (Side-to-Side Differences)	
Rear ride height — maximum	7 mm (0.28 in)
Wheel Track	
Wheel track	0.6 mm (0.02 in)
Ball Joint Deflection	
Lower	0-0.8 mm (0-0.032 in)
Upper	0-0.2 mm (0-0.008 in)

Torque Specifications

Description	Nm	lb-ft

Tie-rod end jam nuts (front)	115	85
Toe link cam bolt nuts (rear)	275	203
Lower arm forward and rearward nuts (front)	350	258
Upper arm-to-frame bolts (rear)	300	221

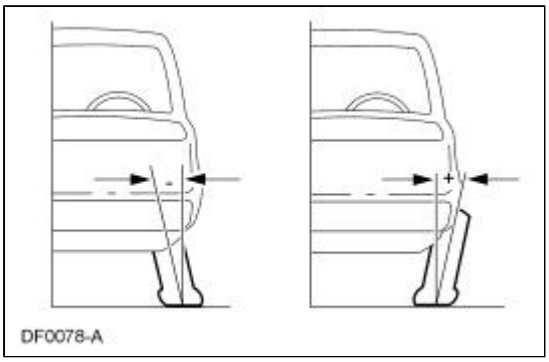
Wheel Alignment Angles

Printable View (188 KB)

The front caster and camber are adjusted by removing the lower arm front and rear bolts and installing adjuster kits to allow the arm to be adjusted in the frame slots. Front toe is adjusted by the use of the front wheel knuckle tie rods. The rear camber is adjusted by removing the upper arm camber set shim or shim pins to allow the arm to be adjusted in the frame slot. The rear toe is adjusted by the use of the rear toe link cam bolt and nut.

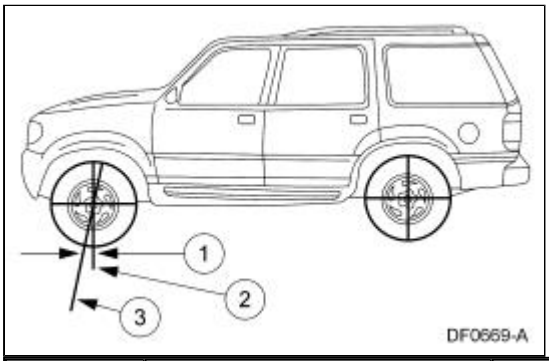
Camber

Negative and Positive Camber



Camber is the vertical tilt of the wheel when viewed from the front. Camber can be positive or negative and has a direct affect on tire wear.

Caster



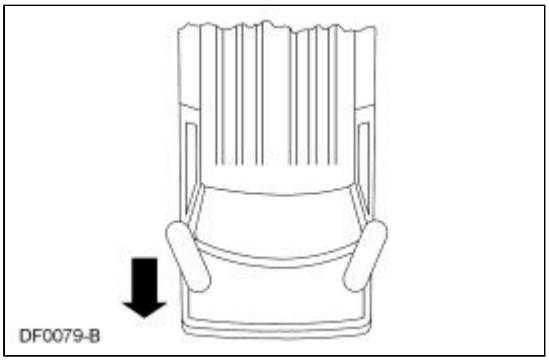
Item	Part Number	Description
1	—	Positive caster
2	—	True vertical
3	—	Steering axis

Caster is the deviation from vertical of an imaginary line drawn through the ball joints when viewed from the side. The caster specifications in this section will give the vehicle the best directional stability

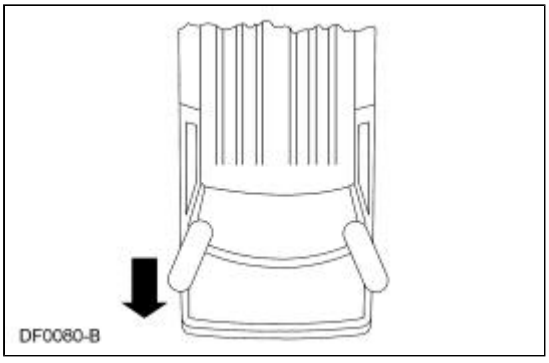
characteristics when loaded and driven. The caster setting does not affect tire wear.

Toe

Positive Toe (Toe In)



Negative Toe (Toe Out)



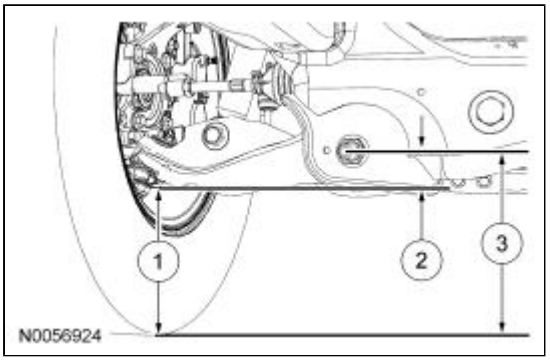
The vehicle toe setting:

- affects tire wear and directional stability.
- must be checked after adding aftermarket equipment, such as a snowplow.

Ride Height

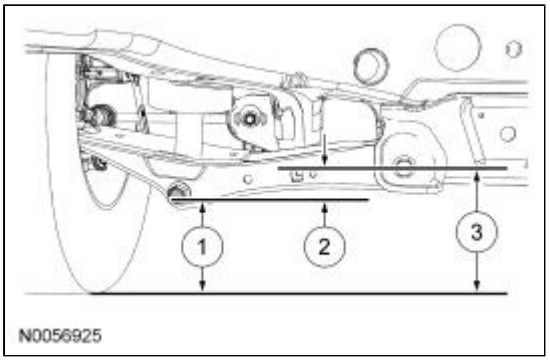
NOTE: Air suspension vehicles must be at trim height prior to measuring the vehicle ride height. Refer to Section 204-05 .

Front Ride Height Measurement



Item	Description
1	Distance between the ground and the lower surface of the wheel knuckle near the ball joint.
2	Ride height = 3-1
3	Distance between the ground and the center of the lower arm rear bolt

Rear Ride Height Measurement



Item	Description
1	Distance between the ground and the lower edge of the arm below the shock absorber lower bolt
2	Ride height = 3-1
3	Distance between the ground and the center of the lower arm front bolt

Wander

Wander is the tendency of the vehicle to require frequent, random left and right steering wheel corrections to maintain a straight path down a level road.

Shimmy

Shimmy, as observed by the driver, is large, consistent, rotational oscillations of the steering wheel resulting from large, side-to-side (lateral) tire/wheel movements.

Shimmy is usually experienced near 64 km/h (40 mph), and can begin or be amplified when the tire contacts pot holes or irregularities in the road surface.

Nibble

Sometimes confused with shimmy, nibble is a condition resulting from tire interaction with various road surfaces or tire imbalance. This condition is observed by the driver as small rotational oscillations of the steering wheel.

Poor Returnability/Sticky Steering

Poor returnability and sticky steering is used to describe the poor return of the steering wheel to center after a turn or when the steering correction is completed.

Drift/Pull

Pull is a tugging sensation, felt by the hands on the steering wheel, that must be overcome to keep the vehicle going straight.

Drift describes what a vehicle with this condition does with hands off the steering wheel.

- A vehicle-related drift/pull, on a flat road, will cause a consistent deviation from the straight-ahead path and require constant steering input in the opposite direction to counteract the effect.
- Drift/pull may be induced by conditions external to the vehicle (such as wind or road camber).

Poor Groove Feel

Poor groove feel is characterized by little or no buildup of turning effort felt in the steering wheel as the wheel is rocked slowly left and right within very small turns around center or straight-ahead (under 20 degrees of steering wheel turn). Efforts may be said to be "flat on center."

- Under 20 degrees of turn, most of the turning effort that builds up comes from the mesh of gear teeth in the steering gear. In this range, the steering wheel is not yet turned enough to feel the effort from the self-aligning forces at the road wheel or tire patch.
- In the diagnosis of a steering or alignment concern, it is important to understand the difference between wander and poor groove feel.

Suspension System

Printable View (290 KB)

Inspection and Verification

1. Road test.
   - Verify the customer's concern by performing a road test on a smooth road. If any vibrations are apparent, refer to Section 100-04 .

2. Inspect the tires.
   - Check the tire pressure with all normal loads in the vehicle and the tires cold. Refer to the vehicle certification (VC) label.
   - Verify that all tires are sized to specification. Refer to the VC label.
   - Inspect the tires for incorrect wear and damage. Refer to Section 204-04 .

3. Inspect chassis and underbody.

4. Inspect for aftermarket equipment.
   - Check for aftermarket changes to the steering, suspension, wheel and tire components (such as competition or heavy duty). The specifications shown in this manual **do not** apply to vehicles equipped with aftermarket equipment.

Visual Inspection Chart

Mechanical
• Front wheel bearing(s) • Loose or damaged front or rear suspension components • Loose, damaged or missing suspension fastener(s) • Incorrect spring usage • Damaged or sagging spring(s) • Damaged or leaking shock absorber(s) • Worn or damaged suspension bushing(s) • Loose, worn or damaged steering system components • Damaged axle components • Ball joint boot seals

5. If an obvious cause for an observed or reported condition is found, correct the cause (if possible) before proceeding to the next step.

6. If the fault is not visually evident, determine the symptom and proceed to the following symptom chart.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action

• Incorrect thrust angle (dogtracking)	• Excessive rear thrust angle	• ADJUST rear toe as necessary.
• Drift/pull	• Unequal tire pressure	• ADJUST tire pressure.
	• Caster total split is not within specification	• CHECK the wheel alignment. ADJUST as necessary.
	• Camber total split is not within specification	• CHECK the wheel alignment. ADJUST as necessary.
	• Tire forces	• CROSS ROTATE tires front to rear.
	• Unevenly loaded or overloaded vehicle	• NOTIFY the customer of incorrect vehicle loading.
	• Steering components	• REFER to Section 211-00 .
	• Brake drag	• REFER to Section 206-00 .
• Front bottoming or riding low	• Spring(s)	• INSTALL new spring(s) as necessary. REFER to Section 204-01A , Section 204-01B or Section 204-05 .
	• Front shock absorber(s)	• INSTALL new shock absorber(s) as necessary. REFER to Section 204-01A , Section 204-01B or Section 204-05 .
• Incorrect tire wear	• Incorrect tire pressure (rapid center rib or inner and outer edge wear)	• ADJUST tire pressure.
	• Excessive front or rear toe (rapid inner or outer edge wear)	• CHECK the wheel alignment. ADJUST as necessary.
	• Excessive negative or positive camber (rapid inner or outer edge wear)	• CHECK the wheel alignment. ADJUST as necessary.
	• Front or rear suspension components	• INSPECT the front and rear suspension system. REPAIR or INSTALL new suspension components as necessary. REFER to Section 204-01A , Section 204-01B , Section 204-02 or Section 204-05 .
	• Tires out of balance (tires cupped or dished)	• BALANCE tires.
• Rough ride	• High tire pressure	• ADJUST tire pressure.
	• Shock absorber(s)	• INSTALL new shock absorbers as necessary. REFER to Section 204-01A , Section 204-02 or Section 204-05 .

	• Spring(s)	• INSTALL new spring(s) as necessary. REFER to Section 204-01A , Section 204-02 or Section 204-05 .
• Shimmy or wheel tramp	• Loose wheel nut (s)	• TIGHTEN to specification. REFER to Section 204-04 .
	• Loose front suspension fasteners	• TIGHTEN to specification. REFER to Section 204-01A , Section 204-01B or Section 204-05 .
	• Front wheel bearing	• REFER to Section 100-04 .
	• Wheel or tire concerns	• REFER to Section 204-04 .
	• Shock absorber(s)	• INSTALL new shock absorber(s) as necessary. REFER to Section 204-01A , Section 204-02 or Section 204-05 .
	• Loose, worn or damaged ball joint (s)	• GO to the Ball Joint Inspection component test in this section.
	• Loose, worn or damaged steering components	• REFER to Section 211-00 .
	• Front wheel alignment	• CHECK the wheel alignment. ADJUST as necessary.
• Sticky steering, poor returnability	• Ball joints	• GO to the Ball Joint Inspection component test in this section.
	• Steering components	• REFER to Section 211-00 .
	• Caster out of specification	• CHECK the wheel alignment. ADJUST as necessary.
• Steering wheel off-center	• Unequal front or rear toe settings (side-to-side)	• CHECK the wheel alignment. ADJUST as necessary
	• Steering components	• REFER to Section 211-00 .
• Sway or roll	• Overloaded, unevenly or incorrectly loaded vehicle	• NOTIFY the customer of incorrect vehicle loading.
	• Loose wheel nut (s)	• TIGHTEN to specification. REFER to Section 204-04 .
	• Shock absorber(s)	• INSTALL new shock absorbers as necessary. REFER to Section 204-01A , Section 204-02 or Section 204-05 .
	• Loose stabilizer assembly	• TIGHTEN to specification. REFER to Section 204-01A , Section 204-01B or Section 204-02 .
	• Worn stabilizer assembly bushing (s) or link(s)	• INSTALL new stabilizer assembly bushings as necessary. REFER to Section 204-01A , Section 204-01B or Section 204-02 .

	• Worn spring(s)	• INSTALL new as necessary. REFER to Section 204-01A or Section 204-02 .
• Vehicle leans to one side	• Unevenly loaded or overloaded vehicle	• NOTIFY the customer of incorrect vehicle loading.
	• Front or rear suspension component	• INSPECT the front and rear suspension systems. REPAIR or INSTALL new suspension components as necessary. REFER to Section 204-01A , Section 204-01B , Section 204-02 or Section 204-05 .
	• Spring(s)	• INSTALL new spring(s) as necessary. REFER to Section 204-01A , Section 204-02 or Section 204-05 .
• Vibration/noise	• Tire and wheel concerns • Wheel bearings • Wheel hubs • Brake components • Suspension components • Steering components	• REFER to Section 100-04 .
• Wander	• Unevenly loaded or overloaded vehicle	• NOTIFY the customer of incorrect vehicle loading.
	• Ball joint(s)	• GO to the Ball Joint Inspection component test in this section.
	• Loose, worn or damaged front wheel bearing(s)	• REFER to Section 100-04 .
	• Loose, worn or damaged suspension component(s)	• INSTALL new suspension components as necessary. REFER to Section 204-01A , Section 204-01B , Section 204-02 or Section 204-05 .
	• Loose suspension fasteners	• TIGHTEN to specification. REFER to Section 204-01A , Section 204-01B , Section 204-02 or Section 204-05 .
	• Steering components	• REFER to Section 211-00 .
	• Wheel alignment (excessive total front toe out)	• ADJUST as necessary.

Component Tests

Ball Joint Inspection

1. Prior to inspecting the ball joints for wear, inspect the wheel bearings. Refer to Section 100-04 .

2. **WARNING: If equipped with vehicle dynamic suspension, the system must be disabled prior to lifting the vehicle. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations. Failure to follow these instructions may result in personal injury. Disabling the vehicle dynamic suspension is covered in Section 204-05 .**

   NOTE: In order to obtain accurate measurements, the suspension must be in full rebound with the weight of the vehicle supported by the frame.

   Raise and support the vehicle by the frame to allow the wheels to hang in the rebound position.

3. Inspect the ball joint and ball joint boot for damage.
   - If the ball joint or ball joint boot is damaged, install a new ball joint as necessary. Refer to Section 204-01A for rear wheel drive (RWD) vehicles and Section 204-01B for four wheel drive (4WD) vehicles.

NOTE: Carry out Steps 4-6 to inspect the lower ball joint. Carry out Steps 7-9 to inspect the upper ball joint.

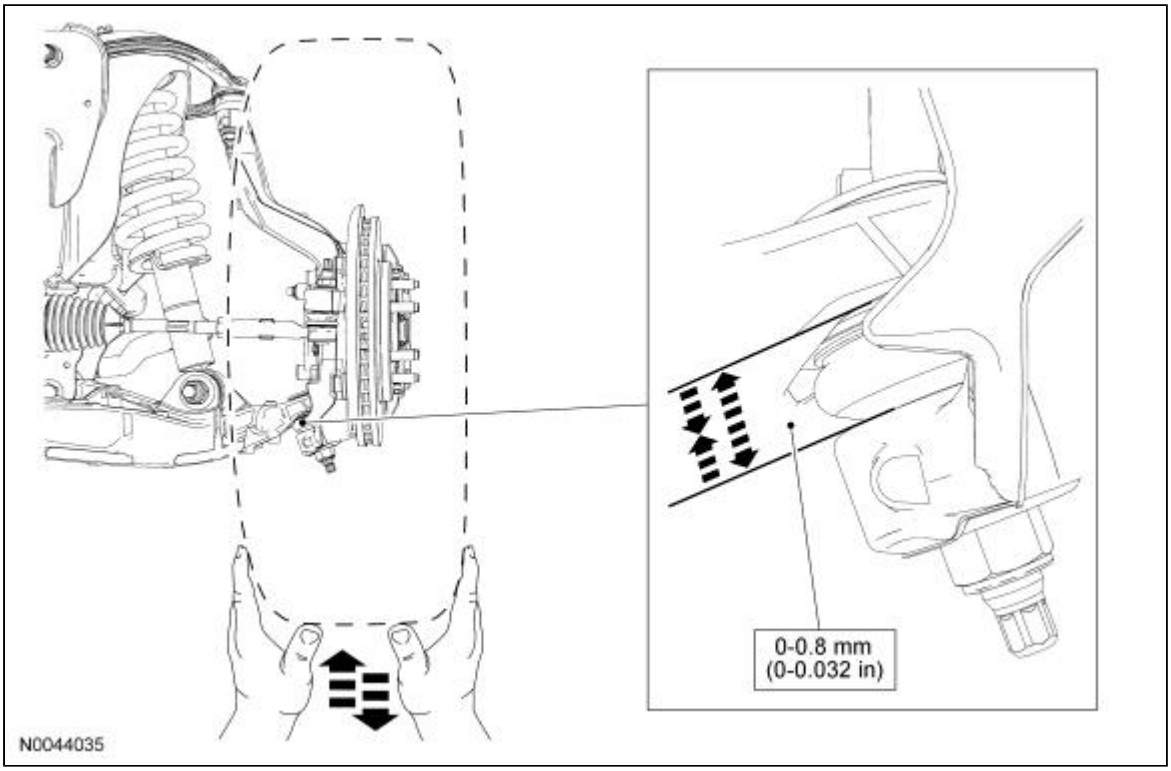
4. **CAUTION: Do not use any tools or equipment to move the wheel and tire assembly or suspension components while checking for relative movement. Suspension damage can occur. The use of tools or equipment will also create relative movement that may not exist when using hand force. Relative movement must be measured using hand force only.**

   NOTE: The weight of the wheel and tire assembly must be overcome to obtain an accurate measurement on the dial indicator.

   Inspect the ball joint for relative movement by alternately pulling downward and pushing upward on the wheel and tire assembly by hand. Note any relative vertical movement between the wheel knuckle and lower arm at the lower ball joint.
   - If relative movement is not felt or seen, the ball joint is OK. Do not install a new ball joint.
   - If relative movement is found, continue with Step 5.

5. **NOTE:** In order to obtain an accurate measurement, the dial indicator should be aligned as close as possible with the vertical axis (center line) of the ball joint.

   To measure ball joint deflection, attach a suitable dial indicator with a flexible arm between the lower control arm and the wheel knuckle or ball joint stud.



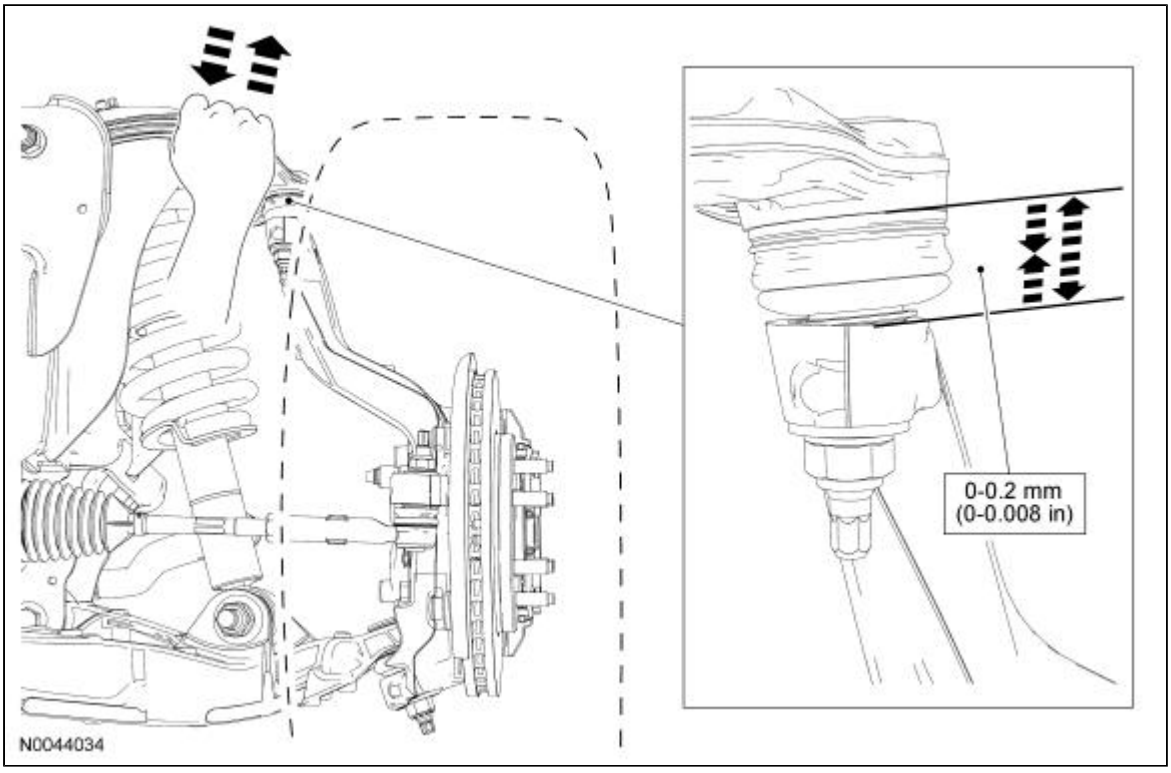
6. Measure the ball joint deflection while an assistant pushes up and pulls down on the wheel and tire assembly by hand.
    - If the deflection exceeds the specification, a new ball joint must be installed. Refer to Section 204-01A for RWD vehicles and Section 204-01B for 4WD vehicles.
    - If the deflection meets the specification, continue with the procedure.

7. **CAUTION: Do not use any tools or equipment to move the wheel and tire assembly or suspension components while checking for relative movement. Suspension damage can occur. The use of tools or equipment will also create relative movement that may not exist when using hand force. Relative movement must be measured using hand force only.**

    Inspect the ball joint for relative movement by alternately pulling downward and pushing upward on the upper control arm by hand. Note any relative vertical movement between the wheel knuckle and upper arm at the upper ball joint.
    - If relative movement is not felt or seen, the ball joint is OK. Do not install a new ball joint.
    - If relative movement is found, continue with Step 8.

8. **NOTE:** In order to obtain an accurate measurement, the dial indicator should be aligned as close as possible with the vertical axis of the ball joint.

    To measure ball joint deflection, attach a suitable dial indicator with a flexible arm between the upper control arm and the wheel knuckle or ball joint stud.



9. Measure the ball joint deflection while an assistant pushes up and then pulls down on the upper control arm by hand.
    - If the deflection exceeds the specification, a new ball joint must be installed. For additional information, refer to Section 204-01A for RWD vehicles and Section 204-01B for 4WD vehicles.
    - If the deflection meets the specification, no further action is required.

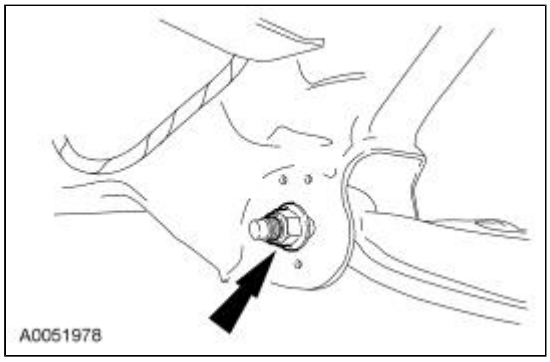
Camber and Caster Adjustment — Front

Printable View (96 KB)

NOTE: Air suspension vehicles must be at trim ride height prior to measuring or adjusting the caster, camber or toe. For additional information, refer to Section 204-05 .

1. Using alignment equipment and the manufacturers instructions, measure the front caster and camber.
   - Refer to Alignment Specifications in the Specifications portion of this section for optimal alignment settings.
   - If the caster and camber values are not within specification, go to the next step.

2. Remove and discard the lower arm front and rear nuts and bolts.



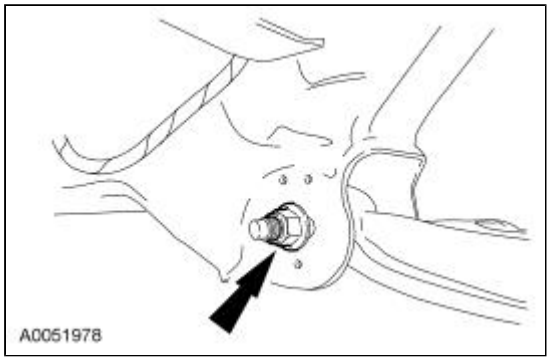
3. **NOTE:** New lower arm front and rear bolts must be installed with cam bolt kit (3B236 for the front and rear bushing), to allow for adjustment of the arm in the frame slot. The vehicle should be supported by the frame to ease movement of the lower arm in the slot.

   Install the cam bolt kit and loosely install the nut.

4. To adjust the caster and camber, refer to the following chart.
   - Adjustments that require moving the front and the rear of the lower arm should be made equally.

Adjustment	Front of Lower Arm	Rear of Lower Arm
Increase caster	In	Out
Decrease caster	Out	In
Increase camber	In	In
Decrease camber	Out	Out
Increase caster and camber simultaneously	In	—
Decrease caster and camber simultaneously	Out	—

5. While holding the cam bolt, tighten the nut to 350 Nm (258 lb-ft).



6. Check and, if necessary, adjust the front toe. For additional information, refer to Toe Adjustment — Front in this section.

Toe Adjustment — Front

Printable View (187 KB)

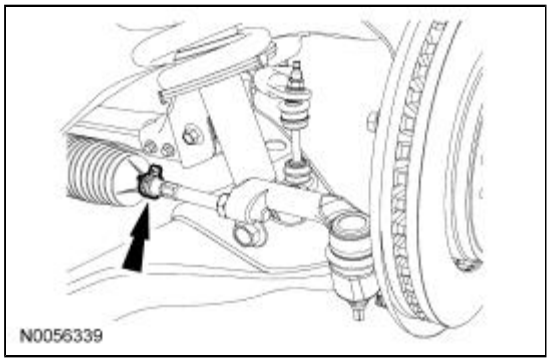
NOTE: Air suspension vehicles must be at trim ride height prior to measuring or adjusting the caster, camber or toe. For additional information, refer to Section 204-05 .

1. Using alignment equipment and the manufacturer's instructions, measure the front toe.
   - Refer to Alignment Specifications in the Specifications portion of this section for optimal alignment settings.
   - If the front toe values are not within specification, go to the next step.

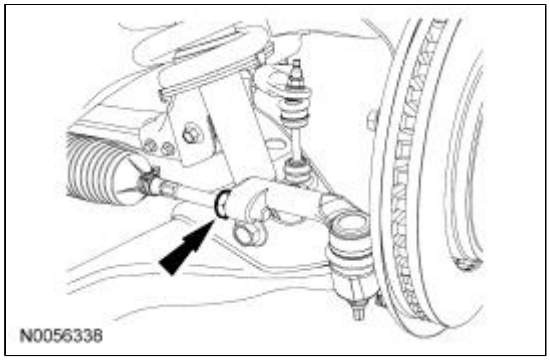
2. Start the engine and center the steering wheel.

3. Turn the engine off and, using a suitable steering wheel holding device, lock the steering wheel in the straight-ahead position.

4. Remove the steering gear bellows clamp(s).

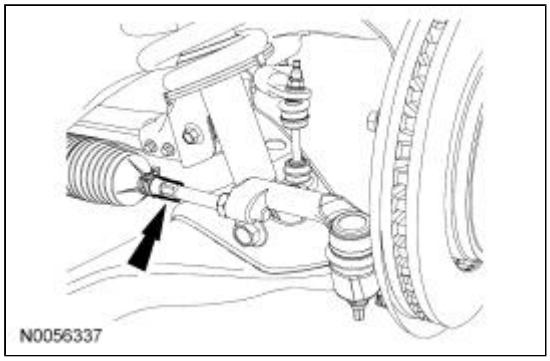


5. Loosen the tie-rod end jam nut(s).



6. **NOTE:** Do not allow the steering gear bellows to twist while rotating the tie rod.

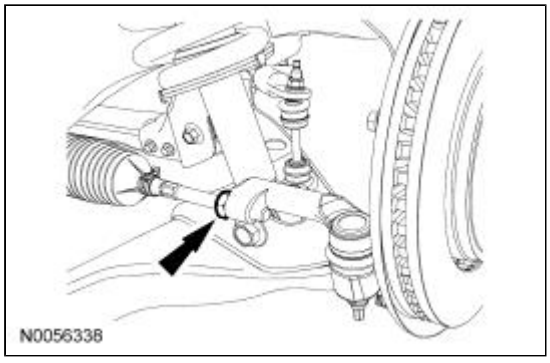
   Rotate the tie rod(s) to achieve the desired toe setting.



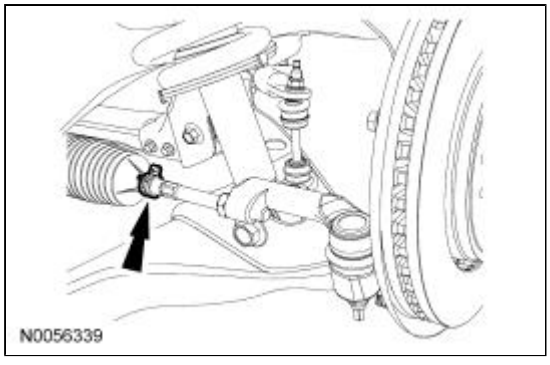
7. **CAUTION: Make sure to hold the tie-rod end stationary while tightening the jam nut or damage to the boot can occur.**

   NOTE: Make sure that the toe settings are not disturbed while tightening the jam nuts.

   Tighten the tie-rod end jam nut(s) to 115 Nm (85 lb-ft).



8. Install the steering gear bellows clamp(s).



Camber Adjustment — Rear

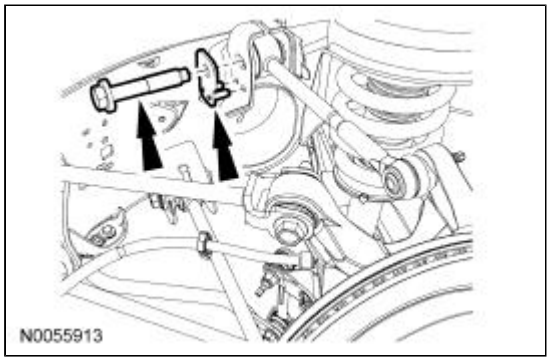
Printable View (121 KB)

NOTE: Air suspension vehicles must be at trim ride height prior to measuring or adjusting the rear camber or toe. For additional information, refer to Section 204-05 .

NOTE: Before carrying out a camber adjustment, check the tires for the correct pressure. Inspect the tires for incorrect wear or damage. Inspect the suspension for wear or damage.

1. Using alignment equipment and the manufacturer's instructions, measure the rear camber.
   - Refer to Alignment Specifications in the Specifications portion of this section for optimal alignment settings.
   - If the rear camber value is not within specification, go to the next step.

2. Remove the upper arm-to-frame bolt and the camber set shim.
   - Discard the camber set shim.
   - Install and snug the upper arm-to frame bolt.



3. Position the upper arm-to-frame bolt in the upper arm-to-frame slot until the camber setting is within specification.

4. **NOTE:** Do not allow the upper arm to move and change the camber adjustment setting when tightening the bolt.

   Tighten the upper arm-to-frame bolt to 300 Nm (221 lb-ft).

5. Recheck the camber setting, adjust as necessary.

6. Check and, if necessary, adjust the rear toe. For additional information, refer to Toe Adjustment — Rear in this section.

Toe Adjustment — Rear

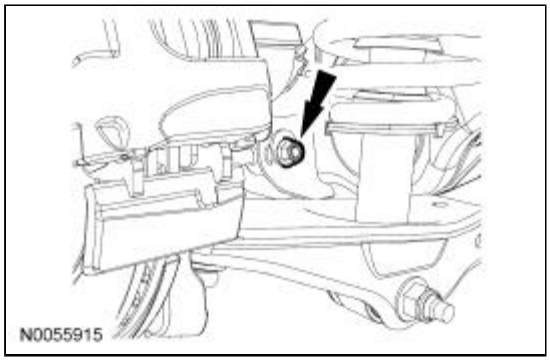
Printable View (158 KB)

NOTE: Air suspension vehicles must be at trim ride height prior to measuring or adjusting the rear toe. For additional information, refer to Section 204-05 .

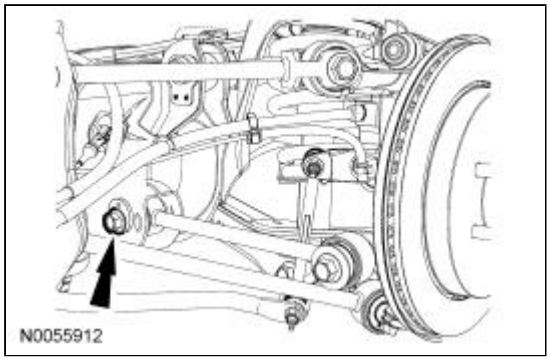
NOTE: Before carrying out a toe adjustment, check the tires for the correct pressure. Inspect the tires for incorrect wear or damage. Inspect the suspension for wear or damage.

1. Using alignment equipment and the manufacturer's instructions, measure the rear toe.
   - Refer to Alignment Specifications in the Specifications portion of this section for optimal alignment settings.
   - If the rear toe values are not within specification, go to the next step.

2. Loosen the toe link cam bolt nut(s).



3. Rotate the toe link cam bolt(s) until the toe setting is within specification.



4. **NOTE:** Make sure the toe settings are not disturbed while tightening the cam nut(s).

   Tighten the toe link cam bolt nut(s) to 275 Nm (203 lb-ft).

5. Recheck the rear toe setting, adjust as necessary.

Printable View (63 KB)

Torque Specifications

Description	Nm	lb-ft
Brake caliper anchor plate bolts	200	148
Brake disc shield bolts	17	13
Lower arm forward and rearward nuts	350	258
Lower ball joint nut	150	111
Shock absorber and spring assembly upper nuts	40	30
Shock absorber and spring assembly lower nut	475	350
Shock rod nut	56	41
Stabilizer bar bracket nuts	55	41
Stabilizer bar link upper and lower nuts	80	59
Tie-rod end nut	115	85
Upper arm-to-frame nuts	150	111
Upper ball joint nut	115	85
Wheel bearing and wheel hub bolts	150	111
Wheel speed sensor harness bracket bolt	12	9
Wheel speed sensor bolt	18	13

Front Suspension

Printable View (80 KB)

WARNING: The vehicle can be equipped with either a vehicle dynamic suspension (using air springs in the rear of the vehicle) or a standard suspension (using coil springs at all 4 corners of the vehicle). If equipped with vehicle dynamic suspension, the system must be disabled prior to jacking or lifting the vehicle. Disabling the vehicle dynamic suspension is covered in Section 204-05 .

CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

The vehicle can be equipped with either a vehicle dynamic suspension (using air springs in the rear of the vehicle) or a standard suspension (using coil springs at all 4 corners of the vehicle). Both are an independent-type front suspension which utilize a stabilizer bar to aid in vehicle stability. Vehicle dynamic suspension is covered in Section 204-05 . The wheel hub and wheel bearing assemblies are sealed units and are serviced as such. The lower ball joints are serviceable. The rear wheel drive (RWD) front suspension consists of the following parts:

- Upper control arms
- Lower control arms
- Shock absorber and coil spring assemblies
- Wheel knuckles
- Wheel bearing and wheel hub assemblies
- Stabilizer bar
- Stabilizer bar links

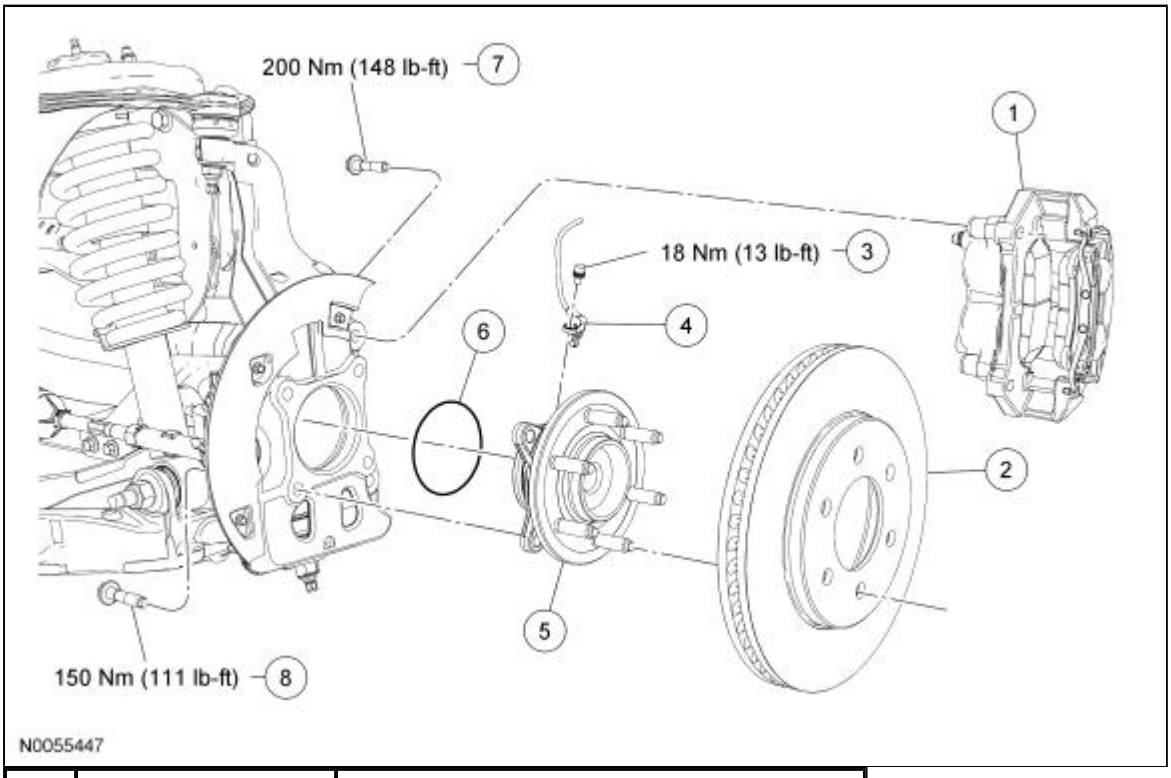
Front Suspension

Printable View (62 KB)

Refer to Section 204-00 .

Wheel Hub

Printable View (237 KB)

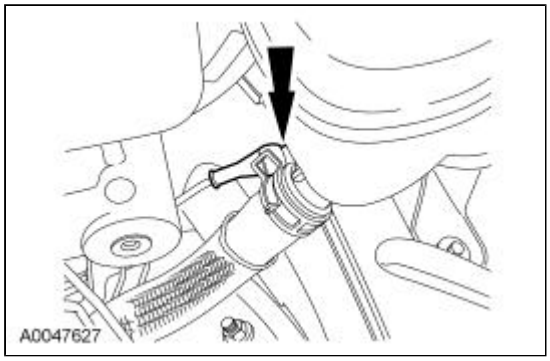


Item	Part Number	Description
1	2B121 LH/ 2B120 RH	Brake caliper and anchor plate assembly
2	1125	Brake disc
3	—	Wheel speed sensor bolt
4	—	Wheel speed sensor
5	2B663	Wheel bearing and wheel hub
6	—	O-ring seal
7	W707292	Brake caliper anchor plate bolt (2 required)
8	W707353	Wheel bearing and wheel hub bolt (4 required)

Removal and Installation

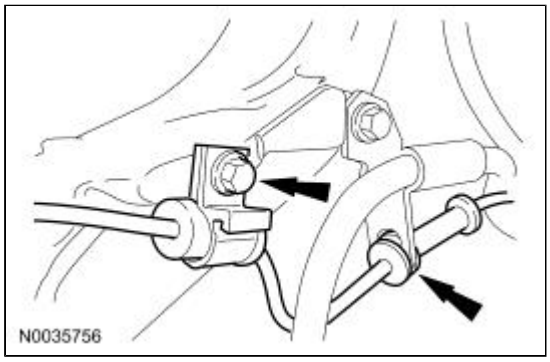
CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Disconnect the wheel speed sensor electrical connector.



2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. Remove the wheel speed sensor harness bracket bolt and detach the harness from the retainers.
   - To install, tighten to 12 Nm (9 lb-ft).



4. **CAUTION: Do not allow the caliper and anchor plate assembly to hang from the brake hose or damage to the hose can result.**

   Remove the bolts and position the caliper and anchor plate aside.
   - Support the caliper using mechanic's wire.
   - To install, tighten to 200 Nm (148 lb-ft).

5. Remove the brake disc.

6. Remove the 4 wheel bearing and wheel hub assembly bolts and the wheel bearing and wheel hub.
   - To install, tighten to 150 Nm (111 lb-ft).

7. If installing a new wheel bearing and wheel hub, remove the wheel speed sensor bolt and the wheel speed sensor.
   - To install, tighten to 18 Nm (13 lb-ft).

8. **CAUTION: If the original wheel bearing and wheel hub is being installed, install a new wheel bearing and wheel hub assembly O-ring seal.**

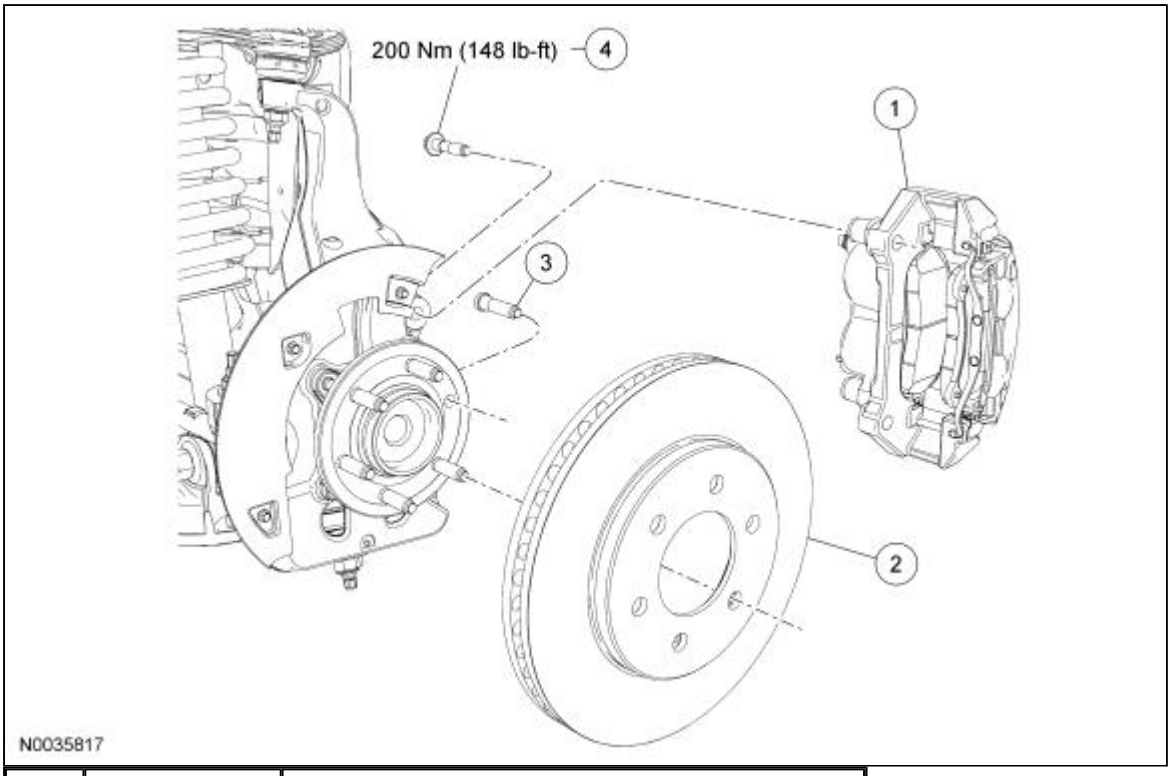
   To install, reverse the removal procedure.

Wheel Studs

Printable View (228 KB)

Special Tool(s)

 ST1494-A	C-Frame and Screw Assembly 211-023 (T74P-3044-A1)



Item	Part Number	Description
1	—	Brake caliper and anchor plate assembly
2	1125	Brake disc
3	W707287	Wheel stud
4	W707353	Brake caliper anchor plate bolt (2 required)

Removal

CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

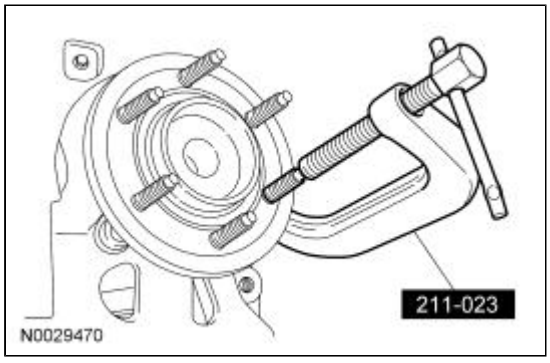
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **CAUTION: Do not allow the brake caliper and anchor plate assembly to hang from the brake hose or damage to the hose can result.**

   Remove the bolts and position the brake caliper and anchor plate assembly aside.
   - Support the brake caliper and anchor plate assembly using mechanic's wire.

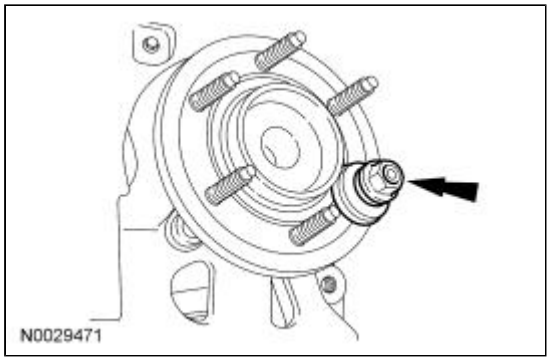
3. Remove the brake disc.

4. Using the special tool, remove the wheel stud.



Installation

1. Position the new wheel stud in the wheel hub, aligning the serrations in the wheel hub flange made by the original wheel stud.
   - Place 4 washers over the outside end of the wheel stud and thread a standard wheel nut onto the wheel stud with the flat side against the washers.
   - Tighten the wheel nut until the wheel stud head seats against the back side of the wheel hub flange.



2. Remove the wheel nut and washers.

3. Install the brake disc.

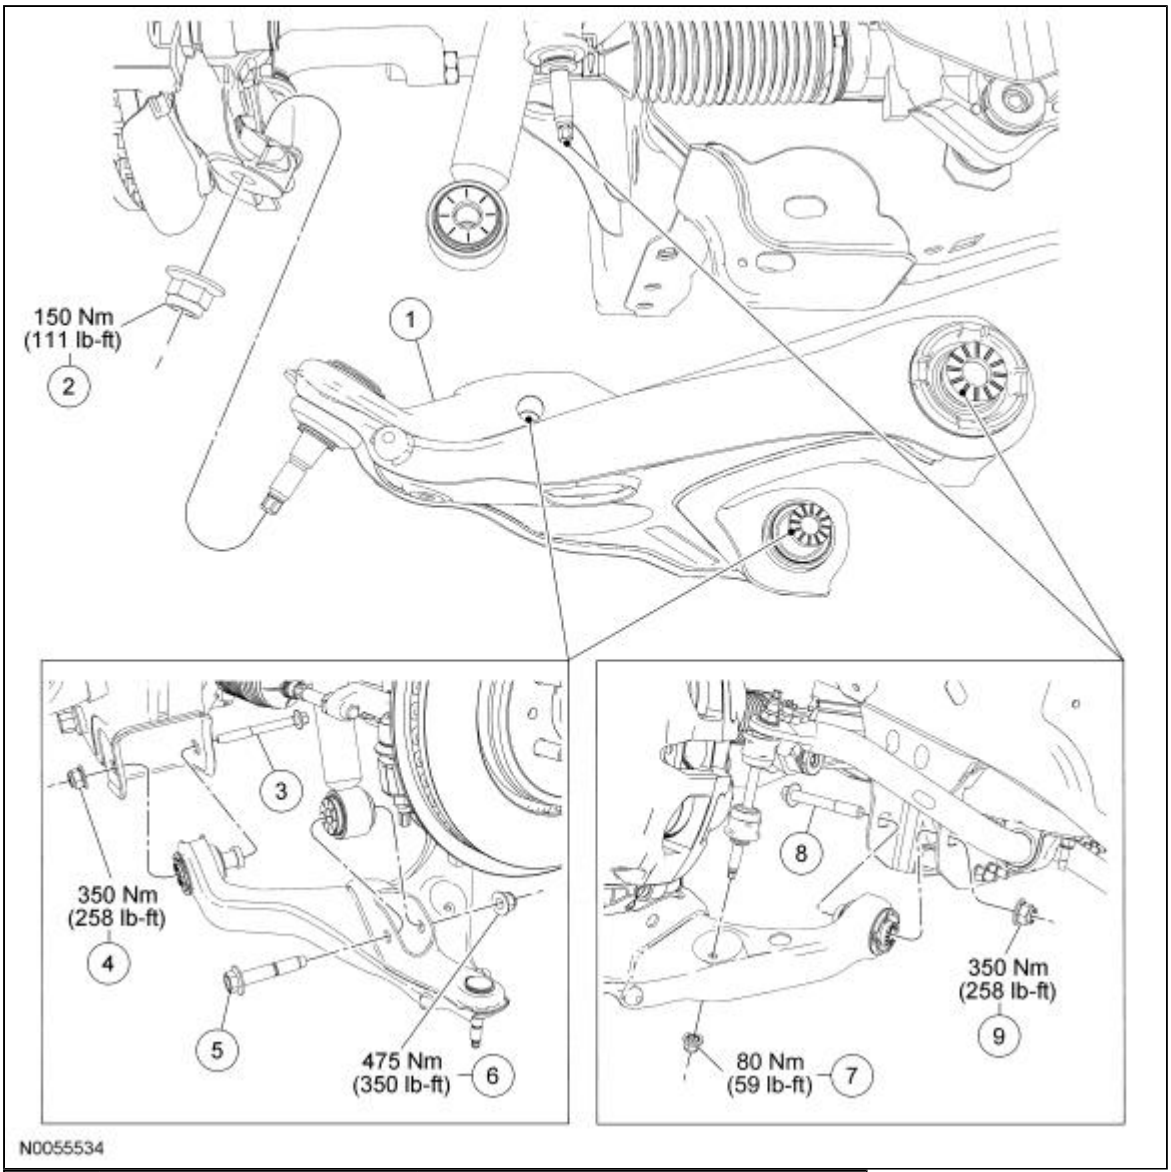
4. Position the brake caliper and anchor plate assembly and install the bolts.
   - Tighten the bolts to 200 Nm (148 lb-ft).

Lower Arm

Printable View (284 KB)

Special Tool(s)

ST2945-A	Separator, Ball Joint 204-592



Item	Part Number	Description
1	3051 LH/ 3042 RH	Lower arm
2	W707254	Lower ball joint nut

3	W711399	Lower arm forward bolt
4	W711310	Lower arm forward nut
5	W712682	Shock absorber lower bolt
6	W520217	Shock absorber lower nut
7	N807144	Stabilizer bar link lower nut
8	W709877	Lower arm rearward bolt
9	W711310	Lower arm rearward nut

Removal and Installation

CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

CAUTION: Do not tighten the lower shock nut, lower arm forward nut or lower arm rearward nut until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

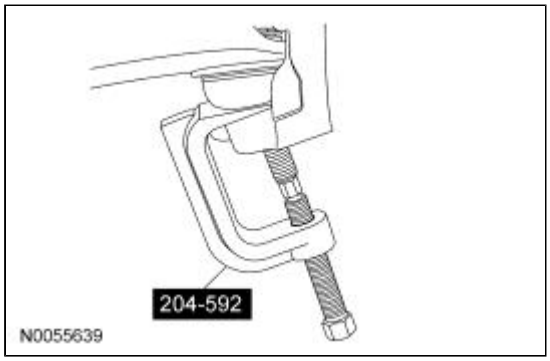
2. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

   Remove and discard the stabilizer bar link lower nut.
   - To install, tighten to 80 Nm (59 lb-ft).

3. Remove and discard the lower ball joint nut.
   - To install, tighten to 150 Nm (111 lb-ft).

4. **CAUTION: Make sure to use the special tool when separating the lower ball joint from the knuckle to prevent damage to the ball joint boot.**

   Using the special tool, separate the ball joint from the knuckle.



5. **NOTE:** Use a crowsfoot wrench to install the lower arm rearward nut.

   Remove the lower arm rearward nut and bolt.
   - Discard the nut.
   - To install, tighten to 350 Nm (258 lb-ft).

6. Remove the lower arm forward nut and bolt.
    - Discard the nut.
    - To install, tighten to 350 Nm (285 lb-ft).

7. Remove the shock absorber lower nut, bolt and the lower arm.
    - Discard the shock absorber lower nut.
    - To install, tighten to 475 Nm (350 lb-ft).

8. To install, reverse the removal procedure.

9. **CAUTION: Do not tighten the lower shock nut, lower arm forward nut or lower arm rearward nut until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.**

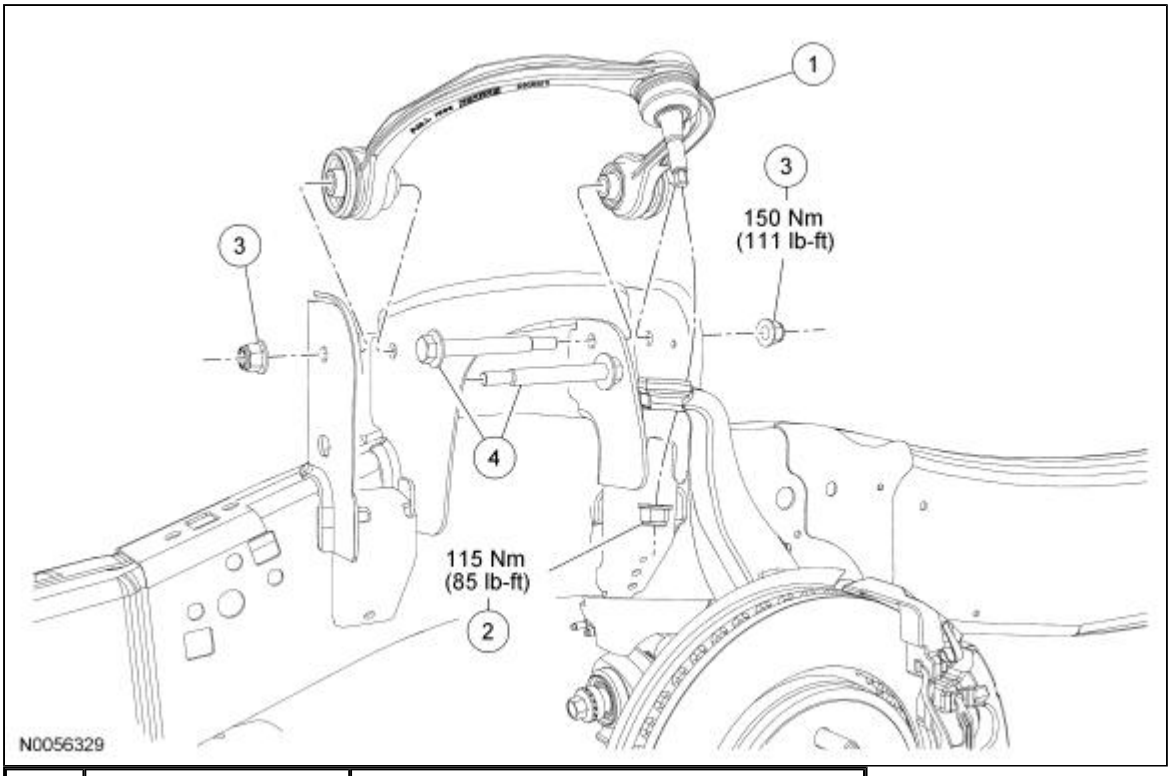
    Check and, if necessary, align the front end. For additional information, refer to Section 204-00 .

Upper Arm

Printable View (222 KB)

Special Tool(s)

ST2945-A	Separator, Ball Joint 204-592



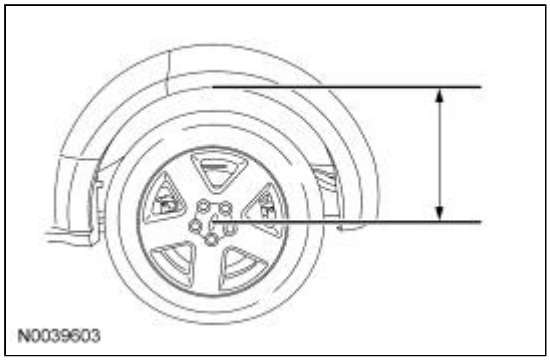
Item	Part Number	Description
1	3091 LH/ 3084 RH	Upper arm
2	W520215	Upper ball joint nut
3	W520215	Upper arm-to-frame nuts (2 required)
4	W707841	Upper arm-to-frame bolts (2 required)

Removal and Installation

CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

CAUTION: Before tightening any suspension bushing fasteners, use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to the measurement taken in Step 1 (curb height).

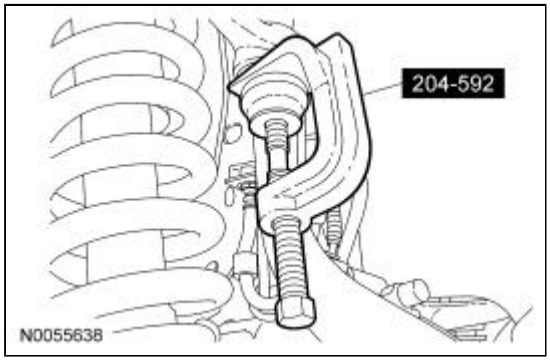
1. Measure the distance from the center of the hub to the lip of the fender with the vehicle in a level, static ground position (curb height).



2. Remove the shock absorber and spring assembly. For additional information, refer to Shock Absorber and Spring Assembly in this section.

3. Remove and discard the upper ball joint nut.
   - To install, tighten to 115 Nm (85 lb-ft).

4. Using the special tool, separate the upper ball joint from the wheel knuckle.



5. Remove the upper arm-to-frame nuts and bolts and the upper bolts.
   - Discard the bolts.
   - To install, tighten to 150 Nm (111 lb-ft).

6. **CAUTION: Before tightening any suspension bushing fasteners, use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to the measurement taken in Step 1 (curb height).**

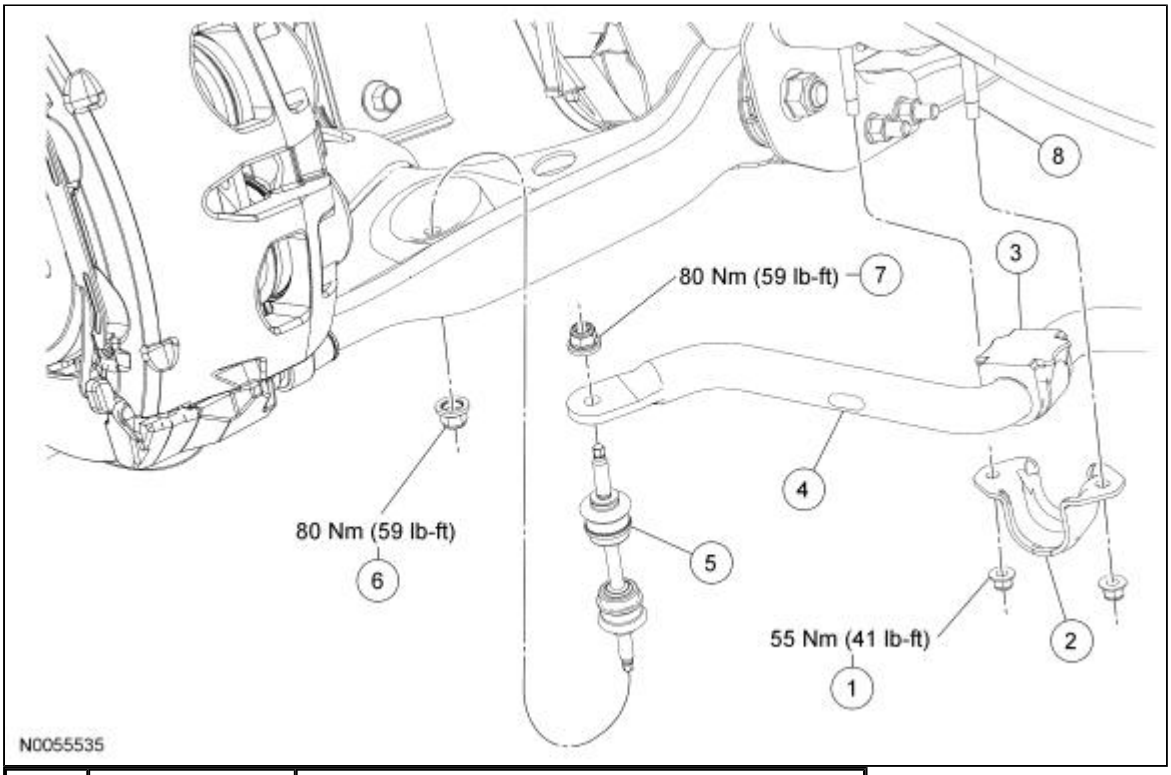
   To install, reverse the removal procedure.

7. Check and, if necessary, align the front end. For additional information, refer to Section 204-00 .

Stabilizer Bar and Link

Printable View (180 KB)

NOTE: LH side shown, RH side similar.



Item	Part Number	Description
1	W520213	Stabilizer bar bracket nut (4 required)
2	3B353	Stabilizer bar bracket (2 required)
3	5484	Stabilizer bar bushing (2 required)
4	5494	Stabilizer bar
5	5K483	Stabilizer bar link (2 required)
6	N807144	Stabilizer bar link lower nut (2 required)
7	N807144	Stabilizer bar link upper nut (2 required)
8	W711583	Stabilizer bracket bolt plate

Removal and Installation

CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** The hex holding feature can be used to prevent turning of the stud while removing the nut.

   Remove and discard the 2 stabilizer bar link upper nuts.
   - To install, tighten to 80 Nm (59 lb-ft).

3. **CAUTION: Do not hold the stabilizer link boot with any tool, as damage to the boot will occur.**

   NOTE: Use the hex holding feature to prevent the stud from turning while removing the nut.

   Remove and discard the 2 stabilizer bar link lower nuts and remove the 2 stabilizer bar links.
   - To install, tighten to 80 Nm (59 lb-ft).

4. Remove the 4 stabilizer bar bracket nuts, brackets and the stabilizer bar.
   - Discard the nuts.
   - To install, tighten to 55 Nm (41 lb-ft).

5. Remove and discard the stabilizer bracket bolt plates.

6. **NOTE:** Make sure the stabilizer bar bushing upset is installed into the bracket groove.

   Inspect and, if necessary, install new stabilizer bar bushings.

7. To install, reverse the removal procedure.

Wheel Knuckle

Printable View (253 KB)

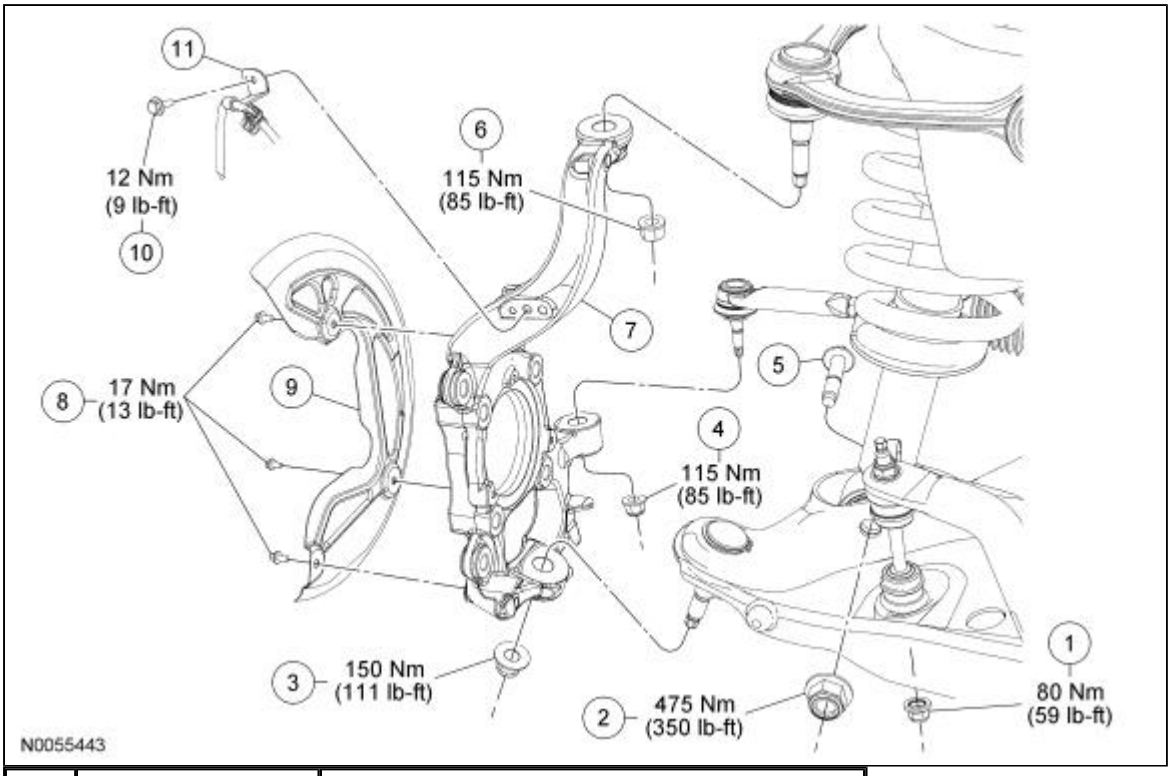
ST2945-A	Separator, Ball Joint 204-592



Item	Part Number	Description
1	N807144	Stabilizer bar link lower nut
2	W520217	Shock absorber lower nut
3	W707254	Lower ball joint nut
4	W520215	Tie-rod end nut
5	W712682	Shock absorber lower bolt
6	W520215	Upper ball joint nut
7	3K186 LH/ 3K185 RH	Wheel knuckle
8	W505211	Brake disc shield bolts (3 required)
9	2K005 LH/ 2K004 RH	Brake disc shield

10	—	Wheel speed sensor harness bracket bolt
11	—	Wheel speed sensor harness bracket (part of 2C204)

Removal and Installation

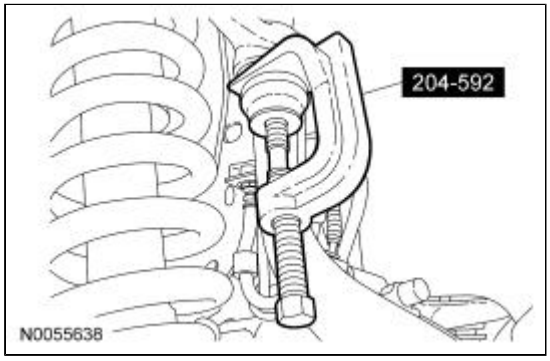
CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

CAUTION: Do not tighten the lower shock nut until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.

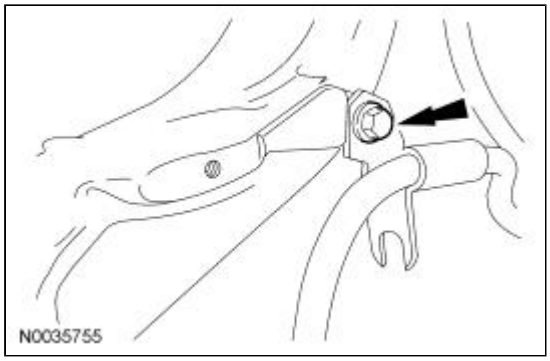
1. Remove the wheel bearing and wheel hub. For additional information, refer to Wheel Hub .

2. Remove and discard the tie-rod end nut.
   - To install, tighten to 115 Nm (85 lb-ft).

3. Using the special tool, separate the upper ball joint from the wheel knuckle.



4. Remove the wheel speed sensor harness bracket bolt and position the harness aside.
   - To install, tighten to 12 Nm (9 lb-ft).



5. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

   Remove and discard the stabilizer bar link lower nut.
   - To install, tighten to 80 Nm (59 lb-ft).

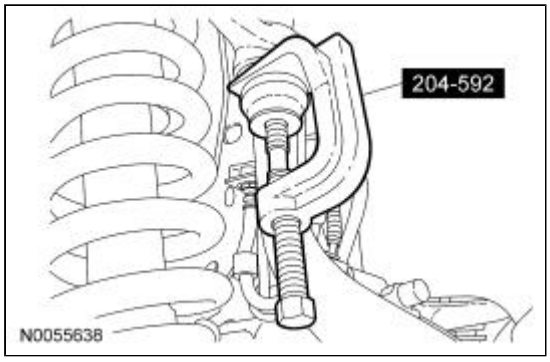
6. Remove and discard the shock absorber lower nut and bolt.

- To install, tighten to 475 Nm (350 lb-ft).

7. Remove and discard the upper ball joint nut.
   - To install, tighten to 115 Nm (85 lb-ft).

8. **NOTE:** Be sure not to damage the ball joint boot when installing the special tool.

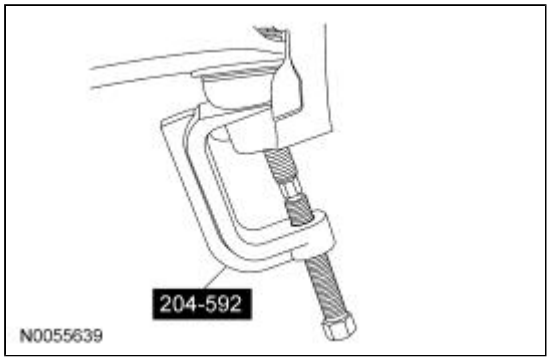
   Using the special tool, separate the upper ball joint from the wheel knuckle.



9. Remove and discard the lower ball joint nut.
   - To install, tighten to 150 Nm (111 lb-ft).

10. **CAUTION: Make sure to use the special tool when separating the lower ball joint from the knuckle to prevent damage to the ball joint boot.**

    Using the special tool, separate the ball joint from the knuckle.



11. If necessary, remove the 3 brake disc shield bolts and remove the brake disc shield.
    - To install, tighten to 17 Nm (13 lb-ft).

12. To install, reverse the removal procedure.

13. **CAUTION: Do not tighten the lower shock nut until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.**

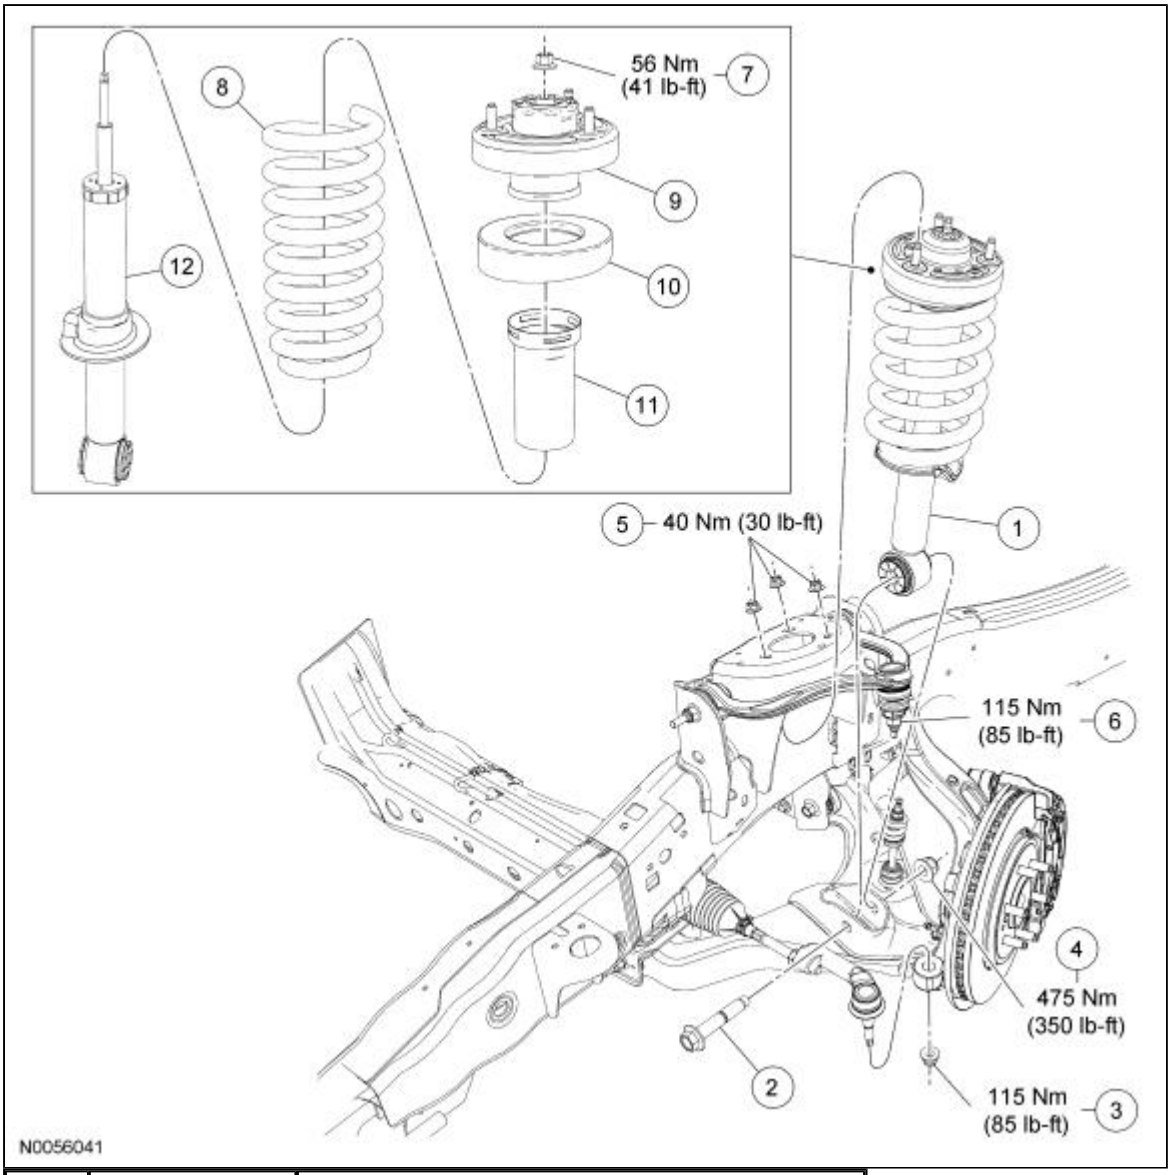
    Check and, if necessary, align the front end. For additional information, refer to Section 204-00 .

Shock Absorber and Spring Assembly

Printable View (333 KB)

Special Tool(s)

ST2945-A	Separator, Ball Joint 204-592



Item	Part Number	Description
1	18B036	Shock absorber and spring assembly
2	W712682	Shock absorber lower bolt

3	W707251	Tie-rod end nut
4	W520217	Shock absorber lower nut
5	W712334	Shock absorber upper nuts (3 required)
6	W520215	Upper ball joint nut
7	W712134	Shock rod nut
8	5310	Spring
9	18A099	Upper mount
10	18A154	Insulator
11	18A047	Dust boot
12	18045	Shock absorber

CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

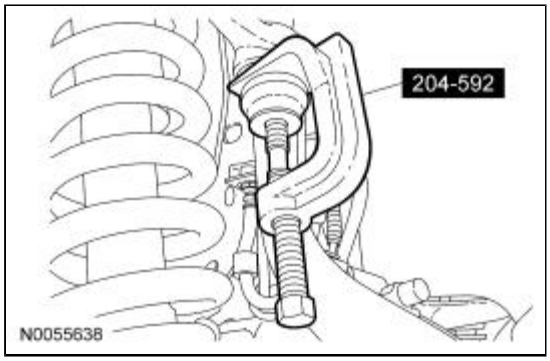
CAUTION: Do not tighten the lower shock nut until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove and discard the shock absorber and spring assembly upper nuts.
   - To install, tighten to 40 Nm (30 lb-ft).

3. Remove and discard the tie-rod end nut.
   - To install, tighten to 150 Nm (111 lb-ft).

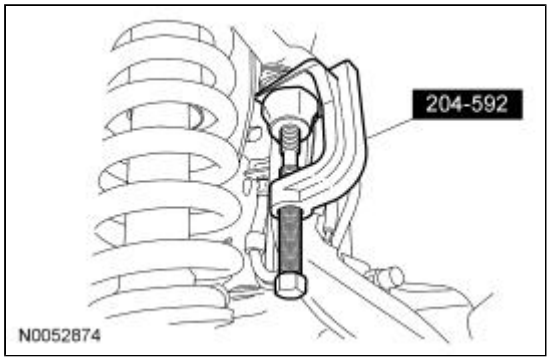
4. Using the special tool, separate the upper ball joint from the wheel knuckle.



5. Remove and discard the upper ball joint nut.
   - To install, tighten to 115 Nm (85 lb-ft).

6. Remove and discard the shock absorber and spring assembly lower nut and bolt.
   - To install, tighten to 475 Nm (295 lb-ft).

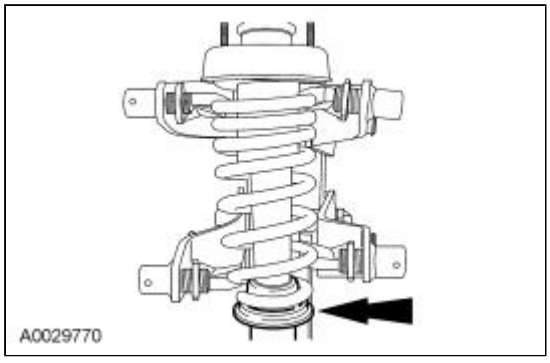
7. Using the special tool, disconnect the upper arm from the wheel knuckle and remove the shock absorber and spring assembly.



8. **NOTE:** If the individual spring and/or shock components are not being serviced, continue with Step 11.

   NOTE: For reference during assembly, index the upper mount, spring and shock absorber.

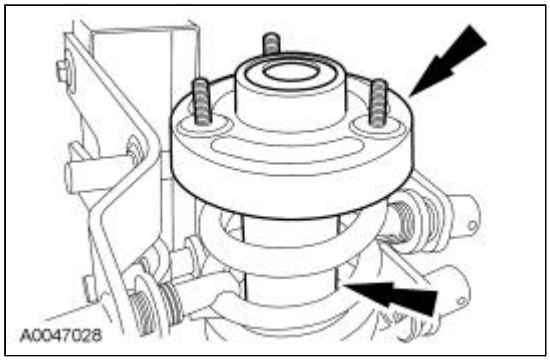
   Using a suitable spring compressor, compress the spring until the tension is released from the shock absorber.



9. **NOTE:** Use the hex holding feature to prevent the shock rod from turning while removing the nut.

   While holding the shock rod, remove the nut and the shock absorber.
   - Discard the nut.
   - To install, tighten to 56 Nm (41 lb-ft).

10. Remove the upper mount, dust boot and insulator.



11. **CAUTION: Do not tighten the lower shock nut until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.**

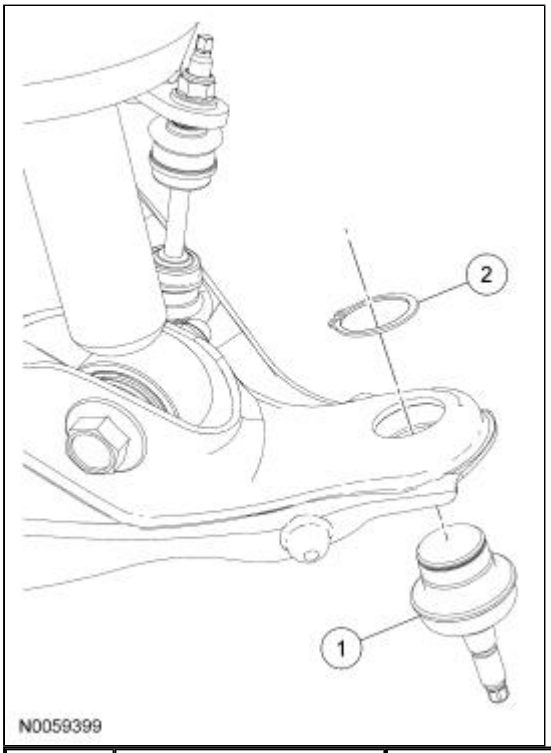
    To install, reverse the removal procedure.

Ball Joint — Lower

Printable View (167 KB)

Special Tool(s)

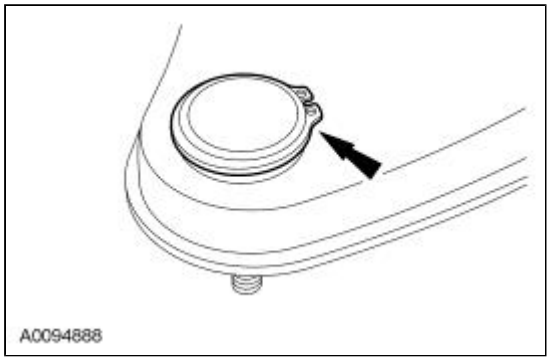
ST1172-A	Installer/Remover, C-Frame and Screw 205-086
ST2929-A	Installer/Remover, Ball Joint 204-358



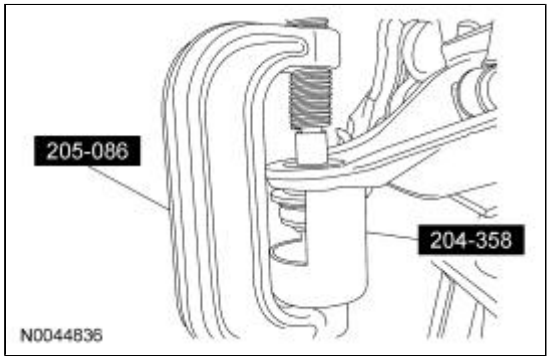
Item	Part Number	Description
1	3050	Lower ball joint
2	—	Lower ball joint snap ring

Removal and Installation

1. Remove the wheel knuckle. For additional information, refer to Wheel Knuckle in this section.
2. Remove and discard the lower ball joint snap ring.



3. Using the special tools, remove the lower ball joint.



4. **CAUTION: Do not damage the lower ball joint boot when installing the special tool.**

   NOTE: Clean and inspect the lower arm ball joint bore for damage before installing a new ball joint.

   NOTE: Make sure the new lower ball joint snap ring is fully seated.

   NOTE: Always install new nuts and cotter pins.

   To install, reverse the removal procedure.

Wheel speed sensor harness bracket bolt	12	9

Front Suspension

Printable View (80 KB)

WARNING: The vehicle can be equipped with either a vehicle dynamic suspension (using air springs in the rear of the vehicle) or a standard suspension (using coil springs at all 4 corners of the vehicle). If equipped with vehicle dynamic suspension, the system must be disabled prior to jacking or lifting the vehicle. Disabling the vehicle dynamic suspension is covered in Section 204-05 .

CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

The vehicle can be equipped with either a vehicle dynamic suspension (using air springs in the rear of the vehicle) or a standard suspension (using coil springs at all 4 corners of the vehicle). Both are an independent-type front suspension which utilize a stabilizer bar to aid in vehicle stability. Vehicle dynamic suspension is covered in Section 204-05 . The wheel hub and wheel bearing assemblies are sealed units and are serviced as such. The lower ball joints are serviceable. The four wheel drive (4WD) front suspension consists of the following parts:

- Upper control arms
- Lower control arms
- Shock absorber and coil spring assemblies
- Wheel knuckles
- Wheel bearing and wheel hub assemblies
- Stabilizer bar
- Stabilizer bar links

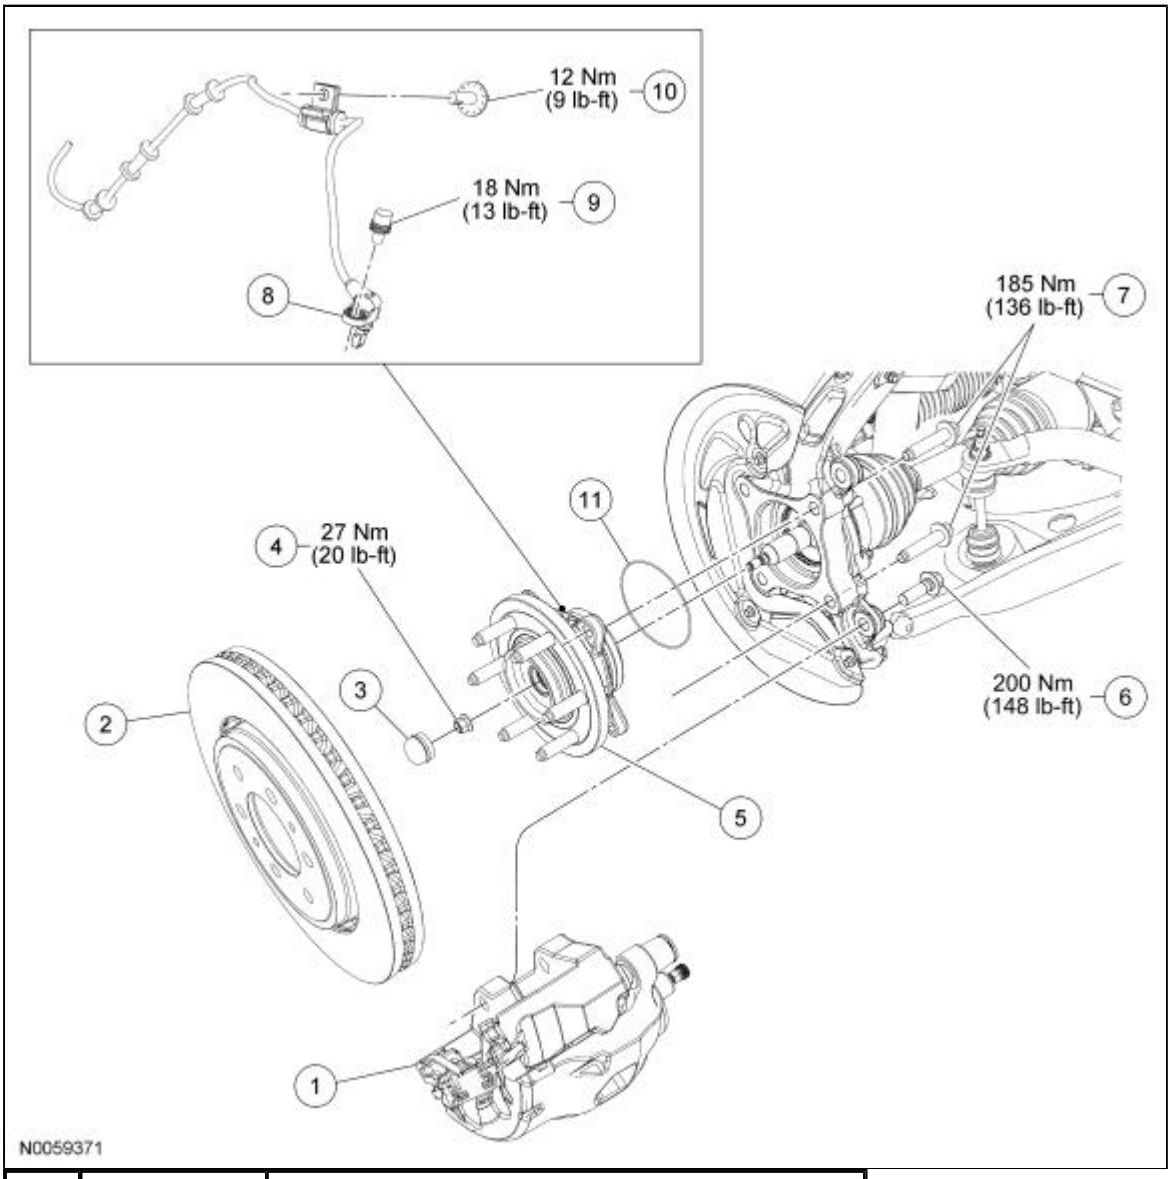
Front Suspension

Printable View (62 KB)

Refer to Section 204-00 .

Wheel Hub

Printable View (261 KB)



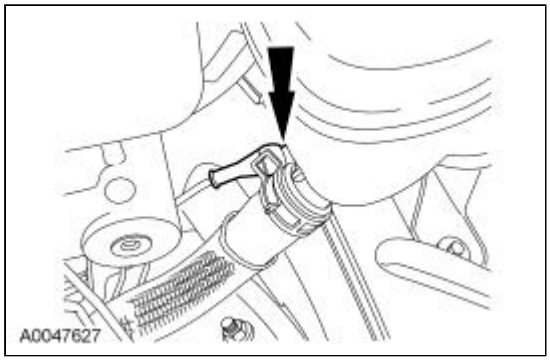
Item	Part Number	Description
1	—	Brake caliper and anchor plate assembly
2	1125	Brake disc
3	1131	Dust cap
4	N808405	Halfshaft nut
5	2B663	Wheel bearing and wheel hub
6	W707292	Brake caliper anchor plate bolt (2 required)
7	W707353	Wheel bearing and wheel hub bolt (4 required)
8	2C204	Wheel speed sensor
9	—	Wheel speed sensor bolt

10	—	Wheel speed sensor harness bracket bolt
11	1177	O-ring seal

Removal and Installation

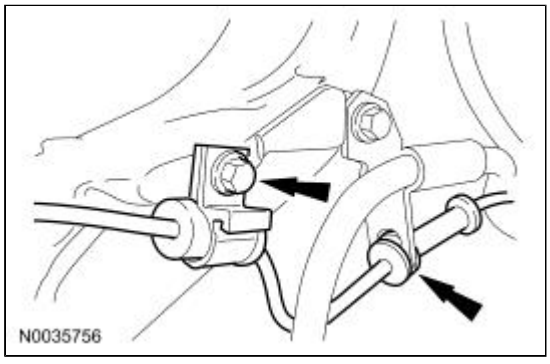
CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Disconnect the wheel speed sensor electrical connector.



2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. Remove the wheel speed sensor harness bolt and detach the harness from the retainers.
   - To install, tighten to 12 Nm (9 lb-ft).



4. **CAUTION: Do not allow the caliper to hang from the brake hose or damage to the hose can result.**

   Remove the bolts and position the brake caliper and anchor plate assembly aside.
   - Support the brake caliper and anchor plate assembly using mechanic's wire.
   - To install, tighten to 200 Nm (148 lb-ft).

5. Remove the brake disc.

6. Remove the halfshaft nut dust cap.

7. Remove and discard the halfshaft nut.

- To install, tighten to 27 Nm (20 lb-ft).

8. Remove the 4 wheel bearing and wheel hub bolts and the wheel hub.
    - To install, tighten to 185 Nm (136 lb-ft).

9. If installing a new wheel bearing and wheel hub, remove the wheel speed sensor bolt and the wheel speed sensor.
    - To install, tighten to 18 Nm (13 lb-ft).

10. **CAUTION: If the original wheel bearing and wheel hub is being installed, install a new wheel hub O-ring seal.**

    To install, reverse the removal procedure.

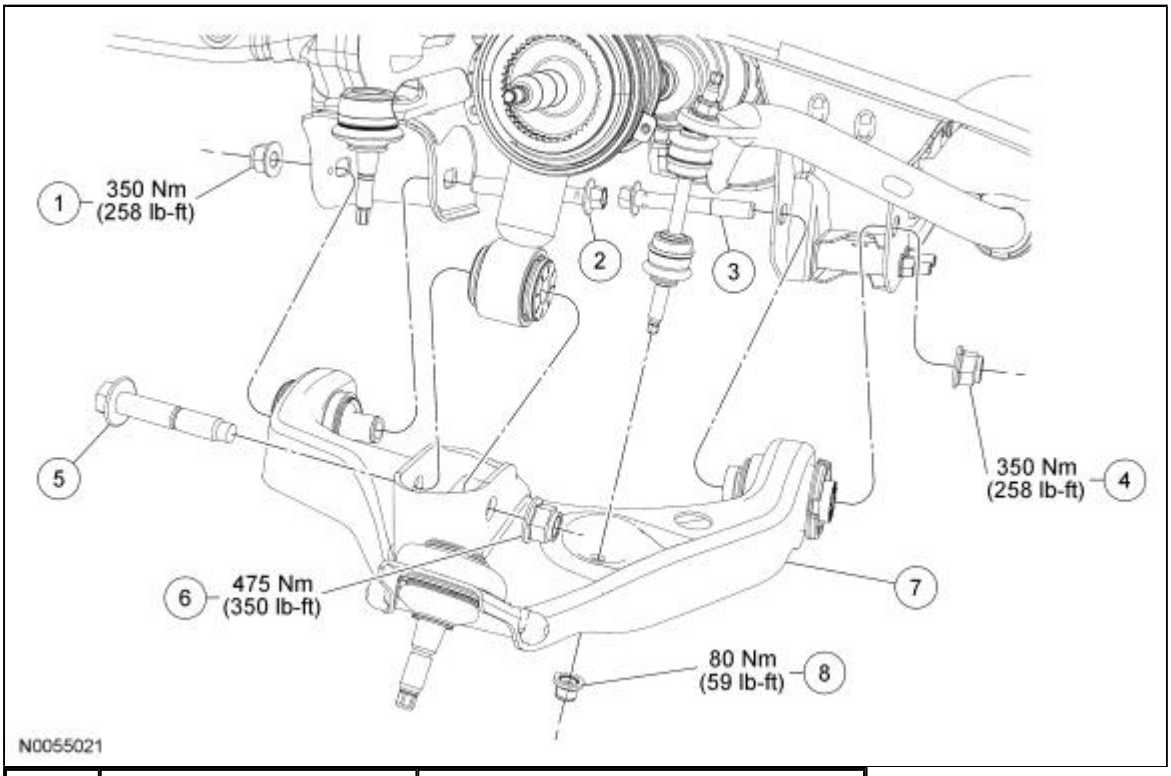
Printable View (183 KB)



Item	Part Number	Description
1	W707254	Lower arm forward nut
2	W707843	Lower arm forward bolt
3	W707202	Lower arm rearward bolt
4	W707254	Lower arm rearward nut
5	W712682	Shock absorber lower bolt
6	W520217	Shock absorber lower nut
7	3051 LH/ 3042 RH	Lower arm
8	N807144	Stabilizer bar link lower nut

Removal and Installation

CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

CAUTION: Do not tighten the lower shock nut, lower arm forward nut or lower arm rearward nut until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.

1. Remove the wheel knuckle. For additional information, refer to Wheel Knuckle in this section.

2. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

   Remove and discard the stabilizer bar link lower nut.
   - To install, tighten to 80 Nm (59 lb-ft).

3. Remove the lower arm rearward nut and bolt.
   - Discard the nut.
   - To install, tighten to 350 Nm (258 lb-ft).

4. Remove the lower arm forward nut and bolt.
   - Discard the nut.
   - To install, tighten to 350 Nm (258 lb-ft).

5. Remove the shock absorber lower nut, bolt and the lower arm.
   - Discard the shock absorber lower nut.
   - To install, tighten to 475 Nm (350 lb-ft).

6. **CAUTION: Do not tighten the lower shock nut, lower arm forward nut or lower arm rearward nut until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.**

   To install, reverse the removal procedure.

7. Check and, if necessary, align the front end. For additional information, refer to Section 204-00 .

8	2K005 LH/ 2K004 RH	Brake disc shield
9	W505211	Brake disc shield bolt (3 required)
10	—	Integrated wheel end disconnect bolt (3 required)
11	—	Wheel speed sensor harness bracket
12	—	Wheel speed sensor harness bracket bolt

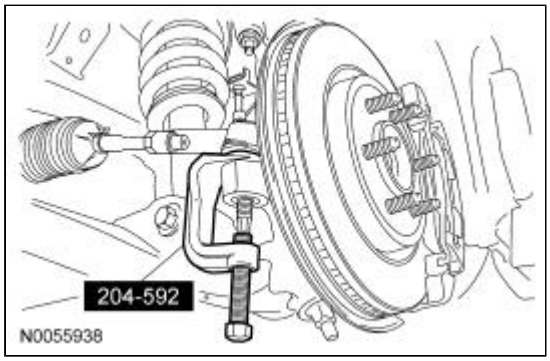
Removal and Installation

CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

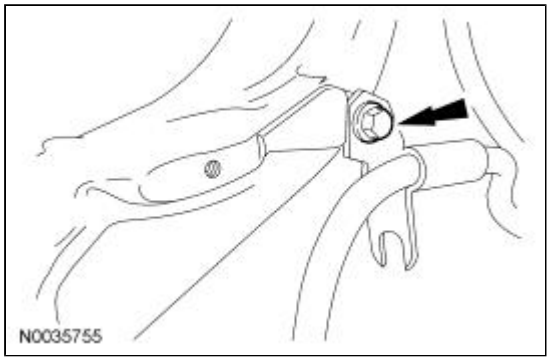
CAUTION: Do not tighten the lower shock nut until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.

CAUTION: When servicing the lower shock nut, take care not to damage the stabilizer link.

1. Remove the wheel bearing and wheel hub. For additional information, refer to Wheel Hub .
2. Remove and discard the tie-rod end nut.
   - To install, tighten to 115 Nm (85 lb-ft).
3. Using the special tool, separate the tie-rod end from the wheel knuckle.



4. Remove the wheel speed sensor harness bracket bolt and position the harness aside.
   - To install, tighten to 12 Nm (9 lb-ft).



5. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

   Remove and discard the stabilizer bar link lower nut.
   - To install, tighten to 80 Nm (59 lb-ft).

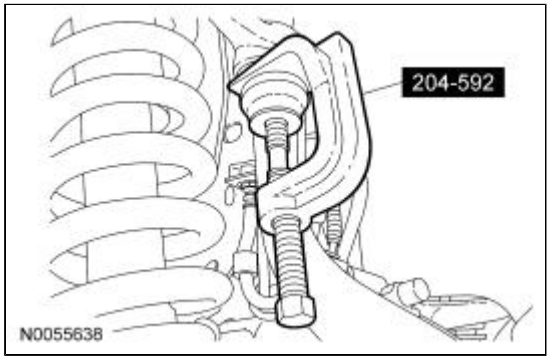
6. Remove and discard the shock absorber lower nut and bolt.
   - To install, tighten to 475 Nm (350 lb-ft).

7. Remove the 3 integrated wheel end bolts.
   - To install, tighten to 15 Nm (11 lb-ft).

8. Remove and discard the upper ball joint nut.
   - To install, tighten to 115 Nm (85 lb-ft).

9. **NOTE:** Be sure not to damage the ball joint boot when installing the special tool.

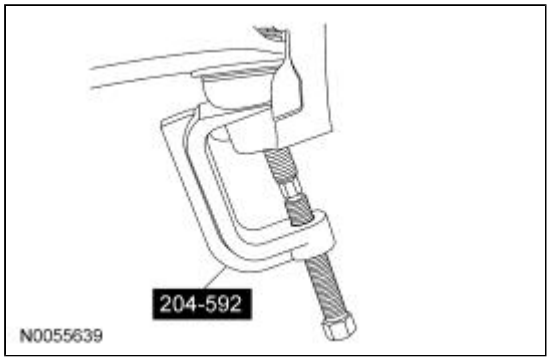
   Using the special tool, separate the upper ball joint from the wheel knuckle.



10. Remove and discard the lower ball joint nut.
    - To install, tighten to 150 Nm (111 lb-ft).

11. **CAUTION: Make sure to use the special tool when separating the lower ball joint from the knuckle to prevent damage to the ball joint boot.**

    Using the special tool, separate the lower ball joint from the wheel knuckle and remove the wheel knuckle.



12. If necessary, remove the 3 brake disc shield bolts and remove the brake disc shield.
    - To install, tighten to 17 Nm (13 lb-ft).

13. **CAUTION: Do not tighten the lower shock nut until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.**

    To install, reverse the removal procedure.

14. Check and, if necessary, align the front end. For additional information, refer to Section 204-00 .

Rear Suspension

Printable View (80 KB)

WARNING: All vehicles are equipped with gas-pressurized shock absorbers which will extend unassisted. Do not apply heat or flame to the shock absorbers during removal or component servicing. Failure to follow these instructions may result in personal injury.

CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

The vehicle can be equipped with either a vehicle dynamic suspension (using air springs in the rear of the vehicle) or a standard suspension (using coil springs in the rear of the vehicle). Vehicle dynamic suspension is covered in Section 204-05 . Both are an independent-type rear suspension which utilize a stabilizer bar to aid in vehicle stability. The wheel hub and wheel bearing assemblies are sealed units and are serviced as such. The rear suspension has serviceable lower ball joints and wheel knuckle bushings. The rear suspension also incorporates toe links to adjust the rear toe and camber adjustment can be made using camber shims located at the upper arm-to-frame mounts. The rear suspension consists of the following parts:

- Upper arms
- Lower arms
- Shock absorber and spring assemblies
- Wheel knuckles
- Wheel bearing and wheel hub assemblies
- Stabilizer bar
- Stabilizer bar links
- Upper trailing arms
- Lower trailing arms
- Toe links

Rear Suspension

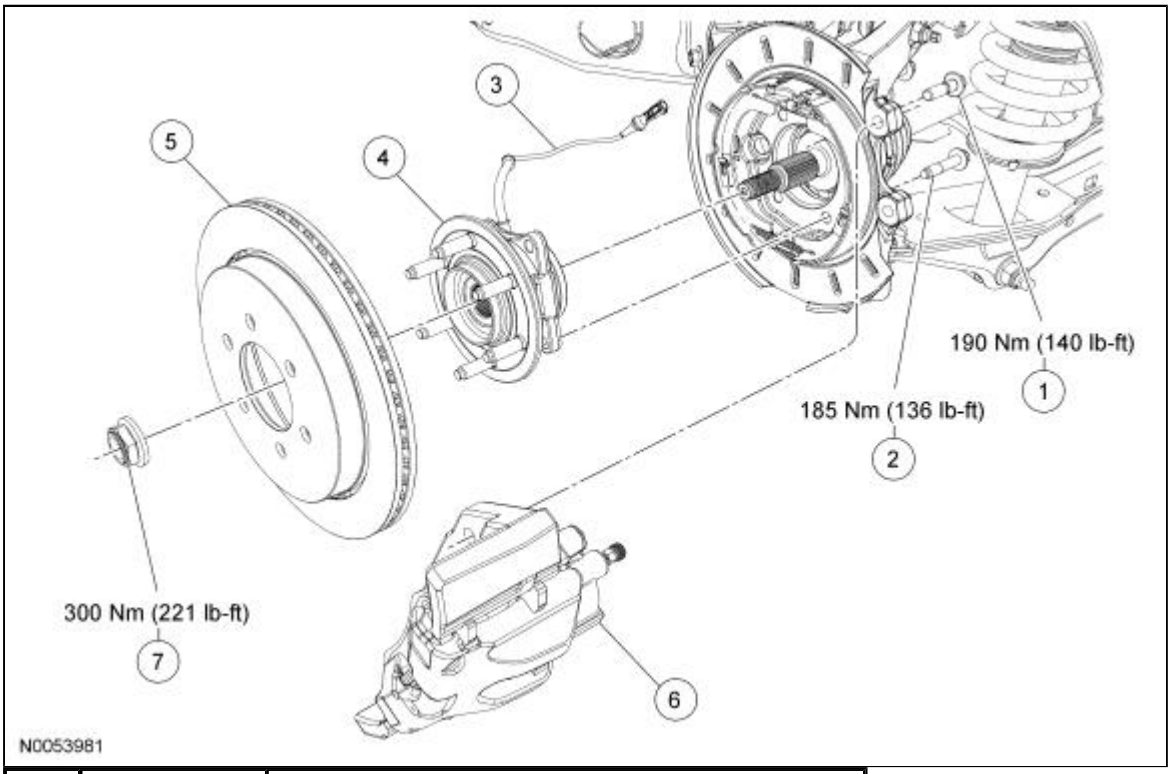
Refer to Section 204-00 .

Wheel Bearing and Wheel Hub

Printable View (279 KB)



Item	Part Number	Description
1	W707292	Brake caliper anchor plate bolt (2 required)
2	W707353	Wheel bearing and wheel hub bolt (4 required)
3	2C204	Rear wheel speed sensor bolt
4	2B664	Wheel bearing and wheel hub
5	1126	Brake disc
6	—	Brake caliper and anchor plate assembly
7	W710084	Halfshaft nut

Removal and Installation

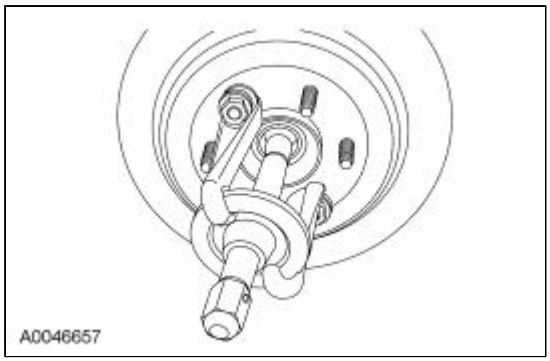
CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** Have an assistant press the brake pedal to keep the axle from rotating.

   Remove and discard the halfshaft nut.
   - To install, tighten to 300 Nm (221 lb-ft).

3. Using a suitable hub puller, separate the outboard CV joint from the wheel hub.

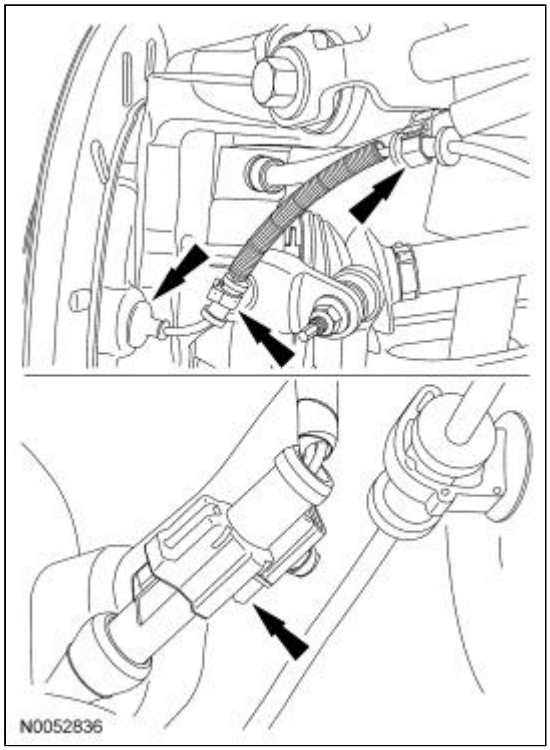


4. **CAUTION: Do not allow the caliper and anchor plate assembly to hang from the brake hose or damage to the hose can result.**

   Remove the bolts and position the caliper and anchor plate assembly aside.
   - Support the caliper and anchor plate assembly using mechanic's wire.
   - To install, tighten to 190 Nm (140 lb-ft).

5. Remove the brake disc.

6. Detach the wheel speed sensor harness from the retainers and disconnect the wheel speed sensor electrical connector. Push the wheel speed sensor harness grommet through the brake disc shield.



7. Remove the 4 wheel bearing and wheel hub bolts, the wheel bearing assembly and the wheel speed sensor as an assembly.
   - Route the sensor wiring through the access hole in the brake disc shield.
   - Discard the bolts.
   - To install, tighten to 185 Nm (136 lb-ft).

8. If necessary, remove the wheel speed sensor bolt and the wheel speed sensor from the wheel bearing and wheel hub.
    - To install, tighten to 18 Nm (13 lb-ft).

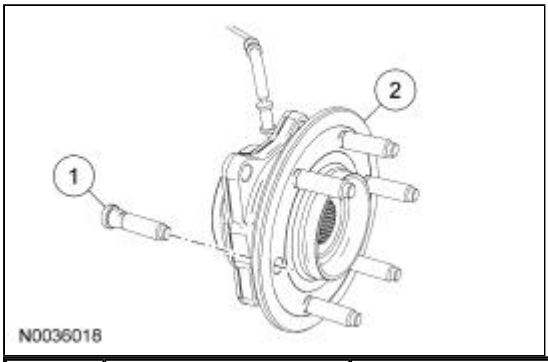
9. To install, reverse the removal procedure.

Wheel Studs

Printable View (146 KB)

Special Tool(s)

ST1494-A	C-Frame and Screw 211-023 (T74P-3044-A1)



Item	Part Number	Description
1	W707287	Wheel stud
2	2B664	Wheel bearing and wheel hub

Removal

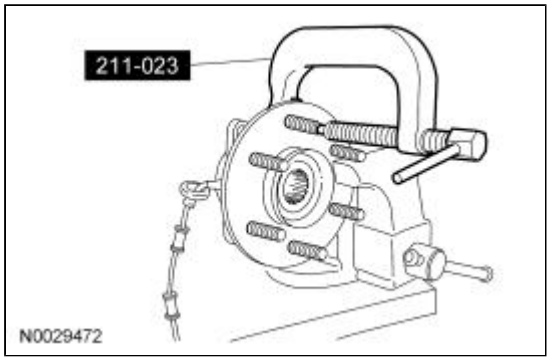
WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH rear quarter trim panel. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations. Failure to follow these instructions may result in personal injury.

CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the wheel bearing and wheel hub. For additional information, refer to Wheel Bearing and Wheel Hub in this section.

2. **CAUTION: Never use a hammer to remove a wheel stud. Damage to the wheel hub can result.**

   Place the wheel hub in a soft-jawed vice and, using the special tool, remove the wheel stud.



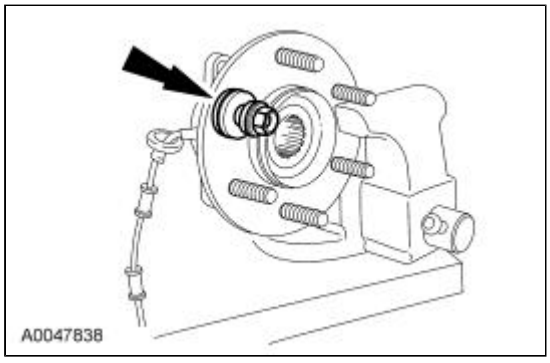
Installation

1. Position the new wheel stud in the wheel bearing and hub assembly, aligning the serrations in the wheel hub flange made by the original wheel stud.

2. **CAUTION: Do not use power tools to install the wheel stud. The serrations on the flange can be stripped.**

   NOTE: Do not use the wheel nut that came with the vehicle.

   Install 4 washers and a wheel nut on the wheel stud and tighten the wheel nut until the stud seats against the flange.

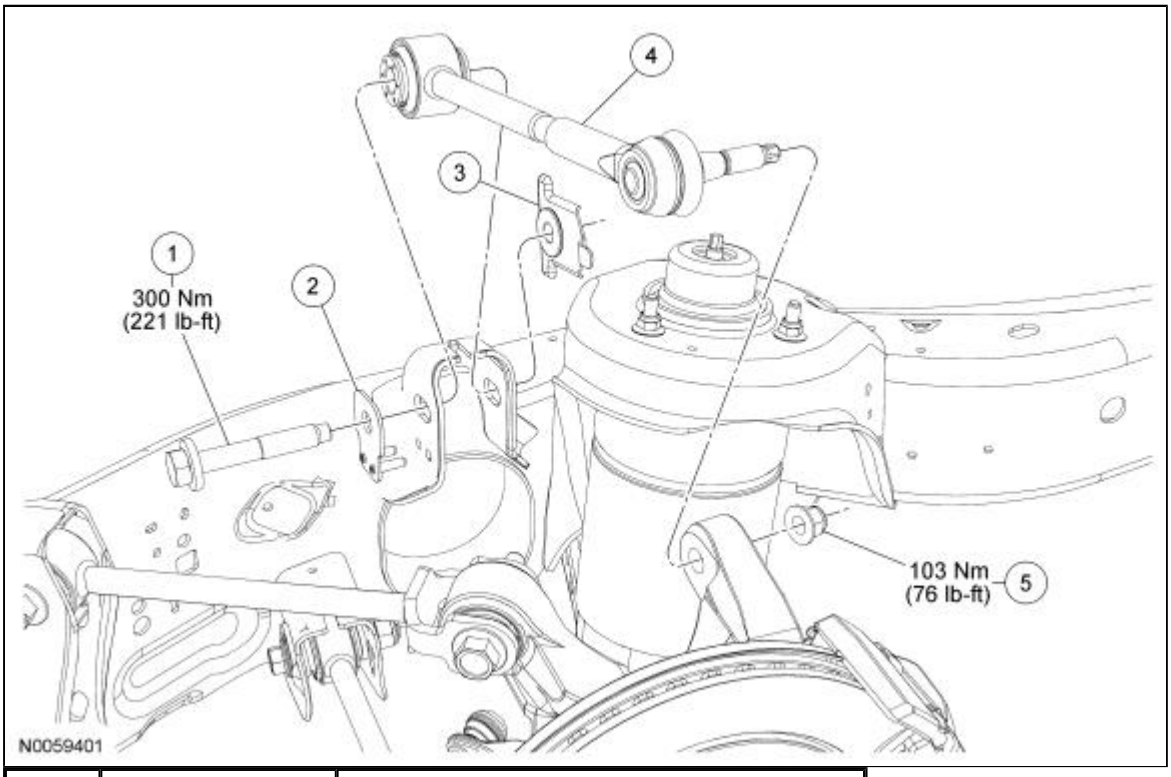


3. Remove the wheel nut and washers.
   - Discard the wheel nut.

4. Install the wheel bearing and wheel hub. For additional information, refer to Wheel Bearing and Wheel Hub in this section.

Upper Arm

Printable View (190 KB)



Item	Part Number	Description
1	W712774	Upper arm-to-frame bolt
2	5A983	Camber set shim
3	W711495	Flagnut
4	5A814	Upper arm
5	W520215	Upper arm-to-wheel knuckle nut

Removal and Installation

CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

CAUTION: Do not tighten the upper arm-to-frame bushing until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove and discard the upper arm-to-wheel knuckle nut.
   - To install, tighten to 103 Nm (76 lb-ft).

3. Remove and discard the upper arm-to-frame bolt, washer, camber set shim and flagnut.
    - To install, tighten to 300 Nm (221 lb-ft).

4. Remove the upper arm.

5. **CAUTION: Do not tighten the upper arm-to-frame bushing until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.**

   To install, reverse the removal procedure.

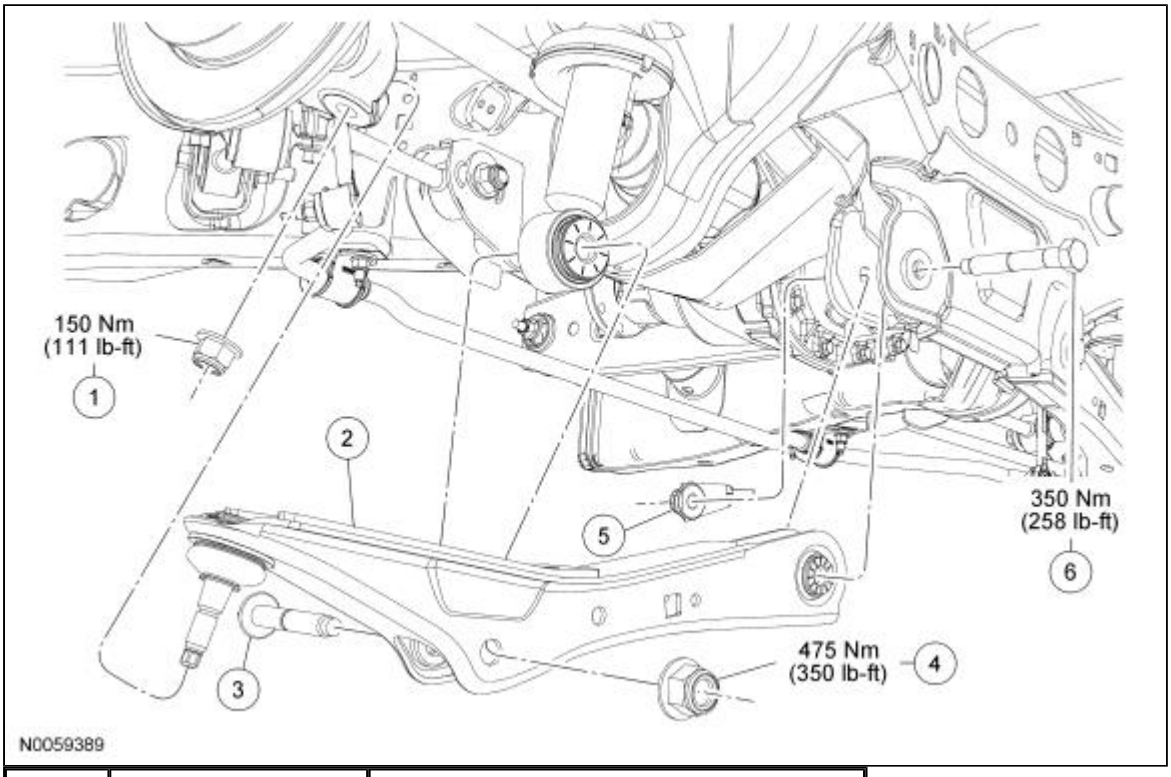
6. Check and, if necessary, adjust the rear alignment. For additional information, refer to Section 204-00 .

Lower Arm

Printable View (251 KB)

Special Tool(s)

ST2945-A	Separator, Ball Joint 204-592



Item	Part Number	Description
1	W520216	Lower ball joint nut
2	5B530	Lower arm
3	W712104	Lower shock absorber bolt
4	W520217	Lower shock absorber nut
5	W712774	Lower arm-to-frame flagnut
6	W711481	Lower arm-to-frame bolt

Removal

CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during

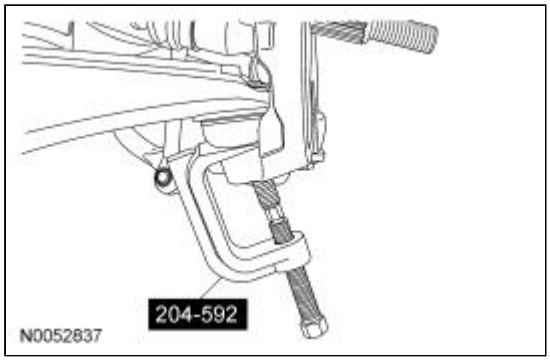
reassembly to make sure of correct retention of these parts.

CAUTION: Orientation of the suspension fasteners is important. Make sure the fasteners are installed in the same direction as they were in when removed.

CAUTION: Do not tighten the lower arm-to-frame bolt or shock absorber lower nut until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. If equipped, disconnect the air suspension height sensor connecting link from the lower arm.
3. Remove and discard the shock absorber lower bolt and flagnut.
4. Remove and discard the lower arm-to-frame bolt and flagnut.
5. Remove and discard the lower ball joint nut.
6. **CAUTION: Do not damage the ball joint boot while installing the special tool.**

   Using the special tool, separate the lower ball joint from the wheel knuckle.



7. Swing the lower arm to the rear of the vehicle and remove the lower arm.

Installation

1. Position the lower arm ball joint onto the wheel knuckle and install the lower ball joint nut.
   - Tighten to 150 Nm (111 lb-ft).
2. **CAUTION: Do not tighten the lower arm-to-frame bolt at this time.**

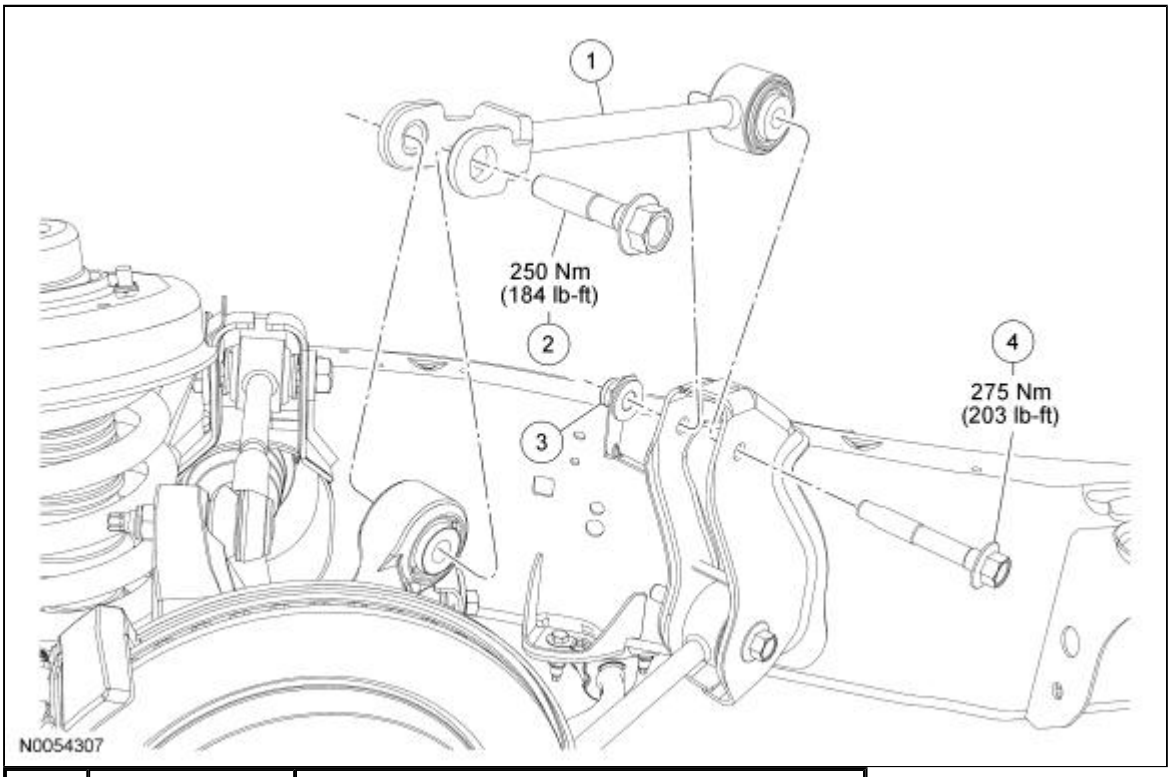
   Install the lower arm-to-frame bolt and flagnut.
3. **CAUTION: Do not tighten the shock absorber lower nut at this time.**

   Position the lower arm and install a new shock absorber lower bolt and nut.
4. Lower the vehicle so that the weight of the vehicle is on the wheel and tire assemblies.

5. Tighten the lower arm-to-frame bolt to 350 Nm (258 lb-ft).
6. Tighten the shock absorber lower bolt to 475 Nm (350 lb-ft).
7. Lower the suspension and remove the jack.
8. If equipped, connect the air suspension height sensor connecting link to the lower arm.

Trailing Arm — Upper

Printable View (188 KB)



Item	Part Number	Description
1	5B672	Upper trailing arm
2	W711865	Upper trailing arm-to-wheel knuckle bolt
3	W711480	Upper trailing arm-to-frame flagnut
4	W711478	Upper trailing arm-to-frame bolt

Removal and Installation

CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

CAUTION: Do not tighten the upper arm-to-frame bolt or upper arm-to-knuckle bolt until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove and discard the upper trailing arm-to-wheel knuckle bolt.
   - To install, tighten to 250 Nm (184 lb-ft).

3. Remove and discard the upper trailing arm-to-frame bolt and flagnut.
    - To install, tighten to 275 Nm (203 lb-ft).

4. **NOTE:** After removal of the upper trailing arm, inspect the knuckle bushing for excessive wear or damage and replace if necessary. For additional information, refer to Wheel Knuckle Bushing in this section.

    Remove the upper trailing arm.

5. **CAUTION: Do not tighten the upper arm-to-frame bolt or upper arm-to-knuckle bolt until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.**

    To install, reverse the removal procedure.

Trailing Arm — Lower

Printable View (173 KB)

4	W711480	Lower trailing arm-to-frame flagnut

Removal and Installation

CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

CAUTION: Do not tighten the lower trailing arm-to-frame bolt until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove and discard the 2 lower trailing arm-to-wheel knuckle bolts.
   - To install, tighten to 103 Nm (76 lb-ft).

3. Remove and discard the lower trailing arm-to-frame bolt and flagnut.
    - To install, tighten to 275 Nm (203 lb-ft).

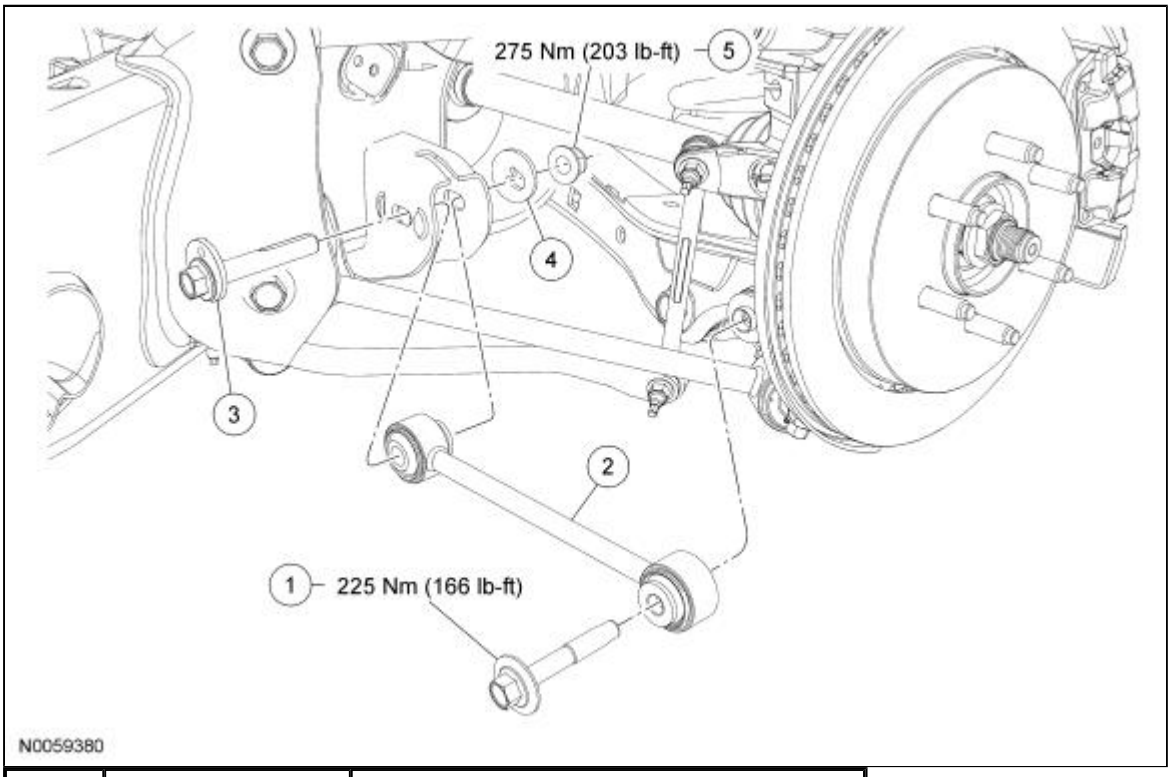
4. Remove the lower trailing arm.

5. **CAUTION: Do not tighten the lower trailing arm-to-frame bolt until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.**

    To install, reverse the removal procedure.

Toe Link

Printable View (189 KB)



Item	Part Number	Description
1	W711237	Toe link-to-wheel knuckle bolt
2	5A972	Toe link
3	W711172	Toe link-to-frame cam bolt
4	W711173	Cam washer
5	W520216	Toe link-to-frame nut

Removal and Installation

CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

CAUTION: Do not tighten the toe link-to-frame cam bolt or toe link-to-wheel knuckle bolt until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Index-mark the cam bolt and cam washer positions.

3. Remove and discard the bolt and washer.
    - To install, tighten to 225 Nm (166 lb-ft).

4. Remove the toe link-to-frame cam bolt, cam washer and nut.
    - To install, tighten to 275 Nm (203 lb-ft).

5. Remove the toe link.

6. **CAUTION: Do not tighten the toe link-to-frame cam bolt or the toe link-to-wheel knuckle bolt until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.**

    NOTE: Using the index marks made in Step 5, transfer the marks onto the new cam bolt and cam washer. Use these index marks when installing the toe link.

    To install, reverse the removal procedure.

7. Check and, if necessary, adjust the rear toe. For additional information, refer to Section 204-00 .

Stabilizer Bar and Link

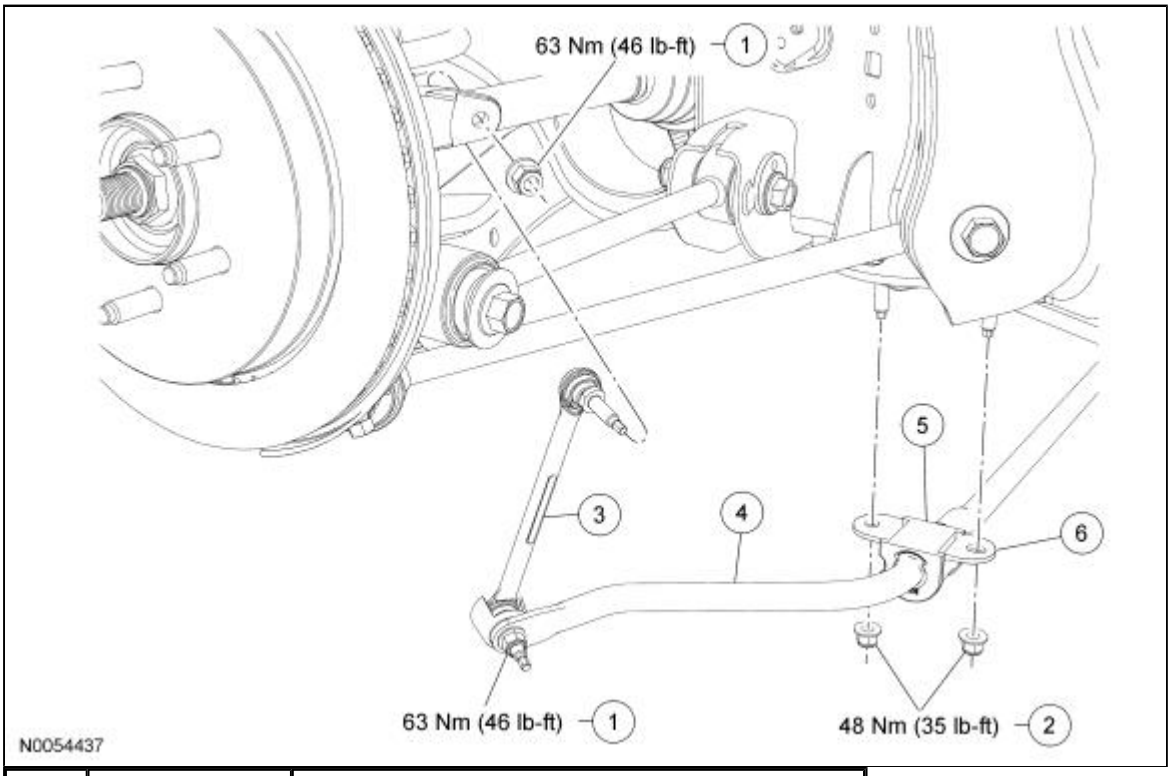
NOTE: RH side shown, LH side similar.



Item	Part Number	Description
1	W520213	Stabilizer bar link nuts (4 required)
2	W520213	Stabilizer bar link lower nuts (4 required)
3	5K484	Stabilizer bar link (2 required)
4	5A772	Stabilizer bar
5	4A037	Stabilizer bar bushing (2 required)
6	5B491	Stabilizer bar bracket (2 required)

Removal and Installation

CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

   NOTE: The stabilizer bar links are designed with low friction ball joints that have a low breakaway

torque.

Remove the 4 stabilizer bar link nuts and the links.

- Discard the nuts.
- To install, tighten to 63 Nm (46 lb-ft).

3. Remove the 4 stabilizer bar bracket nuts, the 2 stabilizer bar brackets and the stabilizer bar.
   - Discard the nuts.
   - To install, tighten to 48 Nm (35 lb-ft).

4. **NOTE:** Inspect and, if necessary, install new bushings.

   NOTE: The rear stabilizer must be installed with the center hump facing down.

   NOTE: The rear stabilizer bar bushings must be installed outboard of the upset rings on the stabilizer bar.

   NOTE: The stabilizer bar link stone shields must be installed on the stabilizer bar attachment point.

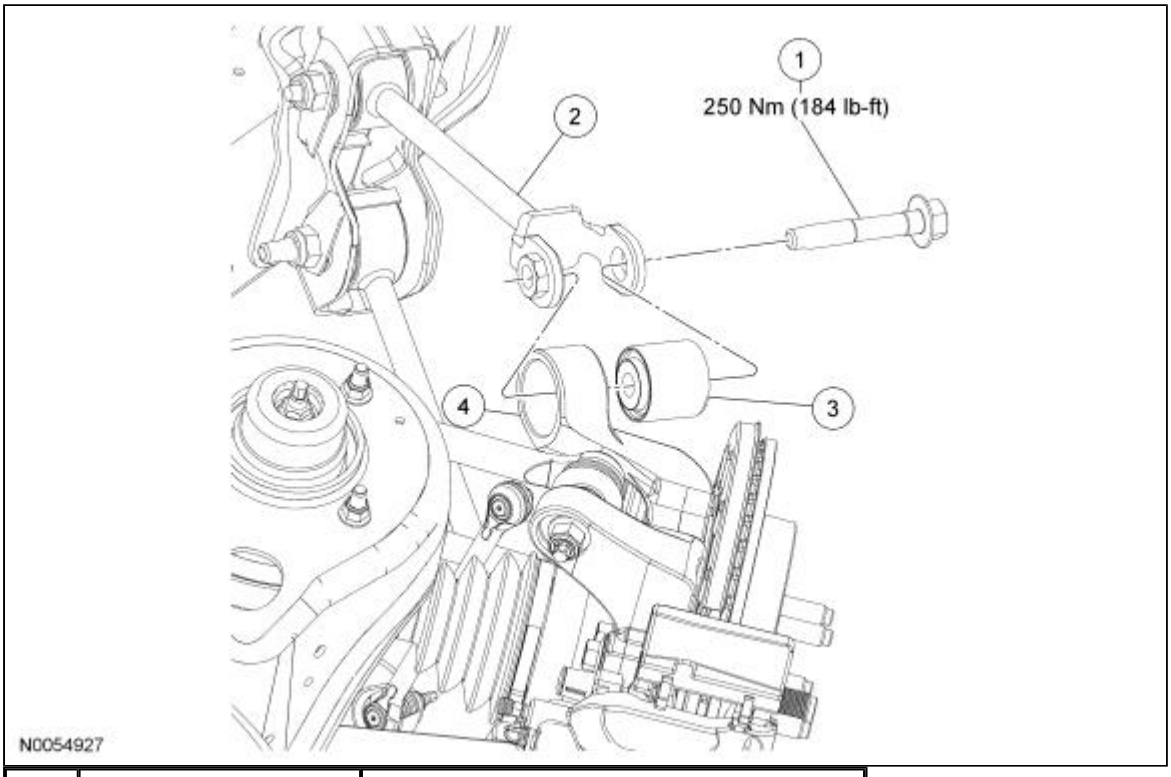
   To install, reverse the removal procedure.

Wheel Knuckle Bushing

Printable View (379 KB)

Special Tool(s)

 ST2233-A	Bushing Remover 204-034
ST2002-A	Bushing Remover/Installer 204-608
ST2238-A	Bushing Remover 204-589/1
ST2951-A	Forcing Screw, Bearings and Washers 205-813



Item	Part Number	Description
1	W711865	Upper trailing arm-to-wheel knuckle bolt
2	5B672	Upper trailing arm
3	—	Wheel knuckle bushing
4	5A970 LH/ 5A971 RH	Wheel knuckle

Removal

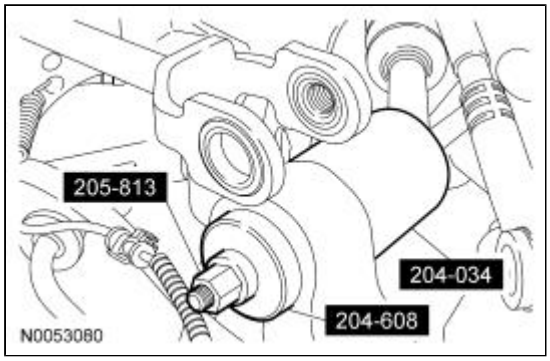
CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

CAUTION: Do not tighten the upper trailing arm-to-knuckle bolt until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

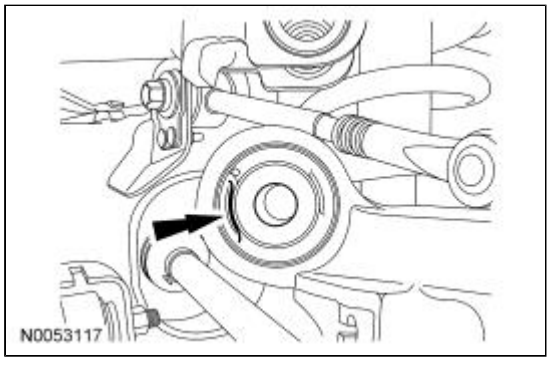
2. Remove and discard the upper trailing arm-to-wheel knuckle bolt.
   - Position the upper trailing arm upward to access the wheel knuckle bushing.

3. Using the special tools, remove the wheel knuckle bushing.

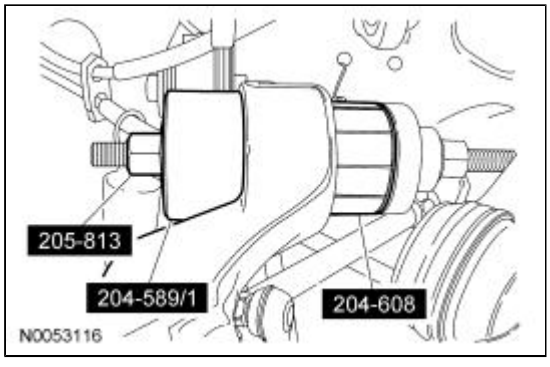


Installation

1. Clean and inspect the wheel knuckle bushing bore for damage or excessive wear.
2. Position the new wheel knuckle bushing with the larger void facing towards the upper trailing arm.

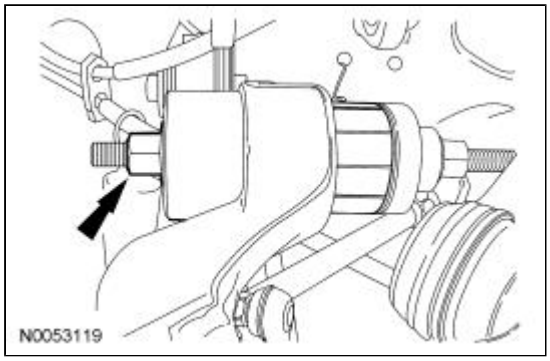


3. Install the special tools.



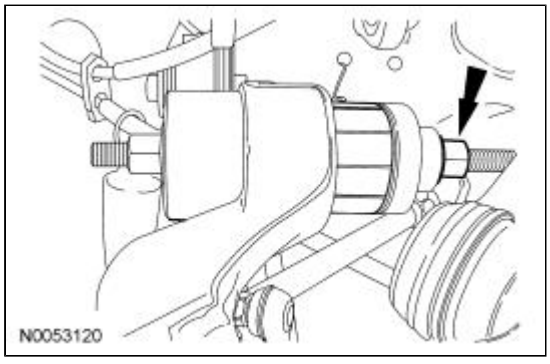
4. **CAUTION: Do not use the forward forcing screw nut to install the bushing. The forward forcing screw nut is only used to properly position and align the bushing for installation.**

   Hand tighten the forward forcing screw nut to align the bushing with the rearward side of the wheel knuckle bore.



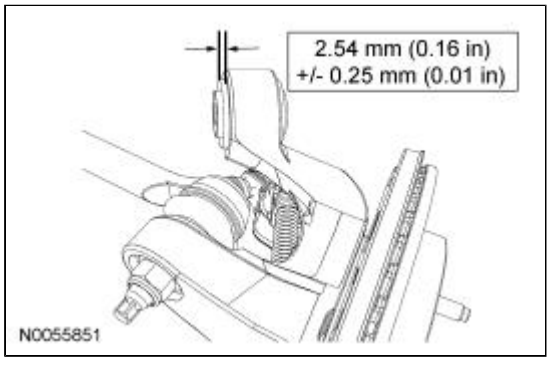
5. **CAUTION: Use the rearward forcing screw nut to install the bushing or damage to the bushing and/or the wheel knuckle bushing bore can result.**

   Tighten the rearward forcing screw nut and install the bushing until it is centered in the wheel knuckle.



6. **NOTE:** After installing the wheel knuckle bushing, make sure to measure the bushings position in the wheel knuckle bore. The measurement from the bushings outer metal surface to the machined face surface of knuckle bore should be 2.54 mm (0.16 in) +/- 0.25 mm (0.01 in).

   If necessary, use the special tool to adjust the bushing position in the wheel knuckle bushing bore.



7. **CAUTION: Do not tighten the upper trailing arm-to-knuckle bolt until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.**

   Connect the upper trailing arm to the wheel knuckle.
   - Tighten the bolt to 250 Nm (184 lb-ft).

8. Remove the jack stand from under the lower arm.

Wheel Knuckle

3	W520213	Stabilizer bar link nut
4	W711237	Toe link-to-wheel knuckle bolt
5	W71170	Lower trailing arm-to-wheel knuckle bolt
6	W520216	Lower ball joint nut
7	5A970 LH/ 5A971 RH	Wheel knuckle

Removal and Installation

CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the

same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

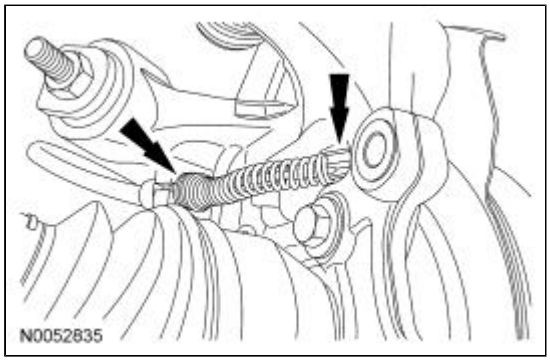
CAUTION: Do not tighten the upper arm-to wheel knuckle bolt or the toe link-to-wheel knuckle bolt until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.

1. Remove the wheel bearing and wheel hub assembly. For additional information, refer to Wheel Bearing and Wheel Hub in this section.

2. Remove the parking brake shoes. For additional information, refer to Section 206-05 .

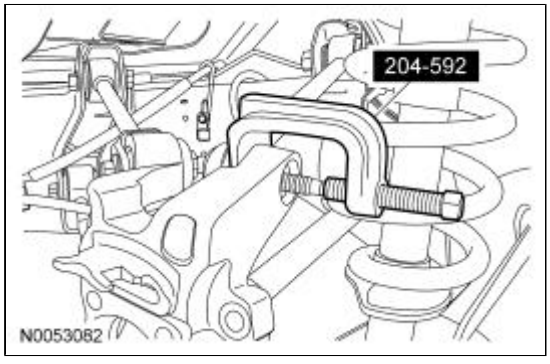
3. Remove the brake disc shield.

4. Compress the spring and depress the retaining tabs and detach the parking brake cable from the wheel knuckle.



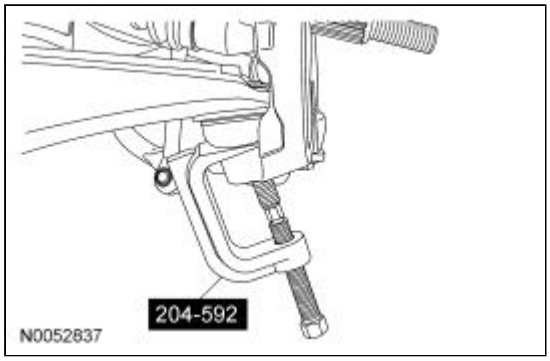
5. Remove and discard the upper arm-to-wheel knuckle nut.
    - To install, tighten to 103 Nm (76 lb-ft).

6. Using the special tool, separate the upper arm from the wheel knuckle.



7. Remove and discard the lower ball joint nut.
    - To install, tighten to 150 Nm (111 lb-ft).

8. Using the special tool, separate the lower ball joint from the wheel knuckle.



9. Remove and discard the 2 bolts and disconnect the lower trailing arm from the wheel knuckle.
    - To install, tighten to 103 Nm (76 lb-ft).

10. **CAUTION: Do not tighten the toe link-to- wheel knuckle bolt until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.**

    Remove and discard the bolt and disconnect the toe link from the wheel knuckle.
    - To install, tighten to 225 Nm (166 lb-ft).

11. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

    Using the hex hold feature, remove and discard the stabilizer bar link nut and disconnect the link from the wheel knuckle.
    - To install, tighten to 63 Nm (46 lb-ft).

12. **CAUTION: Do not tighten the upper arm-to wheel knuckle until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.**

    Remove the upper trailing arm-to-wheel knuckle bolt and the wheel knuckle.
    - Discard the bolt.
    - To install, tighten to 250 Nm (184 lb-ft).

13. **CAUTION: Do not tighten the upper arm-to wheel knuckle bolt or the toe link-to-wheel knuckle bolt until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.**

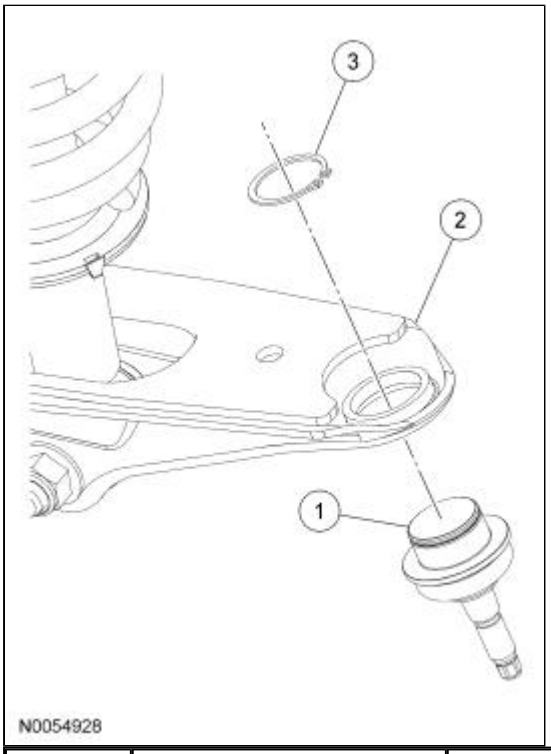
    To install, reverse the removal procedure.

Ball Joint — Lower

Printable View (185 KB)

Special Tool(s)

ST1172-A	Installer/Remover, C-Frame and Screw 205-086
ST2929-A	Installer/Remover, Ball Joint 204-358



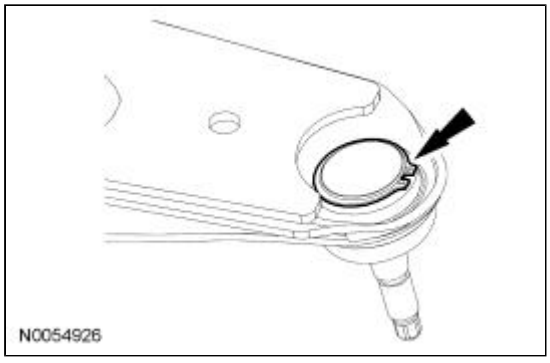
Item	Part Number	Description
1	—	Ball joint
2	5B530	Lower arm
3	—	Ball joint snap ring

Removal

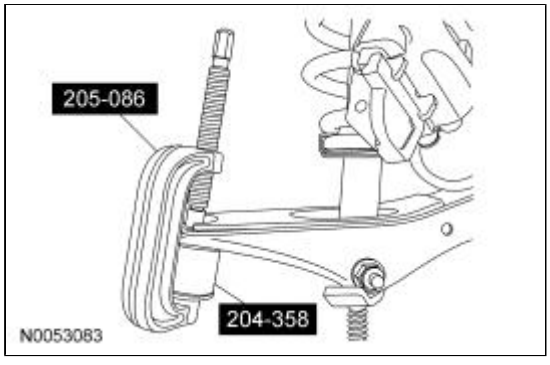
CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the

same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the wheel knuckle. For additional information, refer to Wheel Knuckle in this section.
2. Remove and discard the ball joint snap ring.



3. Using the special tools, remove the ball joint.

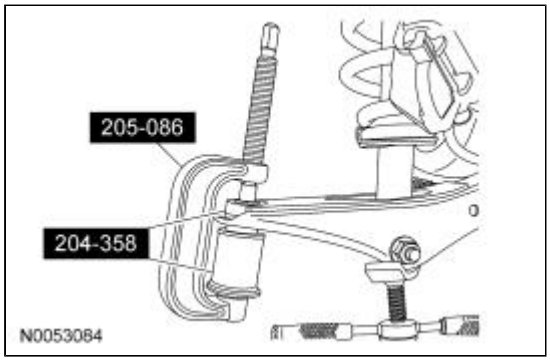


Installation

1. **CAUTION: Do not damage the ball joint boot when installing the special tool.**

   NOTE: Clean and inspect the ball joint bore for bore damage before installing a new ball joint.

   Using the special tool, install the ball joint.



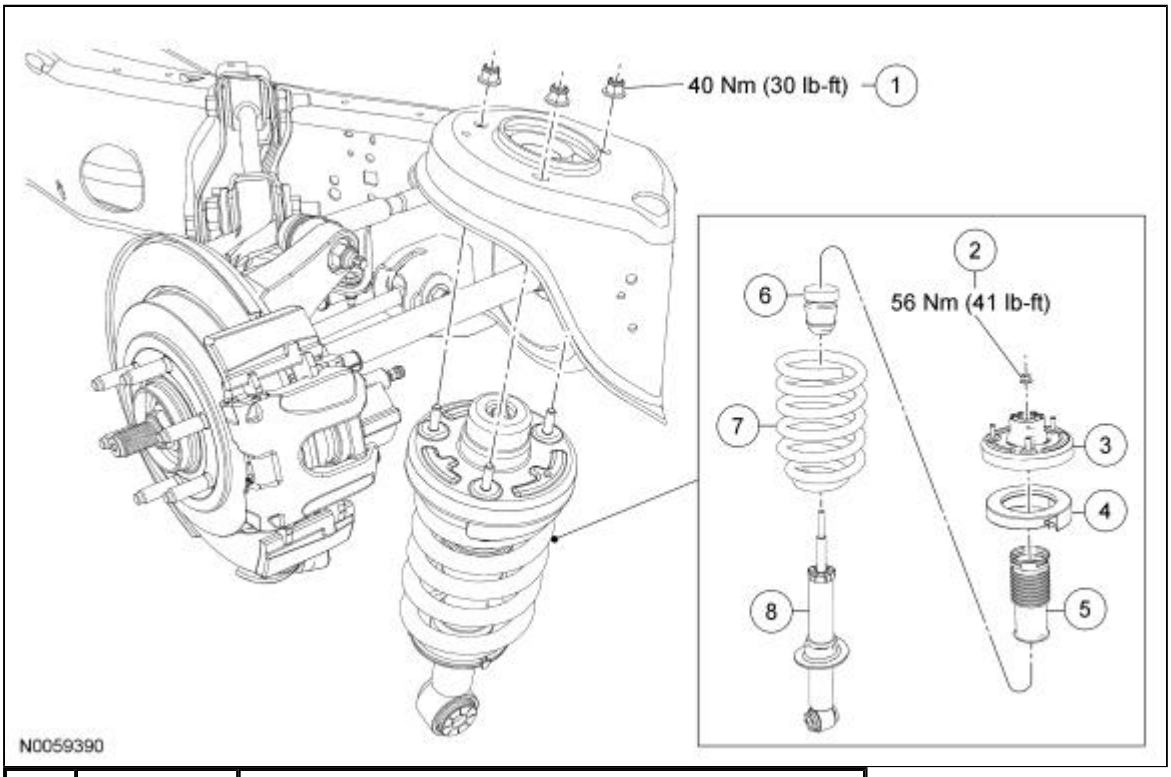
2. **NOTE:** Always use a new ball joint snap ring.

   Install a new snap ring.

3. Install the wheel knuckle. For additional information, refer to Wheel Knuckle in this section.

Shock Absorber and Spring Assembly

Printable View (241 KB)



Item	Part Number	Description
1	—	Shock absorber upper mount nut (3 required) (part of 18080 kit)
2	—	Shock rod nut (part of 18080 kit)
3	18A099	Upper mount
4	5536	Insulator
5	18A047	Dust boot
6	—	Jounce bumper (part of 18080 kit)
7	5534	Spring
8	18080	Shock absorber

Removal and Installation

CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the lower arm. For additional information, refer to Lower Arm in this section.
2. Remove and discard the upper mount nuts.

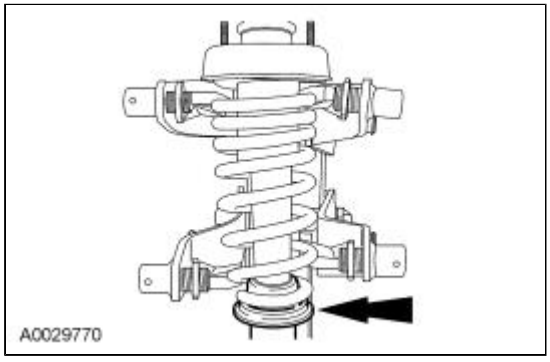
- To install, tighten to 40 Nm (30 lb-ft).

3. Remove the shock absorber and spring assembly.

4. **NOTE:** If the individual spring and/or shock components are not being serviced, continue with Step 7.

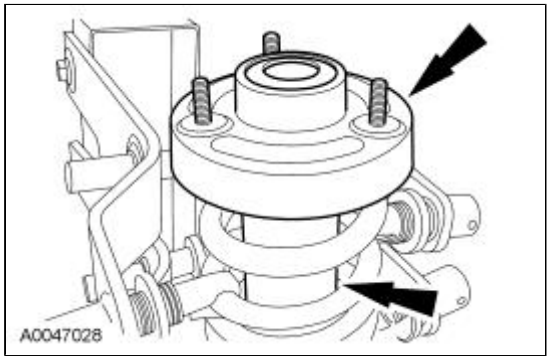
   NOTE: For reference during assembly, index the upper mount, spring and shock absorber.

   Using a suitable spring compressor, compress the spring until the tension is released from the shock absorber.



5. While holding the shock rod, remove the nut and washer.
   - Remove the shock absorber.
   - Discard the nut.
   - To install, tighten to 56 Nm (41 lb-ft).

6. Remove the upper mount, dust boot and insulator.



7. To install, reverse the removal procedure.

Wheels And Tires

Printable View (86 KB)

WARNING: Do not mix different types of tires on the same vehicle such as radial, bias or bias-belted tires except in emergencies (temporary spare usage), because vehicle handling may be seriously affected and may result in loss of control. Failure to follow these instructions may result in personal injury.

Factory-installed tires and wheels are designed to operate satisfactorily with loads up to and including full-rated load capacity when inflated to recommended inflation pressures.

Correct tire pressure and driving techniques have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increase tire wear.

To equalize tire wear, the tires should be rotated at recommended intervals.

Safety Precautions

WARNING: Never run the engine with one wheel off the ground, for example, when changing a tire. The wheel(s) resting on the ground could cause the vehicle to move. Failure to follow these instructions may result in personal injury.

WARNING: The tire and wheel must always be correctly matched. It is very important to determine the size of each component before any assembly operations commence. Failure to adhere to these instructions can result in an explosive separation and cause serious bodily injury or death.

WARNING: Aftermarket aerosol tire sealants are extremely flammable. Always question the customer to make sure these products have not been used. Failure to follow these instructions may result in personal injury.

WARNING: Aftermarket wheel assemblies may not be compatible with the vehicle. Use of incompatible wheel assemblies can result in equipment failure and possible injury. Use only approved wheel assemblies. Failure to follow these instructions may result in personal injury.

WARNING: Use only wheels and wheel nuts that have been designed for current model Ford trucks. Aftermarket wheels or wheel nuts may not fit or function correctly. Failure to follow these instructions may result in personal injury.

WARNING: Always wear safety goggles or a face shield when performing any work with the tire and wheel assemblies. Failure to follow these instructions may result in personal injury.

CAUTION: Reduce the air pressure as much as possible by pushing the valve core plunger in prior to removing the valve core. Avoid working in a position in which the face or body is directly over a tire in which there is pressure.

CAUTION: Do not clean aluminum wheels with steel wool, abrasive-type cleaners or strong detergents. Use Wheel and Tire Cleaner ZC-37-A or -B or equivalent.

When carrying out any inspection or repair procedures on wheels and tires, follow the preceding safety precautions.

Tire Pressure Monitoring System (TPMS)

The TPMS includes:

- the smart junction box (SJB), TPMS functionality is integrated within the SJB.
- four tire pressure sensors.
- four tire pressure sensor cradles.
- four tire pressure sensor straps.
- an instrument cluster indicator.
- a message center (if equipped).

TPMS System Module

The SJB contains the TPMS functionality. Refer to Tire Pressure Monitoring System in Diagnosis and Testing for TPMS fault diagnosis and repair.

The SJB compares the information of each tire pressure sensor transmission against a pressure limit. If the SJB determines that the tire pressure has fallen below the low limit, the SJB communicates this to the instrument cluster on the vehicle communication bus.

TPMS Pressure Sensor

The SJB monitors the air pressure in the 4 road tires with tire pressure sensors. The sensors transmit radio frequency (RF) signals to the SJB approximately every 60 seconds when the vehicle speed exceeds 32 km/h (20 mph).

The tire pressure sensors are battery operated and are mounted to metal brackets (called cradles) on the wheels inside the tires. The sensors are mounted 180 degrees from the valve stem.

The tire pressure sensor can be serviced separately from the cradle and the strap.

TPMS Pressure Sensor Cradle

The tire pressure sensor cradles are mounted to the wheels with metal straps and have an adhesive strip to aid in their retention to the wheel.

To service the sensor cradle, the strap must also be removed.

TPMS Pressure Sensor Strap

The sensor strap is what keeps the sensor and the cradle retained to the wheel. A factory-installed strap is joined together with a one-time use buckle and a dealer-installed strap is joined together with a worm gear (similar to a radiator hose clamp). Both straps should be discarded after removal and should not be re-used.

The strap can be serviced separately from the sensor and the cradle. The sensor is available separately from the cradle and the strap. The cradle and strap are available as a strap kit. There are several different strap kits available based on wheel diameter, all strap kits share the same base part number.

Instrument Cluster and Message Center

The instrument cluster illuminates the TPMS indicator when it receives a message from the SJB to do so and displays the appropriate message(s) in the message center (if equipped).

The instrument cluster and message center are diagnosed and serviced in their own respective workshop manual sections.

Wheels And Tires

Printable View (310 KB)

Special Tool(s)

ST2869-A	Digital Tire Gauge 204-354

Inspection and Verification

WARNING: A vehicle equipped with a Traction-Lok® differential will always have both wheels driving. If, while the vehicle is being serviced, only one wheel is raised off the ground and the rear axle is driven by the engine, the wheel on the ground could drive the vehicle off the stand or jack. Be sure both rear wheels are off the ground. Failure to follow these instructions may result in personal injury.

WARNING: Never run the engine with one wheel off the ground, for example, when changing a tire. The wheel(s) resting on the ground could cause the vehicle to move. Failure to follow these instructions may result in personal injury.

WARNING: Do not balance the wheels and tires while they are mounted on the vehicle. Possible tire disintegration or differential failure could result, causing personal injury and extensive component damage. Use off-vehicle wheel and tire balancer only. Failure to follow these instructions may result in personal injury.

Be sure to follow all warnings when carrying out Inspection and Verification.

Road Test

Verify the customer concern by carrying out a road test on a smooth road. If any vibrations are apparent, refer to Section 100-04 .

To maximize tire performance, inspect for signs of incorrect inflation and uneven wear, which may indicate a need for balancing, rotation or front suspension alignment.

Correct tire pressure and driving techniques have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increase tire wear.

Replacement tires must follow the recommended:

- tire sizes.
- speed rating.
- load range.

- tire construction type.

The use of any other tire size or type can seriously affect:

- ride.
- handling.
- speedometer/odometer calibration.
- vehicle ground clearance.
- tire clearance between the body and chassis.
- wheel bearing life.
- brake cooling.

New wheels need to be installed when the vehicle's wheels:

- are bent.
- are cracked.
- are dented.
- are heavily corroded.
- are leaking.
- have elongated wheel hub bolt holes.
- have excessive lateral or radial runout.

It is mandatory to use only the tire sizes recommended on the tire chart attached to the vehicle. Larger or smaller tires can damage the vehicle, affect durability and require changing the speedometer calibration. Make sure wheel size and offsets match those recommended for the tire in use.

1. Inspect the tires for signs of uneven wear. Refer to the following descriptions to identify the type of wear and the Symptom Chart for the appropriate repair action to be carried out.

2. Check the tires for:
    - cuts.
    - stone bruises.
    - abrasions.
    - blisters.
    - embedded objects.

3. Tread wear indicators are molded into the bottom of the tread grooves. Install a new tire when the indicator bands become visible.

Tire Wear

Tire wear is commonly defined as a loss of tread depth. Tire tread wear occurs due to friction with the contact surface (road/pavement). The tread should wear down uniformly all the way around the circumference of the tire and all the way across the tread face. When this does not occur, the tire may have abnormal/incorrect wear.

Normal Tire Wear

Normal tire wear is identified as even wear around and across the tread. Because there are many factors (driving style, road surfaces, type of vehicle, type of tire, etc.) that can affect tire wear, there is no absolute mileage expectation for a normal wear condition. A tire is considered worn-out when the tread has worn to the level of the tread-wear indicators.

Abnormal/Incorrect Tire Wear

Abnormal/incorrect tire wear is identified as tire wear that is not even around or across the tread and that creates performance-related issues.

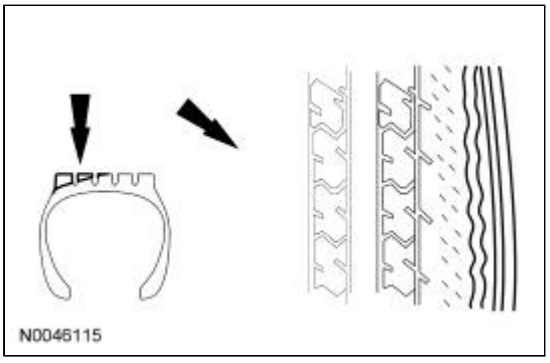
Abnormal/incorrect wear can be caused by numerous factors, some of which include driving style (aggressive, passive), climate (hot, cold), road conditions, vehicle loading and maintenance. It is important to determine the root cause of wear on a vehicle before carrying out repair. Tires exhibiting abnormal/incorrect tire wear may still be serviceable provided that the minimum tread depth is greater than 1.58 mm (2/32 in.) and the tire is not causing a vehicle performance (noise/vibration) concern

Some abnormal/incorrect wear patterns look the same all the way around the tread of the tire, other wear patterns are not consistent and can occur in various spots on the tread area. The underlying causes of the 6 wear categories are different. Refer to the following descriptions to identify the type of wear and the Symptom Chart for the appropriate repair action to be carried out.

Inner Edge/Shoulder Wear

Inner edge (or shoulder) wear occurs on the inside edge of the tire and is usually caused by excessive toe-out and/or excessive negative camber. If the tread depth of the outer shoulder is at least 50% greater than the tread depth of the inner shoulder, the tire is experiencing inner edge/shoulder wear. To determine whether tires have this type of wear, visually inspect the tires. In some instances, you may need to measure the tread depth of each rib and compare it to that of the shoulder.

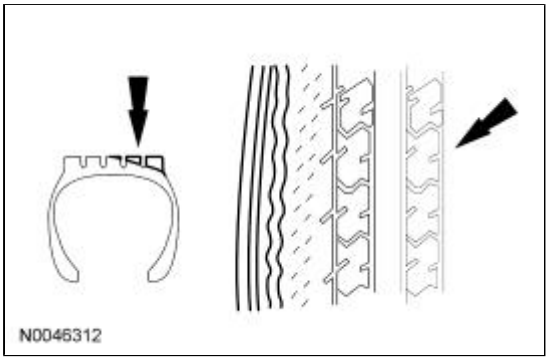
NOTE: RF tire shown, others similar.



Outer Edge/Shoulder Wear

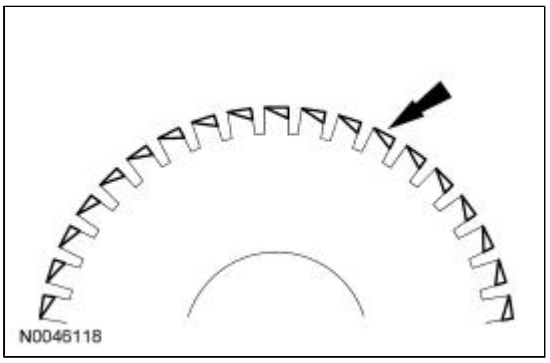
Outer edge (or shoulder) wear occurs on the outside edge of the tire and is usually caused by excessive toe-in and/or excessive positive camber. If the tread depth of the inner shoulder is at least 50% greater than the tread depth of the outer shoulder, the tire is experiencing outer edge/shoulder wear. To determine whether tires have this type of wear, visually inspect the tires. In some instances, you may need to measure the tread depth of each rib and compare it to that of the shoulder.

NOTE: RF tire shown, others similar.



Heel/Toe Wear

Heel/toe wear (also known as feathering) occurs along the outside or inside edge/shoulder of the tire. To determine whether tires have this type of wear, visually inspect the tires in both the inside and outside shoulder ribs. In some instances, you may need to measure the difference in tread depth of leading versus trailing edge of each lug in the inside and outside shoulder rib.



Diagonal Wear

Diagonal wear occurs diagonally across the tread area and around the circumference of the tire. To determine whether tires have this type of wear, visually inspect the tires to determine if the wear pattern runs diagonally across the tread and around the circumference of the tire. In some instances, you may need to measure the difference in tread depth along the diagonal wear pattern.

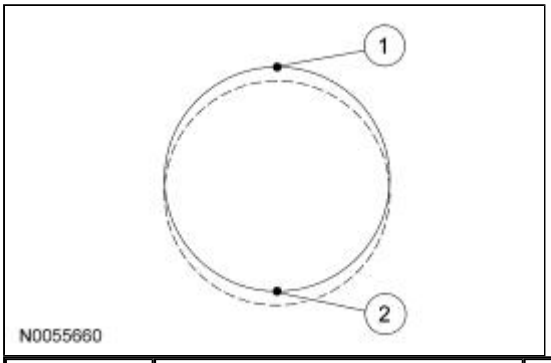
Component Tests

Wheel and Tire Runout

Some vehicles may exhibit a wheel and tire vibration caused by excessive runout. Runout measurements of the wheel and tire assembly can be taken both on and off the vehicle. Runout measurements can be taken both radially and laterally using a runout gauge. The runout gauge is a delicate, precision instrument and should be handled as such. The runout gauge should be mounted on a heavy solid base to eliminate gauge movement when measuring runouts. The measurements are taken using a runout gauge, which defines total runout in 64th or thousandths of an inch (depending on the brand of gauge used) and locates the high and low points of the runout.

Radial Runout

Radial runout is the egg-shaped deviation from a perfect circle and is measured perpendicular on a circumference. On a wheel and tire assembly this usually means measuring the center tire tread rib, although other tread ribs can be measured as well. The center rib is usually a solid rib, easy to measure and normally indicative of the condition of the tire as a whole. It is important to keep in mind that any rib with excessive runout can cause a concern. Total runout is the reading from the gauge. The high spot is the location of maximum runout.



Item	Part Number	Description
1	—	High spot
2	—	Low spot

NOTE: Warm up the tires prior to taking any measurements, this will eliminate slight flat spotting. This is done during a road test.

1. **CAUTION: Use only special tool 204-354, any time tire pressures are measured, to be sure that accurate values are obtained.**

   CAUTION: Place the air chuck straight on the valve stem to inflate the tire. Do not cock the air chuck during the inflation cycle. Doing so can damage the valve stem and cause air leaks.

   CAUTION: Ford Motor Company suggests using a round head air chuck on tire pressure sensors; it is not recommended to use air chucks with long shanks. Doing so can cause tire pressure sensor valve stem damage and loss of tire pressure.

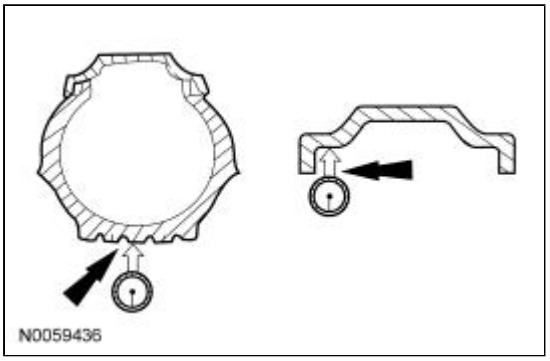
   Make sure that the tire pressures are set to the correct pressure as indicated on the vehicle label.

2. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-04 .

3. Make sure that all 4 positions can be measured. If measurements are to be taken with the wheel and tire assembly off the vehicle, mount each assembly on a suitable dynamic balancing machine.

4. For future reference of the original wheel and tire assemblies position on the wheel hub, index-mark the wheel and a wheel stud.

5. Position the runout gauge to take a radial measurement.
   - Rotate the wheel and tire assembly (or wheel) to locate the low spot.
   - Adjust the runout gauge to read 0.
   - Rotate the wheel and tire assembly (or wheel) one complete revolution to make sure that the low spot has been found and that the runout gauge dial returns to a 0 reading.

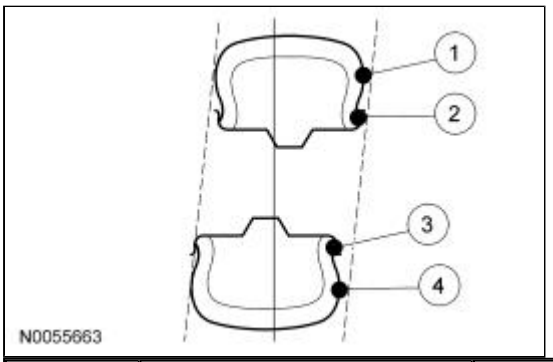


6. **NOTE:** If there is a vast difference in measurements taken from a wheel and tire assembly checked (on the vehicle) compared to readings taken (off the vehicle), check for excessive bolt circle runout, excessive hub runout or a fitting concern between the hub and wheel.

   While slowly and constantly rotating the wheel and tire assembly (or wheel), measure the radial runout.
   - Note the variance (runout) from 0 on the dial of the gauge.
   - If the runout reading of a wheel and tire assembly is not within 1.27 mm (0.050 in), locate and mark the high spot and proceed to Match Mounting Step 1 to correct the concern.
   - If the runout reading of a wheel is not within 1.27 mm (0.050 in), install a new wheel.

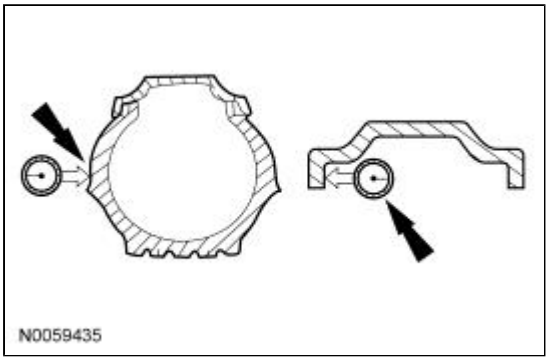
Lateral Runout

Lateral runout is a sideways variation causing a twist or wobble and is measured on a side surface. On the wheel and tire assembly, the lateral runout measurement should be taken as close to the tread shoulder as possible. Total runout is the reading from the gauge.



Item	Part Number	Description
1	—	Tire high spot
2	—	Wheel high spot
3	—	Tire low spot
4	—	Wheel low spot

1. Position the runout gauge to take a lateral measurement.
   - Rotate the wheel and tire assembly (or wheel) to locate the low spot.
   - Adjust the runout gauge to read 0.
   - Rotate the wheel and tire assembly (or wheel) one complete revolution to make sure that the low spot has been found and that the dial returns to a 0 reading.



2. **NOTE:** If there is a vast difference in measurements taken from a wheel and tire assembly checked (on the vehicle) compared to readings taken (off the vehicle), check for excessive bolt circle runout, excessive hub runout or a fitting concern between the hub and wheel.

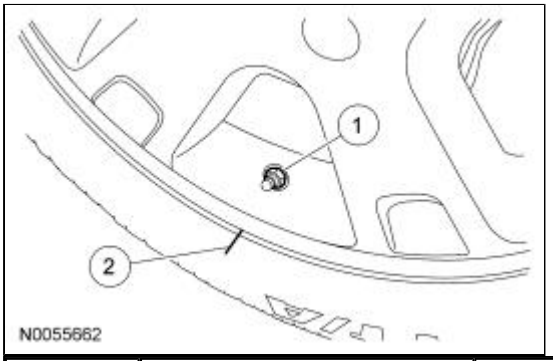
   While slowly and constantly rotating the wheel and tire assembly (or wheel), measure the lateral runout.
   - Note the variance (runout) from 0 on the dial of the gauge.
   - If the runout reading of a wheel and tire assembly is not within 1.27 mm (0.050 in), locate and mark the high spot and proceed to Match Mounting Step 1 to correct the concern.
   - If the runout reading of a wheel is not within 1.27 mm (0.050 in), install a new wheel.

Match Mounting

Match mounting is a technique used to reduce radial and lateral runouts on wheel and tire assemblies. Excessive runout is a source of ride quality complaints and match mounting can be used to minimize the runout. Match mounting can be accomplished by changing the position of the tire on the wheel or by changing the position of the wheel and tire assembly on the hub.

1. Remove the wheel and tire assembly. Refer to Wheel and Tire in this section.

2. Position the wheel and tire assembly on a suitable tire machine and put a reference mark on the tire sidewall at the valve stem position.



Item	Part Number	Description
1	—	Valve stem
2	—	Reference mark

3. **CAUTION: For tires equipped with a tire pressure monitoring system (TPMS), the sensor, cradle and strap can be damaged by incorrect tire mounting or dismounting. Dismount the tire from the wheel as instructed in the Disassembly and Assembly procedure. Failure to follow these instructions can result in TPMS component damage.**

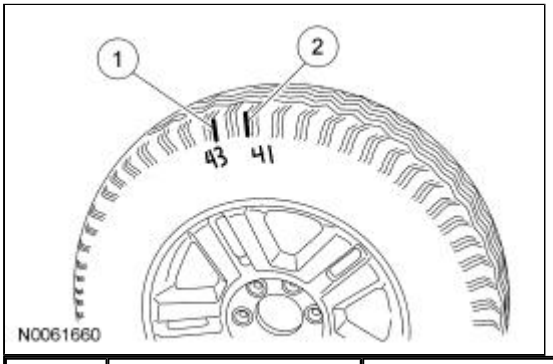
   Using a suitable tire machine, break the tire down from the wheel.

- Position the tire 180 degrees (half-way around) on the rim so the tire reference mark made in Step 2 is opposite the valve stem.

4. Re-inflate the wheel and tire assembly to the specified air pressure and measure the assembly runout again. Mark the second high spot on the tire.
   - If the runout is reduced to within specifications, the problem has been solved.

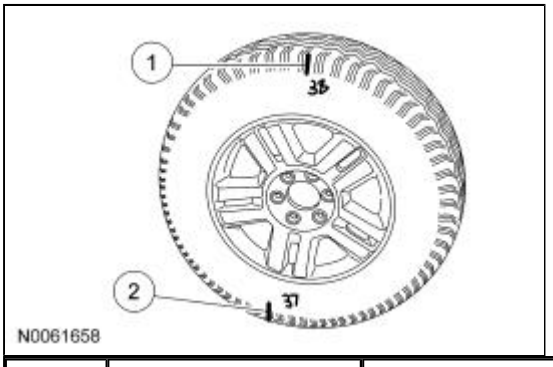
5. If the second runout measurement is still not within specification and both measurements are close to each other (within 101.6 mm [4 in]), the root cause is probably the tire.
   - **NOTE:** To be **SURE** that the tire is causing the high runout, you must have 2 runout measurements that are not within specification and the high spots must be in approximately the same location on the tire's sidewall. In other words, the high spot followed the tire when it was repositioned 180 degrees on the wheel.

     If the second high spot is not within 101.6 mm (4 in) of the first high spot, proceed to the next step.



Item	Part Number	Description
1	—	First high spot on the tire
2	—	Second high spot on the tire

6. If the second high spot is still above specification and is within 101.6 mm (4 in) of being opposite the first high spot on the wheel, the root cause is probably the wheel (the high spot followed the wheel). Dismount the tire from the wheel, mount the wheel on a balancer and check the wheel runout. Install a new wheel if the wheel runout exceeds 1.27 mm (0.050 in).



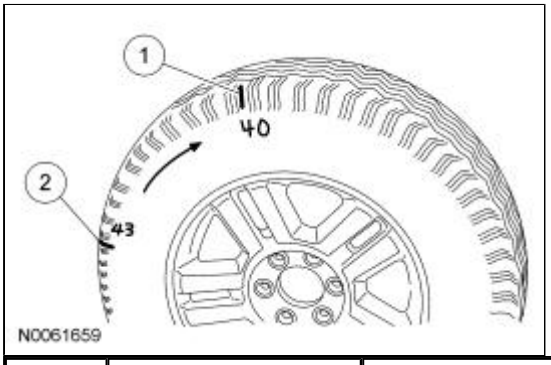
Item	Part Number	Description
1	—	First high spot on the tire
2	—	Second high spot on the tire

7. **NOTE:** If the second high spot did not follow the wheel or the tire and the runout is still not within specification, you may make improvements by rotating the tire 90 degrees (1/4 of a turn).

   Draw an arrow on the tire sidewall from the second high spot towards the first high spot (in the

shortest direction).

- Rotate the tire 90 degrees (1/4 of a turn) in the direction of the arrow.



Item	Part Number	Description
1	—	First high spot on the tire
2	—	Second high spot on the tire

8. Install the wheel and tire assembly. Refer to Wheel and Tire in this section.
    - Align the wheel and tire assembly using the index mark made on the wheel and wheel stud during removal.

Tire Pressure Monitoring System

Printable View (269 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2941-A	Activation Tool, Tire Pressure Monitor 204-363
ST2869-A	Digital Tire Gauge 204-354

Principles of Operation

The tire pressure monitoring system (TPMS) monitors the air pressure of all 4 road tires. The wheel-mounted tire pressure sensors transmit via radio frequency (RF) signals, to the smart junction box (SJB). TPMS functionality is integral to the SJB. These transmissions are sent approximately every 60 seconds when the vehicle speed exceeds 32 km/h (20 mph). The TPMS function compares each tire pressure sensor transmission against a low-pressure limit. If it has been determined that the tire pressure has fallen below this limit, the SJB communicates this on the vehicle communication bus to the instrument cluster. The instrument cluster then illuminates the TPMS indicator and displays the appropriate message(s) in the message center (if equipped).

The system is not affected by wheel and tire rotation.

Ambient Temperature Change and Tire Pressure

CAUTION: Do not inflate tire higher than maximum pressure stamped on tire sidewall.

Tire pressures fluctuate with temperature changes. For this reason, tire pressure must be set to specification when tires are at outdoor ambient temperatures. If the vehicle is allowed to warm up to shop temperatures, and the outside temperature is less than shop temperature, the tire inflation pressure must be adjusted accordingly.

If the tires are inflated to specification at shop temperatures, and the vehicle is moved outdoors when the outdoor ambient temperature is significantly lower, the tire pressure may drop enough to be detected by the tire pressure monitoring system (TPMS) and activate the TPMS warning lamp.

As the ambient temperature decreases by 6°C (10°F), tire pressure decreases 7 kPa (1 psi). Adjust the tire pressure by 7 kPa (1 psi) for each 6°C (10°F) ambient temperature drop as necessary to keep the tire at the specified vehicle certification label pressure. Refer to the following tables to adjust the tire pressure indoors for colder outside temperatures.

Table 1. Use Table to Adjust Tire Pressure Inside Garage for Colder Outside Temperature[1]

** Do Not Inflate Tire Higher than Maximum Pressure Stamped on Tire Sidewall. **

Table is based on a Garage Temperature of 70˚F. Max Pressure Adjustment is 7 psi.

-40	255	270	285	290	310	325	330	340	360	395	425	460	495	530	565	600	635	670

[1]When Outside (Ambient) Temperature is greater than 21˚C (70˚F), Inflate tires to placard pressure.
[1]Use the table to adjust tire pressure for P-metric and LT tires only.
[1]Do NOT use table for Commercial Truck Tires (i.e. 19.5 inch tires for F450 & F550). See F-Super Duty Service Manual for tire inflation procedure.

N0057700

TPMS Indicator and Message Center Messages

The TPMS indicator and vehicle message center (if equipped) sometimes displays faults that cannot be resolved by the customer. Treat these messages as TPMS faults that must be serviced.

TPMS Indicator Illuminates Continuously

NOTE: If the spare tire is in use, the damaged road tire must be repaired and installed on the vehicle to restore complete TPMS functionality before carrying out any diagnosis.

1. The TPMS indicator remains on continuously for the following condition:
    - Low Tire Pressure — The TPMS indicator is illuminated solid and the message center displays LOW TIRE PRESSURE (if equipped). This is displayed when any of the tire pressures are low. When this condition exists, the tire pressure must be adjusted to the

recommended cold pressure as indicated on the vehicle certification label.

2. **NOTE:** The TPMS sensors do not transmit when the vehicle is stationary. If the vehicle has been stationary for more than 30 minutes, it will be necessary to wake up the sensors so they will transmit the latest tire pressure information to the SJB.

   If the vehicle has been stationary for more than 30 minutes, perform the following procedure to wake up the TPMS sensors.
   1. Turn the ignition switch to the ON position.
   2. Adjust the air pressure in the LF tire (as necessary).
   3. Activate the LF TPMS sensor, at least 2 times, using the tire pressure monitor activation tool.
   4. Repeat Steps 2 and 3 for the remaining tires.
   5. If the TPMS indicator remains illuminated after adjusting and activating each sensor, GO to Symptom Chart .

TPMS Indicator Flashes

The TPMS indicator flashes for 70 seconds, then remains ON solid when the ignition switch is turned to the ON position, for the following conditions:

1. Tire Pressure Sensor Fault — If equipped, the message center will display TPMS SENSOR FAULT when a tire pressure sensor is malfunctioning. GO to Symptom Chart .

2. No communication with the SJB (TPMS is integral to the SJB) — The TPMS indicator is illuminated when the instrument cluster has received no signals from the SJB for more than 5 seconds. If equipped, the message center displays TPMS MONITOR FAULT. GO to Symptom Chart .

3. Tire Pressure Monitor Fault — If equipped, the message center will display TPMS MONITOR FAULT when the tire pressure monitoring system is malfunctioning or communication with the instrument cluster has been lost. GO to Symptom Chart .

Inspection and Verification

1. **NOTE:** The tire pressure sensors are not designed to be used with aftermarket wheels.

   NOTE: The use of run-flat tires (tires with steel body cord plies in the tire sidewall) where not originally equipped, may cause the TPMS system to malfunction and is therefore not recommended.

   Verify the customer concern by inspecting the vehicle and observing the message center (if equipped) and the TPMS indicator.

2. **NOTE:** The valve-mounted TPMS sensors and the strap-mounted TPMS sensors are not compatible. Swapping wheels from one vehicle to another with the different systems will set a TPMS fault.

   NOTE: Swapping wheels between vehicles with the same tire pressure monitoring system will cause a TPMS fault to be set if the sensors are not trained. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.

   NOTE: Non-original equipment manufacturer (OEM) modifications made to the vehicle may result in false TPMS warnings.

Inspect to determine if one of the following mechanical or electrical concerns apply:

Visual Inspection Chart

Mechanical	Electrical
• Low tire pressure • TPMS sensor damaged or missing • Spare tire installed as a road wheel • Incorrect TPMS sensor installed • TPMS sensor installed incorrectly • Non-OEM wheels installed (aftermarket rims) • Non-OEM equipped run-flat tires installed • Other non-OEM modifications (roll cages, service barriers, part racks, ladder racks)	• Circuitry • Electrical connectors • SJB missing or damaged • Aftermarket electronic accessories

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record continuous memory diagnostic trouble codes (DTCs).

8. Clear the continuous DTCs and carry out the self-test diagnostics for the tire pressure monitoring system (TPMS) module.

9. If the DTCs retrieved are related to the concern, go to the Tire Pressure Monitoring System (TPMS) Module Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Tire Pressure Monitor System (TPMS) Diagnostic Trouble Code (DTC) Chart

Tire Pressure Monitor System (TPMS) Diagnostic Trouble Code (DTC) Chart

DTC	Description	Source	Action
B106A	Pressure Sensor Range Bit Incorrect State	SJB	Go To Pinpoint Test H .
B2477	Module Configuration Failure/Mismatch	SJB	DTC B2477 is only present when a new SJB is installed, the SJB is incorrectly flashed or the SJB is incorrectly configured. Successfully configuring the SJB is the only way to clear this DTC. Make sure the SJB is configured correctly. If DTC B2477 is still present, REFER to Section 418-00 .
B2868	Left Front Tire Pressure Sensor Fault	SJB	DTC B2868 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
B2869	Right Front Tire Pressure Sensor Fault	SJB	DTC B2869 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
B2870	Right Rear Tire Pressure Sensor Fault	SJB	DTC B2870 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
B2871	Left Rear Tire Pressure Sensor Fault	SJB	DTC B2871 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
B2872	Tire Pressure Sensor Fault	SJB	**NOTE:** If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the smart junction box (SJB). POSITION the tire pressure monitor activation tool against the LH tire sidewall 180 degrees from the tire valve stem. PRESS the test button on the activation tool. The activation tool will provide feedback in the form of a flashing green light and a beep sound for each successful response from a tire pressure sensor. REPEAT this procedure for the remaining 3 sensors. Go To Pinpoint Test G .
B287A	Tire Pressure System Fault	SJB	Go To Pinpoint Test G .
C2780	ECU in Manufacturing Mode	SJB	DTC C2780 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
U0155	Lost Communication with Instrument Cluster	SJB	REFER to Section 418-00 to diagnose the no communication problem.

Symptom Chart

NOTE: The tire pressure monitoring system (TPMS) is not affected by wheel and tire rotation.

Failure of a TPMS component may not cause the message center to display a fault message or a DTC

to be stored. The Symptom Chart is a starting point to begin diagnosis of these concerns.

Symptom Chart

Condition	Possible Sources	Action
• TPMS indicator ON continuously and message center (if equipped) displays LOW TIRE PRESSURE	• Spare tire currently in use • Air pressure not set to specifications listed on the vehicle certification label	• INSTALL the repaired road wheel/tire in place of the spare tire. • Go To Pinpoint Test E .
• SJB will not enter sensor training mode when using the TPMS sensor training procedure	• Brake on/off (BOO) switch • Ignition switch • Vehicle communication bus • Smart junction box (SJB)	• Go To Pinpoint Test F .
• TPMS indicator FLASHES for 70 seconds and then remains ON solid when the ignition key is turned to the ON position and DTC B2872 is present	• TPMS sensor(s) • TPMS sensor(s) not trained to the SJB • SJB	• **NOTE:** If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the smart junction box (SJB). POSITION the tire pressure monitor activation tool against the LH tire sidewall 180 degrees from the tire valve stem. PRESS the test button on the activation tool. The activation tool will provide feedback in the form of a flashing green light and a beep sound for each successful response from a tire pressure sensor. REPEAT this procedure for the remaining 3 sensors. Go To Pinpoint Test G .
• TPMS indicator FLASHES for 70 seconds and then remains ON solid when the ignition key is turned to the ON position, the message center (if equipped) displays TIRE MONITOR FAULT and DTC B287A is present	• All TPMS sensors not trained to the SJB or all TPMS sensors are not installed	• **NOTE:** If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the smart junction box (SJB). POSITION the tire pressure monitor activation tool against

		the LH tire sidewall 180 degrees from the tire valve stem. PRESS the test button on the activation tool. The activation tool will provide feedback in the form of a flashing green light and a beep sound for each successful response from a tire pressure sensor. REPEAT this procedure for the remaining 3 sensors. Go To Pinpoint Test G .
• TPMS indicator FLASHES for 70 seconds and then remains ON solid when the ignition key is turned to the ON position, the message center (if equipped) displays TIRE MONITOR FAULT and there are no DTCs present	• Vehicle communication issue between the SJB and the instrument cluster • SJB	• REFER to Section 418-00 to diagnose the no communication concern. • REFER to Section 419-10 to diagnose the SJB.
• One or more sensors will not train	• Tire pressure sensor(s) • Vehicle communication issue • SJB	• RETRIEVE and RECORD DTCs. REFER to Tire Pressure Monitor System (TPMS) Diagnostic Trouble Code (DTC) Chart.

Pinpoint Tests

Pinpoint Test E: TPMS Indicator ON Continuously And Message Center (If Equipped) Displays LOW TIRE PRESSURE

Normal Operation

The tire pressure monitoring system (TPMS) monitors the air pressure of all 4 road tires. The wheel-mounted tire pressure sensors transmit via radio frequency (RF) signals, to the smart junction box (SJB). TPMS functionality is integral to the SJB. These transmissions are sent approximately every 60 seconds when the vehicle speed exceeds 32 km/h (20 mph). The TPMS function (integral to the SJB) compares each tire pressure sensor transmission against a low-pressure limit. If it has been determined that the tire pressure has fallen below this limit, the SJB communicates this on the vehicle communication bus to the instrument cluster. The instrument cluster then illuminates the TPMS indicator and displays the appropriate message(s) in the message center (if equipped).

Possible Causes

- Low air pressure in tire(s)
- Tire pressure sensor(s)

PINPOINT TEST E: TPMS INDICATOR ON CONTINUOUSLY AND MESSAGE CENTER (IF EQUIPPED) DISPLAYS LOW TIRE PRESSURE

CAUTION: Use only special tool 204-354 any time tire pressures are measured to be sure that accurate values are obtained.

NOTE: If a warranty case is opened for an actual TPMS fault, document and include the actual tire pressure data in all warranty communications.

Test Step	Result / Action to Take
E1 CHECK THE TIRE PRESSURE	
• Measure and record the air pressure in all 4 road tires. • Adjust the air pressure for those found to be below the specification listed on the vehicle certification label. • **NOTE:** If the vehicle has been stationary for more than 30 minutes, activate each TPMS sensor at least 2 times with the tire pressure monitor activation tool. The TPMS sensor does not transmit when the vehicle is stationary. • Verify system operation. • **Have the TPMS indicator and the message center (if equipped) warnings gone out?**	**Yes** The system is functioning normally, diagnosis is complete. INFORM the customer of correct tire pressure maintenance as instructed in the scheduled maintenance guide and the owner guide. **No** GO to E2 .
E2 CHECK THE SYSTEM COMPONENTS	
• Train all 4 tire pressure sensors. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • Using the scan tool, read and record the tire pressures: LF_PRES, RF_PRES, RR_PRES and LR_PRES. • Compare the air pressure readings recorded from the function test to those recorded in A1. • **Do the compared tire pressure values match within ±5 psi, and have the TPMS indicator and the message center (if equipped) warnings gone out?**	**Yes** The system is functioning normally, diagnosis complete. **No** **Before installing a new sensor(s):** If a sensor(s) does not respond to the special tool, ATTEMPT to activate the same sensor(s) with the special tool. If the sensor(s) still does not respond, MOVE the vehicle to rotate the wheels at least 1/4 of a turn and ATTEMPT to activate the same sensor(s) again. INSTALL new tire pressure sensors for those with discrepancies. REFER to Tire Pressure Monitoring System (TPMS) Sensor in this section.

Pinpoint Test F: SJB Will Not Enter Sensor Training Mode

Normal Operation

For the smart junction box (SJB) to enter tire pressure monitoring system (TPMS) sensor training mode, the SJB must receive valid inputs from the brake pedal position switch (OFF-ON-OFF) and ignition switch (both OFF and RUN), and it must receive valid vehicle speed sensor input (0 km/h [0 mph]). Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section for the complete sensor training procedure.

Possible Causes

- Circuit open
- Circuit shorted
- Brake on/off (BOO) switch
- Ignition switch
- Smart junction box (SJB)

PINPOINT TEST F: SJB WILL NOT ENTER SENSOR TRAINING MODE

Test Step	Result / Action to Take
F1 CHECK THE BRAKE PEDAL POSITION (BPP)/BRAKE ON/OFF (BOO) SWITCH	
• Using the scan tool, monitor the SJB BPP/BOO switch PID (SJB reads the brake switch directly). • Press and release the brake pedal while monitoring the PID. • **Do the brake pedal PID values match the brake pedal positions?**	**Yes** GO to F2 . **No** REFER to Section 417-01 to continue diagnosis of the brake pedal switch.
F2 CHECK THE IGNITION SWITCH	
• Using the scan tool, monitor the SJB ignition switch status PID. • Cycle the ignition switch to the ON and OFF position while monitoring the PID (SJB reads the ignition switch directly). • **Do the ignition switch status PID values match the ignition switch positions?**	**Yes** GO to F3 . **No** REFER to Section 211-05 to continue diagnosis of the ignition switch.
F3 CHECK THE VEHICLE SPEED INPUT TO THE SJB	
• Using the scan tool, monitor the SJB vehicle speed PID (SJB receives vehicle speed from the powertrain control module [PCM]). • **Does the vehicle speed PID value match the speed of the vehicle?**	**Yes** GO to F4 . **No** REFER to Section 413-01 to diagnose the vehicle speed concern.
F4 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check the connectors for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect all the SJB connectors and make sure that they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: TPMS Indicator FLASHES For 70 Seconds And Then Remains ON Solid When The Ignition Key Is Turned To The ON Position And DTC B2872 or B287A are Present

Normal Operation

If there is a fault in the tire pressure monitoring system (TPMS), such as a damaged or missing sensor

(s), damaged module or a communication issue within the vehicle, DTCs are set in the smart junction box (SJB), the TPMS warning indicator will flash for 70 seconds and then remain ON solid when the ignition switch is turned to the ON position and the message center (if equipped) will display TIRE PRESSURE SENSOR FAULT.

If the SJB does not get a response from all of the TPMS sensors, DTC B287A may be set and the message center (if equipped) will display TIRE PRESSURE MONITOR FAULT.

Possible Causes

- TPMS sensor(s) missing
- TPMS sensor(s) not trained to the vehicle
- TPMS sensor(s) swapped due to wheel swap
- TPMS sensor(s) damaged
- Vehicle communication issue
- SJB

PINPOINT TEST G: TPMS INDICATOR FLASHES FOR 70 SECONDS AND THEN REMAINS ON SOLID WHEN THE IGNITION KEY IS TURNED TO THE ON POSITION AND DTC B2872 OR B287A ARE PRESENT

NOTE: If a warranty case is opened for an actual TPMS fault, document and include the actual tire pressure data in all warranty communications.

Test Step	Result / Action to Take
G1 CHECK FOR DTCs • Connect the scan tool. • Using the scan tool, read the TPMS sensor IDs currently trained to the SJB. • Using the scan tool, read the TPMS system status PID: TP_STAT. • **Is the TP_STAT PID equal to SENSOR FAULT?**	**Yes** GO to G2 . **No** If the TP_STAT PID is equal to SYSTEM FAULT, GO to G3 .
G2 CARRY OUT THE SENSOR TRAINING PROCEDURE • Train all 4 tire pressure sensors. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • **Did all of the tire pressure sensors transmit correctly and did the horn sound when each tire pressure sensor transmitted to the SJB?**	**Yes** Using the scan tool, locate the updated TPMS sensor IDs trained to the SJB module. COMPARE these values to those recorded prior to the TPMS sensor training procedure. Disregarding sensor position (the system is not affected by tire rotation), any sensor IDs that do not match those retrieved from the module were changed but not retrained. The sensors are now trained to the vehicle, diagnosis is complete. DOCUMENT all TPMS sensor IDs on the applicable warranty claim. VERIFY system operation. **No** **Before installing a new sensor(s)** : If a sensor(s) does not respond to the special tool, ATTEMPT to activate the same sensor(s) with the special tool. If the sensor(s)

	still does not respond, MOVE the vehicle to rotate the wheels at least 1/4 of a turn and ATTEMPT to activate the same sensor(s) again. If the sensor(s) fail to train a second time, INSTALL a new tire pressure sensor(s). REFER to Tire Pressure Monitoring System (TPMS) Sensor .
G3 TP_STAT PID EQUALS SYSTEM FAULT WITH DTC B287A PRESENT • Train all 4 tire pressure sensors. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • **Did all of the tire pressure sensors transmit correctly and did the horn sound when each tire pressure sensor transmitted to the SJB?**	**Yes** Using the scan tool, locate the updated TPMS sensor IDs trained to the SJB module. COMPARE these values to those recorded prior to the TPMS sensor training procedure. Disregarding sensor position (the system is not affected by tire rotation), any sensor IDs that do not match those retrieved from the module were changed, but not retrained. The sensors are now trained to the vehicle, diagnosis is complete. DOCUMENT all TPMS sensor IDs on the applicable warranty claim. VERIFY system operation. **No** **Before diagnosing the SJB** : If the sensors do not respond to the special tool, ATTEMPT to activate the same sensors with the special tool a second time. If the sensors still do not respond, MOVE the vehicle to rotate the wheels at least 1/4 of a turn and ATTEMPT to activate the same sensors again. **Note:** the sensors may not be present. DISMOUNT the tire, REFER to Wheel and Tire in this section. VERIFY that the sensors are present and mounted to the wheels. If missing, INSTALL new sensors. If the sensors are present but all 4 sensors failed to train the second time, GO to G4 .

G4 CHECK FOR CORRECT SJB OPERATION
 	
• Disconnect all the SJB electrical connectors.
• Check the connectors for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect all the SJB connectors and make sure that they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB module. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test H: DTC B106A — Pressure Sensor Range Bit Incorrect State

Normal Operation

This DTC may be encountered if a high-pressure sensor (designed for trucks with much higher tire

pressures and molded in green plastic) was installed. The SJB will only allow a low-pressure sensor to be trained using the TPMS sensor training procedure. Make sure the correct sensors are used to avoid compatibility issues.

Possible Causes

- Tire pressure sensor(s)
- Incorrect tire pressure sensor(s) installed
- SJB

PINPOINT TEST H: DTC B106A — PRESSURE SENSOR RANGE BIT INCORRECT STATE

Test Step	Result / Action to Take
H1 DETERMINE IF THE VEHICLE IS EQUIPPED WITH AN INCORRECT SENSOR	
• Train all 4 tire pressure sensors. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • **Did all of the tire pressure sensors transmit correctly and did the horn sound when each tire pressure sensor transmitted to the SJB?**	**Yes** CLEAR the DTCs. REPEAT the self-test. VERIFY system operation. **No** **Before installing a new sensor(s)** : If a sensor(s) does not respond to the special tool, ATTEMPT to activate the same sensor(s) with the special tool. If the sensor(s) still does not respond, MOVE the vehicle to rotate the wheels at least 1/4 of a turn and ATTEMPT to activate the same sensor(s) again. If the sensor(s) fail to train a second time, INSTALL a new tire pressure sensor(s). REFER to Tire Pressure Monitoring System (TPMS) Sensor .

Tire Pressure Monitoring System (TPMS) Sensor Training

Printable View (123 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2941-A	Activation Tool, Tire Pressure Monitor 204-363

NOTE: If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the smart junction box (SJB). Refer to TPMS Indicator Illuminates Continuously in the Principles of Operation portion of the Tire Pressure Monitoring System Diagnosis and Testing section.

NOTE: The tire pressure sensor training procedure must be done on a single vehicle, in an area without radio frequency (RF) noise and at least 1 meter (3 feet) away from other vehicles equipped with TPMS.

RF noise is generated by electrical motors and appliance operation, cellular telephones, remote transmitters, power inverters and portable entertainment equipment.

NOTE: If a sensor does not respond to the activation tool, attempt to activate the same sensor with the activation tool. If the sensor still does not respond, move the vehicle to rotate the wheels at least 1/4 of a turn and attempt to activate the same sensor again.

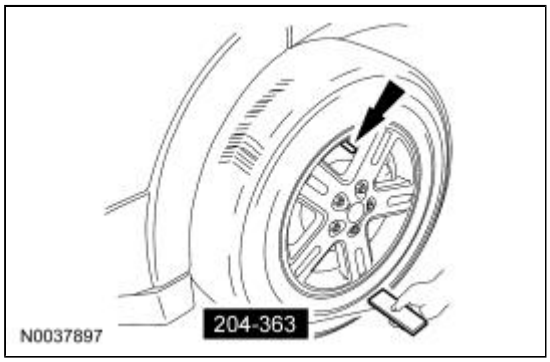
NOTE: The SJB has a 2 minute time limit between sensor responses. If the SJB does not recognize any 1 of the 4 tire pressure sensors during this time limit, the horn will sound twice and the message center (if equipped) will display TIRE NOT TRAINED REPEAT and the entire procedure must be repeated.

NOTE: The tire pressure monitoring system is not affected by wheel and tire rotation.

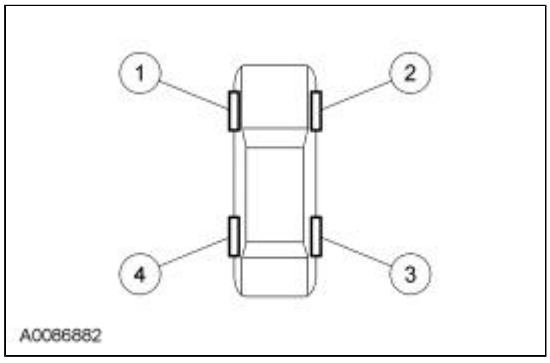
1. Turn the ignition switch to the OFF position, then press and release the brake pedal.
2. Cycle the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position.
3. Press and release the brake pedal.
4. Turn the ignition switch to the OFF position.
5. Turn the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position.
    - The horn will sound once and the TPMS indicator will flash if the training mode has been entered successfully. If equipped, the message center will display TRAIN LF TIRE.

6. **NOTE:** It may take up to 6 seconds to activate a tire pressure sensor. During this time, the activation tool must remain in place 180 degrees from the valve stem.

   Place the activation tool on the LF tire sidewall opposite (180 degrees) from the valve stem. Press and release the test button on the special tool. The horn will sound briefly to indicate that the tire pressure sensor has been recognized by the smart junction box (SJB).



7. Within 2 minutes of the horn sounding, place the activation tool on the RF tire sidewall opposite (180 degrees) from the valve stem and press and release the test button to train the RF tire pressure sensor.



8. **NOTE:** Do not wait more than 2 minutes between training each sensor or the SJB will time out and the entire procedure must be repeated.

   Repeat Step 7 for the RR and LR tires.
   The procedure is completed after the last tire has been trained. When the training procedure is complete, the message center (if equipped) will display TIRE TRAINING COMPLETE.
   For vehicles not equipped with a message center, successful completion of the training procedure will be verified by turning the ignition switch to the OFF position without the horn sounding. If the horn sounds twice when the switch is turned to the OFF position, the training procedure was not successful.

9. Using the scan tool, locate the updated TPMS sensor IDs trained to the SJB and document them on the applicable warranty claim.

10. **NOTE:** This step is required to clear DTC C2780, cause the SJB to exit the manufacturing mode and to make sure there are no other concerns with a newly programmed SJB.

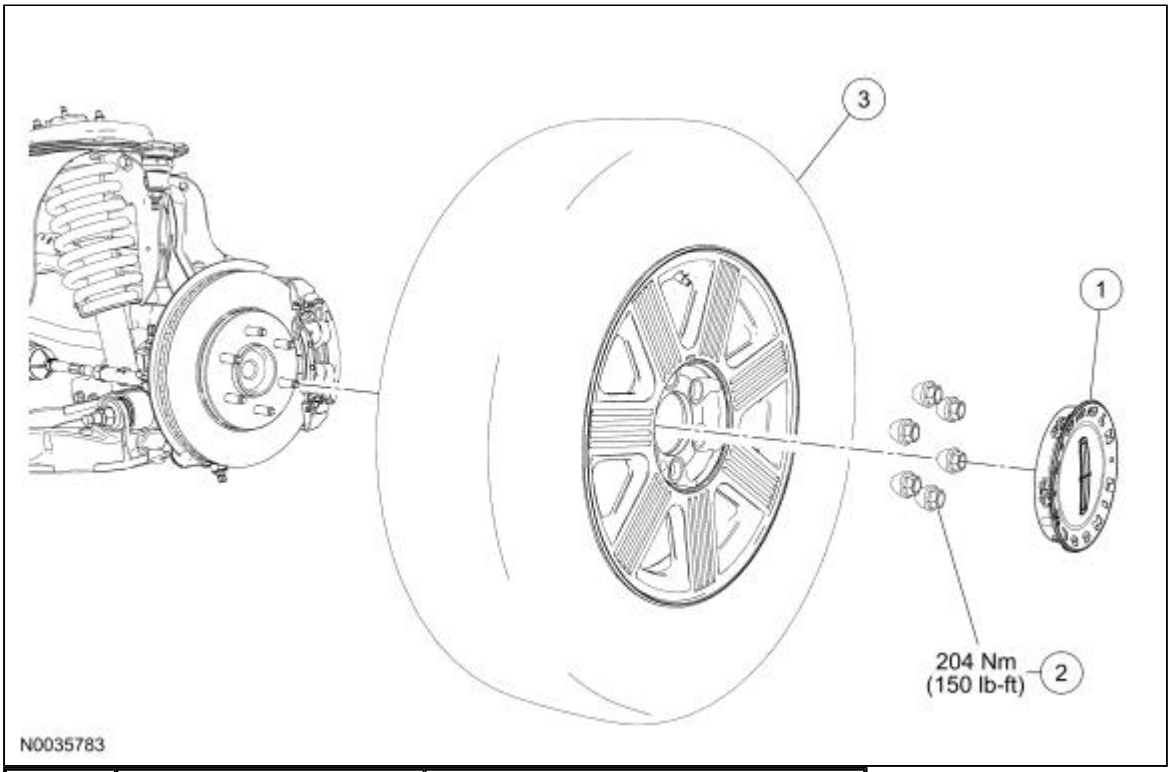
    If the sensors are being trained due to the installation of a new SJB, clear any DTCs and perform the SJB on-demand self-test.

Wheel and Tire

Printable View (197 KB)

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2 (US); CXG-2-B (Canada)	ESE-M12A4-A



Item	Part Number	Description
1	1A096	Center cap
2	W706943/1012	Wheel nut (6 required)
3	1007/1508	Wheel/tire assembly

Removal

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH rear quarter trim panel. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations. Failure to follow these instructions may result in personal injury.

1. If equipped, turn the air suspension switch to the OFF position.

2. **NOTE:** To avoid damage or scratching to the center cap, place facing up when removed.

If equipped, remove the center cap.

3. **CAUTION: Do not use heat to loosen a seized wheel nut. Heat can damage the wheel and wheel bearings.**

   With the weight of the vehicle on the wheels, loosen the wheel nuts.

4. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

5. Remove the wheel nuts and the wheel and tire assembly.

Installation

1. **WARNING: Before a wheel is installed, always remove any corrosion, dirt or foreign material present on the mounting surfaces of the wheel or the surface of the wheel hub, brake drum or brake disc that contacts the wheel. Installing wheels without correct metal-to-metal contact at the wheel mounting surfaces can cause the wheel nuts to loosen and the wheel to come off while the vehicle is in motion, causing loss of control. Failure to follow these instructions may result in personal injury.**

   WARNING: Retighten the wheel nuts at 160 km (100 miles) after any wheel change or any time the wheel nuts are loosened. Failure to follow these instructions may result in personal injury.

   WARNING: Failure to retighten wheel nuts at the mileage specified can allow wheels to come off while the vehicle is in motion, possibly causing loss of vehicle control and collision. Failure to follow these instructions may result in personal injury.

   Clean the wheel-to-wheel hub mounting surface(s).

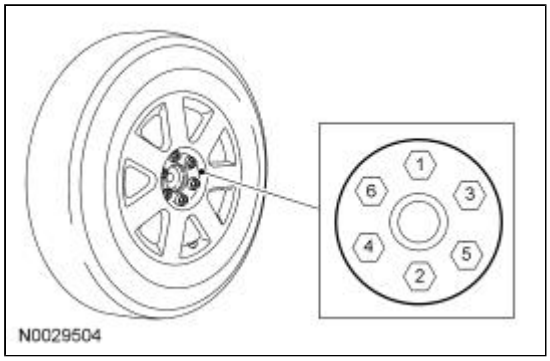
2. **CAUTION: Make sure to apply a thin coat of anti-seize lubricant only to the area of the wheel that contacts hub pilot surface. Do not allow the lubricant to make contact with the wheel studs, brake pads or brake disc.**

   Apply a thin coat of anti-seize lubricant to the wheel hub pilot surface.

3. Position the tire and wheel assembly and install the wheel nuts hand-tight, then lower the vehicle.

4. **CAUTION: Failure to tighten the wheel nuts in a star pattern can result in high brake disc runout, which will speed up the development of brake roughness, shudder and vibration.**

   Tighten the wheel nuts, using the pattern indicated, to 204 Nm (150 lb-ft).



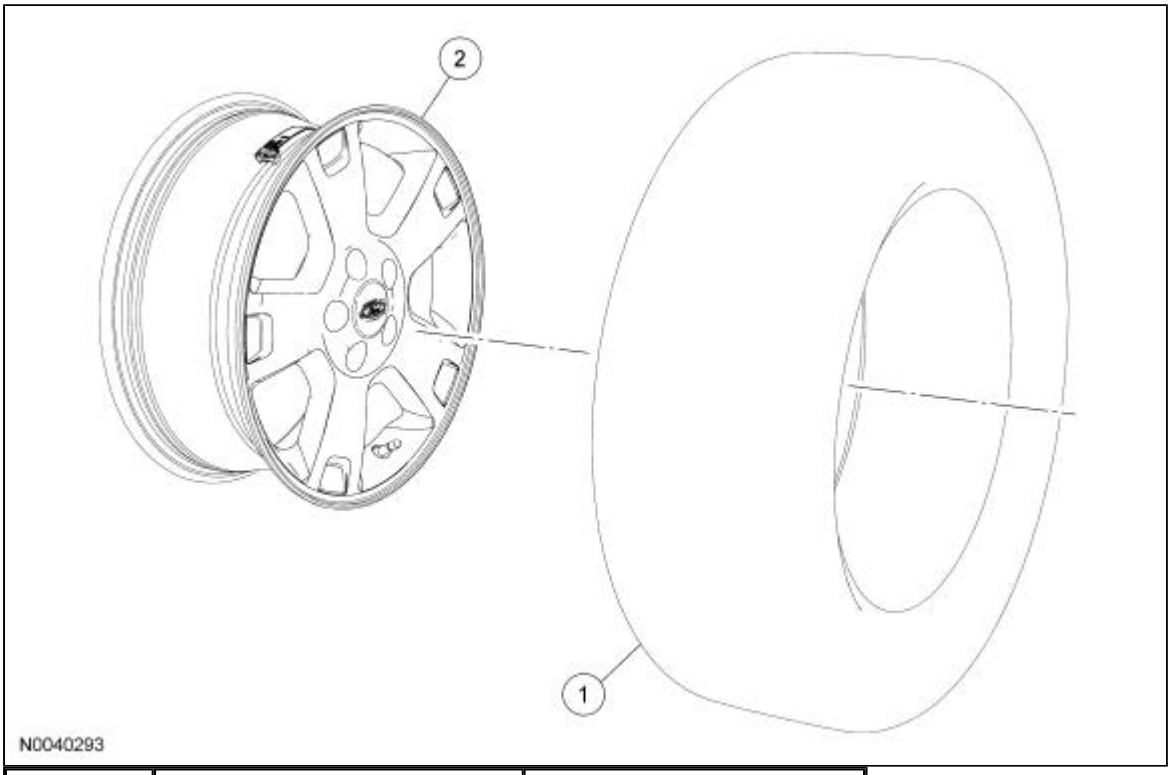
5. If removed, install the center cap.
6. If equipped, turn the air suspension switch to the ON position.

Wheel and Tire

Printable View (352 KB)

Special Tool(s)

ST2869-A	Digital Tire Gauge 204-354



Item	Part Number	Description
1	1508	Tire
2	1007	Wheel

Disassembly

CAUTION: Use only special tool 204-354 any time tire pressures are measured to be sure that accurate values are obtained.

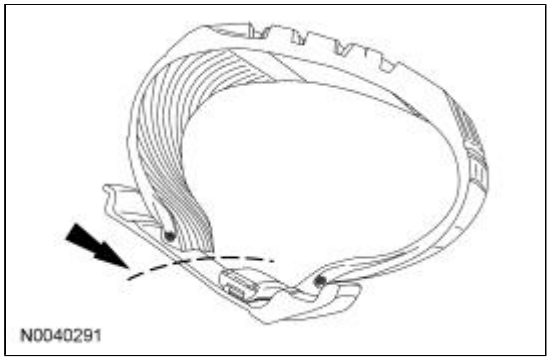
CAUTION: Failure to follow the instructions below may result in damage to the tire pressure monitoring system (TPMS) sensor.

NOTE: A wheel and tire assembly equipped with a TPMS sensor will have the following verbiage stamped or cast on the wheel: SENSOR MAY BE INSIDE.

NOTE: The TPMS sensor is mounted to the wheel 180 degrees opposite of the valve stem and is held in place by a stainless steel strap. The sensor is not mounted to the valve stem.

1. Remove the wheel and tire assembly. For additional information, refer to Wheel and Tire in this section.

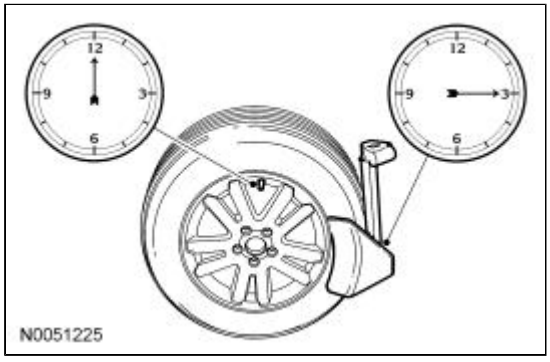
CAUTION: Do not allow the tire beads to move beyond the wheel mid-plane (middle of the wheel) when separating the beads from the wheels, damage to the TPMS sensor may occur.

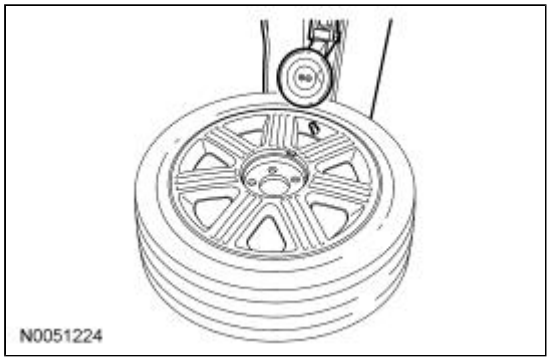


2. **CAUTION: Tire and valve stem position is critical to prevent damage to the TPMS sensor when using a paddle-type bead separator.**

   NOTE: Some machines may have a nylon roller bead separator at the 12 o'clock position instead of the paddle-type bead separator at the 3 o'clock position.

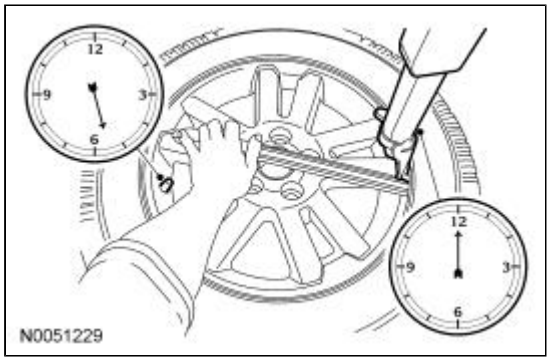
   Position the wheel and tire assembly on a suitable tire machine and separate both beads of the tire from the wheel.
   - For a paddle-type tire machine, position the valve stem at the 12 o'clock or 6 o'clock position and the paddle at the 3 o'clock position.
   - For a roller-type tire machine, align the valve stem with the roller at any position.



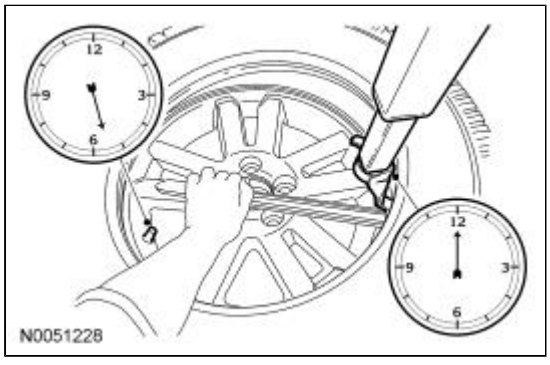


3. **NOTE:** Index-mark the valve stem and wheel weight positions on the tire.

   Place the wheel and tire assembly on the turntable of the tire machine with the valve stem between the 5 and 6 o'clock positions and the machine arm at the 12 o'clock position and dismount the outer bead from the wheel.



4. Reset the wheel and tire assembly on the turntable of the tire machine with the valve stem between the 5 and 6 o'clock positions and the machine arm at the 12 o'clock position and dismount the inner bead from the wheel.



5. Inspect the TPMS sensor, cradle and strap for damage, install new parts as necessary.
   - For information on removal and installation of the TPMS sensor, refer to Tire Pressure Monitoring System (TPMS) Sensor in this section.
   - When installing a new wheel, reuse the TPMS sensor from the previous wheel if possible. The TPMS will not have to be trained if the sensor is reused. The new wheel will not come with a sensor strap. A sensor strap kit will need to be ordered with the new wheel.

Assembly

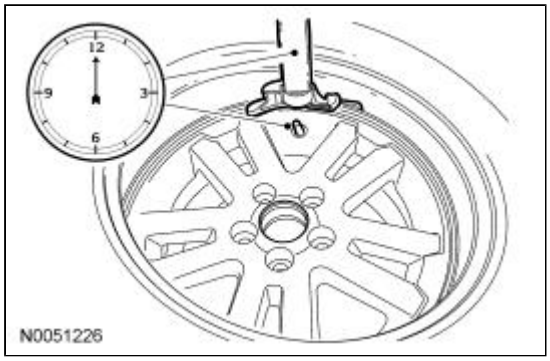
CAUTION: Damage to the TPMS sensor may result if the tire mounting is not carried out as instructed.

1. **CAUTION: Use only a soap and water solution to lubricate the tire. Use of anything other than soap and water may result in damage to the TPMS sensor.**

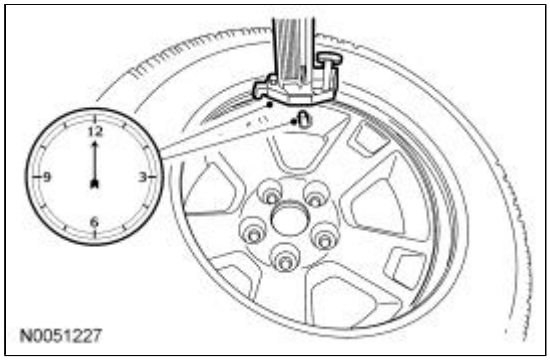
   CAUTION: Do not mount the tire at this time.

   Position the wheel on the turntable of the tire machine, then lubricate and position the inner bead of the tire on the wheel.

2. Position the wheel to align the valve stem with the machine arm, at the 12 o'clock position, and mount the bottom bead of the tire.



3. Reposition the wheel to align the valve stem with the machine arm, at the 12 o'clock position, and mount the top bead of the tire.



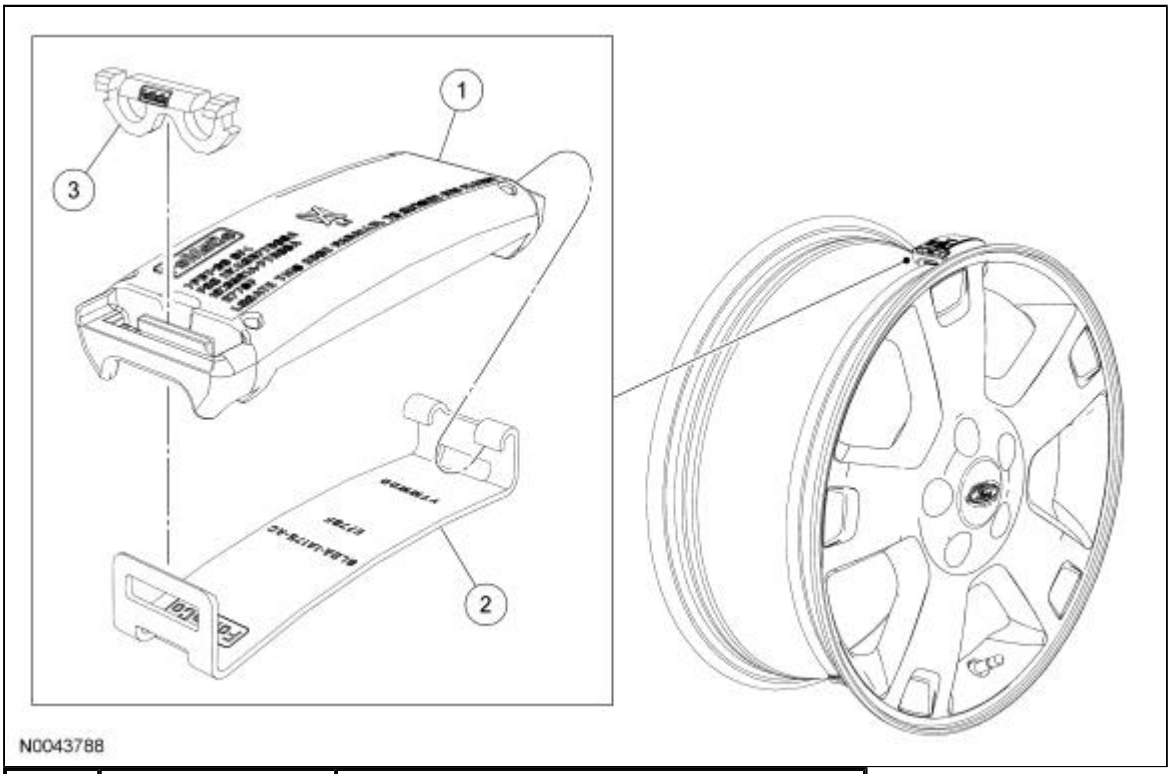
4. **CAUTION: Use only special tool 204-354 any time tire pressures are measured to be sure that accurate values are obtained.**

   Inflate the tire to the pressure specified on the vehicle certification label located on the driver door or door pillar.

5. Install the wheel and tire assembly. For additional information, refer to Wheel and Tire in this section.

Tire Pressure Monitoring System (TPMS) Sensor

Printable View (268 KB)



Item	Part Number	Description
1	1A150/1A189	Tire pressure sensor/sensor kit
2	1A175	Sensor cradle
3	14C202	Locking clip (also part of 1A189)

Disassembly

CAUTION: Tire pressure sensors are manufactured in multiple colors based on their application. When installing a new sensor, make sure the color of the sensor being installed matches the color of the sensor that was removed. The different colored sensors are not interchangeable.

NOTE: The sensor can be removed and installed without removing the strap or the cradle.

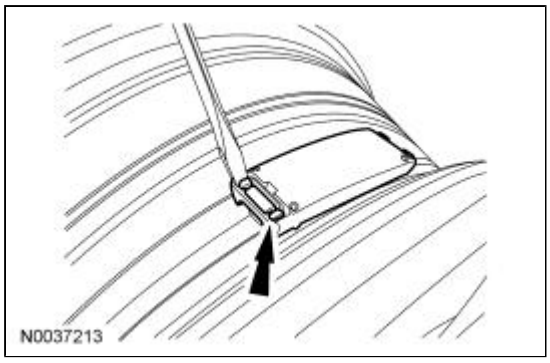
NOTE: Tire pressure sensors are equipped with Lithium-ion batteries and must be disposed of accordingly.

1. **CAUTION: The sensor, cradle and strap can be damaged by incorrect tire mounting or dismounting. Dismount the tire only as instructed.**

   Remove the tire from the wheel. For additional information, refer to Wheel and Tire in this section.

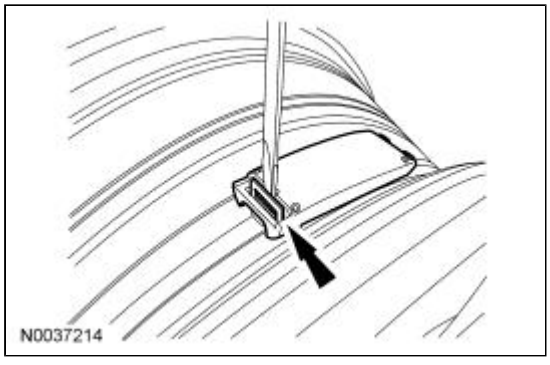
2. **CAUTION: Do not use a large screwdriver. Apply minimum force during removal or damage to the sensor locking clip can occur.**

Using a pocket screwdriver, or similar tool, remove the sensor locking clip.



3. **CAUTION: Do not use a large screwdriver. Apply minimum force during removal or damage to the sensor can occur.**

   Using a pocket screwdriver or similar tool, detach the sensor from the cradle.



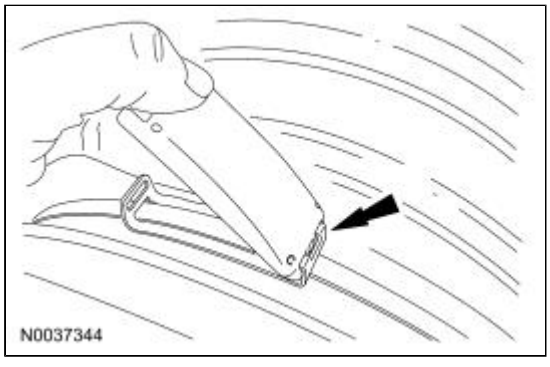
4. Remove the sensor.

Assembly

1. **CAUTION: Damage to the sensor can occur if excessive force is applied during sensor installation.**

   NOTE: Make sure the sensor is fully seated into the cradle. The sensor will make a "click" noise when correctly seated.

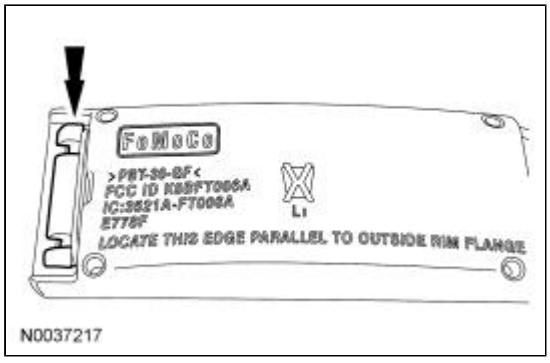
   Position the sensor into the cradle by inserting the hinge end of the sensor into the hook end of the cradle and pushing the opposite end of the sensor down onto the cradle.



2. **NOTE:** The locking clip can only be fully seated when installed in the correct orientation. If the

sensor locking clip cannot be fully inserted, then the sensor may not be fully seated on the cradle or the locking clip may be inserted backward.

Insert a new locking clip into the sensor.



3. **CAUTION: The sensor, cradle and strap can be damaged by incorrect tire mounting or dismounting. Mount the tire only as instructed.**

   Install the tire onto the wheel. For additional information, refer to Wheel and Tire in this section.

4. **NOTE:** A new tire pressure sensor is shipped in an off mode (or battery saver mode) and must be turned on before it can be trained. To turn the sensor on, install it on a wheel, mount the tire and inflate the tire to the recommended inflation pressure. Wait at least 2 minutes, then continue with the sensor training procedure.

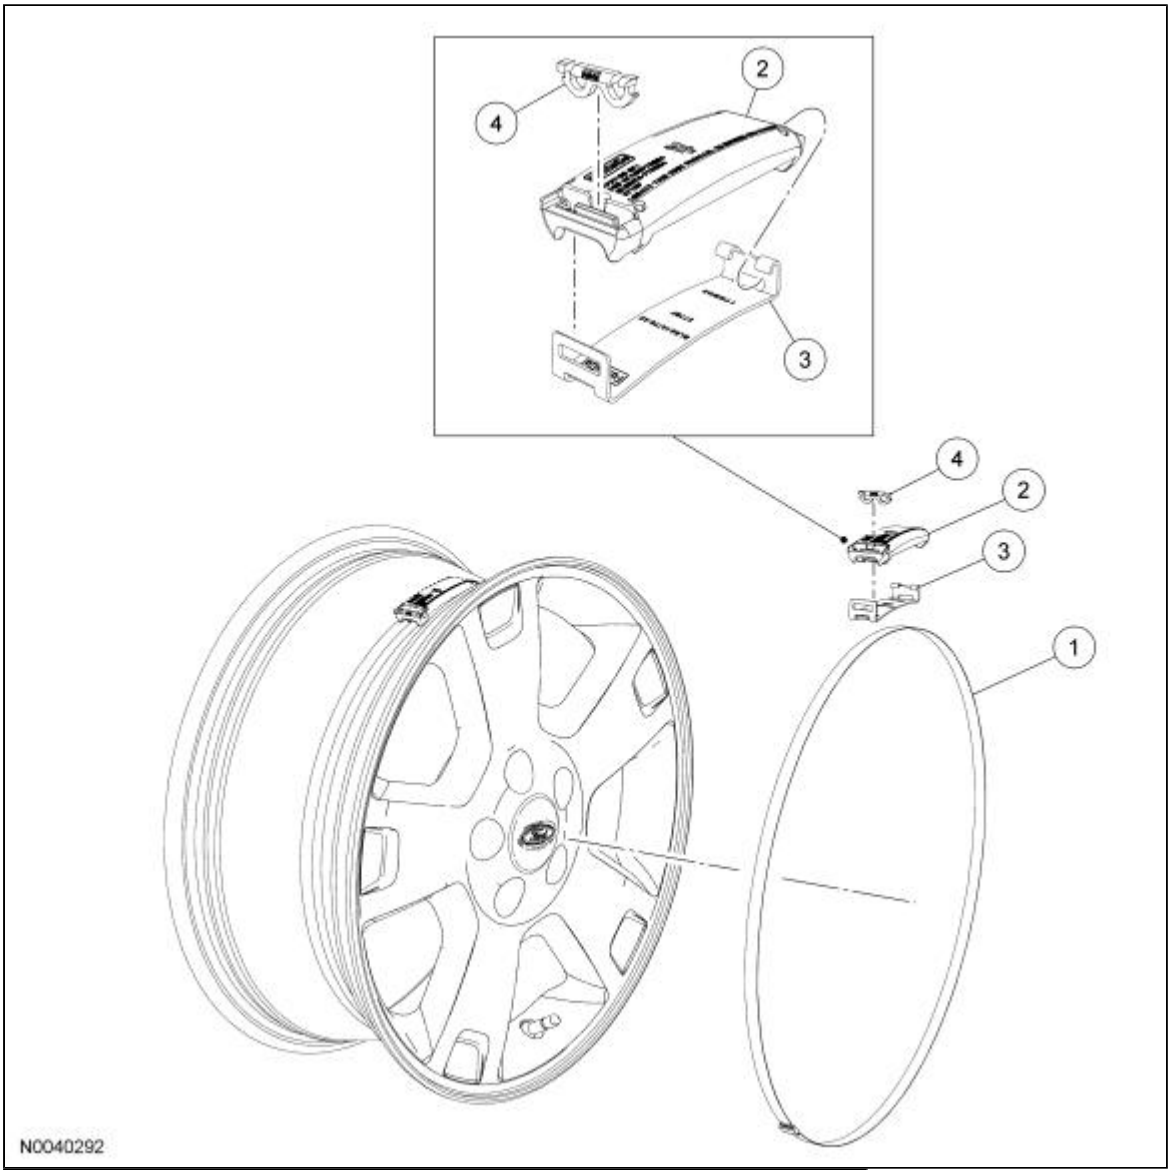
   Train the tire pressure sensor(s). For additional information, refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.

Tire Pressure Monitoring System (TPMS) Strap and Cradle

Printable View (299 KB)

Material

Item	Specification
Wheel and Tire Cleaner ZC-37-A or -B	—



Item	Part Number	Description
1	1A177/1A193	Strap/strap kit
2	1A150/1A189	Tire pressure sensor/sensor kit
3	1A175	Sensor cradle (also part of 1A193)
4	14C202	Locking clip (also part of 1A189)

Disassembly

CAUTION: Tire pressure sensors are manufactured in multiple colors based on their application. When installing a new sensor, make sure the color of the sensor being installed matches the color of the sensor that was removed. The different colored sensors are not interchangeable.

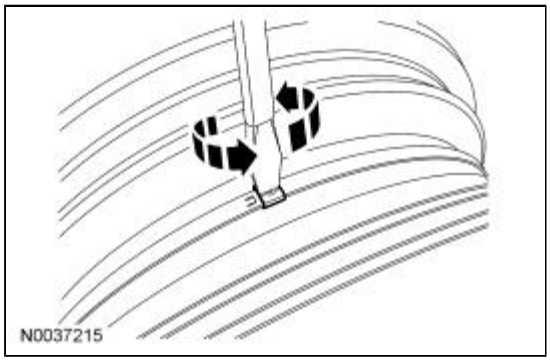
NOTE: The sensor is available separately, the cradle and strap are available as a strap kit. There are several different strap kits available based on wheel diameter but all strap kits share the same base part number.

NOTE: Tire pressure sensors are equipped with Lithium-ion batteries and must be disposed of accordingly.

1. Remove the tire pressure monitoring system (TPMS) sensor. For additional information, refer to Tire Pressure Monitoring System (TPMS) Sensor in this section.

2. **WARNING: The TPMS band is under tension. Always use safety goggles or a face shield and gloves when removing the TPMS band/strap. Failure to follow these instructions may result in personal injury.**

   Remove a factory installed strap in the following sequence:
   1. Locate the strap buckle and secure the strap to the wheel using duct tape or a similar item, on both sides of the buckle approximately 25 mm (0.98 in) from the buckle.
   2. Using a large screwdriver and a twisting motion, unbuckle the strap.
   3. Discard the strap.



3. To remove a dealer installed strap, turn the worm gear screw until the strap is fully released from the worm gear.
   - Discard the strap.

4. **NOTE:** To aid assembly, mark the location of the cradle prior to disassembly.

   Using a screwdriver, or similar tool, remove the cradle by inserting the screwdriver under the cradle and prying up.

Assembly

1. **NOTE:** Make sure the sensor is fully seated into the new cradle. The sensor will make a "click" noise when fully seated.

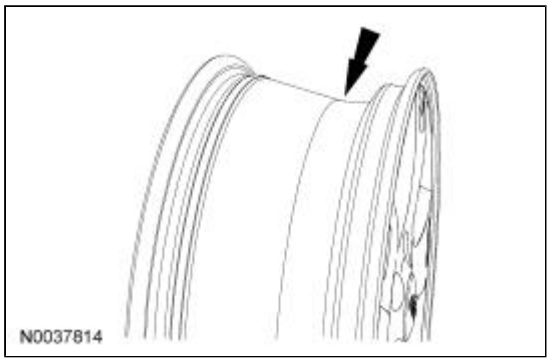
   Position the sensor into the new cradle by inserting the hinge end of the sensor into the hook end of the cradle and pushing the opposite end of the sensor down onto the cradle.

2. **CAUTION: Metal scrapers can damage the wheel. Use only plastic or non-metallic**

scrapers to remove the cradle adhesive strip residue.

NOTE: The sensor and cradle must be installed in the drop well of the wheel, 180 degrees from the valve stem.

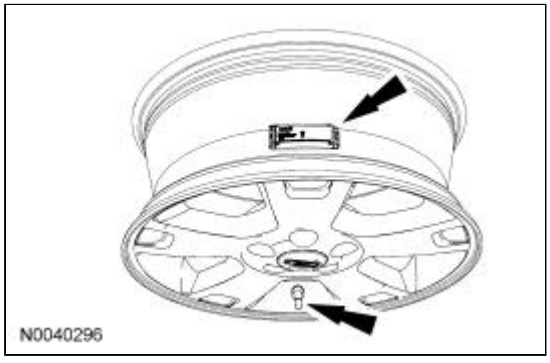
Clean the area where the sensor and cradle are to be installed.



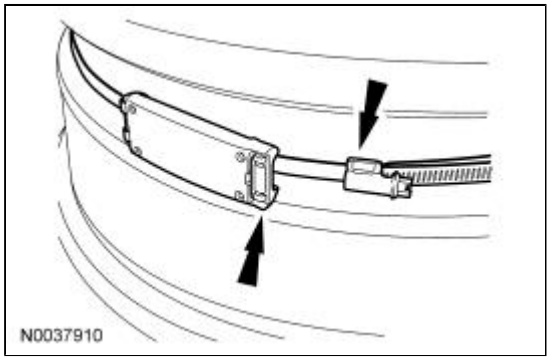
3. **NOTE:** The sensor and cradle must be positioned with the hinge side of the sensor on the RH side when viewed from the curb side (beauty side) of the wheel.

   NOTE: The sensor has raised markings indicating how to position the sensor.

   Remove the adhesive tape liner from the cradle and position the sensor and cradle into the wheel drop well 180 degrees from the valve stem.



4. Install the tapered end of the strap through the opening of the cradle on the hinge side of the sensor. This will position the worm gear on the locking clip side of the sensor.

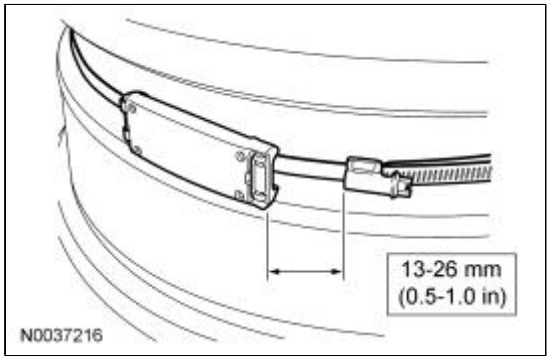


5. **CAUTION: Steel wheels have a "high spot" along their circumference. Make sure the strap is positioned in the lowest spot possible for correct sensor and cradle retention.**

   NOTE: Keep the strap parallel with the wheel flange while tightening the worm gear.

Position the worm gear 13-26 mm (0.5-1.0 in) away from the sensor and tighten the worm gear.

- Tighten to 3 Nm (27 lb-in).



6. **CAUTION: The sensor, cradle and strap can be damaged by incorrect tire mounting or dismounting. Mount the tire only as instructed.**

   Install the tire onto the wheel. For additional information, refer to Wheel and Tire in this section.

7. **NOTE:** A new tire pressure sensor is shipped in an off mode (or battery saver mode) and must be turned on before it can be trained. To turn the sensor on, install it on a wheel, mount the tire and inflate the tire to the recommended inflation pressure. Wait at least 2 minutes, then continue with the sensor training procedure.

   Train the tire pressure sensor(s). For additional information, refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.

Vehicle Dynamic Suspension

Printable View (98 KB)

WARNING: The air suspension system must be shut off prior to hoisting or jacking an air suspension equipped vehicle. Failure to do so may result in unexpected inflation or deflation of the air springs, which may result in shifting of the vehicle during these operations. Failure to follow these instructions may result in personal injury.

WARNING: Do not remove an air spring under any circumstances when there is pressure in the air spring. Do not remove any components supporting an air spring without either exhausting the air or providing support for the air spring. Failure to follow these instructions may result in personal injury.

The rear air suspension system is comprised of the following components:

- Message center
- Control module
- Two suspension ride height sensors
- Compressor and drier assembly (includes vent solenoid)
- Air tubes
- Rear air spring and shock absorber assemblies
- Two air spring solenoid valves
- Compressor relay

Air Suspension System Operation

The rear wheel air suspension system operates in the following manner:

- Vehicle height is controlled by the rear air suspension module (vehicle dynamic module (VDM).
- Each air spring has a solenoid that must open to vent (or compress).
- The air suspension compressor has a vent solenoid that must open to vent the system.
- The rear air springs raise or vent together.
- The system does not operate when:
  - any of the doors are open.
  - the liftgate or liftgate glass is open.
  - the power running boards are deployed.
- The system will vent/compress when the vehicle speed exceeds 24 km/h (15 mph) even if the air suspension has been set to the OFF position.
- Trim height is normal driving height.
- The height sensor:
  - system uses RH and LH rear height sensors.
  - output voltage is between 0.5 and 4.5 volts.
  - voltage output decreases (goes from high to low) as the suspension system raises the vehicle.
- The suspension ride height changes when:
  - the key is in the ON position, the load leveling feature automatically makes adjustments to the vehicle height so that the vehicle is always at target height and constant front-to-rear vehicle attitudes are maintained over the load range of the vehicle.
  - the key is in the OFF position, the system will remain active for 40 minutes after the ignition is turned off to make limited height adjustments as necessary.

Air Suspension Pneumatic Diagram

Vehicle Dynamic Suspension

Printable View (444 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST1176-A	Vacuum Tester or equivalent 014-R1054
ST1137-A	73 Digital Multimeter or equivalent 105-R0051 or equivalent
 ST1138-A	Flex Probe Kit 105-R025B or equivalent

Principles of Operation

WARNING: Before repairing or installing any air suspension component(s), disable the air suspension system through the message center or disconnect the battery ground cable. Failure to follow these instructions may result in personal injury.

WARNING: Do not attempt to inflate any air spring which has collapsed while deflated from the rebound hanging position to the jounce stop. Failure to follow these instructions may result in personal injury.

WARNING: When installing a new air spring, care must be taken to not apply a load to the suspension until the air springs have been inflated using the air spring fill procedure. Failure to follow these instructions may result in personal injury.

WARNING: After inflating an air spring in the hanging position, it must be inspected for correct shape. Failure to follow these instructions may result in personal injury.

The air suspension system is designed to improve ride handling and general vehicle driving performance. A microprocessor controls the air suspension system. The microprocessor and the supporting hardware are contained in the air suspension module. The air suspension module responds to signals from various sensors in the vehicle to maintain the programmed ride height while the vehicle is either moving or stopped. This is accomplished by opening and closing the solenoid valves to control the amount of air in the air spring(s). The air suspension module controls the air compressor by applying voltage through the compressor relay to inflate the air spring(s) and raise the vehicle. The air suspension module opens the vent solenoid to lower the vehicle by releasing air from the air spring(s) in response to signal inputs from the air suspension height sensor. The air suspension module has a preprogramming trim height.

The load leveling feature automatically makes adjustments in vehicle height so that the vehicle is always at target height and constant front-to-rear vehicle attitudes are maintained over the load range of the vehicle.

The system will remain active for 40 minutes after the ignition is turned off to make limited height adjustments as necessary.

Air Suspension Disable Feature

The air suspension system can be disabled through the message center. Refer to Air Suspension System Disable/Enable in this section. When the driver elects to disable the air suspension system, the message center sends a message over the high speed controller area network (HS-CAN) to the air suspension module. Once the message is received, the air suspension module will take no further action to inflate or deflate the air springs, below 15 MPH. The system will remain ON or OFF when the ignition key is cycled.

When the air suspension system has been disabled, the message center will display SUSPENSION SWITCHED OFF.

Air Compressor

The air compressor:

- consists of the compressor and vent solenoid; neither are serviced as individual items.
- is a single cylinder electric motor driven unit that provides pressurized air as required.
- is powered by an electromechanical relay, which is controlled by the air suspension module.
- passes pressurized air through the compressor air drier that contains silica gel (a drying agent). Moisture is then removed from the compressor air drier when vented air passes out of the system during vent operation.
- has a single port drier that can be serviced separately.

The vent solenoid:

- allows air to escape from the system during venting actions.
- is part of the air compressor cylinder head.
- shares a common electrical connector with the air compressor motor.
- is enclosed in the cylinder head casting and forms an integral valve housing.
- has an O-ring seal that prevents air leakage past the dryer tip.
- opens when the air suspension module determines that lowering is required.
- provides an escape route for pressurized air when system pressures exceed safe operating levels.
- has a 1,034 kPa (150psi) internal relief valve.
- is installed with the air compressor as a unit.

Air Spring

The air suspension system has 2 rear air springs. The air springs provide a varying spring rate

proportional to the system air pressure and volume. The air suspension system regulates the air pressure in each air spring by compressing and venting the air. Increasing air pressure (compressing) raises the vehicle; decreasing air pressure (venting) lowers the vehicle. Vehicle height is maintained by the addition and removal of air in each air spring through an air spring solenoid installed in the upper spring cap and energized through the air suspension module.

Air Tubes and Fittings

NOTE: Apply a soapy water solution to the air tubes to verify the location of air leaks. If the air tubes are cut, ruptured or leaking, a service repair kit is available.

Nylon air tubes with quick connect fittings connect to the air compressor and air spring solenoids. A Y-fitting is also used to divide the air supply to the RH and LH air spring solenoids.

Air Suspension Height Sensors

There are 2 suspension height sensors used for the rear suspension. The sensors send a voltage signal to the air suspension module. The output ranges from approximately 4.5 volts at minimum height (when the vehicle is low or in full jounce) to 0.5 volt at maximum height (when the vehicle is high or in full rebound).

The sensors have a usable range of ±45 degrees. The sensors are mounted to the suspension at a point where full suspension travel at the wheel is relative to the travel at the height sensor. The sensors are mounted to the frame and the link is attached to a ball stud on the rear lower arm. The left and right sensors have opposite polarity and are not interchangeable.

When the height sensor indicates that the vehicle is lower than trim under normal driving conditions, the air compressor will turn on and pump compressed air to the system. When the sensor indicates that the vehicle is raised above trim under normal driving conditions, this will cause the air to be vented from the system to lower the vehicle to the trim height level.

Compressor Relay

An electromechanical relay is used in the air suspension system for compressor control. The relay switches high current loads in response to low power signals and is controlled by the air suspension module.

The compressor relay is energized by the air suspension module to have high current flow from the battery to the compressor motor.

Air Suspension Module

CAUTION: The air suspension module must receive a ride height adjustment calibration and pass a pneumatic test when it is installed new or swapped. Failure to follow these instructions will result in the air suspension system operating incorrectly.

The air suspension module controls the air compressor motor (through an electromechanical relay), all air spring solenoids and provides power to the rear height sensors. The module also controls vehicle height adjustments by monitoring the 2 height sensors and other HS-CAN messages. The module conducts all fail-safe and diagnostic strategies and contains self-test and communication software for testing the vehicle and related components.

The module monitors and controls the air suspension system through an 8-pin connector and a 16-pin connector. The connectors and the module are keyed so that the connectors cannot be plugged in incorrectly. The air suspension module uses the HS-CAN communications network for sending and receiving various information.

Air Spring Solenoid

WARNING: Never rotate an air spring solenoid valve to the release slot in the end cap fitting until all pressurized air has escaped from the spring. Failure to follow this instruction may result in personal injury.

The air spring solenoid:

- allows air to enter and exit the air spring during leveling operations.
- is electrically operated and controlled by the air suspension module.
- is serviced separately from the air spring.

Inspection and Verification

1. Verify the customer concern.

2. **NOTE:** If the door ajar indicator is illuminated when all the doors, the liftgate and the liftgate glass are closed, the air suspension will not work correctly. Repair the door ajar indicator. Refer to Section 413-01 .

   Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Restricted suspension movement
• Excessive vehicle load
• Damaged or disconnected air tube(s) and/or fitting(s)
• Unmounted or damaged height sensor(s)
• Damaged rear air spring(s)
• Damaged solenoid valve(s)
	• Battery junction box (BJB) fuses:
	  ▪ 6 (50A)
	  ▪ 47 (30A)
	  ▪ 65 (10A)
	• Damaged wiring harness(es)
	• Loose, corroded or disconnected electrical connectors
	• Damaged air suspension module

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the powertrain control module

(PCM).

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record continuous memory diagnostic trouble codes (DTCs).

8. Clear the continuous DTCs and carry out the self-test diagnostics for the air suspension module. Refer to Self-Test in this section.

9. If the DTCs retrieved are related to the concern, go to Air Suspension Module Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Pneumatic Test

This test verifies that the air tubes are connected and that they are not restricted. It also verifies that the air compressor, air compressor vent solenoid and air spring solenoid valves are functioning correctly. This test is used to clear DTCs C1990 and C1991. Verify that the following conditions are met before running the Pneumatic Test.

- All the doors, the liftgate and the liftgate glass must be closed.
- The transmission is in PARK.
- The vehicle speed is less the 10 km/h (6 mph).
- The ignition switch is in the ON position.
- The air suspension system is enabled.
- Battery voltage is greater than 11 volts for the duration of the test.

1. Fulfill the pre-conditions.

2. Install a battery charger for the Pneumatic Test to prevent battery drain.

3. Using the scan tool, run the Pneumatic Test.

Trim Height Test (or Accurate Trim Test)

NOTE: The Trim Height Test is used to verify trim height only. If trim height needs to be adjusted, refer to Ride Height Adjustments in this section.

The trim height test is used to make the vehicle level to within 2 mm (0.08 in) of the calibrated trim height. An accurate trim test should be run before setting vehicle alignment.

The following conditions must be met for the trim height test to run:

- All the doors, the liftgate and the liftgate glass must be closed.
- The transmission is in PARK.
- The vehicle speed is less than 10 km/h (6 mph).
- The ignition switch is in the ON position.
- The air suspension system is enabled.
- Battery voltage is greater than 11 volts for the duration of the test.

1. Fulfill the pre-conditions.

2. Install a battery charger for the Trim Height Test to prevent battery drain.

3. Using the scan tool, run the Trim Height Test.

Self-Test

Verify that the following conditions are met before running the On-Demand Self Test.

- All doors, the liftgate and the liftgate glass must be closed.
- The transmission is in PARK.
- The vehicle speed is less than 10 km/h (6 mph).
- The ignition switch is in the ON position.

1. Fulfill the pre-conditions.
2. Install a battery charger for the On-Demand Self Test to prevent battery drain.
3. Run the air suspension module On-Demand Self Test.
4. Record all listed DTCs.
5. Retrieve stored DTCs.
6. Troubleshoot any On-Demand Self Test DTCs first.
7. Repeat the On-Demand Self Test and clear DTCs after repairs are completed.

Air Suspension Module Diagnostic Trouble Code (DTC) Chart

Air Suspension Module Diagnostic Trouble Code (DTC) Chart

NOTE: Repair all other DTCs before repairing C1726, repair DTCs C1990 and C1991 last.

DTCs	Description	Source	Action
B1317	Battery Voltage High	Air Suspension Module	Go To Pinpoint Test A .
B1318	Battery Voltage Low	Air Suspension Module	Go To Pinpoint Test A .
B1342	ECU is Faulted	Air Suspension Module	INSTALL a new air suspension module. REFER to Air Suspension Module in this section. SET the ride height. REFER to Ride Height Adjustments in this section. CARRY OUT the pneumatic test. TEST the system for normal operation.
B1566	Door Ajar Circuit Short to Ground	Air Suspension Module	INSTALL a new air suspension module. REFER to Air Suspension Module in this section. SET the ride height. REFER to Ride Height Adjustments in this section. CARRY OUT the pneumatic test. TEST the system for normal operation.
B2477	Module Configuration Failure	Air Suspension Module	INSTALL a new air suspension module. REFER to Air Suspension Module in this section. SET the ride height. REFER to Ride Height Adjustments in this section. CARRY OUT the pneumatic test. TEST the system for normal operation.
C1724	Air Suspension Height	Air	Go To Pinpoint Test B .

	Sensor Power Circuit Failure	Suspension Module	
C1726	Air Suspension Rear Pneumatic Failure	Air Suspension Module	Go To Pinpoint Test C .
C1770	Air Suspension Vent Solenoid Output Circuit Failure	Air Suspension Module	Go To Pinpoint Test D .
C1790	Air Suspension LR Air Spring Solenoid Output Circuit Failure	Air Suspension Module	Go To Pinpoint Test E .
C1795	Air Suspension RR Air Spring Solenoid Output Circuit Failure	Air Suspension Module	Go To Pinpoint Test E .
C1810	Air Suspension Height Sensor Delta Out of Range	Air Suspension Module	Go To Pinpoint Test L .
C1830	Air Suspension Compressor Relay Circuit Failure	Air Suspension Module	Go To Pinpoint Test F .
C1885	Air Suspension RR Height Sensor Circuit Failure	Air Suspension Module	Go To Pinpoint Test G .
C1893	Air Suspension LR Height Sensor Circuit Failure	Air Suspension Module	Go To Pinpoint Test G .
C1990	New Control Module Initialization (requires ride height calibration and pneumatic test pass)	Air Suspension Module	REFER to Clearing DTC C1990 or C1991.
C1991	Plant Ride Height Setting and/or Tests Incomplete	Air Suspension Module	REFER to Clearing DTC C1990 or C1991.
C1964	Compressor Run Time Exceeded	Air Suspension Module	ALLOW the compressor to cool for at least 10 minutes, REPEAT the self-test.
C2001	Ride Height Calibration Error	Air Suspension Module	ADJUST the ride height, REFER to Ride Height Adjustments in this section. CLEAR the DTCs. REPEAT the self-test.
C2002	Pneumatic Test Failure	Air Suspension Module	VERIFY that all pneumatic test pre-conditions are met, REFER to Pneumatic Test in this section. REPEAT the pneumatic test. If all conditions are met, the scan tool can communication with the air suspension module and the module is still unable to complete the pneumatic test, Go To Pinpoint Test C .
U0073	Control Module Communication Bus A Off	Air Suspension Module	REFER to Section 418-00 to diagnose the HS-CAN bus.
U0100	Lost Communication with Powertrain Control Module (PCM)	Air Suspension Module	REFER to Section 418-00 to diagnose the HS-CAN bus.
U0140	Lost Communication with Body Control Module	Air Suspension Module	REFER to Section 418-00 to diagnose the HS-CAN bus.

U0155	Lost Communication with Instrument Cluster	Air Suspension Module	REFER to Section 418-00 to diagnose the HS-CAN bus.
U2011	Module Transmitted Invalid Data	Air Suspension Module	CLEAR the DTC. REPEAT the self-test. If DTC U2011 returns, INSTALL a new air suspension module. REFER to Air Suspension Module in this section. CLEAR the DTC. REPEAT the self-test.
U2050	Application Not Present	Air Suspension Module	INSTALL a new air suspension module. REFER to Air Suspension Module in this section. CLEAR the DTC. REPEAT the self-test.

Clearing DTC C1990, C1991, C2001 and C2002

NOTE: Before proceeding with the following steps, make sure that the air suspension system is fully functional. The vehicle must pass the pneumatic test and have both ride height sensors calibrated for these codes to clear.

1. Connect the scan tool to the vehicle.
2. If C1990, C1991 and C2002 are present, carry out the pneumatic test. The tester will indicate if the vehicle has passed the test.
3. **NOTE:** The vehicle must be on a level surface before calibrating the ride height sensors. Failure to follow this instruction will result in system malfunction.

   If C1990, C1991 and C2001 are present, use the scan tool to manually raise and lower the vehicle to the correct ride height on an alignment machine and calibrate the ride heights. Refer to Ride Height Adjustments in this section.
4. Using the scan tool, retrieve the DTCs. Verify that all DTCs have been cleared.
5. Drive the vehicle and verify the repair. Verify that the message center does not display "Check Suspension".

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the air suspension module	• Fuse(s) • Circuitry • Air suspension module	• REFER to Section 418-00 to diagnose the no communication problem.
• **NOTE:** Make sure that the ignition switch is in the ON position and the air suspension is enabled before determining that the air suspension module will not enter the self-test.	• Air suspension system disabled	• VERIFY that the air suspension system is enabled. REFER to Air Suspension System Disable/Enable in this section. REPEAT the self-test.

Unable to enter self-test	• One or more self-test preconditions not fulfilled	• VERIFY that all self-test preconditions are fulfilled, REFER to Self-Test in this section. REPEAT the self-test. If all conditions are met and the scan tool cannot communicate with the air suspension module, REFER to Section 418-00 to diagnose the no communication problem.
	• Air suspension module	• VERIFY that all self-test preconditions are met, REFER to Self-Test in this section. REPEAT the self-test. If all conditions are met, the scan tool can communicate with the air suspension module and the module is still unable to enter self-test, INSTALL a new air suspension module. REFER to Air Suspension Module in this section.
• Vehicle raises and/or lowers too slowly	• Dryer restricted • Compressor vent solenoid • Air tube(s) blocked or pinched • Air leaks • Air spring solenoid(s) • Air compressor assembly	• Go To Pinpoint Test C .
• Uneven vehicle height	• Air leaks • Circuitry • Height sensor(s) • Air spring solenoid(s) • Air compressor assembly • Air tube(s) blocked or pinched	• Go To Pinpoint Test C .
• The air compressor continuously cycles with the ignition switch in the OFF position and no DTC is set	• Circuitry • Air suspension relay • Air suspension module	• Go To Pinpoint Test H .
• The air suspension system is inoperative without DTCs and with the vehicle at rest	• Fuse • Circuitry • HS-CAN network communication fault	• Go To Pinpoint Test I .
• Excessive air compressor noise	• Bracket isolator (s)	• Go To Pinpoint Test J .

	• Mounting bracket • Air compressor assembly • Air compressor assembly in contact with other components	
• The air compressor is inoperative	• Fuse(s) • Air compressor assembly • Circuitry • Air suspension relay	• Go To Pinpoint Test K .
	• Compressor run time exceeded	• ALLOW the air compressor to cool for at least 10 minutes. TEST the system for normal operation.

Pinpoint Tests

CAUTION: Electronic modules are sensitive to electrostatic discharge. If exposed to these charges, damage to the module may result.

Refer to Inspection and Verification, the Air Suspension Module Diagnostic Trouble Code (DTC) Chart and the Symptom Chart for direction to the appropriate pinpoint test.

Pinpoint Test A: DTC B1317 or B1318 — Battery Voltage High or Low

Refer to Wiring Diagrams Cell 41 , Vehicle Dynamic Suspension for schematic and connector information.

Normal Operation

The air suspension module is supplied fused battery voltage through battery junction box (BJB) fuse 47 (30A) along circuit SBB47 (WH/RD), and fused ignition voltage through BJB fuse 65 (10A) along circuit CBB65 (WH/OG). A ground path is provided along circuits GD133 (BK) and GD120 (BK/GN).

Possible Causes

- Fuse(s)
- Circuit open
- Air suspension module

PINPOINT TEST A: DTC B1317 OR B1318 — BATTERY VOLTAGE HIGH OR LOW

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take

A1 CHECK FOR ACTIVE DTCs	
• Repeat the self-test • **Are the DTCs active?**	**Yes** GO to A2 . **No** The system is operating correctly at this time. Concern may have been caused by low battery or charging system voltage. VERIFY that the battery and charging system are OK. REFER to Section 414-00 .
A2 CHECK THE BATTERY VOLTAGE	
• Measure the battery voltage between the positive and negative battery posts with the key on/engine off (KOEO) and with the engine running. • **Is the battery voltage between 10 and 13 volts with KOEO and between 11 and 16 volts with the engine running?**	**Yes** GO to A3 . **No** REPAIR the battery or charging system. REFER to Section 414-00 . TEST the system for normal operation.
A3 CHECK FOR VOLTAGE TO THE AIR SUSPENSION MODULE	
• Disable the air suspension system. Refer to Air Suspension System Disable/Enable in this section. • Key in OFF position. • Disconnect: Air Suspension Module C2131a. • Key in ON position. • Both with the key on/engine off (KOEO) and with the engine running, measure the voltage between ground and: ▪ air suspension module 2131a-3, circuit CBB65 (WH/OG), harness side. ▪ air suspension module 2131a-11, circuit SBB47 (WH/RD), harness side. ▪ air suspension module 2131a-12, circuit SBB47 (WH/RD), harness side.  N0055980 • **Is the voltage between 10 and 13 volts with KOEO, and between 11 and 16 volts with the engine running?**	**Yes** GO to A4 . **No** VERIFY BJB fuse 65 (10A) is OK. If OK, REPAIR the affected circuit (s). CLEAR the DTCs. REPEAT the self-test.
A4 CHECK CIRCUIT GD133 (BK) AND GD120 (BK/GN) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between ground and: ▪ air suspension module 2131a-5, circuit GD133 (BK), harness side. ▪ air suspension module 2131a-14, circuit GD120	**Yes** GO to A5 . **No** REPAIR the affected circuit(s).

(BK/GN), harness side.  N0055981 • **Is the resistance less than 5 ohms?**	CLEAR the DTCs. REPEAT the self-test.

A5 CHECK THE AIR SUSPENSION MODULE CONNECTOR
• Check air suspension module C2131a for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect: Air Suspension Module C2131a.
• Make sure the connector is seated correctly then operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new air suspension module. REFER to Air Suspension Module in this section. CLEAR the DTCs. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test B: DTC C1724 — Air Suspension Height Sensor Power Circuit Failure

Refer to Wiring Diagrams Cell 41 , Vehicle Dynamic Suspension for schematic and connector information.

Normal Operation

The 2 rear height sensors receive a 5-volt reference voltage from the air suspension module along circuit LCL12 (VT/OG), both sensors share a common return path along circuit RCL12 (GN/WH). The RR sensor sends the suspension height voltage back to the air suspension module along circuit VCL12 (WH/VT) and the LR sensor sends the suspension height voltage back to the module along circuit VCL13 (BN/BU). The air suspension module monitors the 2 height sensors and makes adjustments to the rear suspension based on sensor input.

Possible Causes

- Circuit open
- Circuit shorted
- Height sensor(s)
- Air suspension module

PINPOINT TEST B: DTC C1724 — AIR SUSPENSION HEIGHT SENSOR POWER CIRCUIT FAILURE

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
B1 CHECK THE AIR SUSPENSION HEIGHT SENSOR VOLTAGE PIDs	
• Disable the air suspension system. Refer to Air Suspension System Disable/Enable in this section. • Connect the diagnostic tool. • Key in ON position. • Disconnect the sensor arm linkage from both rear air suspension height sensors. • **NOTE:** The voltage will increase as the suspension is compressed. • While monitoring both rear height sensor voltage PID displays, slowly move the height sensors through their full range of travel up and down. • **Do the voltages vary from approximately 0.50 volt and 4.50 volts?**	**Yes** INSPECT the height sensor electrical connectors for corrosion and damage, REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. **No** CONNECT the sensor arm linkages to the height sensors. For the LR height sensorGO to B2 . For the RR height sensor GO to B3 .
B2 CHECK FOR AIR SUSPENSION MODULE OUTPUT (LR HEIGHT SENSOR VOLTAGE)	
• Key in OFF position. • Disconnect: LR Height Sensor C4092. • Key in ON position. • Measure the voltage between LR height sensor C4092-3, circuit LCL12 (VT/OG), harness side and ground.  N0055970 • **Are 5 volts present?**	**Yes** GO to B3 . **No** If less than 5 volts are present, GO to B4 . If more than 5 volts are present, GO to B6 .
B3 CHECK FOR AIR SUSPENSION MODULE OUTPUT (RR HEIGHT SENSOR VOLTAGE)	
• Key in OFF position. • Disconnect: RR Height Sensor C4093. • Key in ON position. • Measure the voltage between RR height sensor C4093-3, circuit LCL12 (VT/OG), harness side and ground.  N0055970	**Yes** GO to B7 . **No** If less than 5 volts are present, GO to B4 . If more than 5 volts are present, GO to B6 .

• **Are 5 volts present?**	
B4 CHECK CIRCUIT LCL12 (VT/OG) FOR AN OPEN	
• Key in OFF position. • Disconnect: Air Suspension Module C2131b. • **For the RR height sensor** , measure the resistance between air suspension module C2131b-4, circuit LCL12 (VT/OG), harness side and RR height sensor C4093-3, circuit LCL12 (VT/OG), harness side. • **For the LR height sensor** , measure the resistance between air suspension module C2131b-4, circuit LCL12 (VT/OG), harness side and LR height sensor C4092-3, circuit LCL12 (VT/OG), harness side.  N0055983 • **Is the resistance less than 5 ohms?**	**Yes** GO to B5 . **No** REPAIR circuit LCL12 (VT/OG). CLEAR the DTCs. REPEAT the self-test.
B5 CHECK CIRCUIT LCL12 (VT/OG) FOR A SHORT TO GROUND	
• **For the RR height sensor** , measure the resistance between RR height sensor C4093-3, circuit LCL12 (VT/OG), harness side and ground. • **For the LR height sensor** , measure the resistance between LR height sensor C4092-3, circuit LCL12 (VT/OG), harness side and ground.  N0055969 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B7 . **No** REPAIR circuit LCL12 (VT/OG). CLEAR the DTCs. REPEAT the self-test.
B6 CHECK CIRCUIT LCL12 (VT/OG) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Air Suspension Module C2131b. • Key in ON position. • **For the LR height sensor,** measure the voltage between LR height sensor C4092-3, circuit LCL (VT/OG). harness side and ground. • **For the RR height sensor,** measure the voltage between RR height sensor C4093-3, cuircuit LCL (VT/OG). harness side and ground. • **Is voltage present?**	**Yes** REPAIR circuit LCL12 (VT/OG). CLEAR the DTCs. REPEAT the self-test. **No** GO to B7 .
B7 CHECK THE AIR SUSPENSION MODULE CONNECTOR	
• Key in OFF position.	**Yes**

• Disconnect: Air Suspension Module C2131b.
• Check the air suspension module connector for:
  ■ corrosion.
  ■ pushed-out pins.
  ■ spread terminals.
• Connect: Air Suspension Module C2131b.
• Make sure the connector is seated correctly, then operate the system and verify the concern is still present.
• **Is the concern still present?**
	INSTALL a new air suspension module. REFER to Air Suspension Module in this section. CLEAR the DTCs. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test C: DTC C1726 — Air Suspension Rear Pneumatic Failure

Normal Operation

The air suspension height sensor sends a voltage signal to the air suspension module. The output ranges from approximately 4.5 volts at minimum height (when the vehicle is low or in full jounce) to 0.5 volt at maximum height (when the vehicle is high or in full rebound).

When the suspension height sensor indicates that the rear of the vehicle is lower or higher than trim height under normal driving conditions, the air suspension module will command the air compressor and air solenoid valves to either fill or vent the air springs depending on the input from the 2 height sensors. The air compressor sends the air to the air springs first through the drier then along the air tubes, passing through a Y-fitting and connections, through the air solenoid valves and finally to the air springs.

Possible Causes

- Air leak(s)
- Air tube restricted or leak(s)
- Air tube(s)
- Mounting bracket(s)
- Air compressor drier
- Air spring solenoid valve(s)
- Height sensor(s)
- Air compressor
- Air spring(s)
- Air suspension module

PINPOINT TEST C: DTC C1726 — AIR SUSPENSION REAR PNEUMATIC FAILURE

NOTE: It may be necessary to vent air from the front air suspension air springs during this pinpoint test.

Test Step	Result / Action to Take
C1 CHECK THE AIR SUSPENSION HEIGHT SENSORS	
• Inspect the air suspension height sensors for correct installation. • Inspect the air suspension height sensor mounting brackets for damage. • While listening for air leaks, verify that all air tubes are fully seated. • **Are the air suspension height sensors, mounting brackets and air tubes OK?**	**Yes** GO to C2 . **No** REPAIR as necessary. If one or both height sensor assemblies are installed or repaired, both height sensors must be

	calibrated. RESET the vehicle ride height. REFER to Ride Height Adjustments in this section. CLEAR the DTCs. REPEAT the self-test.
C2 CHECK THE AIR SUSPENSION HEIGHT SENSOR VOLTAGE PIDs • Disable the air suspension system. Refer to Air Suspension System Disable/Enable in this section. • Disconnect the sensor arm linkage from both rear air suspension height sensors. • Connect the diagnostic tool. • Key in ON position. • **NOTE:** The voltage will increase as the suspension is compressed. • While monitoring both height sensor voltage PIDs, slowly move the height sensors through their full range of travel up and down. • **Do the voltages vary from approximately 0.50 volt and 4.50 volts?**	**Yes** CONNECT the sensor arm linkages to the height sensors.GO to C3 . **No** INSTALL a new height sensor(s) and CALIBRATE both height sensors. REFER to Suspension Height Sensor in this section. CLEAR the DTCs. RESET the vehicle ride height. REFER to Ride Height Adjustments in this section. REPEAT the self-test.
C3 VERIFY THAT THE REAR OF THE VEHICLE CAN BE RAISED • Trigger the LR and RR air spring solenoid active command ON. Trigger the air compressor active command ON. • Trigger the air suspension module active commands OFF. • While monitoring both height sensor voltage PIDs, allow the vehicle to raise for 30 to 45 seconds. • **Does the rear of the vehicle raise normally and hold the new height?**	**Yes** GO to C4 . **No** GO to C5 .
C4 VERIFY THAT THE REAR OF THE VEHICLE CAN BE LOWERED • Trigger the LR and RR air spring solenoid active command OFF. Trigger the vent solenoid active command ON. • **NOTE:** Allow the rear to lower for 30 seconds. • Trigger air suspension module active commands OFF. • **Does the rear lower normally?**	**Yes** CARRY OUT the pneumatic test and VERIFY system operation. **No** GO to C7 .
C5 CHECK OPERATION OF THE AIR COMPRESSOR **CAUTION: The air suspension module limits the air compressor run time. If the air compressor overheats, it will not restart until it cools down. The ignition switch must be in the OFF position to allow the compressor thermal switch to cool.** • Trigger the air compressor active command ON. • **Does the air compressor run (slight buzzing noise from RF corner of vehicle)?**	**Yes** TRIGGER the air compressor active command OFF. GO to C6 . **No** TRIGGER the air compressor active command OFF. Go To Pinpoint Test K .
C6 CHECK THE AIR COMPRESSOR PRESSURE OUTPUT **CAUTION: The air suspension module limits the air compressor run time. If the air compressor overheats, it will not restart until it cools down. The ignition switch must be in the OFF position to allow the compressor thermal switch to cool. NOTE:** If fluid is present when disconnecting an air tube, clear the air	**Yes** GO to C9 . **No** INSTALL a new air suspension compressor. REFER to Air Suspension Compressor in this

tubes. Refer to Air Line Fluid Purge procedure in this section. Check the compressor air drier for water or the front air spring for oil. • Disconnect the air tube at the air compressor drier. • Connect an air pressure gauge (1,723 kPa [250 psi] maximum reading) with common fittings to the air drier. • **NOTE:** The vehicle will lower quickly. • **NOTE:** When triggering the compressor ON, the vent solenoid will open as well. To prevent the vent solenoid from opening during this test, first trigger a single spring solenoid ON, then trigger the compressor ON. • Trigger the LR spring solenoid active command ON. • Trigger the air compressor active command ON. • Operate the air compressor for 30 seconds then trigger the air compressor active command OFF. • **Did the compressor produce 1,034 kPa (150 psi) within 30 seconds?**	section. CARRY OUT the pneumatic test. VERIFY system operation.
C7 CHECK THE PNEUMATIC SYSTEM — VENT THE AIR SPRINGS	
NOTE: If fluid is present when disconnecting the air tube, clear the air tubes. Refer to Air Line Fluid Purge . Check the air compressor drier for water or the air compressor for oil contamination. **NOTE:** The rear springs must be partially inflated in order to carry out this test. Add air as necessary. • Disconnect the air tube at the air compressor drier. • Trigger the LR air spring solenoid active command ON. This will activate both the LR and RR air spring solenoids. • **Does the air vent from the air compressor drier air tube?**	**Yes** TRIGGER the LR air spring solenoid active command OFF. GO to C9 . **No** CONNECT the air tube to the air compressor drier. TRIGGER the LR air spring solenoid active command OFF. GO to C8 .
C8 CHECK THE PNEUMATIC SYSTEM — AIR TUBE	
NOTE: If fluid is present when disconnecting the air tube, clear the air tubes. Refer to Air Line Fluid Purge . Check the air compressor drier for water or the air compressor for oil contamination. • Disconnect the suspected rear air spring solenoid air tube. • Connect the vacuum tester to the air tube and try to pull a vacuum. • **Can a vacuum be developed?**	**Yes** REPAIR or INSTALL a new air tube. CLEAR the DTC. REPEAT the self-test. **No** GO to C11 .
C9 CHECK THE VENT SOLENOID OPERATION	
• Disconnect the air tube at the drier. • Connect the vacuum tester to the drier and try to pull a vacuum. • Trigger the vent solenoid active command ON. • Try to pull a vacuum again. • **Can a vacuum be developed with the vent solenoid active command OFF and no vacuum developed with the vent solenoid active command ON?**	**Yes** INSTALL a new air suspension module. REFER to Air Suspension Module in this section. CLEAR the DTCs. REPEAT the self-test. **No** If a vacuum **cannot** be developed with the vent solenoid OFF, GO to C10 . If a vacuum **can** be developed with the vent solenoid OFF, INSTALL a new air compressor. REFER to Air Suspension Compressor in this section.
C10 CHECK THE AIR TUBE AND CONNECTIONS	

• Check the air tube and connections between the vacuum tester and the air compressor. • **Are the air tube and connections OK?**	**Yes** INSTALL a new air compressor. REFER to Air Suspension Compressor in this section. CLEAR the DTC. REPEAT the self-test. **No** REPAIR the air tube. GO to C9.
C11 CHECK THE SPRING SOLENOID VALVE	
NOTE: The air springs must be inflated for this test. • Disconnect the air tube at the air spring solenoids. • Using the scan tool, open the solenoids. • **Does air vent from the solenoids?**	**Yes** INSTALL a new air suspension module. REFER to Air Suspension Module in this section. **No** INSTALL a new air spring solenoid. REFER to Air Spring Solenoid Valve in this section.

Pinpoint Test D: DTC C1770 — Air Suspension Vent Solenoid Output Circuit Failure

Refer to Wiring Diagrams Cell 41 , Vehicle Dynamic Suspension for schematic and connector information.

Normal Operation

The air suspension module will command the air suspension system vent solenoid ON or OFF when certain conditions are met. The air suspension module supplies voltage to the vent solenoid through circuit CCL14 (BN/VT), which activates the vent solenoid and vents the air suspension system. The vent solenoid is grounded through circuit GD123 (BK/GY).

The vent solenoid is part of the air suspension compressor, if a new vent solenoid is needed, an air suspension compressor must be installed.

Possible Causes

- Circuit open
- Circuit shorted
- Air suspension compressor
- Air suspension module

PINPOINT TEST D: DTC C1770 — AIR SUSPENSION VENT SOLENOID OUTPUT CIRCUIT FAILURE

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
D1 CHECK THE VENT SOLENOID PID	
• Connect the diagnostic tool. • Key in ON position. • Monitor the vent solenoid PID.	**Yes** For a short to ground GO to D3 .

• **Does the PID indicate a short to ground or a short to voltage?**	For a short to voltage GO to D4 . **No** GO to D2 .
D2 CHECK CIRCUIT GD123 (BK/GY) FOR AN OPEN	
• Key in OFF position. • Disable the air suspension system. Refer to Air Suspension System Disable/Enable in this section. • Disconnect: Air Suspension Compressor C1179. • Measure the resistance between air compressor assembly C1179-3, circuit GD123 (BK/GY), harness side and ground.  N0055962 • **Is the resistance less than 5 ohms?**	**Yes** INSPECT the air suspension compressor C1179 for corrosion and damage. If the connector is corroded or damaged, REPAIR as necessary. If the connector is OK, GO to D5 . **No** REPAIR circuit GD123 (BK/GY). CLEAR the DTCs. REPEAT the self-test.
D3 CHECK THE VENT CONTROL CIRCUIT FOR A SHORT TO GROUND	
• Disable the air suspension system. Refer to Air Suspension System Disable/Enable in this section. • Key in OFF position. • Disconnect: Air Suspension Compressor C1179. • Disconnect: Air Suspension Module C2131a. • Disable the air suspension system. Refer to Air Suspension System Disable/Enable in this section. • Measure the resistance between air compressor C1179-4 circuit CCL14 (BN/VT), harness side, and ground.  N0059653 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D5 . **No** REPAIR cuircuit CCL14 (BN/VT). CLEAR the DTCs. REPEAT the self-test.
D4 CHECK THE VENT CONTROL CIRCUIT FOR A SHORT TO VOLTAGE	
• Disable the air suspension system. Refer to Air Suspension System Disable/Enable in this section. • Key in OFF position. • Disconnect: Air Suspension Compressor C1179. • Disconnect: Air Suspension Module C2131a. • Key in ON position. • Measure the voltage between air compressorC1179-4 circuit CCL14 (BN/VT), harness side and ground.	**Yes** REPAIR cuircuit CCL14 (BN/VT). CLEAR the DTCs. REPEAT the self-test. **No** GO to D6 .

 N0059654 • **Is voltage present?**	
D5 CHECK THE VENT SOLENOID FOR AN OPEN OR A SHORT	**Yes** GO to D6 . **No** INSTALL a new air compressor. REFER to Air Suspension Compressor in this section. CLEAR the DTCs. REPEAT the self-test.
• Measure the resistance between air compressor C1179 pin-2, component side, and C1179 pin-1, component side. • **Is the resistance between 17 and 22 ohms?**	
D6 CHECK THE AIR SUSPENSION MODULE CONNECTOR	**Yes** INSTALL a new air suspension module. REFER to Air Suspension Module in this section. CLEAR the DTCs. REPEAT the self-test. Both height sensors must be calibrated. RESET the vehicle ride height. REFER to Ride Height Adjustments in this section. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

• Key in OFF position.
• Check air suspension module C2131a for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect: Air Suspension Module C2131a.
• Make sure the connector is seated correctly then operate the system and verify the concern is still present.
• **Is the concern still present?**	

Pinpoint Test E: DTC C1790 (LR) and C1795 (RR) — Air Suspension Air Spring Solenoid Output Circuit Failure

Refer to Wiring Diagrams Cell 41 , Vehicle Dynamic Suspension for schematic and connector information.

Normal Operation

The air suspension module will command the air spring solenoid(s) ON or OFF when certain conditions are met. The left solenoid receives voltage from the air suspension module along circuit CCL05 (WH/BN), the right solenoid receives voltage from the air suspension module along circuit CCL07 (YE/GY). The 2 solenoids share a common ground along circuit GD120 (BK/GN).

Possible Causes

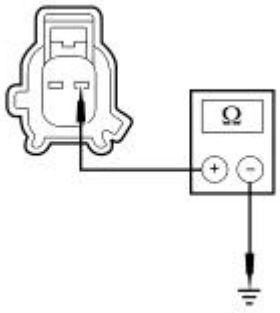
- Circuit open
- Circuit shorted
- Air spring solenoid(s)

- Air suspension module

PINPOINT TEST E: DTC C1790 (LR) AND C1795 (RR) — AIR SUSPENSION AIR SPRING SOLENOID OUTPUT CIRCUIT FAILURE

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
E1 CHECK THE AIR SPRING SOLENOID PID • Connect the diagnostic tool. • Key in ON position. • Monitor the suspect air spring solenoid PID: • **Does the PID indicate a short to ground or a short to voltage?**	**Yes** For a short to ground GO to E3 . For a short to voltage GO to E4 . **No** GO to E2 .
E2 CHECK THE AIR SPRING SOLENOID CONNECTOR(S) • Disable the air suspension system. Refer to Air Suspension System Disable/Enable in this section. • Using the DTCs obtained after running the air suspension module self-test, determine which air spring solenoid is causing the concern. • Key in OFF position. • Disconnect: Suspect Air Spring Solenoid Connector. • Inspect the pins and terminals of the air spring solenoid connector(s) for corrosion, damage, pushed-out pins, spread terminals, moisture or other damage. • **Is the air spring solenoid connector(s) OK?**	**Yes** GO to E3 . **No** REPAIR the connector(s) as necessary. CLEAR the DTCs. REPEAT the self-test.
E3 CHECK THE AIR SPRING SOLENOID CONTROL CIRCUIT(S) FOR A SHORT TO GROUND • Disable the air suspension system. Refer to Air Suspension System Disable/Enable in this section. • Key in OFF position. • Disconnect: Air Suspension Module C2131b. • Disconnect: Air Spring Solenoids C4044 LR, and C4045 RR. • Measure the resistance between C4044-1, circuit CCL05 (WH/BN), harness side and ground.  • Measure the resistance between C4045-1, circuit CCL07 (YE/GY), harness side and ground.	**Yes** GO to E4 . **No** REPAIR the affected circuit (s). CLEAR the DTCs. REPEAT the self-test.



N0059656

- **Is the resistance greater than 10,000 ohms?**

E4 CHECK THE AIR SPRING SOLENOID CONTROL CIRCUIT FOR SHORT TO VOLTAGE	
• Disable the air suspension system. Refer to Air Suspension System Disable/Enable in this section. • Key in OFF position. • Disconnect: Air Suspension ModuleC2131b. • Disconnect: Air Spring Solenoids C4044 LR, and C4045 RR. • Key in ON position. • **For the LR air spring solenoid,** measure the resistance between C4044-1, circuit CCL05 (WH/BN), harness side and ground.  N0059656 • **For the RR air spring solenoid,** measure the resistance between C4045-1, circuit CCL07 (YE/GY), harness side and ground.  N0059656 • **Is voltage present?**	**Yes** GO to E5 . **No** REPAIR the affected circuit (s). CLEAR the DTCs. REPEAT the self-test.
E5 CHECK CIRCUIT GD120 (BK/GN) FOR AN OPEN	
• Key in OFF position. • **For the RR air spring solenoid** , measure the resistance between C4045-2, circuit GD120 (BK/GN), harness side and ground.	**Yes** REPAIR circuit GD120 (BK/GN). CLEAR the DTCs. REPEAT the self-test. **No** GO to E6 .

 N0055959 • **For the LR air spring solenoid** , measure the resistance between C4044-2, circuit GD120 (BK/GN), harness side and ground.  N0055959 • **Is the resistance greater than 10,000 ohms?**	
E6 CHECK THE AIR SPRING SOLENOID COIL(S) FOR AN OPEN • **For the RR air spring solenoid** , measure the resistance between air spring solenoid C4045 pin-1, component side and air spring solenoid C4045 pin-2, component side. • **For the LR air spring solenoid** , measure the resistance between air spring solenoid C4044 pin-1, component side and air spring solenoid C4044 pin-2, component side. • **Is the resistance between 15 and 19 ohms (if the solenoid is very hot, the resistance may be as high as 22 ohms)?**	**Yes** GO to E7 . **No** INSTALL a new air spring solenoid(s). REFER to Air Spring Solenoid Valve in this section. CLEAR the DTCs. REPEAT the self-test.
E7 CHECK THE AIR SUSPENSION MODULE CONNECTOR • Check the air suspension module connector for: ▪ corrosion. ▪ pushed-out pins. ▪ spread terminals. • Connect: Air Suspension Module C2131b. • Make sure the connector is seated correctly then enable the air suspension system, operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new air suspension module. REFER to Air Suspension Module in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test F: DTC C1830 — Air Suspension Compressor Relay Circuit Failure

Refer to Wiring Diagrams Cell 41 , Vehicle Dynamic Suspension for schematic and connector information.

Normal Operation

The air suspension module will command the air compressor ON or OFF when certain conditions are met. The air suspension module supplies voltage to the air suspension compressor relay through circuit CCL01 (WH/VT), which engages the relay and supplies fused battery voltage along circuit CCL08 (BU/BN) to the air compressor. The air compressor and the relay are both supplied a ground through circuit GD123 (BK/GY).

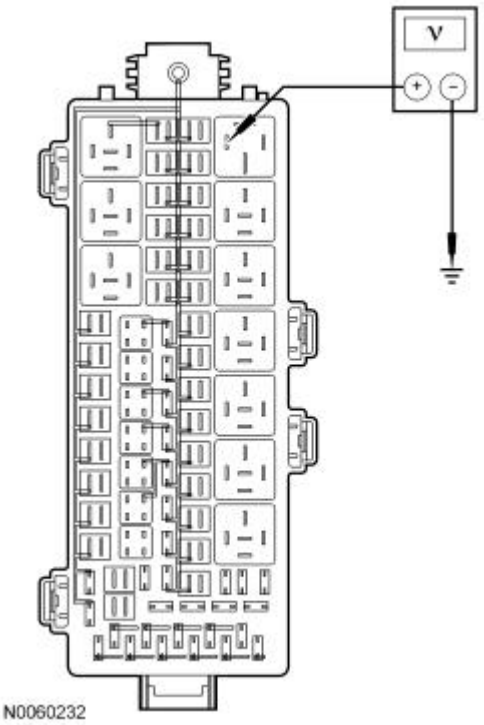
Possible Causes

- Circuit open
- Circuit shorted
- Air compressor relay
- Air suspension module

PINPOINT TEST F: DTC C1830 — AIR SUSPENSION COMPRESSOR RELAY CIRCUIT FAILURE

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
F1 CHECK THE AIR COMPRESSOR RELAY OUTPUT PID	
• Connect the diagnostic tool. • Key in ON position. • Monitor the air compressor relay output PID. • **Does the PID indicate a short to ground, short to voltage or an open circuit?**	**Yes** For a short to voltage, GO to F2 . For a short to ground GO to F3 . For an open circuit GO to F4 . **No** GO to F5 .
F2 CHECK THE RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE	
• Disable the air suspension system. Refer to Air Suspension System Disable/Enable in this section. • Key in OFF position. • Disconnect: Air Suspension Module C2131a. • Disconnect: Air Compressor Relay. • Key in ON position. • Measure the voltage between air compressor relay socket pin-1, circuit CCL01B (WH/VT), harness side and ground.	**Yes** REPAIR circuit CCL01B WH/VT). CLEAR the DTCs. REPEAT the self-test. **No** GO to F3 .



- **Is voltage present?**

F3 CHECK THE RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND	
• Disable the air suspension system. Refer to Air Suspension System Disable/Enable in this section. • Key in OFF position. • Disconnect: Air Suspension Module C2131a. • Disconnect: Air Compressor Relay. • Measure the resistance between air compressor relay socket pin-1, circuit CCL01B (WH/VT), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to F4 . **No** REPAIR circuit CCLO1B (WH/VT). CLEAR the DTCs. REPEAT the self-test.

F4 CHECK THE RELAY CONTROL CIRCUIT FOR AN OPEN	
• Disable the air suspension system. Refer to Air Suspension System Disable/Enable in this section. • Key in OFF position. • Disconnect: Air Suspension Module C2131a. • Disconnect: Air Compressor Relay. • Measure the resistance between air compressor relay socket pin-1, circuit CCL01B (WH/VT) and the air suspension module C2131a-6. • **Is the resistance less than 5 ohms?**	**Yes** GO to F5 . **No** REPAIR circuit CCL01B (WH/VT). CLEAR the DTCs and REPEAT the self-test.
F5 CHECK THE AIR COMPRESSOR RELAY AND SOCKET	
• Disconnect: Air Compressor Relay. • Carry out the Air Compressor Relay Component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • Inspect the terminals of the air compressor relay socket for corrosion, spread or pushed-out terminals, moisture or other damage. • **Are the relay and connector OK?**	**Yes** GO to F6 . **No** REPAIR the connector or INSTALL a new air compressor relay. CLEAR the DTCs. REPEAT the self-test.
F6 CHECK THE RELAY GROUND CIRCUIT GD123 (BK/GY) FOR AN OPEN	
• Measure the resistance between air compressor relay socket pin-2, circuit GD123 (BK/GY), harness side and ground.  N0055963 • **Is the resistance less than 5 ohms?**	**Yes** GO to F7 . **No** REPAIR circuit GD123 (BK/GY). CLEAR the DTCs. REPEAT the self-test.
F7 CHECK THE AIR SUSPENSION MODULE CONNECTOR	
• Check the air suspension module connector for: ▪ corrosion. ▪ pushed-out pins. ▪ spread terminals. • Connect: Air Suspension Module C2131a. • Make sure the connector is seated correctly then enable the	**Yes** INSTALL a new air suspension module. REFER to Air Suspension Module in this section. CLEAR the DTCs. REPEAT the self-test.

air suspension system, operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test G: DTC C1883 (LR) and C1885 (RR) — Air Suspension Height Sensor Signal Circuit Failure

Refer to Wiring Diagrams Cell 41 , Vehicle Dynamic Suspension for schematic and connector information.

Normal Operation

The 2 rear height sensors receive a 5-volt reference voltage from the air suspension module along circuit LCL12 (VT/OG), both sensors share a common return path along circuit RCL12 (GN/WH). The RR sensor sends the suspension height voltage back to the air suspension module along circuit VCL12 (WH/VT). The LR sensor sends the suspension height voltage back to the module along circuit VCL13 (BN/BU). The air suspension module monitors the 2 height sensors and makes adjustments to the rear suspension based on sensor input.

Possible Causes

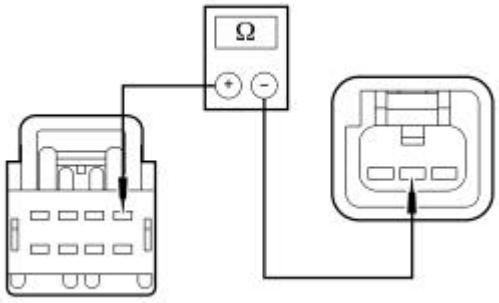
- Circuit open
- Circuit shorted
- Height sensor(s)
- Air suspension module

PINPOINT TEST G: DTC C1883 (LR) AND C1885 (RR) — AIR SUSPENSION HEIGHT SENSOR SIGNAL CIRCUIT FAILURE

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
G1 CHECK THE AIR SUSPENSION HEIGHT SENSOR VOLTAGE PIDs	
• Disable the air suspension system. Refer to Air Suspension System Disable/Enable in this section. • Connect the diagnostic tool. • Key in ON position. • Disconnect the sensor arm linkage from both rear air suspension height sensors. • **NOTE:** The voltage will increase as the suspension is compressed. • While monitoring both height sensor voltage PIDs, slowly move the height sensors through their full range of travel up and down. • **Do the voltages vary from approximately 0.50 volt and 4.50 volts?**	**Yes** INSPECT the height sensor electrical connector(s) for corrosion and damage, REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. **No** CONNECT the sensor arm linkages to the air suspension height sensors GO to G2 .
G2 CHECK CIRCUIT VCL12 (VT/OG) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Suspect Height Sensor. • Key in ON position.	**Yes** GO to G3 .

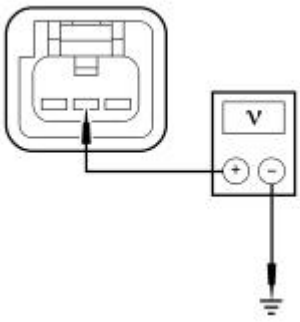
• **For the LR height sensor** , measure the voltage between LR height sensor C4092-3, circuit VCL12 (VT/OG), harness side and ground.  N0060240 • **For the RR height sensor** , measure the voltage between RR height sensor C4093-3, circuit VCL12 (VT/OG), harness side and ground.  N0060240 • **Are 5 volts present?**	**No** Go To Pinpoint Test B .
G3 CHECK CIRCUITS VCL13 (BN/BU) AND VCL12 (WH/VT) FOR AN OPEN	
• Key in OFF position. • Disconnect: Air Suspension Module C2131b. • **For the LR height sensor** , measure the resistance between air suspension module C2131b-6, circuit VCL13 (BN/BU), harness side and LR height sensor C4092-2, circuit VCL13 (BN/BU), harness side.  N0055984 • **For the RR height sensor** , measure the resistance between air suspension module C2131b-1, circuit VCL12 (WH/VT), harness side and RR height sensor C4093-2, circuit VCL12 (WH/VT), harness side.	**Yes** REPAIR the affected circuit (s). CLEAR the DTCs. REPEAT the self-test. **No** GO to G4 .



N0055985

- **Is the resistance greater than 10,000 ohms?**

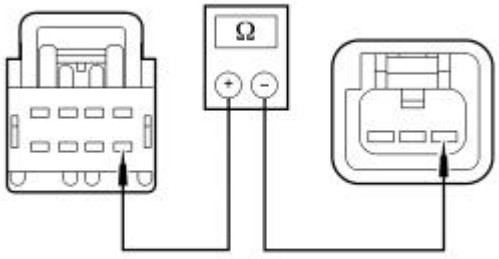
G4 CHECK CIRCUITS VCL13 (BN/BU) AND VCL12 (WH/VT) FOR A SHORT TO GROUND	
• **For the LR height sensor** , measure the resistance between LR height sensor C4092-2, circuit VCL13 (BN/BU), harness side and ground.  N0055968 • **For the RR height sensor** , measure the resistance between RR height sensor C4093-2, circuit VCL12 (WH/VT), harness side and ground.  N0055968 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the affected circuit (s). CLEAR the DTCs. REPEAT the self-test. **No** GO to G5 .
G5 CHECK CIRCUITS VCL13 (BN/BU) AND VCL12 (WH/VT) FOR A SHORT TO VOLTAGE	
• Key in ON position. • **For the LR height sensor** , measure the voltage between LR height sensor C4092-2, circuit VCL13 (BN/BU), harness side and ground. • **For the RR height sensor** , measure the voltage between RR height sensor C4093-2, circuit VCL12 (WH/VT), harness side and ground.	**Yes** REPAIR the affected circuit (s). CLEAR the DTCs. REPEAT the self-test. **No** GO to G6 .



N0055967

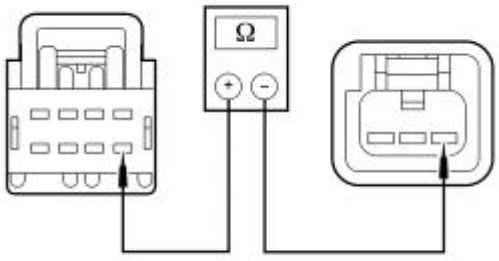
- **Is voltage present?**

G6 CHECK FOR SIGNAL RETURN SHORTED TO VOLTAGE	
• **For the LR height sensor** , measure the voltage between LR height sensor C4093-1, circuit RCL12 (GN/WH), harness side and ground.  N0060242 • **For the RR height sensor** , measure the voltage between RR height sensor C4092-1, circuit RCL12 (GN/WH), harness side and ground.  N0060242 • **Is 5 volts present?**	**Yes** GO to G7 . **No** Go To Pinpoint Test B .
G7 CHECK CIRCUIT RCL12 (GN/WH) FOR AN OPEN	
• Key in OFF position. • **For the LR height sensor** , measure the resistance between air suspension module C2131b-5, circuit RCL12 (GN/WH), harness side and LR height sensor C4092-1, circuit RCL12 (GN/WH), harness side.	**Yes** REPAIR circuit VCL12 (WH/VT). CLEAR the DTCs. REPEAT the self-test. **No** GO to G8 .



N0060248

- **For the RR height sensor** , measure the resistance between air suspension module C2131b-5, circuit VCL12 (WH/VT), harness side and RR height sensor C4093-2, circuit VCL12 (WH/VT), harness side.



N0060248

- **Is the resistance greater than 10,000 ohms?**

G8 VERIFY HEIGHT SENSOR(S) OUTPUT VOLTAGE	
• Connect: Air Suspension Module C2131b. • Connect: RH Height Sensor C4093 and LH Height Sensor C4092. • Disable the air suspension system. Refer to Air Suspension System Disable/Enable in this section. • Back probe RR height sensor C4093-2, circuit VCL12 (WH/VT) and LR height sensor C4092-2, circuit VCL12 (WH/VT). • **Is the voltage reading the same as the sensor PID reading?**	**Yes** GO to G9 . **No** INSTALL a new height sensor(s) and CALIBRATE both height sensors. REFER to Suspension Height Sensor in this section, CLEAR the DTCs. REPEAT the self-test.
G9 CHECK THE AIR SUSPENSION MODULE CONNECTOR	

• Disconnect: Air Suspension Module C2131b.
• Check air suspension module C2131b for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect: Air Suspension Module C2131b.
• Make sure the connector is seated correctly then enable the air suspension system, operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new air suspension module. REFER to Air Suspension Module in this section. CLEAR the DTCs. REPEAT the self test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test H: The Air Compressor Continuously Cycles With the Ignition Switch in the OFF Position and No DTC is Set

Normal Operation

The air suspension module will command the air compressor ON or OFF when certain conditions are met. The air suspension module supplies voltage to the air suspension compressor relay through circuit CCL01 (WH/VT), which engages the relay and supplies fused battery voltage along circuit SBB39 (WH/RD) through the air compressor relay and then to the air compressor along circuit CCL08 (BN/BU). The air compressor is supplied a ground along circuit A_GD123 (BK/GY) and the air compressor relay is supplied a ground along circuit GD123 (BK/GY).

Possible Causes

- Circuit shorted
- Air compressor relay
- Air suspension module

PINPOINT TEST H: THE AIR COMPRESSOR CONTINUOUSLY CYCLES WITH THE IGNITION SWITCH IN THE OFF POSITION AND NO DTC IS SET

Test Step	Result / Action to Take
H1 CHECK THE AIR COMPRESSOR RELAY OUTPUT PIDs	
• Connect the diagnostic tool. • Key in ON position. • Monitor the air compressor relay output PIDs. • **Do the letters YES appear next to any of the PIDs?**	**Yes** REPAIR circuit CCL01 (WH/VT). CLEAR the DTCs. REPEAT the self-test. **No** GO to H2 .
H2 CHECK THE AIR COMPRESSOR CONNECTOR	

• Key in OFF position.
• Disconnect: Air Suspension Compressor C1179.
• Check air compressor C1179 for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect: Air Suspension Compressor C1179.
• Make sure the connector is seated correctly then enable the air suspension system, operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	GO to H3 .
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

H3 CHECK THE AIR SUSPENSION MODULE CONNECTOR	

• Key in OFF position.
• Disconnect: Air Suspension Module C2131a.
• Check air suspension module C2131a for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect: Air Suspension Module C2131a.
• Make sure the connector is seated correctly then enable the air suspension system, operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	GO to H4 .
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

H4 CHECK FOR MODULE ACTIVITY	
NOTE: If the key has been off for 3 minutes and 30 seconds or more, the compressor is permitted	**Yes** GO to H5 .

to run for a maximum of 30 seconds. • Key in OFF position. • Verify the air compressor still cycles for a maximum of 30 seconds after the ignition is turned OFF. • **Does the air compressor still cycle after the module turns off?**	**No** The system is OK. INFORM the owner of system operations.
H5 CHECK THE AIR SUSPENSION MODULE	
• Disable the air suspension system. Refer to Air Suspension System Disable/Enable in this section. • Key in OFF position. • Disconnect: Air Suspension Module C2131a. • Disconnect: Air Suspension Module C2131b. • **Does the air compressor still cycle?**	**Yes** GO to H6 . **No** INSTALL a new air suspension module. REFER to Air Suspension Module in this section. REPEAT the self-test.
H6 CHECK CIRCUIT CCL08 (BN/BU) FOR A SHORT TO VOLTAGE	
• Disconnect: Air Compressor Relay. • **Does the air compressor still cycle?**	**Yes** REPAIR circuit CCL08 (BN/BU). TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test I: Air Suspension System Inoperative Without DTCs and With the Vehicle at Rest

Normal Operation

The scan tool is used to communicate with the air suspension module and run the self-test. The air suspension module is supplied fused battery voltage through battery junction box (BJB) fuse 47 (30A) along circuit SBB74 (WH/RD), and fused ignition circuit through BJB fuse 65 (10A) along circuit CBB65 (WH/OG). A ground path is provided for the module along circuits GD120 (BK/GN) and GD133 (BK). The air suspension module communicates with the other modules along the high speed communication area network (HS-CAN). The air suspension module must receive inputs from several different components before it will allow the vehicle dynamic suspension system to operate.

Possible Causes

- Fuse(s)
- Circuit open
- Door switch is indicating door ajar status
- Vehicle speed
- System is not enabled
- Air suspension module

PINPOINT TEST I:

NOTE: If the vehicle has been sitting with the key in the run position, it may be necessary to open and close the drivers side door. This will enable the system to carry out the pump or vent functions quicker.

Test Step	Result / Action to Take

I1 VERIFY THAT THE SYSTEM IS ENABLED	
• Verify that the air suspension system is enabled. Refer to Air Suspension System Disable/Enable in this section. • **Is the air suspension system enabled?**	**Yes** GO to I2. **No** ENABLE the air suspension system. Refer to Air Suspension System Disable/Enable in this section.
I2 CHECK THE AIR SUSPENSION MODULE FOR IGNITION SWITCH INPUT	
• Connect the diagnostic tool. • Key in ON position. • While cycling the ignition key from ON to OFF and then back to ON, monitor the air suspension module ignition run detection PID. • **Does the PID display NO with the key in the OFF position and YES with the key in the ON position?**	**Yes** GO to I3. **No** VERIFY battery junction box (BJB) fuse 65 (10A) is OK. If OK, REPAIR circuit CBB65 (WH/OG). TEST the system for normal operation.
I3 CHECK THE AIR SUSPENSION MODULE FOR DOOR AJAR INPUT	
• Key in ON position. • Monitor air suspension module door ajar PID. • Close all the doors, liftgate, liftgate glass and power running boards. • While observing the scan tool, open and close one door. • **Does the door ajar PID change from CLOSED to OPEN?**	**Yes** GO to I4. **No** REFER to Section 418-01 to diagnose the HS-CAN concern.
I4 CHECK THE AIR SUSPENSION MODULE FOR VEHICLE SPEED INPUT	
• Monitor the air suspension module vehicle speed PID. • Test drive the vehicle at different speeds. • **Does the vehicle speed PID match the speedometer within 8 km/h (5 mph)?**	**Yes** GO to I5. **No** REFER to Section 418-01 to diagnose the HS-CAN concern.
I5 CHECK THE AIR SUSPENSION MODULE CONNECTORS	

• Key in OFF position.
• Disconnect: Air Suspension Module C2131a.
• Disconnect: Air Suspension Module C2131b.
• Check the air suspension module connectors for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect: Air Suspension Module C2131a.
• Connect: Air Suspension Module C2131b.
• Make sure the connectors are seated correctly then enable the air suspension system, operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	GO to I6.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

I6 VERIFY THE SYSTEMS OPERATION	
• Using the scan tool, carry out the pneumatic test. • **Does running the pneumatic test generate any DTCs?**	**Yes** RECORD the DTCs and REFER to the Air Suspension Module Diagnostic Trouble Code (DTC) Chart.

	No The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test J: Excessive Air Compressor Noise

Normal Operation

The air compressor is isolated from the rest of the vehicle and other components by 3 rubber isolators and a bracket. The bracket is mounted to the vehicle using 3 rubber isolators with metal inserts. The air compressor should not be in contact with the vehicle or other components.

Possible Causes

- Compressor bracket
- Bracket isolators
- Compressor mounts
- Component routing
- Wire harness routing

PINPOINT TEST J: EXCESSIVE AIR COMPRESSOR NOISE

Test Step	Result / Action to Take
J1 CHECK FOR THE AIR COMPRESSOR AND/OR THE AIR COMPRESSOR WIRING CONTACTING OTHER COMPONENTS	
• Check the air compressor wiring to see if it is contacting other components inside the engine compartment at any place other than the mounting points. • Check for anything contacting the air compressor (other wire harnesses, air tubes, hoses, loose fasteners, stones or other foreign material). • Check for any contact between the wire harness and other compressor components. • **Is any portion of the wire harness contacting the compressor motor components or is anything contacting the compressor assembly other than the mounts?**	**Yes** REMOVE the air compressor assembly, REFER to Air Suspension Compressor in this section. ADJUST the air compressor wiring harness so that it does not contact the compressor motor or FASTEN/REMOVE objects so they no longer contact the air compressor assembly. INSTALL the air compressor assembly, REFER to Air Suspension Compressor in this section. TEST the system for normal operation. **No** GO to J2.
J2 CHECK FOR A BENT AIR COMPRESSOR BRACKET	
• Check the air compressor bracket for any damage/bends that may contact other components within the engine compartment. • Check the bracket rubber isolators and inserts for any excessive wear or damage. • **Is the air compressor bracket making contact with other components or are the bracket**	**Yes** INSTALL a new air compressor assembly or REPAIR other components as necessary. Refer to Air Suspension Compressor in this section. TEST the system for normal operation. **No** GO to J3.

isolators damaged?	
J3 CHECK THE AIR COMPRESSOR MOUNTS FOR DAMAGE	
• Check the air compressor mounts for signs of cracks or tearing away from the inner sleeve. • **Is damage present in the mounts?**	**Yes** INSTALL a new air compressor assembly. Refer to Air Suspension Compressor in this section. TEST the system for normal operation. **No** GO to J4 .
J4 CHECK THE AIR COMPRESSOR FOR NOISE	
CAUTION: Do not run the air compressor for more than 3 minutes. The air compressor can overheat and stop operating due to an internal temperature sensitive thermal breaker. **The air suspension module will limit run time to protect the air compressor. When DTC C1964 is present, the compressor will not operate for approximately 10 minutes.** • Remove the air compressor assembly, but leave it connected electrically. Refer to Air Suspension Compressor in this section. • Connect the diagnostic tool. • Key in ON position. • Trigger the air suspension module air compressor active command ON. • **Is the air compressor exhibiting any unusual noise?**	**Yes** INSTALL a new air compressor. REFER to Air Suspension Compressor in this section. TEST the system for normal operation. **No** RECHECK the mountings and bracket for damage. If damaged, INSTALL a new air compressor bracket. REFER to Air Suspension Compressor in this section. TEST the system for normal operation.

Pinpoint Test K: The Air Compressor is Inoperative

Refer to Wiring Diagrams Cell 41 , Vehicle Dynamic Suspension for schematic and connector information.

Normal Operation

The air suspension module will command the air compressor ON or OFF when certain conditions are met. The air suspension module supplies voltage to the air suspension compressor relay through circuit CCL01 (WH/VT), which engages the relay and supplies fused battery voltage along circuit SBB39 (WH/RD) through the air compressor relay and then to the air compressor along circuit CCL08 (BN/BU). The air compressor is supplied a ground along circuit GD123 (BK/GY) and the air compressor relay is supplied a ground along circuit GD123 (BK/GY).

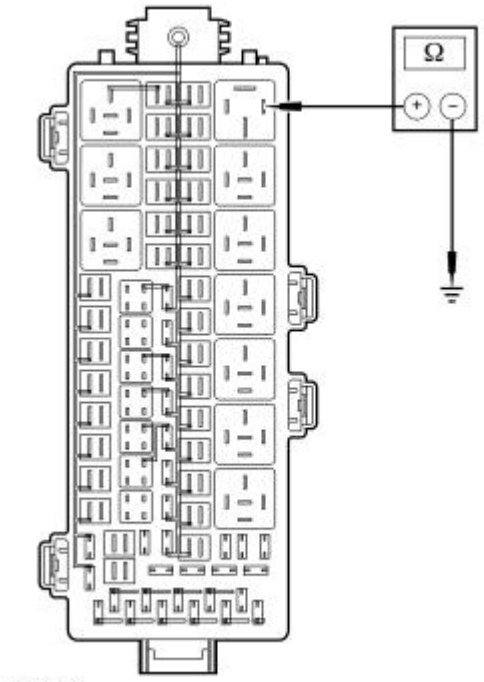
Possible Causes

- Fuse(s)
- Circuit open
- Circuit shorted
- Air compressor relay
- Air compressor
- Air suspension module

PINPOINT TEST K: THE AIR COMPRESSOR IS INOPERATIVE

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
K1 CHECK THE AIR COMPRESSOR RELAY AND SOCKET	
• Disable the air suspension system. Refer to Air Suspension System Disable/Enable in this section. • Key in OFF position. • Disconnect: Air Compressor Relay. • Inspect the pins and terminals of the air compressor relay socket for corrosion, spread or pushed-out terminals, moisture or other damage. Carry out the Air Compressor Relay Component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Are the relay and connector OK?**	**Yes** GO to K2. **No** REPAIR the connector or INSTALL a new air compressor relay. CLEAR the DTCs. REPEAT the self-test.
K2 CHECK CIRCUIT SBB39 (WH/RD) FOR VOLTAGE	
NOTE: Make sure the battery voltage is greater than 10 volts before testing the compressor relay voltage. • Measure the voltage between air compressor relay socket pin-3, circuit SBB39 (WH/RD), harness side and ground.  N0055964 • **Is the voltage greater than 10 volts?**	**Yes** GO to K3. **No** Verify BJB fuse 6 (50A) is OK. If OK, REPAIR circuit SBB39 (WH/RD). TEST the system for normal operation.
K3 CHECK CIRCUIT GD123 (BK/GY) FOR AN OPEN	
• Measure the resistance between air compressor relay socket pin-2, circuit GD123 (BK/GY), harness side and ground.	**Yes** REPAIR circuit GD123 (BK/GY). TEST the system for normal operation.

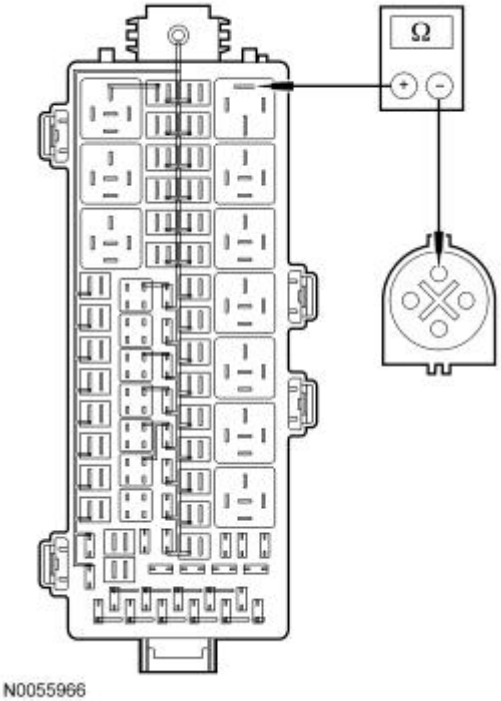


- **Is the resistance greater than 10,000 ohms?**

No
GO to K4 .

K4 CHECK CIRCUIT CCL08 (BN/BU) FOR AN OPEN

- Disconnect: Air Compressor Assembly C1179.
- Measure the resistance between air compressor relay socket pin-5, circuit CCL08 (BN/BU), harness side and air compressor assembly C1179-2, circuit CCL08 (BN/BU), harness side.



- **Is the resistance greater than 10,000 ohms?**

Yes
REPAIR circuit CCL08 (BN/BU). TEST the system for normal operation.

No
GO to K5 .

K5 CHECK CIRCUIT GD123 (BK/GY) FOR AN OPEN

- Measure the resistance between air compressor assembly C1179-1, circuit GD123 (BK/GY), harness side and ground.

Yes
REPAIR circuit GD123 (BK/GY). TEST the

 N0055960 • **Is the resistance greater than 10,000 ohms?**	system for normal operation. **No** GO to K6 .
K6 CHECK THE AIR COMPRESSOR RELAY POWER	
CAUTION: Do not run the air compressor for more than 3 minutes. The air compressor can overheat and stop operating due to an internal temperature sensitive thermal breaker. The air suspension module will limit run time to protect the air compressor. • Connect: Air Compressor Assembly C1179. • Connect the diagnostic tool. • Key in ON position. • Enable the air suspension system. Refer to Air Suspension System Disable/Enable in this section. • Trigger the air compressor active command ON. • Measure the voltage between air compressor relay socket pin-1, circuit CCL01 (WH/VT), harness side and ground.  N0055965 • **Is the voltage greater than 5 volts?**	**Yes** GO to K7 . **No** REPAIR circuit CCL01 (WH/VT). TEST the system for normal operation.
K7 CHECK THE AIR COMPRESSOR STATUS	
• Key in OFF position. • Connect: Air Compressor Relay. • Key in ON position. • Carry out the On-Demand Self Test. • **Is DTC C1964 present?**	**Yes** If the air suspension compressor run time has been exceeded, DISCONNECT the air suspension module connectors for 10

	minutes. GO to K8 . **No** If no DTC is present, GO to K9 .
K8 CHECK THE AIR COMPRESSOR AFTER COOL DOWN PERIOD • Key in OFF position. • Disable the air suspension system. Refer to Air Suspension System Disable/Enable in this section. Allow the vehicle to sit for 10 minutes to give the air compressor assembly time to cool off. • Enable the air suspension system. Refer to Air Suspension System Disable/Enable in this section. • Key in ON position. • Trigger the vent solenoid active command ON. • Trigger the air compressor active command ON. • **Does the air compressor assembly operate?**	**Yes** GO to K9 . **No** INSTALL a new air compressor. REFER to Air Suspension Compressor in this section. TEST the system for normal operation.
K9 CHECK THE AIR COMPRESSOR THERMAL BREAKER • Trigger the air suspension LR and RR air spring solenoid active commands ON. • Run the air compressor assembly for 60 seconds. • **Did the air compressor assembly run for 60 seconds?**	**Yes** The thermal breaker was overheated. RETEST to validate the system is OK. **No** INSTALL a new air compressor assembly. REFER to Air Suspension Compressor in this section. TEST the system for normal operation.

Pinpoint Test L: DTC 1810 — Height Sensor Delta Out of Range

Normal Operation

The 2 rear height sensors receive a 5-volt reference voltage from the air suspension module along circuit LCL12 (VT/OG), both sensors share a common return path along circuit RCL12 (GN/WH). The RR sensor sends the suspension height voltage back to the air suspension module along circuit VCL12 (WH/VT). The LR sensor sends the suspension height voltage back to the module along circuit VCL13 (BN/BU). The air suspension module monitors the 2 height sensors and makes adjustments to the rear suspension based on sensor input.

Possible Causes

- Vehicle lean (air spring leak, asymmetric loading)
- Height sensor bracket bent or loose
- Height sensor link arm bent, loose or disconnected
- Height sensor(s) out of calibration
- Air tube restriction

PINPOINT TEST L: DTC 1810 — HEIGHT SENSOR DELTA OUT OF RANGE

Test Step	Result / Action to Take

L1 VERIFY THAT DTC C1810 IS PRESENT AND ACTIVE	
NOTE: The air suspension module will log code DTC C1810 if the left and right calculated ride height value differs by 100 mm (3.93 in) or more. • Connect the diagnostic tool. • Key in ON position. • Carry out the pneumatic system test: • **Does DTC C1810 set after carrying out the pneumatic system test?**	**Yes** GO to L2 . **No** GO to L3 .
L2 INSPECT THE RH AND LH HEIGHT SENSORS	
• Verify that both height sensor arms are fastened to the ball studs on the height sensor(s) and lower control arm(s). • Verify that the height sensor arms are installed correctly, and not positioned on backwards. • Inspect for loose or bent height sensor(s) and height sensor(s) arms. • **Are any of the height sensor components damaged?**	**Yes** INSTALL new component(s) as necessary, RESET the vehicle ride height. REFER to Ride Height Adjustments in this section. REPEAT the self-test. **No** GO to L3 .
L3 CHECK THE VEHICLE FOR ASYMMETRICAL LOADING	
• Check for unbalanced or heavy load on one side of the vehicle. • **Is the vehicle heavily loaded on one side causing the ride height to be incorrect?**	**Yes** REPAIR the loading issue and REPEAT the self-test. **No** GO to L4 .
L4 CHECK FOR VEHICLE LEANING	
• Key in OFF position. • Position the vehicle on a level surface. • Using the scan tool, carry out the accurate trim test. • **Are both the LR and RR ride heights within specification?**	**Yes** GO to L7 . **No** GO to L5 .
L5 CHECK THE HEIGHT SENSOR OPERATION DURING PUMP	
• Using the scan tool, inflate the system to for 30 seconds and monitor the LR and RR height sensor voltage pids. • **Does the system inflate evenly?**	**Yes** GO to L6 . **No** Go To Pinpoint Test C .
L6 CHECK HEIGHT SENSOR OPERATION DURING VENT	
• Using the scan tool, command the system to vent for 20 seconds and monitor the LR and RR height sensor voltage PIDS. • **Does the system deflate evenly?**	**Yes** GO to L7 . **No** Go To Pinpoint Test C .
L7 CHECK THE AIR SPRING(S) FOR LEAKS.	
• Inspect both the LR and RR air spring for leaks. • **Are any leaks present?**	**Yes** REPAIR the leaks, REPEAT the self-test. **No**

	System operating correctly at this time.

Component Test

Relay

Refer to Wiring Diagrams Cell 149 for schematic and connector information.

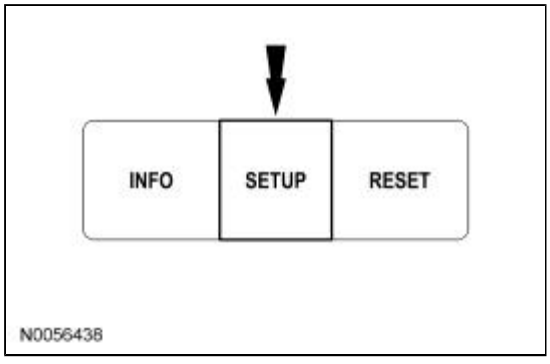
Air Suspension System Disable/Enable

Printable View (92 KB)

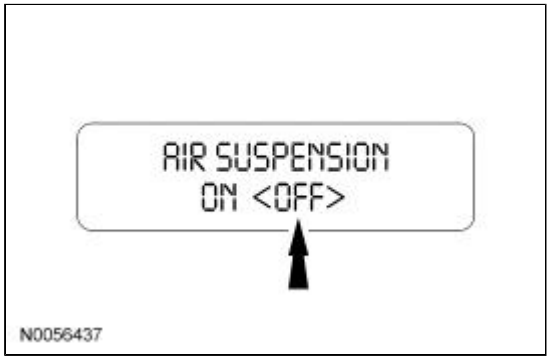
WARNING: The air suspension system must be shut off prior to hoisting or jacking an air suspension equipped vehicle. Failure to do so may result in unexpected inflation or deflation of the air springs, which may result in shifting of the vehicle during these operations. Failure to follow these instructions may result in personal injury.

NOTE: The message center is located on the instrument cluster and displays important information through a constant monitoring of vehicle systems. You may select display features on the message center for a display of status proceeded by a brief chime. The system will also notify you of potential vehicle problems with a display of system warnings followed by a long indicator chime. The message center is used to disable and enable the vehicle air suspension system. When the driver elects to disable the air suspension system, the message center sends a message over the high speed controller area network (HS-CAN) to the air suspension module. Once the message is received, the air suspension module will take no further action to inflate or deflate the air springs. The system will default to ON when the ignition key is cycled.

1. Turn the ignition to the ON position, close all doors and clear warnings.
2. Select the SETUP control function on the message center.



3. Select the AIR SUSPENSION function to display the current status of the air suspension system.



4. Press the RESET control to turn the air suspension OFF or ON.

Ride Height Adjustments

Printable View (109 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

CAUTION: The suspension height D dimensions are for reference only. The vehicle attitude must be controlled by the correct dimensions to prevent vehicle damage.

NOTE: If one or both height sensors are installed new, both height sensors must be calibrated.

NOTE: Incorrect air suspension ride height D dimension can be caused by an air suspension system that is incorrectly set.

NOTE: The air suspension module has a preprogrammed trim height.

1. **NOTE:** The vehicle must be on a level surface, such as a drive on alignment hoist.

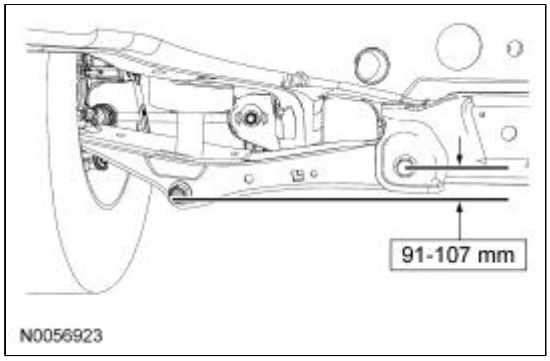
   Position the vehicle on a level surface.

2. Using the vehicle message center, verify that the air suspension is in the ON mode. For additional information, refer to Air Suspension System Disable/Enable in this section.

3. Using the scan tool, run the accurate trim test.

4. Measure the ride height D dimension. For additional information, refer to Section 204-00 .

5. If ride height dimension D is not within specification, use the scan tool to vent or fill the air suspension to the correct dimension.



6. **NOTE:** The air suspension height sensor sends a signal to the air suspension module. The output ranges from approximately 4.5 volts at minimum height (when the vehicle is low or in full jounce) to 0.5 volt at maximum height (when the vehicle is in high or in full rebound).

Using the scan tool, monitor the 2 suspension height sensors voltage parameter identifications (PIDs).

7. Using the scan tool, save the vehicle's trim height for both sensors.

Air Leaks

Printable View (97 KB)

1. Apply a soapy water solution to the air lines, air line fittings, air springs, upper spring shock mount and the air compressor.

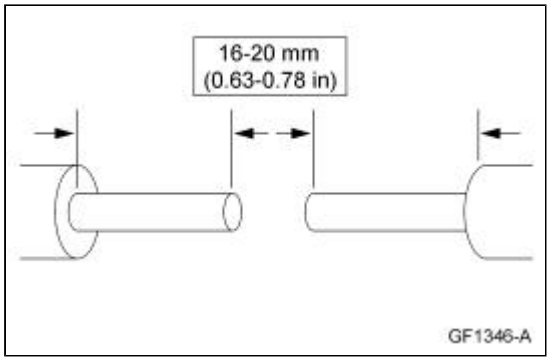
2. **NOTE:** If a leak is detected within the air compressor, install a new compressor. If a leak is detected in a line, carry out the air line repair procedure.

   Verify the location of air leak(s) and repair or install new components as necessary.

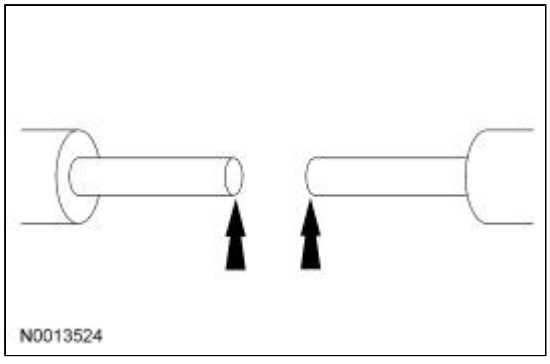
Air Line Repair

1. Cut the line at the damaged area.

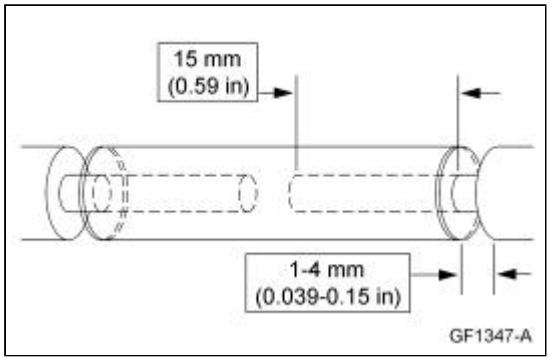
2. Trim the sleeve material from both ends of the damaged line.



3. Taper both ends of the tube by shaving or sanding it 3 mm (0.11 in) from the tips.



4. Install the repair filling.



5. **NOTE:** Check system for leaks.

   Inflate the air suspension system. For additional information, refer to Ride Height Adjustments in this section.

Air Line Fluid Purge

Printable View (80 KB)

WARNING: Do not remove an air spring under any circumstances when there is pressure in the air spring. Do not remove any components supporting an air spring without either exhausting the air or providing support for the air spring. Failure to follow these instructions may result in personal injury.

WARNING: Disconnecting an air tube that is connected to the air compressor can cause damage to components as high pressure air is vented uncontrolled. Failure to follow these instructions may result in personal injury.

CAUTION: Suspension fasteners are critical parts because they effect performance of vital components and systems and their failure can result in major service expense. A new part with the same part number or an equivalent part must be installed, if installation is necessary. Do not use a part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. **NOTE:** Carry out this procedure if fluid (water and/or oil) is found in the air tube. Purge fluid from rear air tubes and install new components if affected.

   Disconnect the air tube at the air compressor drier.

2. Disconnect the air tube from the air springs.

3. Connect shop air to the disconnected air tube and blow any fluid out.

4. **NOTE:** When installing the air tubes, make sure the white tube is fully inserted into the fitting for correct installation.

   Reconnect the air tubes at the air springs.

5. Install a new air compressor drier. For additional information, refer to Air Suspension Compressor .

6. Reconnect the air tube to the air compressor drier.

7. Make sure that all air tube fittings are sealed.

Air Spring Inflation and Deflation

Printable View (86 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

WARNING: Do not remove an air spring under any circumstances when there is pressure in the air spring. Do not remove any components supporting an air spring without either exhausting the air or providing support for the air spring to prevent vehicle damage. Failure to follow these instructions may result in personal injury.

CAUTION: Suspension fasteners are critical parts because they effect performance of vital components and systems and their failure can result in major service expense. A new part with the same part number or an equivalent part must be installed, if installation is necessary. Do not use a part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

CAUTION: Failure to observe the following instructions can result in a sudden failure of the air spring or suspension system.

- **Any rear spring which is unfolded must be refolded prior to being installed in a vehicle.**
- **The air spring refolding procedure should only be used for an air spring which has never supported the vehicle's weight while in the incorrectly folded position.**
- **Improperly folded air springs found on vehicles during pre-delivery inspection or after use must be replaced.**
- **When installing a new air spring, care must be taken not to apply a load to the suspension until the springs have been inflated using the air spring fill procedure.**
- **After inflating an air spring in the hanging position, it must be inspected for correct shape.**

CAUTION: Prior to installing an air spring, make sure the air spring is in the correct shape with no folds or creases. If the air spring is not in the correct shape, carry out air spring refold before installing the air spring.

1. Turn the ignition switch to the RUN position.

2. Connect the scan tool to the data link connector (DLC).

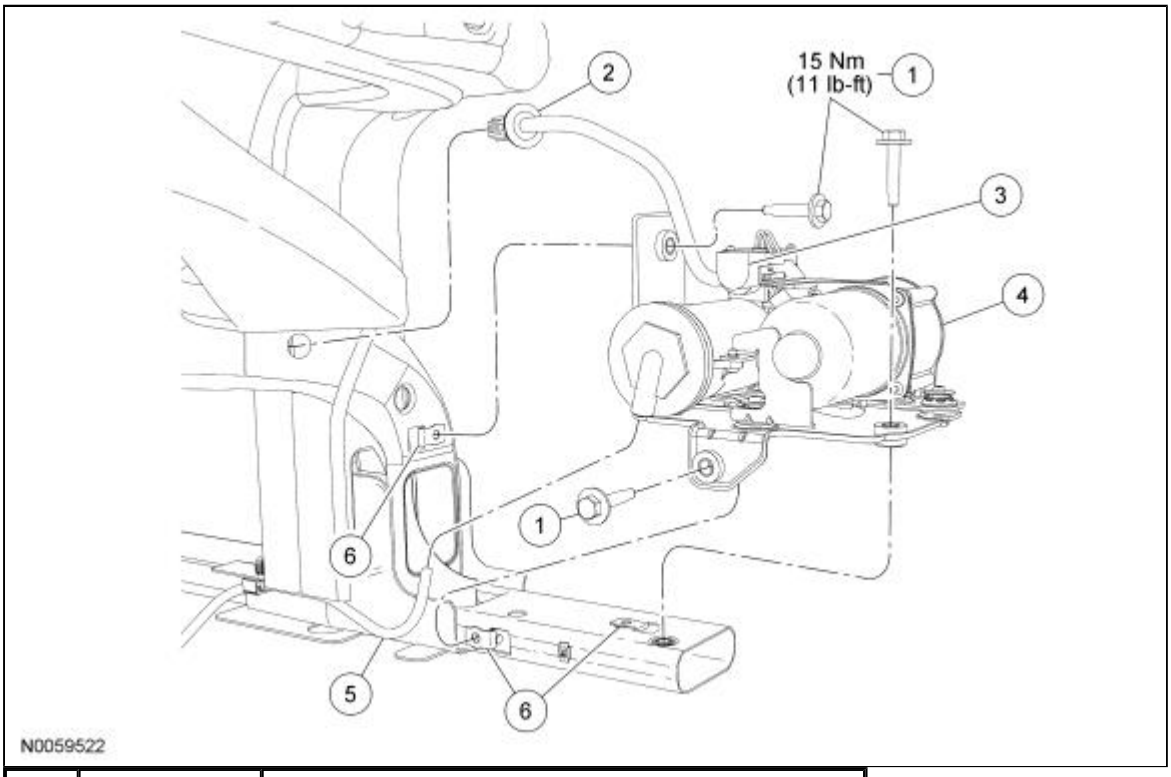
3. Select the air suspension control module active command LR_SOL (LR) or RR_SOL (RR) from OFF to ON.

4. **NOTE:** When using the air suspension control module active command AS_COMP, do not run the air compressor for more than 3 minutes to prevent overheating and shutdown. If this occurs, wait for the system to cool down before resuming the inflation procedure.

Select the air suspension control module active command AS_VENT to deflate the air springs or AS_COMP to inflate the air springs.

Air Suspension Compressor

Printable View (156 KB)



Item	Part Number	Description
1	W505436	Compressor bolts (3 required)
2	—	Compressor air intake hose
3	—	Compressor electrical connector (part of 14624)
4	3B484	Compressor and bracket assembly
5	3C002	Air line
6	W520823	Clip nuts (3 required)

Removal and Installation

1. Remove the inner fender splash shield. For additional information, refer to Section 501-02 .
2. Disconnect the air line from the compressor drier.
   - Compress the quick connect lock ring inward, then pull the line outward from the air drier.
3. Disconnect the air compressor air intake hose.
4. Disconnect the air compressor electrical connector.
5. Remove the 3 air compressor bracket bolts and remove the air compressor and bracket assembly.
   - To install, tighten to 15 Nm (11 lb-ft).
6. **NOTE:** When installing the air lines, make sure the white inner air line is fully inserted into the

fitting for correct installation.

NOTE: Make sure that there are no objects trapped under or on the bracket.

Make sure that the air compressor is not in contact with any surrounding components that could cause vibration noises.

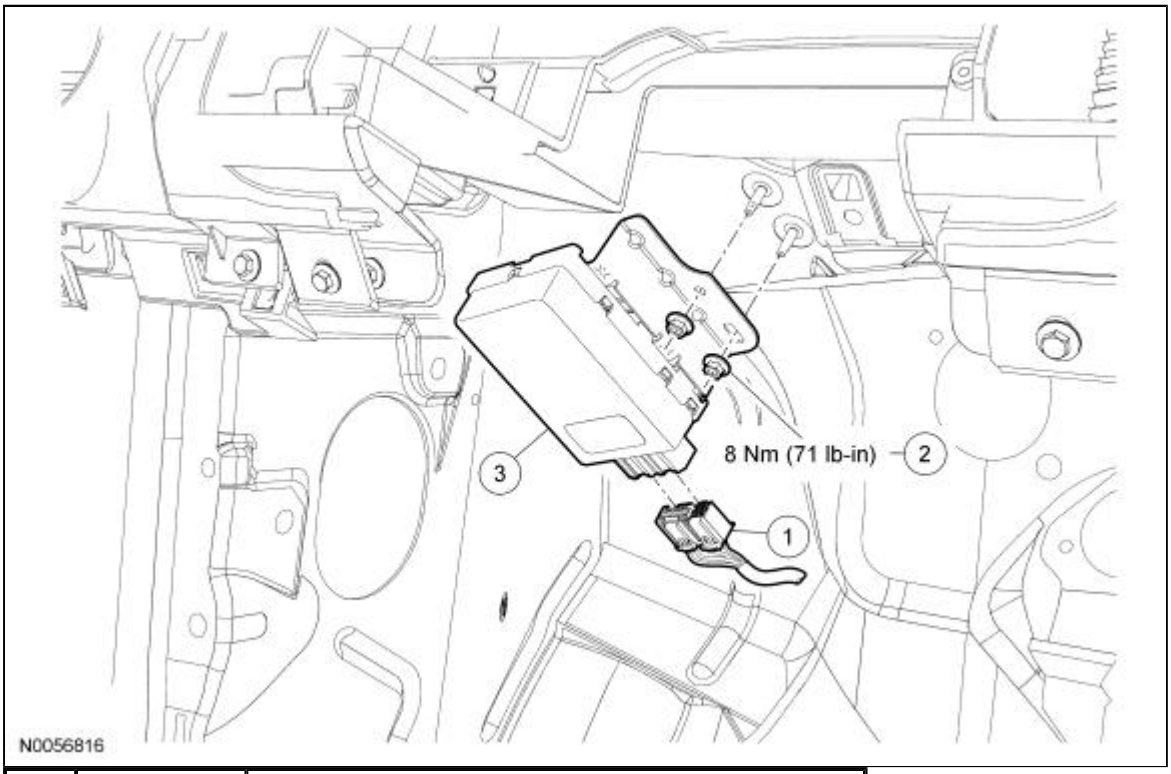
NOTE: Make sure that the air compressor moves freely in the rubber isolators.

Make sure that the bracket has no deformations that could cause the 3 rubber isolators to load against each other.

To install, reverse the removal procedure.

Air Suspension Module

Printable View (197 KB)



Item	Part Number	Description
1	—	Module electrical connectors (2 required) (part of 14489)
2	W707142	Module bracket nut (2 required)
3	3C142	Air suspension control module and bracket assembly

Removal and Installation

1. **CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.**

   Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

2. **NOTE:** The air suspension control module is mounted to the lower left side of the dash above the parking brake control.

   Disconnect the 2 air suspension control module electrical connectors.

3. Remove the air suspension control module nuts and the air suspension control module.
   - To install, tighten to 8 Nm (71 lb-in).

4. **NOTE:** The air suspension control module is calibrated with information from the ride height sensors. A new or exchanged air suspension control module requires that the LH and RH ride

height sensors are calibrated and a pneumatic test is carried out. For additional information, refer to Vehicle Dynamic Suspension Calibration Initialize System — Clear C1990 and C1991 DTCs in this section.

To install, reverse the removal procedure.

Air Shock Absorber — Rear

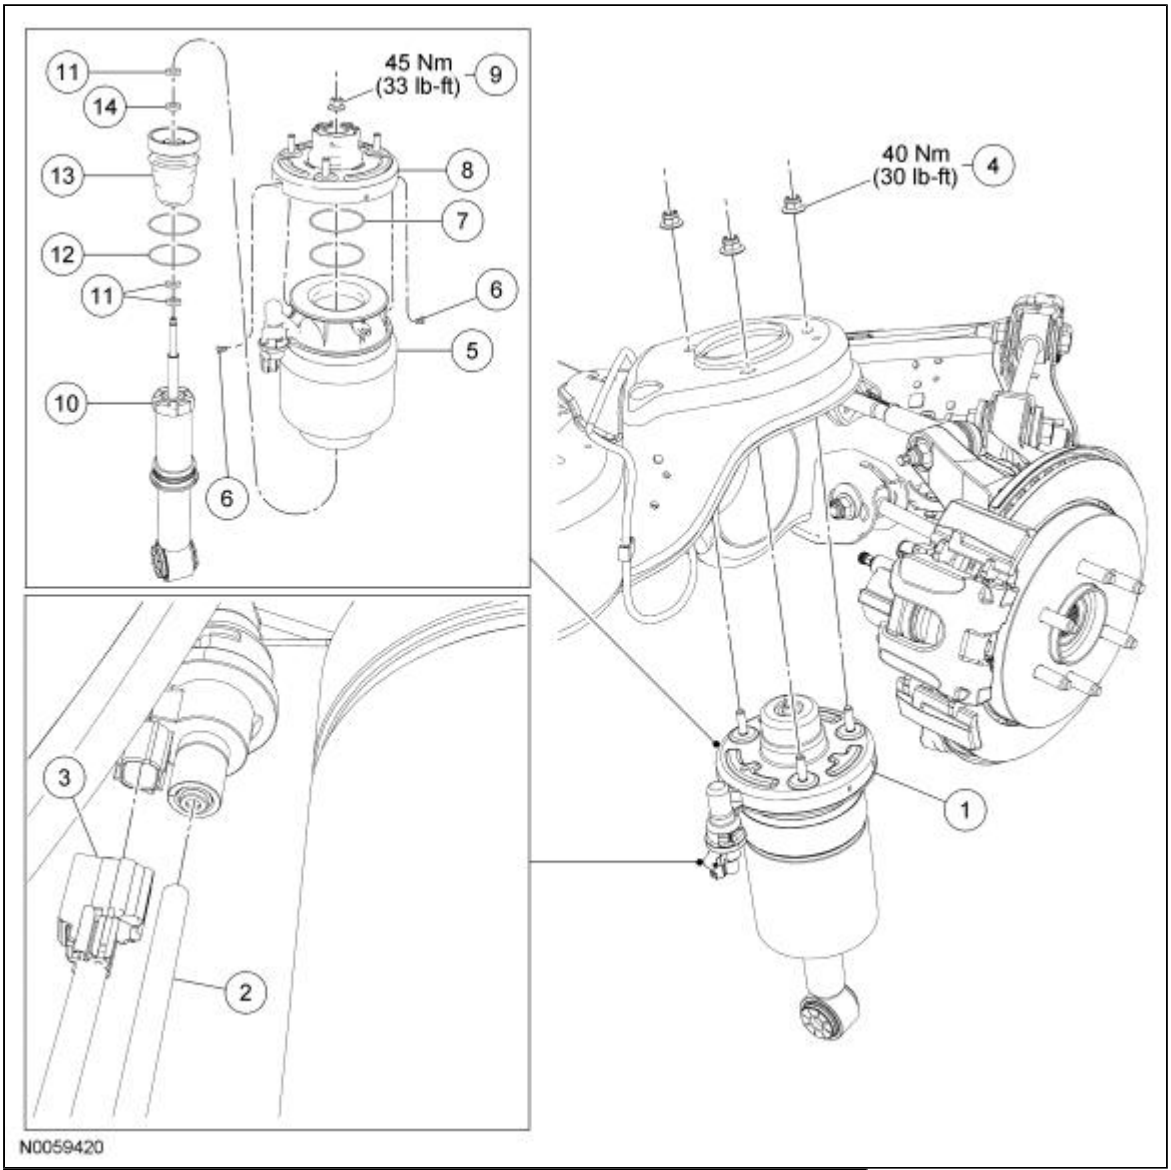
Material

Item	Specification
Multi-Purpose Grease XG-4 and/or XL-5	ESB-M1C93-B



Item	Part Number	Description
1	5A980	Air shock and spring assembly
2	—	Air line (part of 3209)
3	—	Air valve electrical connector (part of 14A464)
4	W712334	Shock upper nuts (3 required)
5	5A891	Air spring assembly
6	—	Screws (part of 5B302)
7	—	Air spring upper O-ring seals (2 required) (part of 5B302)
8	18A099	Upper mount
9	W712134	Shock rod nut
10	18080	Shock absorber
11	—	Shock rod O-ring seals (2 required) (part of 5B302)
12	—	Air spring lower O-ring seals (2 required) (part of 5B302)
13	—	Jounce bumper (part of 18080)

14	—	Shock rod washer (part of 18080)

Removal and Installation

WARNING: Do not remove an air spring under any circumstances when there is pressure in the air spring. Do not remove any components supporting an air spring without either exhausting the air or providing support for the air spring. Failure to follow these instructions may result in personal injury.

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be used if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Using the scan tool, vent the appropriate air spring.

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. Remove the lower arm. For additional information, refer to Section 204-02 .

4. Disconnect the air spring solenoid valve electrical connector.

5. Disconnect the air line at the air valve.
   - Compress the orange quick connect lock ring, then pull downward on the air supply line.

6. Remove and discard the 3 shock upper nuts.
   - To install, tighten to 40 Nm (30 lb-ft).

7. Remove the air shock absorber.

8. **NOTE:** If the individual spring and/or shock components are not being serviced, continue with Step 14.

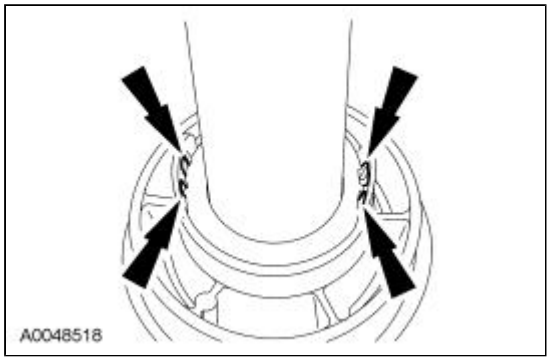
   NOTE: Use the hex holding feature to prevent the shock rod from turning while removing the nut.

   Remove and discard the shock rod nut.
   - To install, tighten to 45 Nm (33 lb-ft).

9. **CAUTION: If the retainer tabs are broken, a new air spring must be installed.**

   NOTE: Index-mark the air spring and shock absorber for reference during the installation procedure.

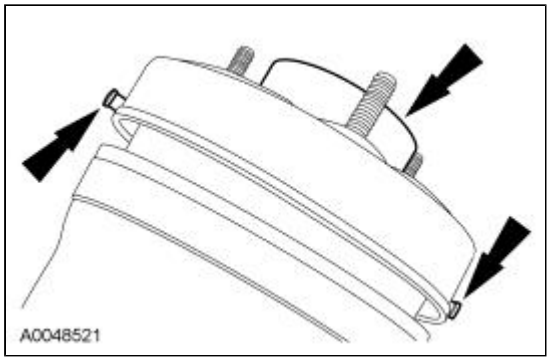
   Depress the retainer tabs and remove the air spring.



10. Remove the shock rod O-ring seal, washer and jounce bumper.
    - Discard the seal and washer.

11. Remove and discard the 2 air spring lower O-ring seals.

12. Remove the 2 retainer screws and the upper mount.
    - Discard the screws.



13. Remove and discard the 2 air spring upper O-ring seals.

14. **CAUTION: Use a suitable press to install the upper mount retainer pins. Do not use a hammer or damage may occur.**

    NOTE: Make sure that all seals are clean and free of debris.

    NOTE: Apply a thin coat of grease to the new O-ring seals.

    To install, reverse the removal procedure.

Air Spring Solenoid Valve

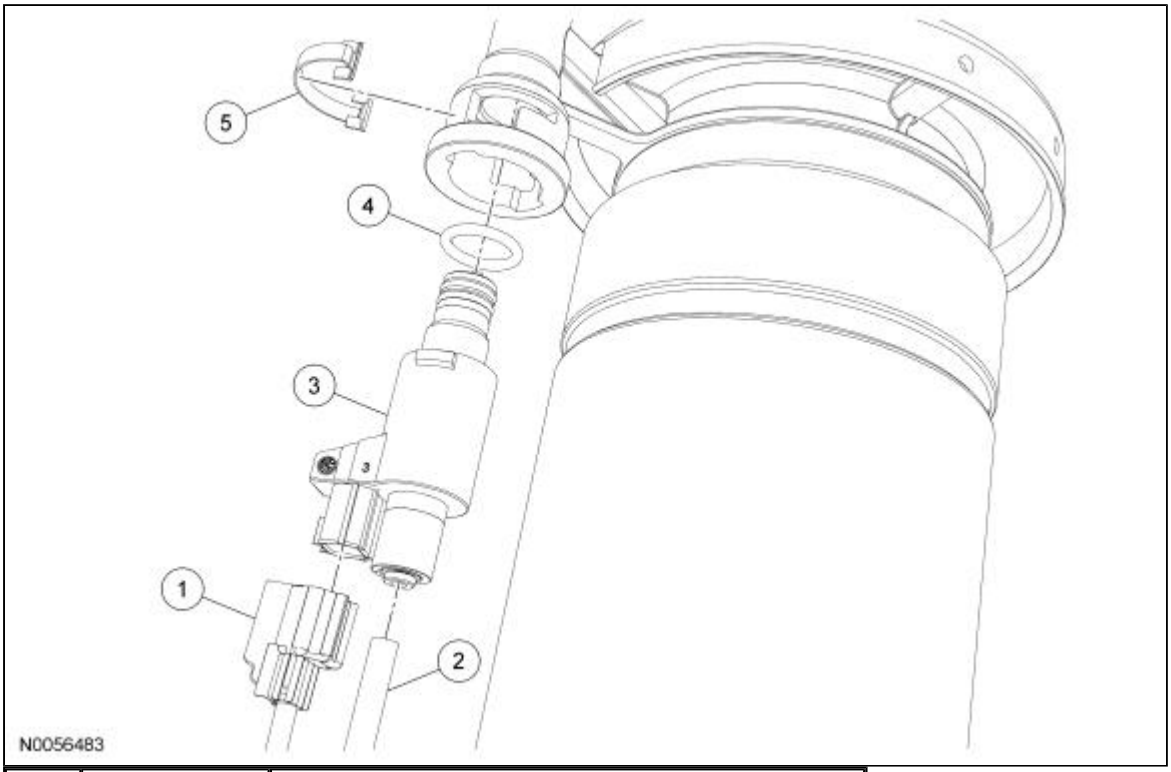
Printable View (153 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

Item	Specification
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A



Item	Part Number	Description
1	—	Air valve electrical connector (part of 14A464)
2	—	Air line (part of 3C002)
3	—	Air spring solenoid valve (part of 3C199)
4	—	Solenoid valve O-ring (part of 3C199)
5	—	Air spring solenoid clip (part of 3C199)

Removal and Installation

WARNING: Do not remove an air spring under any circumstances when there is pressure in the air spring. Do not remove any components supporting an air spring without either exhausting the air or providing support for the air spring. Failure to follow these instructions may result in personal injury.

1. If the air spring solenoid valve is functional, use the scan tool to vent the appropriate air spring(s).

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. Disconnect the air spring solenoid valve electrical connector.

4. Disconnect the air line at the air valve.
   - Compress the orange quick connect lock ring, then pull downward on the air supply line.

5. **CAUTION: Remove any dirt or other foreign material from the air spring assembly prior to removing the air spring solenoid valve from the air spring assembly.**

   Remove the air spring solenoid clip.

6. **WARNING: The air spring solenoid valve has a 2-stage release. When removing a non-functional solenoid and the air spring is inflated, carefully rotate the solenoid counterclockwise until it reaches the first stage to release the air from the air spring. Turn the solenoid to the second stage to remove the solenoid. Failure to follow these instructions when removing a non-functional air spring solenoid may result in personal injury or damage to components as high pressure air is vented uncontrolled.**

   Rotate the air spring solenoid and remove the solenoid.

7. **NOTE:** Inspect the air spring O-ring for damage and install a new O-ring as necessary. Lightly lubricate the solenoid seal area with silicone grease.

   NOTE: After installing the solenoid, it is necessary to inflate the air suspension system. For additional information, refer to Ride Height Adjustments in this section.

   NOTE: When installing the air spring solenoid, make sure that the electrical connector is positioned away from the air spring.

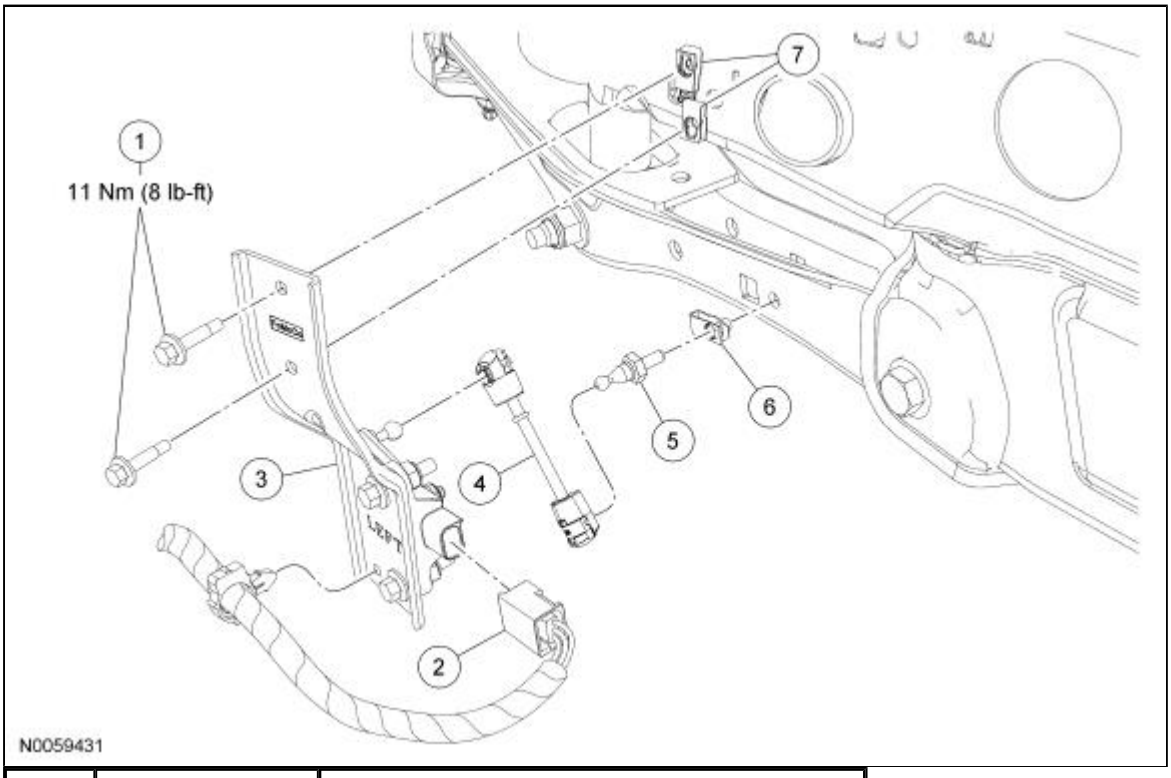
   NOTE: When installing the air lines, make sure the air line is fully inserted into the fitting for correct installation.

   To install, reverse the removal procedure.

Suspension Height Sensor

Printable View (248 KB)

LH Side



Item	Part Number	Description
1	W506014	Sensor assembly bolts (4 required)

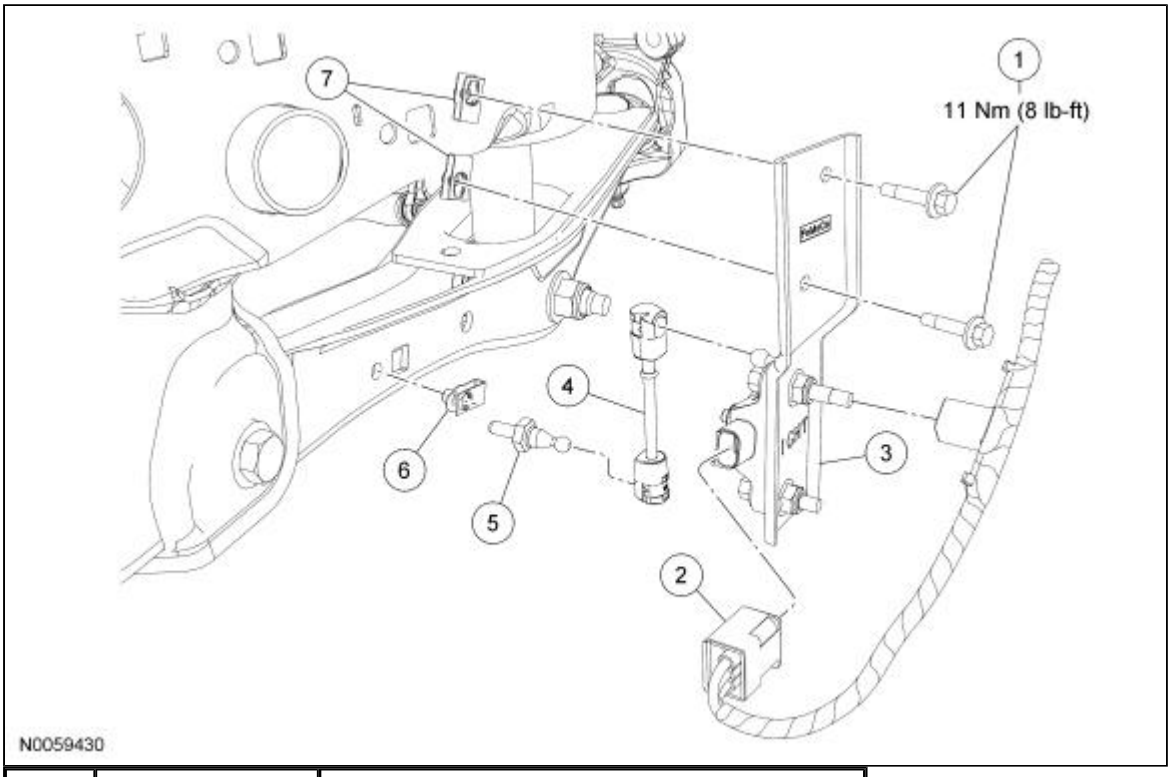
6	W711660	Ball stud nut clip
7	W712408	Frame nut clips (2 required)

RH Side



Item	Part Number	Description
1	W506014	Sensor assembly bolts (4 required)
2	—	Sensor electrical connector
3	5A967	Ride height sensor
4	—	Sensor arm (part of 3C034)
5	5A945	Ride height sensor ball stud
6	W711660	Ball stud nut clip
7	W712408	Frame nut clips (2 required)

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the senor harness from the sensor bracket.

3. Disconnect the sensor electrical connector.

4. Disconnect the sensor arm from the ball stud on the lower control arm.

5. Remove and discard the 2 sensor bolts.
   - To install, tighten to 11 Nm (8 lb-ft).

6. **NOTE:** The RH and LH height sensor assemblies **cannot** be used on opposite sides of the vehicle.

   To install, reverse the removal procedure.

7. Calibrate the LH and RH height sensors. For additional information, refer to Ride Height Adjustments in this section.

Printable View (78 KB)

General Specifications

Item	Specification
Driveline Angles	
Universal Joint Operating Angle	0.5°-3.0°
Epoxy Sealer	M-3D35A(E)

Driveline System

Printable View (188 KB)

The source of the drivetrain's power is generated by the engine and delivered to the transmission. The driveline transfers the engine torque through the driveshaft to the axle.

- On rear wheel drive (RWD) vehicles, power is transmitted through the transmission to the driveshaft and then to the rear axle.
- On four wheel drive (4WD) vehicles, power is transmitted through the transmission and the transfer case. The transfer case directs the power to the rear driveshaft and then to the rear axle. When engaged, it also transmits power through the front driveshaft to the front axle.

The rear driveshaft is connected to the output shaft of the transmission and to the rear axle. The front driveshaft is connected to the transfer case and to the front axle. For Expedition, slip yokes are used to allow for any changes to the length of the driveshaft. Navigator RWD vehicles use a fixed flange at the transmission with a flex coupling. Changes in length are self adjusted up in the driveshaft slip mechanism. The engine torque enters the axle through the drive pinion, which rotates the ring gear. The ring gear is mounted to the differential case, which contains the gears that transmit power to the rear axle shafts or front halfshafts. These shafts rotate the drive wheels.

For additional information on the front axle assembly, refer to Section 205-03 .

For additional information on the halfshafts, refer to Section 205-04 or Section 205-05 .

For additional information on the driveshaft, refer to Section 205-01 .

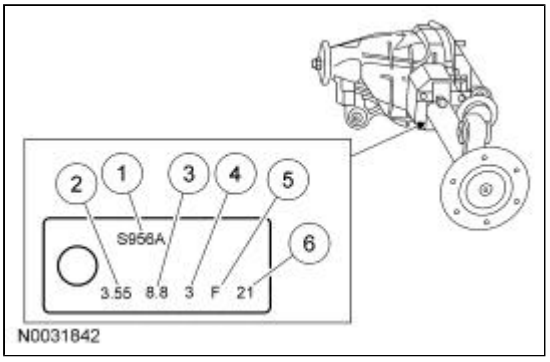
For additional information on the rear axle, refer to Section 205-02 .

The engine angle is built into the engine mounts. If the engine angle is out of specification, the engine mounts must be inspected for damage. For additional information, refer to Section 303-01 .

Vehicle Certification (VC) Label Example

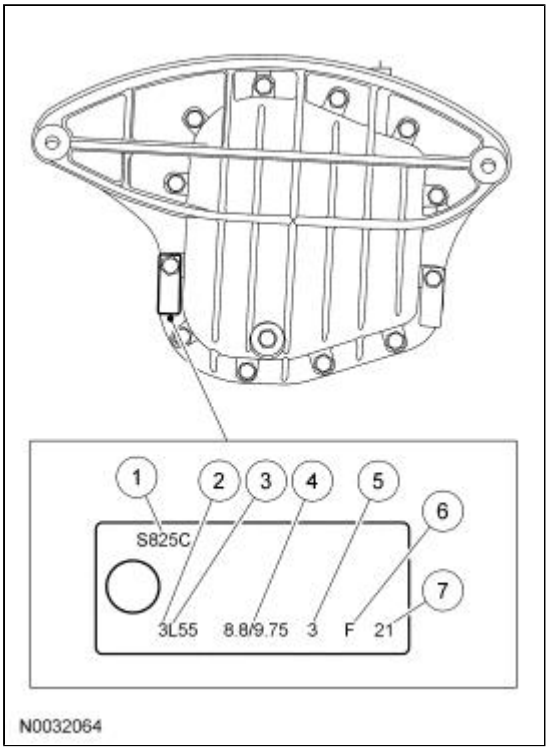
The vehicle certification (VC) label is located in the driver door jamb. The first 2 digits of the axle code indicate the rear axle and the third digit refers to the front axle, if so equipped. For additional information on the VC label, refer to Section 100-01 .

Front Axle Identification Tag



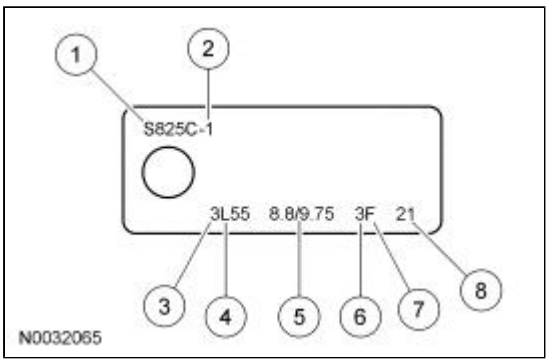
Item	Description
1	Plant code
2	Axle ratio
3	Ring gear diameter (in)
4	Build year
5	Build month
6	Build day

Rear Axle Identification Tag



Item	Description
1	Plant code
2	Axle ratio
3	Denotes Traction-Lok®
4	Ring gear diameter (in)
5	Build year
6	Build month
7	Build day

Axle Identification Tag Denoting Interchangeability Affected Internally



Item	Description
1	Plant code
2	Denotes interchangeability affected internally
3	Axle ratio
4	Denotes Traction-Lok®
5	Ring gear diameter (in)

6	Build year
7	Build month
8	Build day

CAUTION: The axle identification tag is the official service identifier. Do not damage the tag. Always reinstall the tag after removing it for axle inspection/repair.

The plant code denotes a particular axle design, a specific ratio, and if it is a conventional or limited slip (Traction-Lok®) type. In addition, the plant code will not change as long as that particular axle assembly never undergoes an external design change. If, however, an internal design change takes place during the production life of the axle and that internal change affects component interchangeability, a dash and numerical suffix is added to the plant code.

Note that the plant code in the front and rear axle identification tag illustrations is similar, but the illustration denoting interchangeability affected internally shows the addition of the suffix. This means that as an assembly both axles are interchangeable; however, internally they are different. Each axle requires different internal components at the time of repair.

Inspection and Verification

Certain axle noise or vibration symptoms are also common to the engine, transmission, wheel bearings, tires and other components of the vehicle. For this reason, make sure that the cause of the trouble is in the axle before disassembling, adjusting or repairing the axle. For additional information, refer to Section 100-04 .

Certain driveshaft vibration symptoms are common to the front engine accessory drive (FEAD), the engine, transmission or tires. Make sure the cause of the concern is the driveshaft before repairing or installing a new driveshaft. For additional information, refer to Section 100-04 .

Certain symptoms may be caused by Traction-Lok® differentials. Check the vehicle certification label and axle identification tag to determine the type of differential. For additional information, refer to Section 100-01 .

Noise Acceptability

NOTE: A gear-driven unit will produce a certain amount of noise. Some noise is acceptable and audible at certain speeds or under various driving conditions such as a newly paved blacktop road. Slight noise is not detrimental to the operation of the axle and is considered normal.

With the Traction-Lok® differential axle, slight chatter noise on slow turns after extended highway driving is considered acceptable and has no detrimental effect on the locking axle function.

Universal Joint (U-Joint) Inspection

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

Position the vehicle on a frame hoist and rotate the driveshaft by hand. Check for rough operation or seized U-joint. Install a new U-joint if it shows signs of seizure, excessive wear or incorrect seating. For additional information, refer to Section 205-01 .

Analysis of Leakage

Clean up the leaking area enough to identify the exact source. An axle leak can be caused by the following:

- Axle lubricant level is too high
- Worn or damaged axle shaft seals or differential seals
- Differential housing is cracked
- Flange yoke seal is worn or damaged
- Pinion flange is scored or damaged
- Axle cover is not sealed
- Vent is plugged

Repair the axle as necessary. Make sure the axle lubricant is at the correct level. For additional information, refer to Specifications in this section.

Axle Vent

NOTE: If a plugged vent cannot be cleared, install a new one.

A plugged vent will cause excessive seal lip wear due to internal pressure buildup. If a leak occurs, check the vent. Make sure the vent hose is not kinked. Remove the hose from the vent nipple and clear the hose of any foreign material. While the hose is removed, pass a length of mechanics wire or a small diameter Allen wrench in and out of the vent to clean it. Connect the hose when done.

Flange Yoke Seal

Leaks at the drive pinion seal originate for the following reasons:

- Drive pinion seal was not correctly installed.
- Poor quality drive pinion seal journal surface.

Any damage to the seal bore (dings, dents, gouges or other imperfections) will distort the seal casing and allow leakage past the outer edge of the axle drive pinion seal.

The drive pinion seal can be torn, cut or gouged if it is not installed carefully. The spring that holds the drive pinion seal against the pinion flange may be knocked out and allow leakage past the lip.

The rubber lips can occasionally become hard (like plastic) with cracks at the oil lip contact point. The contact point on the pinion flange may blacken, indicating excessive heat. Marks, nicks, gouges or rough surface texture on the drive pinion seal journal of the pinion flange will also cause leaks.

Drive pinion seal wear 1.27 mm (0.050 in) or greater is considered excessive.

A new pinion flange must be installed if any of these conditions exist.

Metal chips or sand trapped at the sealing lip may also cause oil leaks. This can cause a wear groove on the pinion flange and heavy drive pinion seal wear.

When a drive pinion seal leak occurs, install a new drive pinion seal and check the vent and the vent hose to make sure they are clean and free of foreign material.

Axle Shaft Seals

Axle shaft oil seals are susceptible to the same kinds of damage as drive pinion seals if incorrectly installed. The axle shaft oil seal bore must be clean and the lip handled carefully to avoid cutting or tearing it. Axle shaft journal surface must be free of nicks, gouges, and rough surface texture.

Differential Seals

For additional information on differential seals, refer to Section 205-02 for the rear axle or Section 205-03 for the front axle.

Analysis of Vibration

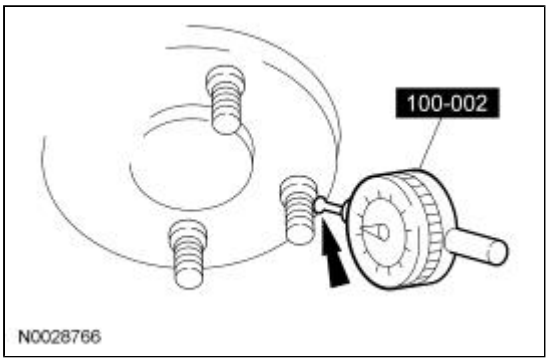
WARNING: A vehicle equipped with a Traction-Lok® differential will always have both wheels driving. If only one wheel is raised off the floor and the rear axle is driven by the engine, the wheel on the floor could drive the vehicle off the stand or jack. Be sure both rear wheels are off the floor.

Few vibration conditions are caused by the front or rear axle. On a vibration concern, follow the diagnosis procedure in Section 100-04 unless there is a good reason to suspect the axle.

Wheel Hub or Axle Flange Bolt Circle Runout

NOTE: The brake discs must be removed to carry out all runout measurements.

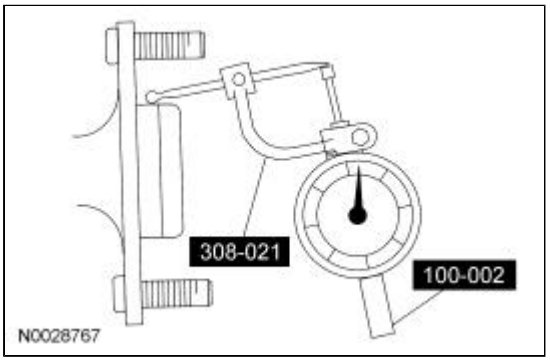
1. Position the special tool perpendicular to the wheel hub or axle flange bolt, as close to the hub or flange face as possible. Zero the indicator to allow the pointer to deflect either way.



2. Rotate the hub or flange until the next bolt is contacted. Record the measurement and continue until each bolt is checked. The difference between the maximum and minimum contact readings will be the total wheel hub or axle flange bolt pattern runout. The runout must not exceed 0.38 mm (0.015 in).

Pilot Runout

1. Position the special tool as close to the hub or axle flange face as possible. Zero the indicator to allow the pointer to deflect either way.

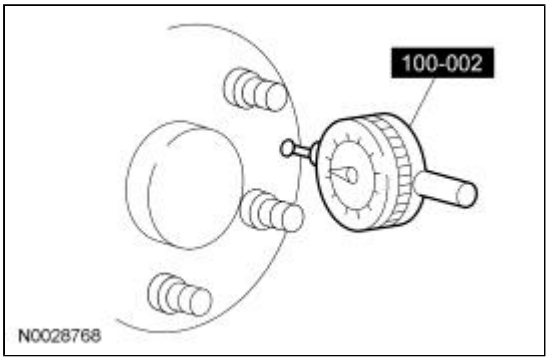


2. Rotate the hub or flange one full turn and note the maximum and minimum readings. The difference between the maximum and minimum readings will be the total pilot runout. Pilot runout must not exceed 0.15 mm (0.006 in).

Wheel Hub or Axle Flange Face Runout

NOTE: If the axle shaft assembly is removed, check runout of the shaft itself. The forged (unmachined) part of the shaft is allowed to have as much as 3 mm (0.11 in) runout. This alone will not cause a vibration condition.

1. Position the special tools on the wheel hub or axle flange face, as close to the outer edge as possible. Zero the indicator to allow the pointer to deflect either way.



2. Rotate the hub or flange one full turn and note the maximum and minimum readings. The difference between the maximum and minimum readings will be the total face runout. The runout must not exceed 0.254 mm (0.010 in).

Drive Pinion Stem and Pinion Flange

Check the pinion flange runout when all other checks have failed to show the cause of vibration.

One cause of excessive pinion flange runout is incorrect installation of the drive pinion seal. Check to see if the spring on the seal lip has been dislodged before installing a new ring gear and pinion.

Halfshafts

NOTE: New constant velocity (CV) joints must not be installed unless disassembly and inspection reveals unusual wear. For additional information, refer to Section 205-04 or Section 205-05 .

NOTE: Inspect the boots for indentations ("dimples") in the boot convolutions. Indentations must be removed.

- Inspect the boots for evidence of cracks, tears or splits.
- Inspect the underbody for any indication of grease splatter near the boots outboard and inboard locations. This is an indication of boot/clamp damage.

Axle Noise

NOTE: Before disassembling the axle to diagnose and correct gear noise, eliminate the tires, exhaust, trim items, roof racks, axle shafts and wheel bearings as possible causes. Follow the diagnostic procedures. For additional information, refer to Section 100-04 .

The noises described as follows usually have specific causes that can be diagnosed by observation as the unit is disassembled. The initial clues are the type of noise heard during the road test.

Gear Howl and Whine

Howling or whining of the ring gear and pinion is due to an incorrect gear pattern, gear damage or incorrect bearing preload.

Bearing Whine

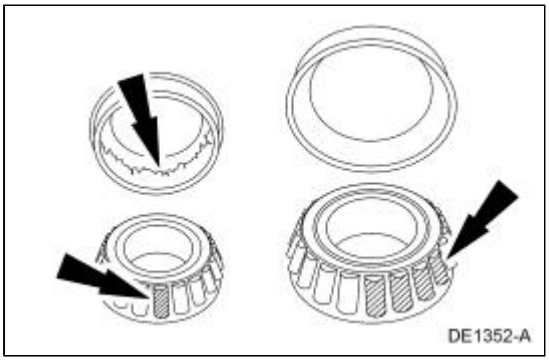
Bearing whine is a high-pitched sound similar to a whistle. It is usually caused by worn/damaged pinion bearings, which are operating at driveshaft speed. Bearing noise occurs at all driving speeds. This distinguishes it from gear whine which usually comes and goes as speed changes.

As noted, pinion bearings make a high-pitched, whistling noise, usually at all speeds. If however there is

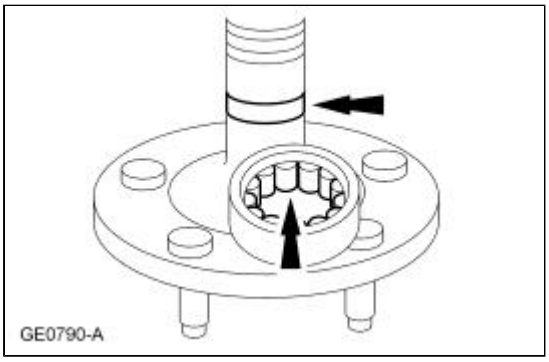
only one pinion bearing that is worn/damaged, the noise may vary in different driving phases. New pinion bearings must not be installed unless scoring or damage is found or there is a specific pinion bearing noise. A worn/damaged bearing will normally be obvious at disassembly. Examine the large end of the rollers for wear. If the pinion bearings original blend radius has worn to a sharp edge, a new pinion bearing must be installed.

NOTE: A low-pitched rumble normally associated with a worn/damaged wheel bearing can be caused by the exterior luggage rack or tires.

A wheel bearing noise can be mistaken for a pinion bearing noise. On rear wheel drive (RWD) vehicles, check the wheel bearing for a spalled cup, and spalled/damaged rollers. Install a new wheel bearing if any of these concerns are detected.



If the wheel bearing is damaged, the roller surface on the axle shaft may also be damaged. Install a new axle shaft if any damage is detected.



On four wheel drive (4WD) vehicles, check the wheel bearing for rotating smoothness and end play. Install new wheel bearings as required.

Chuckle

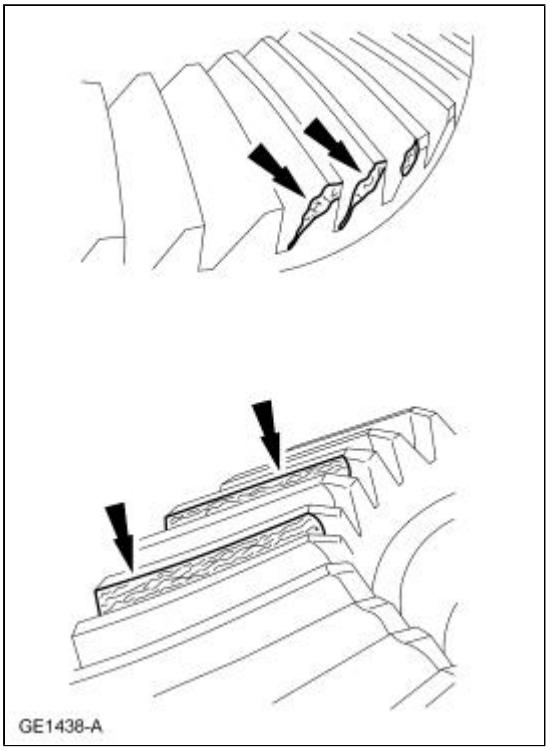
Chuckle that occurs on the coast driving phase is usually caused by excessive clearance between the differential gear hub and the differential case bore.

Damage to a gear tooth on the coast side can cause a noise identical to a chuckle. A very small tooth nick or ridge on the edge of a tooth can cause the noise.

Clean the gear tooth nick or ridge with a small grinding wheel. If the damaged area is larger than 3.2 mm (1/8 in), install a new gearset.

To check the ring gear and pinion, remove as much lubricant as possible from the gears with clean solvent. Wipe the gears dry or blow them dry with compressed air. Look for scored or damaged teeth. Also look for cracks or other damage.

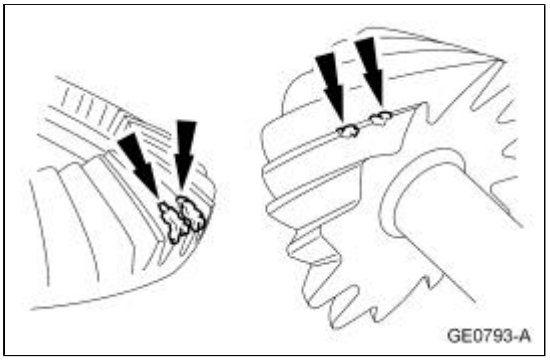
If either gear is scored or damaged badly, a new ring gear and pinion must be installed.



If metal has broken loose, the axle housing must be cleaned to remove particles that will cause damage. At this time if any other damaged components are found in the axle housing, new components must also be installed.

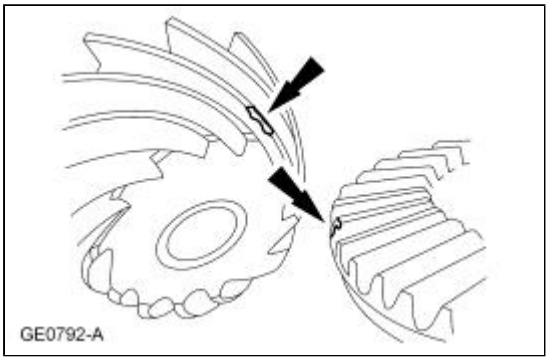
Knock

Knock, which can occur on all driving phases, has several causes including damaged teeth or gearset.



In most cases, one of the following conditions will occur:

1. A gear tooth damaged on the drive side is a common cause of the knock. This can usually be corrected by grinding the damaged area.



2. **NOTE:** Measure the end play with a Dial Indicator Gauge with Holding Fixture and not by feel.

   The knock is also caused by excessive end play in the axle shafts. Up to 0.762 mm (0.030 in) is allowed in semi-float axles. The frequency of the knock will be less because the axle shaft speed is slower than the driveshaft.

Clunk

Clunk is a metallic noise heard when the automatic transmission is engaged in REVERSE or DRIVE. The noise may also occur when throttle is applied or released. It is caused by backlash somewhere in the driveline or loose suspension components; it is felt or heard in the axle. Refer to Total Backlash Check in this section.

Additionally, clunk may be heard upon initial drive-away. This occurs as engine torque shifts vehicle weight, forcing changes in driveline angles, preventing the driveshaft slip-yoke from sliding on the output shaft. To correct this condition, lubricate the slip-yoke splines. For additional information, refer to Section 205-01 .

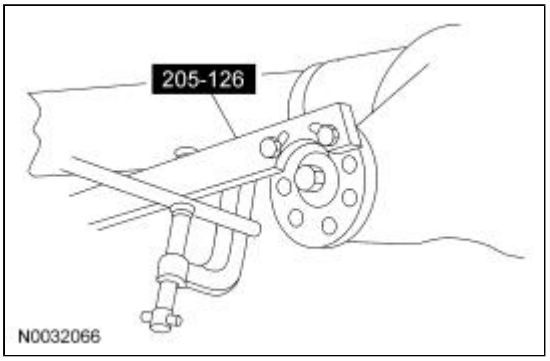
Total Backlash Check

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the driveshaft. For additional information, refer to Section 205-01 .

3. Install the special tool.
   - Clamp a rigid bar or pipe to the tool. Clamp the other end of the bar or pipe to the frame or a body member in order to prevent movement of the pinion flange.



4. Lower the vehicle so that one rear wheel is resting on a wheel chock to prevent it from turning. The other rear wheel will be used to measure total rear axle backlash.

5. Rotate the free wheel slowly, by hand, until the feeling of driving the rear axle is encountered. Place a mark on the side of the tire, 305 mm (12 in) from the center of the wheel, with a crayon or chalk.

6. While holding the crayon or chalk against the tire, rotate the wheel slowly in the opposite direction until the feeling of driving the rear axle is encountered again.

7. Measure the length of the crayon or chalk mark on the tire.
    - If the length of the mark is 25.4 mm (1 in) or less, the rear axle backlash is within allowable limits.
    - If the chalk mark is greater than 25.4 mm (1 in), check for these conditions:
        - Elongation of the differential pinion shaft and holes in the differential case.
        - Missing differential pinion thrust washer or differential side gear thrust washer.
        - Galling of the differential pinion shaft and bore.
        - Excessive ring gear and pinion backlash. Follow the procedure for the type of rear axle to check backlash.

Axle Shaft Bearing Noise

Axle shaft bearing noise is similar to gear noise and differential pinion bearing whine. Axle shaft bearing noise will usually distinguish itself from gear noise by occurring in all driving modes (drive, coast and float), and will persist with the transmission in NEUTRAL while the vehicle is moving at the speed in which the concern is occurring. If the vehicle makes this noise, remove the suspect axle shaft and install a new bearing and axle seal. Re-evaluate the vehicle for noise before removing any internal components.

Bearing Rumble

Bearing rumble sounds like marbles being tumbled. This condition is usually caused by a worn/damaged wheel bearing. The lower pitch is because the wheel bearing turns at only about one-third of the driveshaft speed. Wheel bearing noise also may be high-pitched, similar to gear noise, but will be evident in all 4 driving modes.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Traction-Lok® does not work in snow, mud or on ice	• Differential.	• CARRY OUT the Traction-Lok® Differential Operation Check in this section.

		REPAIR as necessary. REFER to Section 205-02 .
• Lubricant leaking from the pinion seal, axle shaft oil seals or support arm to the housing	• Vent. • Damage in the seal contact area or dust slinger on the pinion flange dust shield.	• CLEAN the axle housing vent. • INSTALL a new pinion flange and the pinion seal if damage is found.
• The vehicle does not shift between the different modes correctly	• Mode switch. • Wiring/relays. • Shift motor. • Transfer case. • GEM.	• REFER to Section 308-07A .
• Front axle will not engage	• Switches • Wiring. • GEM. • Shift motor.	• REFER to Section 308-07A .
• Front axle will not disengage	• Switches. • Wiring. • GEM. • Shift motor.	• REFER to Section 308-07A .
• Differential side gears/pinion gears are scored	• Insufficient lubrication. • Incorrect or contaminated lubricant type.	• INSTALL new gears. REFER to Section 205-02 or Section 205-03 . FILL the axle to specification. • INSTALL new gears. REFER to Section 205-02 or Section 205-03 . CLEAN and REFILL the axle to specification.
• Axle overheating	• Lubricant level too low. • Incorrect or contaminated lubrication type. • Bearing preload adjusted too tight. • Excessive gear wear. • Incorrect ring gear backlash.	• CHECK the lubricant level. FILL the axle to specification. • INSPECT the axle for damage. REPAIR as necessary. CLEAN and REFILL the axle to specification. • CHECK the ring and pinion for damage. INSPECT the ring and pinion wear pattern. ADJUST the preload as necessary. • INSPECT all the axle gears for wear or damaged. INSTALL new components as necessary. • INSPECT the ring gear for scoring. INSPECT the ring and pinion wear pattern. ADJUST the ring gear backlash as necessary.
• Broken gear teeth on the ring gear or pinion	• Overloading the vehicle.	• INSTALL a new ring and pinion. REFER to Section 205-02 or Section 205-03 .
• Axle shaft broken	• Overloading the vehicle.	• INSTALL a new axle shaft. REFER to Section 205-02 or Section 205-03 .

	• Misaligned axle shaft tube.	• INSPECT the axle for damage. CHECK axle shaft tube alignment. INSTALL a new axle shaft. REFER to Section 205-02 or Section 205-03 .

Component Tests

Driveline Vibration

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

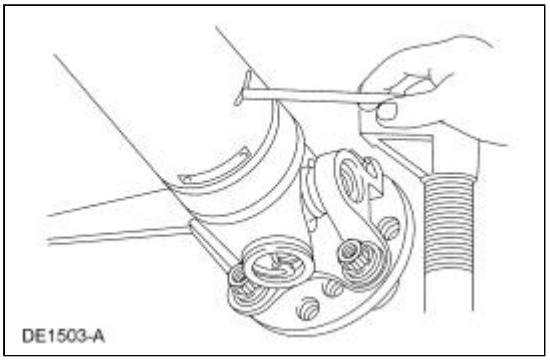
Driveline vibration exhibits a higher frequency and lower amplitude than does high-speed shake. Driveline vibration is directly related to the speed of the vehicle and is usually noticed at various speed ranges. Driveline vibration can be perceived as a tremor in the floor pan or is heard as a rumble, hum, or boom. Driveline vibration can exist in all drive modes, but may exhibit different symptoms depending upon whether the vehicle is accelerating, decelerating, floating or coasting. Check the driveline angles if the vibration is particularly noticeable during acceleration or deceleration, especially at lower speeds. Driveline vibration can be duplicated by supporting the axle upon a hoist or upon jack stands, though the brakes may need to be applied lightly in order to simulate road resistance.

1. Raise the vehicle promptly after road testing. Use twin-post hoist or jack stands to prevent tire flat-spotting. Engage the drivetrain and accelerate to the observed road test speed to verify the presence of the vibration. If the vibration is not evident, check the non-driving wheels with a wheel balancer to rule out imbalance as a possible cause. If required, balance the non-driving wheels and repeat the road test. If the vibration is still evident, proceed to Step 2.

2. Mark the relative position of the drive wheels to the wheel bolts. Remove the wheels. Install all the wheel nuts in the reversed position and repeat the road speed acceleration. If the vibration is gone, refer to the tire and wheel runout procedure in Section 204-04 . If the vibration persists, proceed to Step 3.

3. Inspect the driveshaft(s) for signs of physical damage, missing balance weight, undercoating, incorrect seating, wear and binding universal joints. Clean the driveshaft and install new universal joints or install a new driveshaft if damaged. Check the index marks (paint spots) on the rear of the driveshaft and pinion flange. If these marks are more than 1/4 turn apart, disconnect the driveshaft and re-index to align the marks as closely as possible. After any corrections are made, recheck for vibration at the road test speed. If the vibration is gone, reinstall the wheels and road test. If the vibration persists, proceed to Step 4.

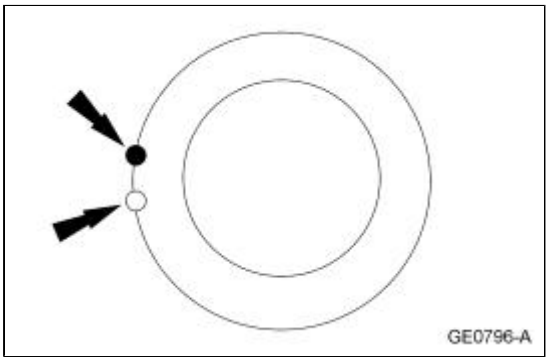
4. Raise the vehicle on a hoist and remove the wheels. Rotate the driveshaft by turning the axle and measure the runout at the front, the center and the rear of the driveshaft with the indicator. If the runout exceeds 0.51 mm (0.020 in) at the front or center, a new driveshaft must be installed. If the front and center are within this limit, but the rear runout is not, mark the rear runout high point and proceed to Step 5. If the runout is within the limits at all points, proceed to Step 7.



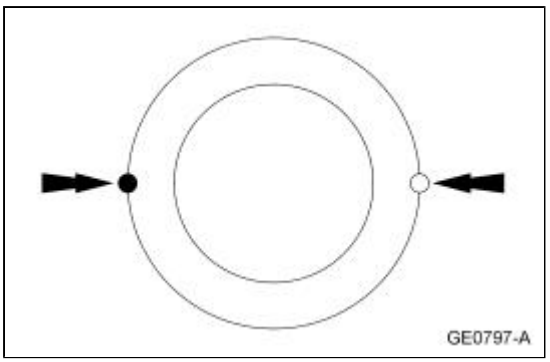
5. **NOTE:** Check the U-joints during re-indexing. If a U-joint feels stiff or gritty, install new U-joints.

   Scribe alignment marks on the driveshaft and the pinion flange. Disconnect the driveshaft, rotate it one half turn, and reconnect it. Circular pinion flanges can be turned in 1/4 increments to fine tune the runout condition; half-round pinion flanges are limited to 2 positions. Check the runout at the rear of the driveshaft. If it is still over 0.51 mm (0.020 in), mark the high point and proceed to Step 6. If the runout is no longer excessive, check for vibration at the road test speed. If vibration is still present, re-index the driveshaft slip-yoke on the transmission output shaft one half turn and road test the vehicle. If the vibration persists, proceed to Step 7.

6. Excessive driveshaft runout may originate in the driveshaft itself or in the pinion flange. To determine which, compare the 2 high points marked in Steps 4 and 5. If the marks are close together, within about 25 mm (1 in), a new driveshaft must be installed and the vehicle road tested.



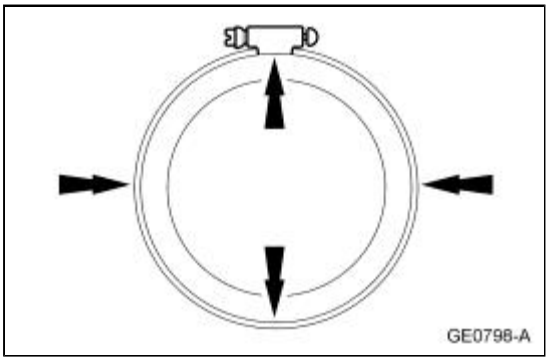
If the marks are on opposite sides of the driveshaft, the yoke or pinion flange is responsible for the vibration.



When installing a new pinion flange, the driveshaft runout must not exceed 0.51 mm (0.020 in). When runout is within limits, recheck for vibration at road speed. If vibration persists, balance the driveshaft.

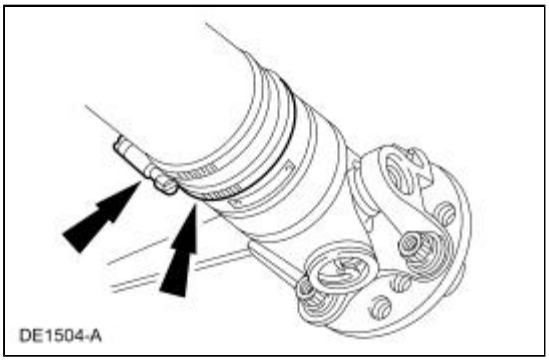
7. To balance the driveshaft, install 1 or 2 hose clamps on the driveshaft, near the rear. Position of the hose clamp head(s) can be determined by trial-and-error.

8. Mark the rear of the driveshaft into 4 approximately equal sectors and number the marks 1 through 4. Install a hose clamp on the driveshaft with its head at position No. 1.

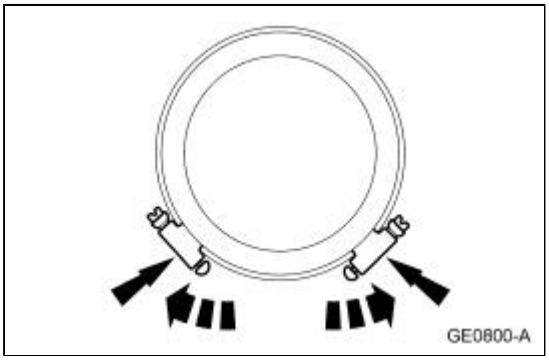


Check for vibration at road speed. Recheck with the clamp at each of the other positions to find the position that shows minimum vibration. If 2 adjacent positions show equal improvement, position the clamp head between them.

9. If the vibration persists, add a second clamp at the same position and recheck for vibration.



If no improvement is noted, rotate the clamps in opposite directions, equal distances from the best position determined in Step 8. Separate the clamp heads about 13 mm (1/2 in) and recheck for vibration at the road speed.



Repeat the process with increasing separation until the best combination is found or the vibration is reduced to an acceptable level.

10. Install the wheels and road test (vibration noticeable on the hoist may not be evident during the road test). If the vibration is still not acceptable, install a new axle drive line vibration damper first, if so equipped. If the vibration is still not acceptable, refer to Section 205-02 for differential case and ring gear runout checks.

Driveshaft Vibrates

1. Road test the vehicle to determine the critical vibration points. Note the road speed, the engine rpm, and the shift lever positions at which the vibration occurs. Road test in OD and OD - 1 gear.

2. Stop the vehicle, place the transmission lever in neutral and run the engine through the critical speed ranges determined in Step 1.

3. If no vibration is felt, balance the driveshaft. Refer to Driveline Vibration in this section.

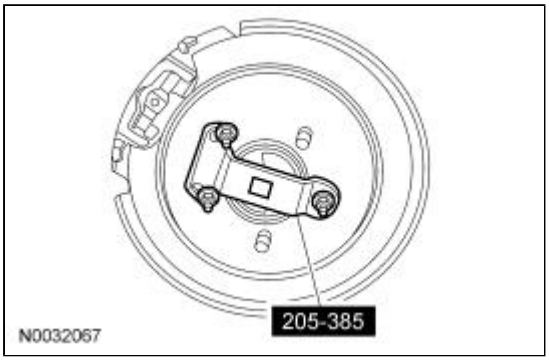
Traction-Lok® Differential Operation Check

A Traction-Lok® differential can be checked for correct operation without removing it from the rear axle housing.

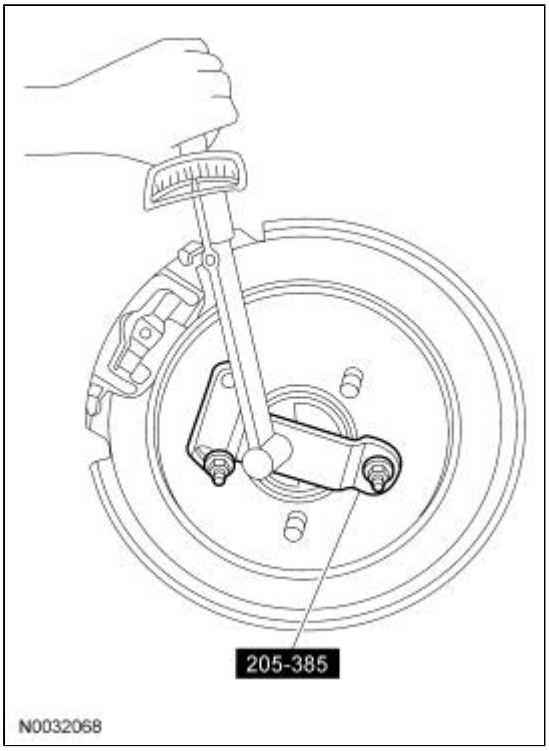
WARNING: A vehicle equipped with a Traction-Lok® differential will always have both wheels driving. If only one wheel is raised off the floor and the rear axle is driven by the engine, the wheel on the floor could drive the vehicle off the stand or jack. Be sure both rear wheels are off the floor.

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

Raise and remove only one rear wheel. Install the special tool on the wheel bolts.



Use a torque wrench with the capacity of at least 271 Nm (200 lb-ft) to rotate the axle shaft. Make sure that the transmission is in NEUTRAL, and that one rear wheel is on the floor while the other rear wheel is raised off the floor. The breakaway torque required to start rotation must be at least 27 Nm (20 lb-ft). The initial breakaway torque may be higher than the continuous turning torque.



The axle shaft must turn with even pressure throughout the check without slipping or binding. If the torque reading is less than specified, check the differential case for incorrect assembly.

Traction-Lok® Differential Check Road Test

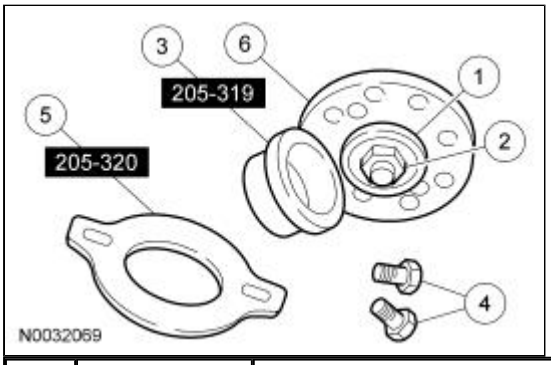
1. Place one wheel on a dry surface and the other wheel on ice, mud or snow.
2. Gradually open the throttle to obtain maximum traction prior to break away. The ability to move the vehicle demonstrates correct performance of a Traction-Lok® rear axle assembly.
3. When starting with one wheel on an excessively slippery surface, a slight application of the parking brake may be necessary to help energize the Traction-Lok® feature of the differential. Release the brake when traction is established. Use light throttle on starting to provide maximum traction.
4. If, with unequal traction, both wheels slip, the limited slip rear axle has done all it can possibly do.
5. In extreme cases of differences in traction, the wheel with the least traction may spin after the Traction-Lok® has transferred as much torque as possible to the non-slipping wheel.

Pinion Flange Runout Check — Circular

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

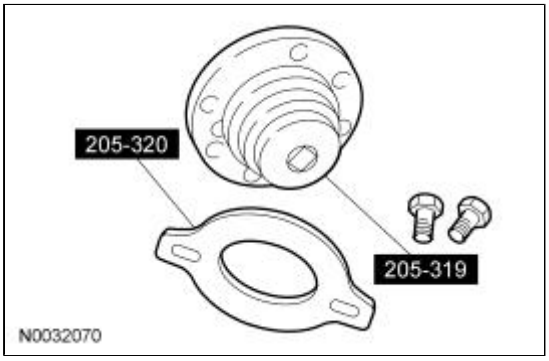
CAUTION: Pinion bearing preload must be reset if the pinion nut has been loosened or removed for pinion flange reindexing or replacement.

1. Raise the vehicle on a twin-post hoist that supports the rear axle.
2. Remove the driveshaft. For additional information, refer to Section 205-01 .
3. Check the pinion flange for damage.
4. Position special tool on the pinion flange.

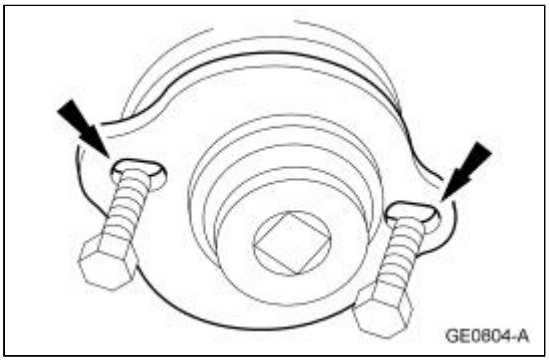


Item	Part Number	Description
1	—	Pilot (part of 205-319) (T92L-4851-B)
2	354845	Pinion nut
3	205-319	Gauge, Companion Flange Runout (T92L-4851-B)
4	—	Bolts (2 required) (part of 205-320) (T92L-4851-C)
5	205-320	Plate, Companion Flange (T92L-4851-C)
6	4851	Pinion flange

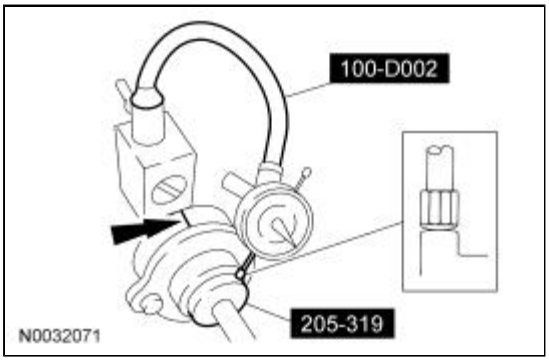
5. Position the special tools onto the pinion flange.



6. Align the holes on the clamp plate with the holes in the pinion flange and install the bolts. Snug the bolts evenly.

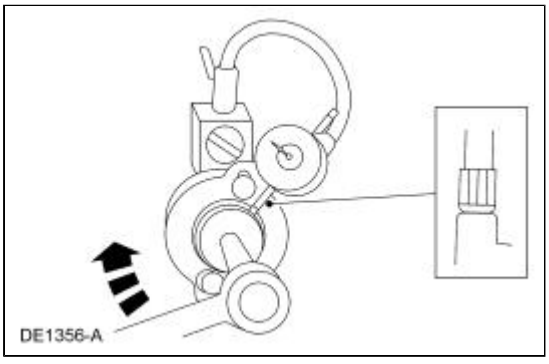


7. Position the special tool as shown. Turn the special tool, and locate and mark the high spot on the pinion flange with yellow paint.



If the flange runout exceeds 0.25 mm (0.010 in), remove the pinion flange, reindex the flange one-half turn on the pinion, and reinstall it. Refer to Section 205-02 or Section 205-03 for the flange removal and installation procedures.

8. Check the runout again. If necessary, rotate the flange until an acceptable runout is obtained. If the flange runout is still more than 0.25 mm (0.010 in), install a new pinion flange.



9. If excessive runout is still evident after replacement of the pinion flange, install a new ring and pinion. Repeat the above checks until the runout is within specifications.

10. Install the driveshaft. For additional information, refer to Section 205-01 .

Tooth Contact Pattern Check — Gearset

1. To check the gear tooth contact, paint the gear teeth with the special marking compound. A mixture that is too wet will run and smear; a mixture that is too dry cannot be pressed out from between the teeth.

2. Use a box wrench on the ring gear bolts as a lever to rotate the ring gear several complete revolutions in both directions or until a clear tooth contact pattern is obtained.

3. Certain types of gear tooth contact patterns on the ring gear indicate incorrect adjustment. Incorrect adjustment can be corrected by readjusting the ring gear or the pinion.

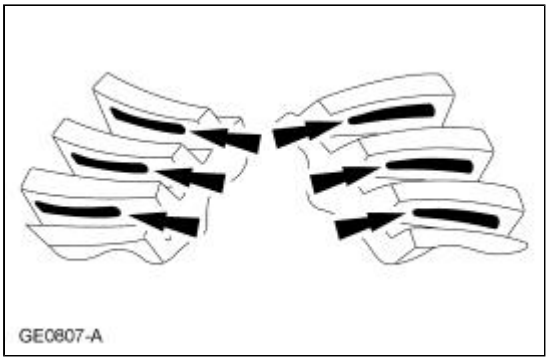
Contact Pattern Location

In general, desirable ring gear tooth patterns must have the following characteristics:

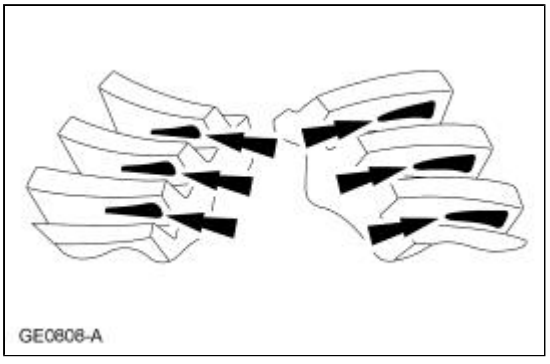
- Drive pattern on the drive side ring gear well centered on the tooth.

- Coast pattern on the coast side ring gear well centered on the tooth.
- Clearance between the pattern and the top of the tooth.
- No hard lines where the pressure is high.

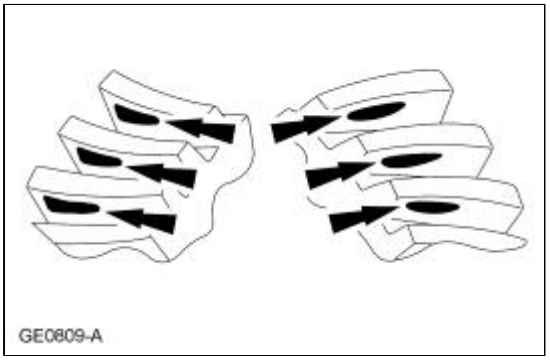
Acceptable ring gear tooth patterns for all axles.



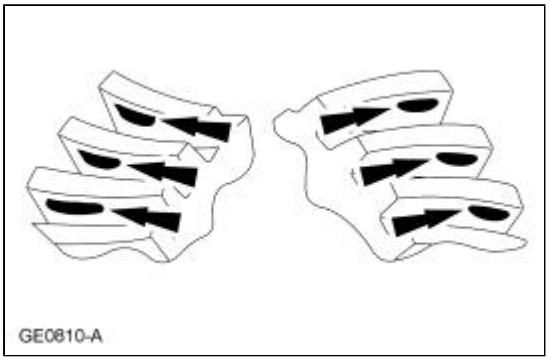
Correct backlash with a thinner pinion position shim required.



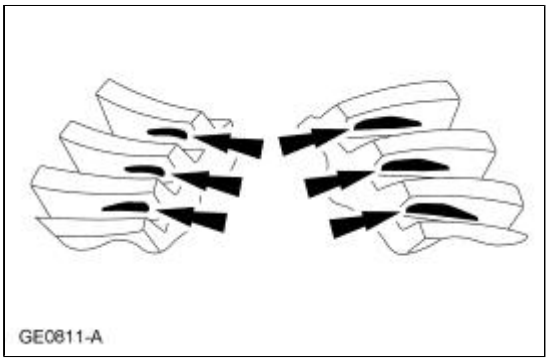
Correct backlash with a thicker pinion position shim required.



Correct pinion position shim that requires a decrease in backlash.



Correct pinion position shim that requires an increase in backlash.



Driveline Angle Measurement

Printable View (178 KB)

Special Tool(s)

ST1622-A	Anglemaster II Driveline Inclinometer/Protractor 164-R2402 or equivalent

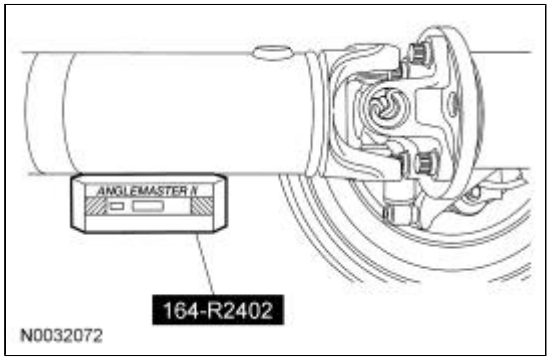
CAUTION: Prior to checking driveline angularity, inspect the U-joints for correct operation.

NOTE: An incorrect driveline angle can cause a vibration or shudder. For additional information, refer to Section 100-04 .

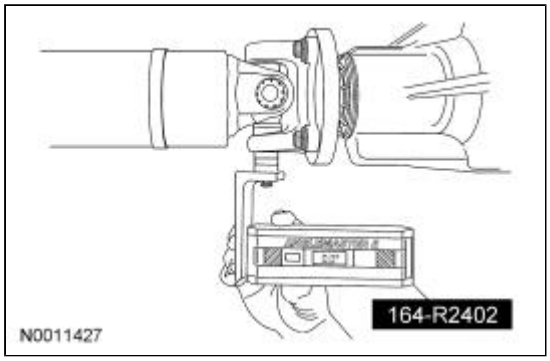
NOTE: Driveline angularity is the angular relationship between the engine crankshaft, the driveshaft and the rear axle pinion. Factors determining driveline angularity include ride height, rear spring and engine mounts.

1. Carry out the following preliminary setup steps:
   - Inspect the U-joints for correct operation.
   - Park the vehicle on a level surface such as a drive-on hoist, or back onto a front end alignment rack.
   - Verify the curb position ride height is within specifications with the vehicle unloaded and all of the tires are inflated to their normal operating pressures.
   - Rotate the transmission output yoke until vertical. This will simplify taking measurements.
   - Calibrate the special tool by placing the tool on a clean, flat level section of the frame rail and press the ALT-ZERO button.

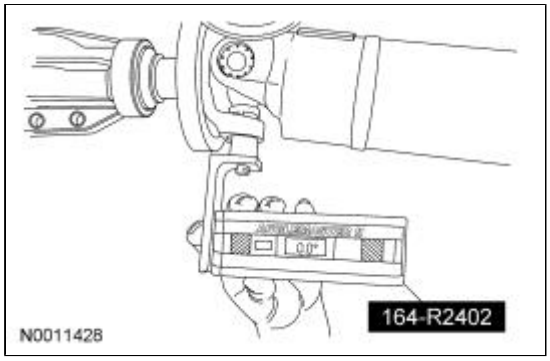
2. Using the special tool, measure the slope of the components. Record the measurements and the direction of the component's slope.



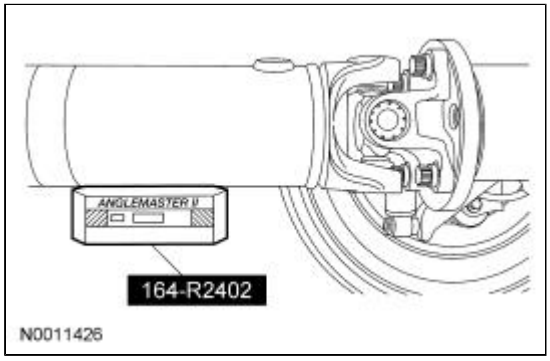
3. To check the pinion operating angle, rotate the driveshaft so that the rear axle pinion flange yoke ear is parallel to the floor. Install the special tool. Check and record the pinion operating angle reading.
   - If the angle is not within specifications, repair or adjust to obtain the correct angle. Inspect the rear suspension, rear axle, rear axle mounting or the frame for wear or damage.



4. To check the transmission operating angle, place the special tool on a flat and level surface. Press the ALT ZERO button to calibrate the inclinometer.



5. For the driveshaft angle reading, place the special tool flush against the bottom of the driveshaft. Press the ALT ZERO button to calibrate the inclinometer.

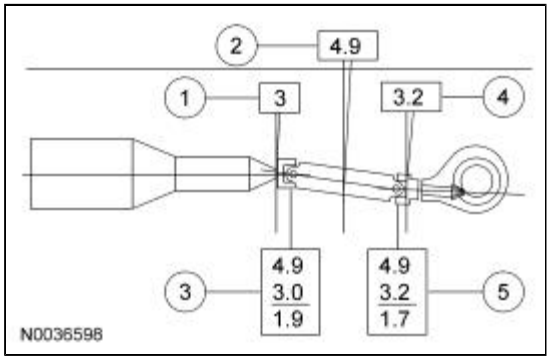


6. Calculate the difference in the slope of the components to determine the U-joint operating angle.

Item	Description
1	Output yoke slope
2	Driveshaft slope
3	The driveshaft slope minus the output yoke slope equals the transmission/driveshaft operating angle
4	Pinion flange slope
5	The driveshaft slope minus the pinion flange slope equals the driveshaft/axle operating angle

- When 2 connected components slope in the same direction, subtract the smaller number from the largest to find the U-joint operating angle. When 2 connected components slope in opposite directions, add the measurements to find the U-joint operating angle.

- The U-joint operating angle is the angle formed by 2 yokes connected by a cross and bearing kit. Ideally, the operating angles on each end of the driveshaft must:
    - be equal or within 1 degree of each other.
    - have a 3 degree maximum operating angle.
    - have at least 1/2 of 1 degree continuous operating angle.



7. Compare the operating angles. Ideally, the operating angles on each end of the driveshaft must:
    - be equal or within 1 degree of each other.
    - have a 3 degree maximum operating angle.
    - have at least 1/2 degree of operating angle.

Axle Housing Casting Porosity (Holes in Casting) Repair

Printable View (90 KB)

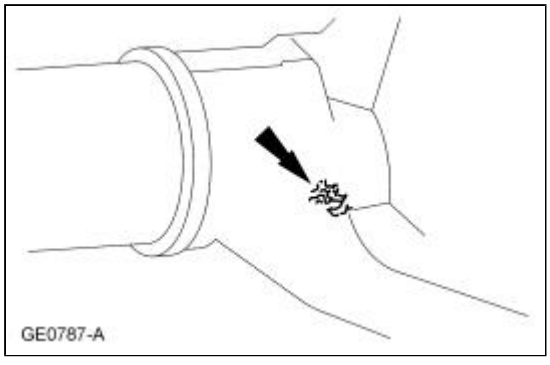
Material

Item	Specification
Epoxy Sealer	M-3D35A (E)

CAUTION: To keep the axle's sound characteristics, do not disassemble the carrier.

NOTE: Casting porosity is a condition where occasionally gas bubbles will form during the casting process leaving small pockets in the metal that will cause the axle housing to leak.

1. To fill small pockets, peen in a small amount of body lead.



2. Seal the pocket.
   - Use Epoxy Sealer meeting Ford specification M-3D35A(E).

3. To fill large pockets, drill and tap a shallow hole for a small setscrew. Install the setscrew and seal it.
   - Use Epoxy Sealer meeting Ford specification M-3D35A(E).

Torque Specifications

Description	Nm	lb-ft
Driveshaft center bearing bolts	48	35
Driveshaft flange bolts	103	76
Flex-coupler-to-flange nuts	150	111
Front flange-to-front drive axle constant velocity (CV) flange bolts	55	41
Rear flange-to-transfer case flange bolts	103	76
Stabilizer bar nuts	55	41

Driveshaft

Printable View (80 KB)

CAUTION: All driveshafts are balanced. If undercoating the vehicle, protect the driveshaft and universal joints to prevent overspray of any undercoating material.

NOTE: Refer to Section 205-00 for driveshaft runout and balance, and indexing procedures.

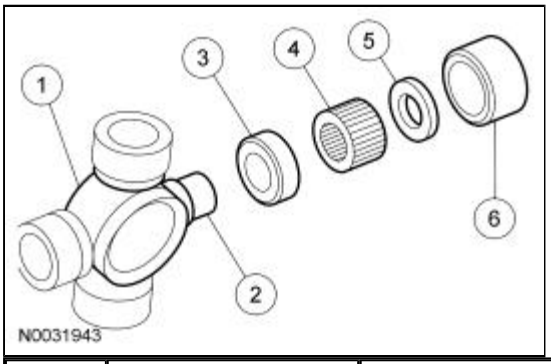
The driveshaft is composed of the universal joints (U-joints), constant velocity (CV) joints, flex couplers, connecting shafts and the attaching yokes. Some vehicles are equipped with a center support bearing. The center support bearing is prelubricated and sealed for the life of the bearing. The vehicles have the following types of driveshafts:

- Driveshaft — the shaft that accommodates the change in length (slip) in the driveshaft system. The driveshaft is the shaft that is the input to the front or rear axle. The front driveshafts are not serviced.
- Coupling shaft — all shafts that connect the transmission to the rear axle, except for the driveshaft. Coupling shafts are attached to the chassis by a center support bearing.

Driveshafts differ in length, diameter and type of yoke to accommodate various wheelbase and powertrain combinations.

Universal Joints

Printable View (84 KB)



Item	Part Number	Description
1	—	Spider (part of 4635)
2	—	Trunnion (part of 4635)
3	—	Grease seal (part of 4635)
4	—	Needle rollers (part of 4635)
5	—	Thrust washer (part of 4635)
6	—	Bearing cup (part of 4635)

The universal joint (U-joint) connects to the drive axle of the driveshaft and allows for up and down movement of the axle. The U-joint is lubricated for the life of the vehicle.

Driveshaft

Refer to Section 205-00 .

Driveshaft — Front

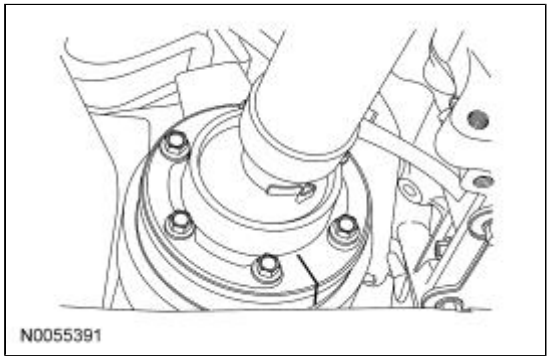
Printable View (203 KB)

Material

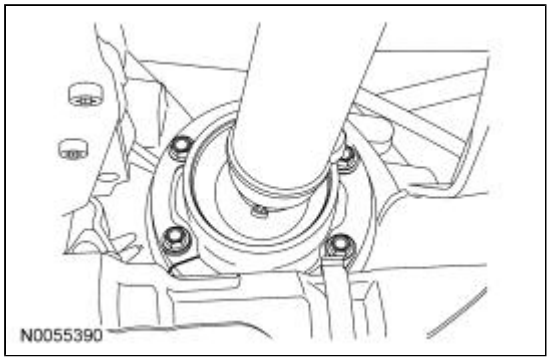
Item	Specification
Threadlock and Sealer TA-25	WSK-M2G351-A5

Removal and Installation

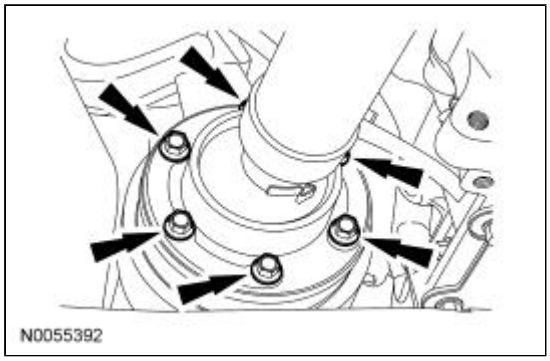
1. Disable the air suspension system. For additional information, refer to Section 204-05 .
2. With the vehicle in NEUTRAL, position the vehicle on a hoist. For additional information, refer to Section 100-02 .
3. Index-mark the front flange to the pinion flange.



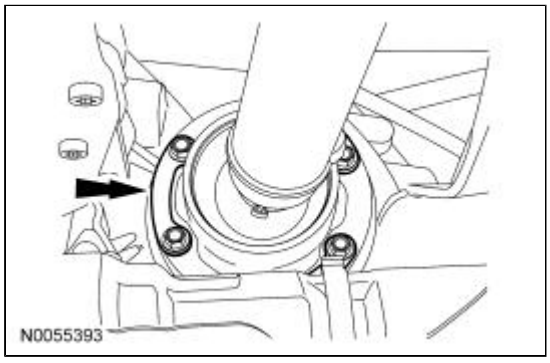
4. Index-mark the rear flange to the transfer case flange.



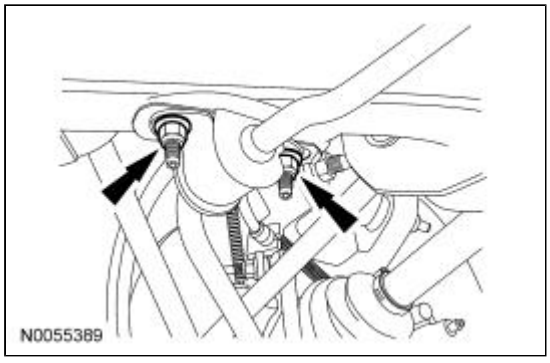
5. Remove and discard the 6 rear flange-to-transfer case flange bolts. Retain the 3 washers.
   - To install, tighten to 103 Nm (76 lb-ft).



6. Remove and discard the 6 front flange-to-pinion flange bolts. Retain the 2 washers.
    - To install, tighten to 103 Nm (76 lb-ft).



7. Remove and discard the 4 stabilizer bracket nuts and allow the stabilizer bar to swing downward.
    - To install, tighten to 55 Nm (41 lb-ft).



8. Remove the front driveshaft from the vehicle.

9. To install, reverse the removal procedure.

Driveshaft — Rear, Expedition

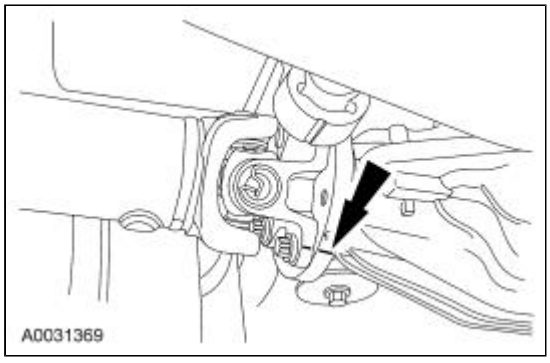
Printable View (191 KB)

Material

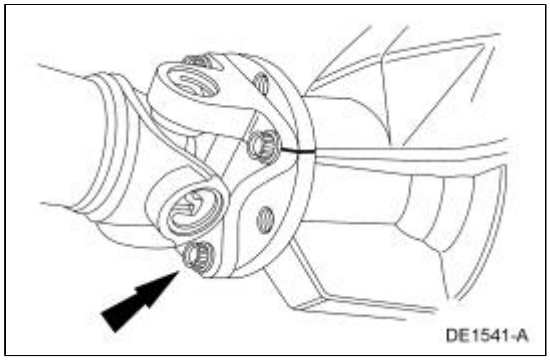
Item	Specification
Threadlock and Sealer TA-25	WSK-M2G351-A5
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B

Removal and Installation

1. Disable the air suspension system. For additional information, refer to Section 204-05 .
2. With the vehicle in NEUTRAL, position the vehicle on a hoist. For additional information, refer to Section 100-02 .
3. Index-mark the driveshaft flange to the rear axle pinion flange.

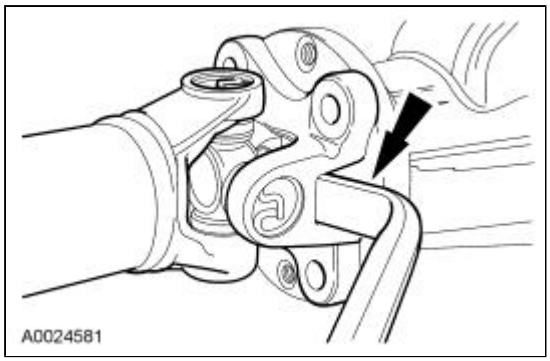


4. Remove the 4 driveshaft flange bolts.
   - To install, tighten to 103 Nm (76 lb-ft).



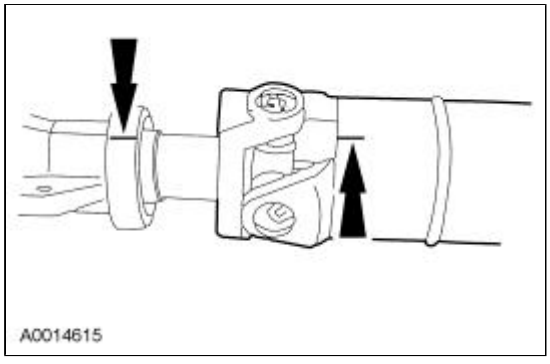
5. **CAUTION: The driveshaft flange fits tightly on the rear axle pinion flange pilot. Never hammer on the driveshaft or any of its components to disconnect the driveshaft from the pinion flange. Pry only in the area shown, with a suitable tool, to disconnect the driveshaft flange from the pinion flange.**

Using a suitable tool, disconnect the driveshaft flange from the rear axle pinion flange.



6. **NOTE:** Do not rotate the driveshaft when removing the slip yoke from the transmission output shaft.

   Index-mark the driveshaft slip yoke and the transmission extension housing.
   - Mark the transmission output shaft to the transmission extension housing after removing the driveshaft.

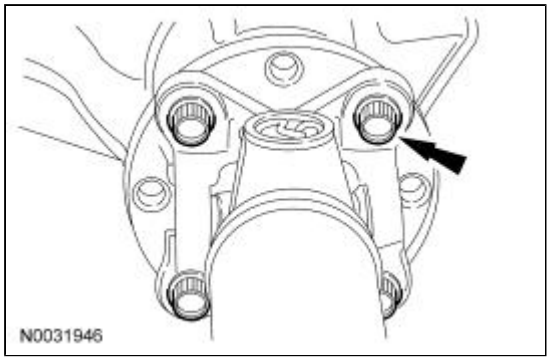


7. **CAUTION: Coat the threads of the original bolts with sealer.**

   CAUTION: The driveshaft flange fits tightly on the rear axle pinion flange pilot. To make sure that the driveshaft flange seats squarely on the pinion flange, tighten the bolts evenly in a cross pattern as shown.

   CAUTION: Make sure all index marks are aligned.

   To install, reverse the removal procedure.
   - Tighten the driveshaft flange bolts to 103 Nm (76 lb-ft).



Driveshaft — Rear, Navigator

Printable View (276 KB)

Material

Item	Specification
Threadlock and Sealer TA-25	WSK-M2G351-A5

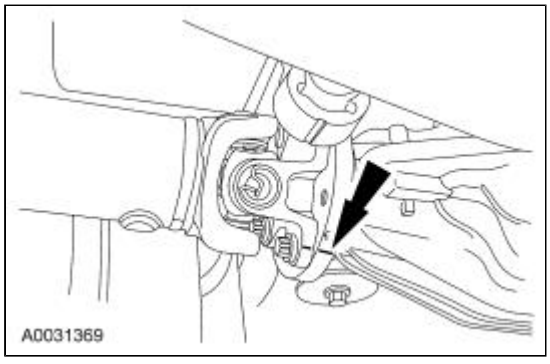
Removal and Installation

All vehicles

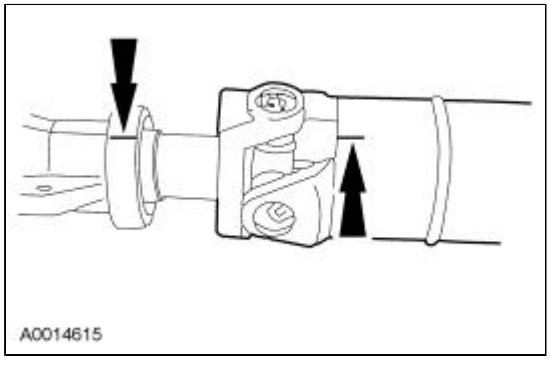
1. Disable the air suspension system. For additional information, refer to Section 204-05 .
2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

Four wheel drive (4WD) vehicles

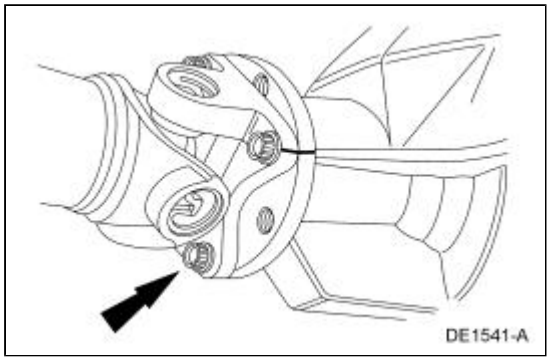
3. Index-mark the driveshaft flange to the pinion flange.



4. Index-mark the driveshaft slip yoke to the transmission extension housing.

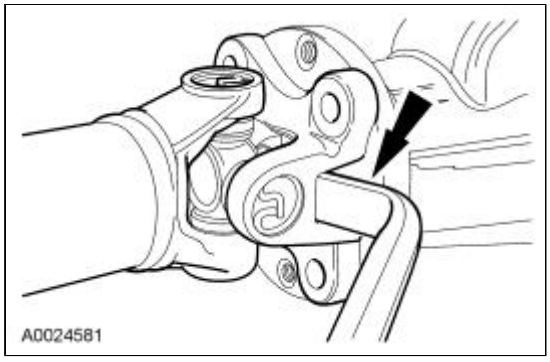


5. Remove and discard the 4 driveshaft flange bolts.



6. **CAUTION: The driveshaft flange fits tightly on the pinion flange pilot. Never hammer on the driveshaft or any of its components to disconnect the driveshaft from the pinion flange. Pry only in the area shown, with a suitable tool, to disconnect the driveshaft flange from the pinion flange.**

   Using a suitable tool, disconnect the driveshaft flange from the pinion flange.

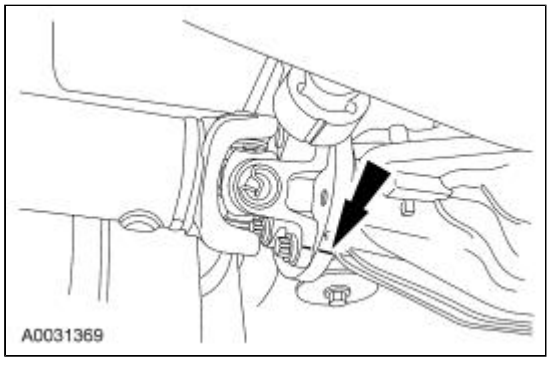


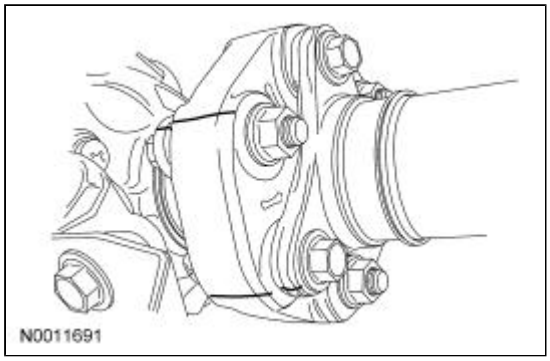
7. **NOTE:** Do not rotate the driveshaft when removing the slip yoke from the transmission output shaft.

   Remove the driveshaft.
   - Mark the transmission output shaft to the transmission extension housing after removing the driveshaft.

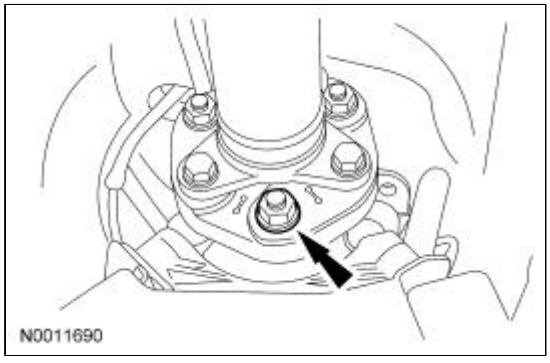
Rear wheel drive (RWD) vehicles

8. Index-mark the driveshaft for correct alignment during installation.

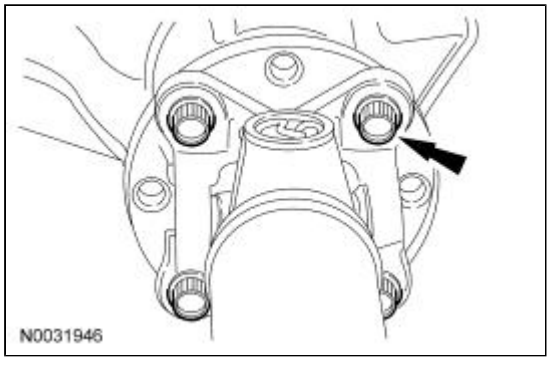




9. Remove and discard the 3 flex-coupler-to-flange nuts and the 3 flex-coupler-to-flange bolts.

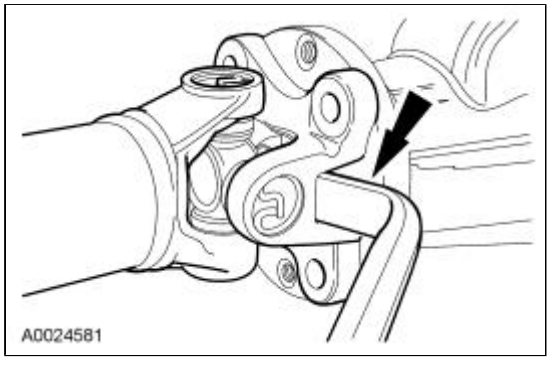


10. Remove and discard the 4 driveshaft flange bolts.

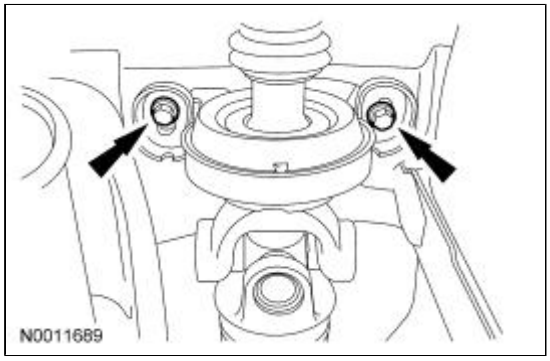


11. **CAUTION: The driveshaft flange fits tightly on the pinion flange pilot. Never hammer on the driveshaft or any of its components to disconnect the driveshaft from the pinion flange. Pry only in the area shown, with a suitable tool, to disconnect the driveshaft flange from the pinion flange.**

    Using a suitable tool, disconnect the driveshaft flange from the pinion flange.



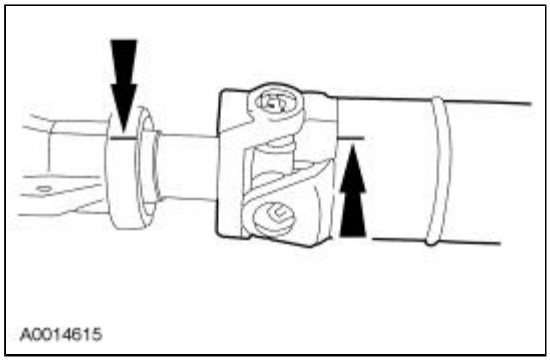
12. Remove the 2 driveshaft center bearing bolts, then remove the driveshaft.
    - Discard the driveshaft center bearing bolts.



Installation

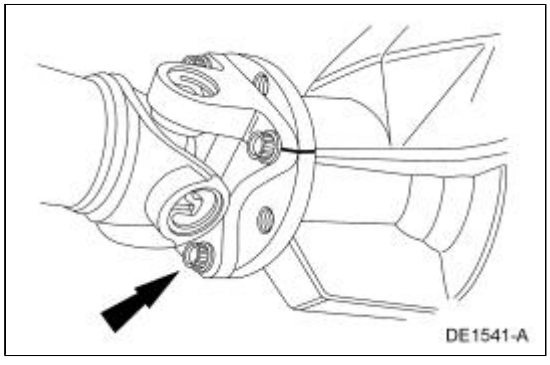
4WD vehicles

1. Align all the index marks and install the driveshaft slip yoke into the transmission extension housing.



2. **CAUTION: The driveshaft flange fits tightly on the pinion flange pilot. To make sure that the driveshaft flange seat squarely on the pinion flange pilot, tighten the driveshaft flange bolts evenly in a cross pattern.**

   Align the index marks and install the driveshaft flange and the driveshaft flange bolts.
   - Tighten to 103 Nm (76 lb-ft).

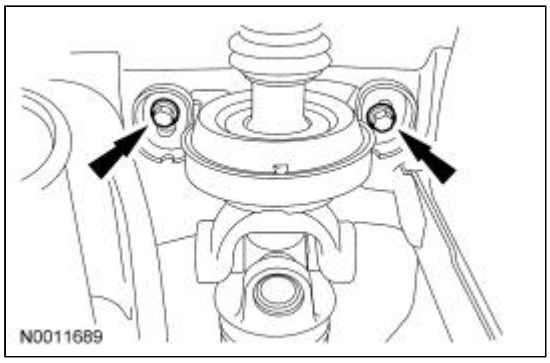


RWD vehicles

3. **CAUTION: If new driveshaft center bearing bolts are not available, coat the threads of the original driveshaft center bearing bolts with Threadlock and Sealer.**

Position the driveshaft center bearing and hand-tighten the 2 new driveshaft center bearing bolts until the driveshaft is mounted to the flanges.

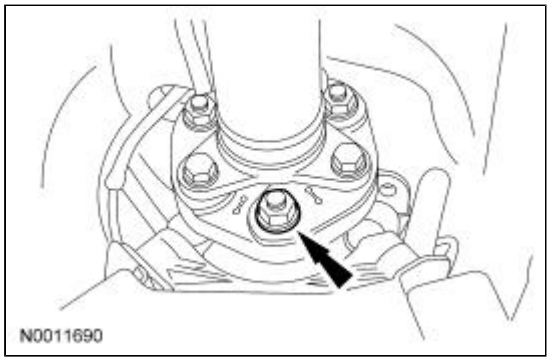
- Tighten to 48 Nm (35 lb-ft).



4. **CAUTION: If new flex-coupler-to-flange bolts and flex-coupler-to-flange nuts are not available, coat the threads of the original flex-coupler-to-flange bolts with Threadlock and Sealer.**

   Install the 3 new flex-coupler-to-flange bolts and the 3 new flex-coupler-to-flange nuts.

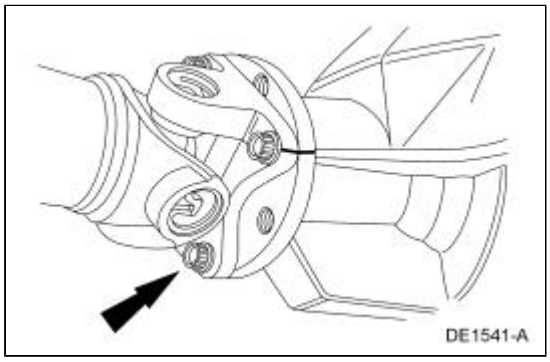
   - Tighten the nuts to 150 Nm (111 lb-ft).



5. **CAUTION: The driveshaft flange fits tightly on the pinion flange pilot. To make sure that the driveshaft flange seat squarely on the pinion flange pilot, tighten the driveshaft flange bolts evenly in a cross pattern.**

   Install the 4 new driveshaft flange bolts.

   - Tighten to 103 Nm (76 lb-ft).



Driveshaft Slip Yoke Boot

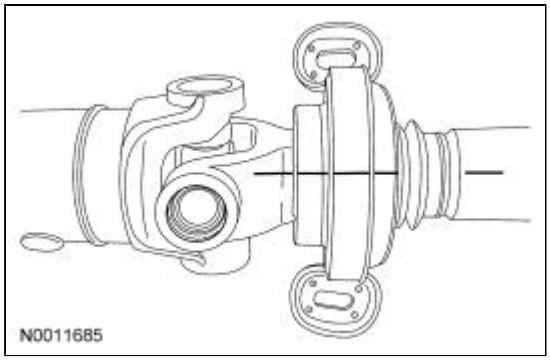
Printable View (222 KB)

Material

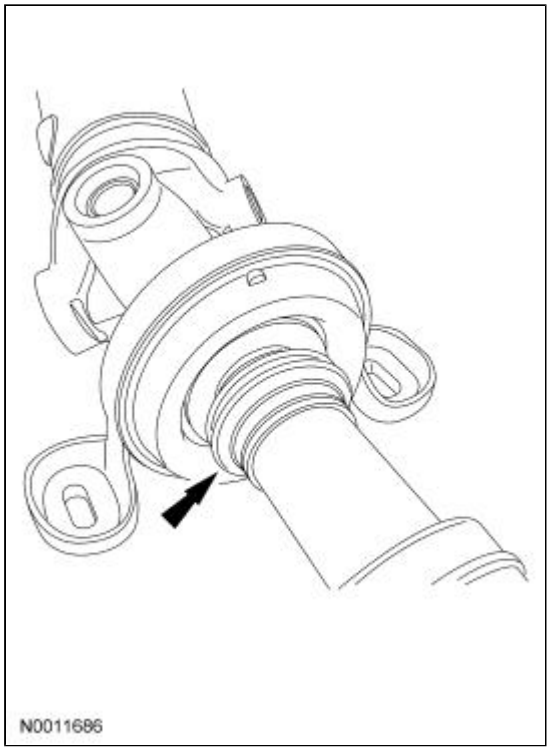
Item	Specification
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B

Removal and Installation

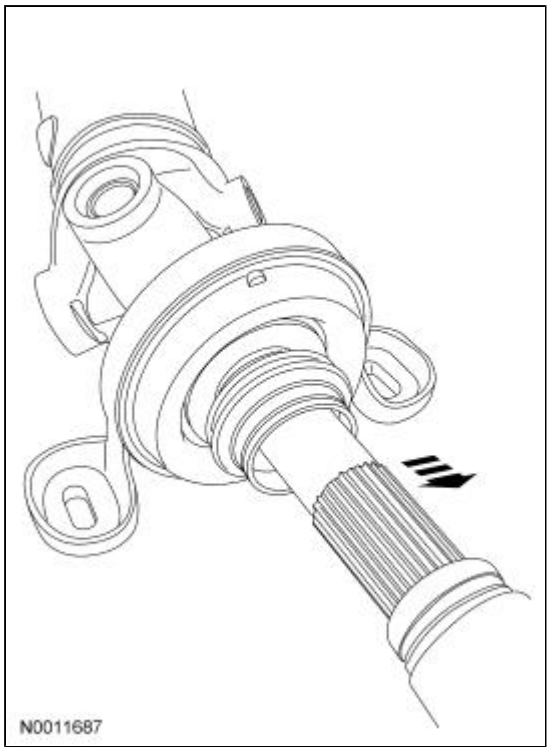
1. Remove the driveshaft. For additional information, refer to Driveshaft — Rear, Navigator
2. Index-mark the driveshaft to the center bearing for correct alignment during installation.



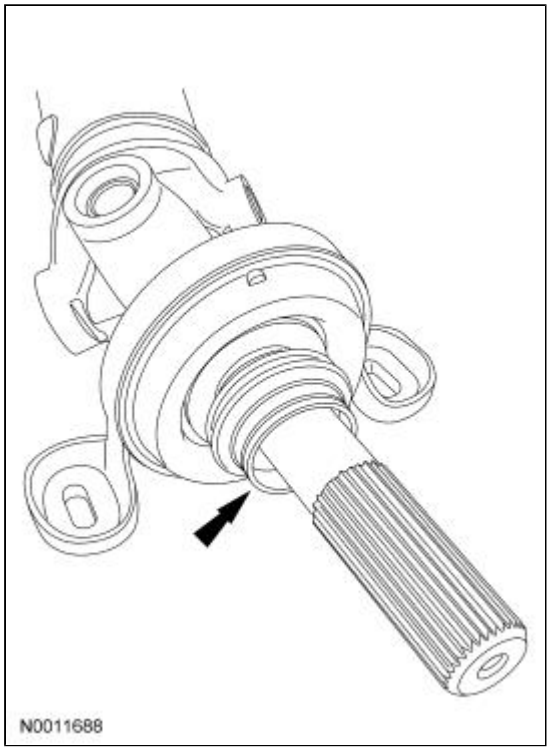
3. Disconnect the slip yoke boot.



4. Separate the driveshaft.



5. Remove the slip yoke boot.



6. **NOTE:** Lubricate the slip yoke splines with premium long-life grease.

To install, reverse the removal procedure.

- Align the index marks for correct alignment.

Driveshaft — Exploded View

Driveshaft Universal Joint — Single Cardan

Printable View (211 KB)

Special Tool(s)

ST1172-A	Installer/Remover, C-Frame and Screw 205-086 (T74P-4635-C)

Disassembly

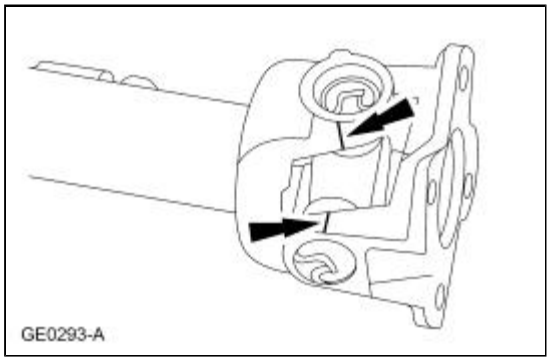
1. Remove the driveshaft. For additional information, refer to Driveshaft — Front , Driveshaft — Rear, Expedition or Driveshaft — Rear, Navigator in this section.

2. **CAUTION: Do not clamp the driveshaft in the jaws of a vise or a similar holding fixture.**

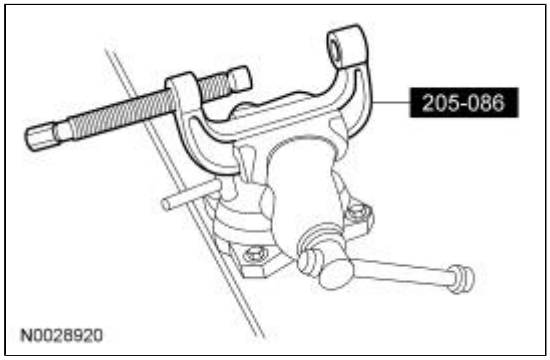
   Carefully place the driveshaft on a suitable workbench.

3. **NOTE:** Index-mark the driveshaft components relative to the driveshaft tube. Make sure all components are reassembled in the same relationship to maintain correct balance.

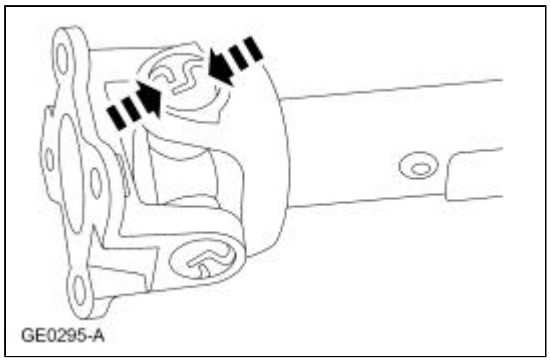
   Index the driveshaft and driveshaft components.



4. Position the special tool in a vise.

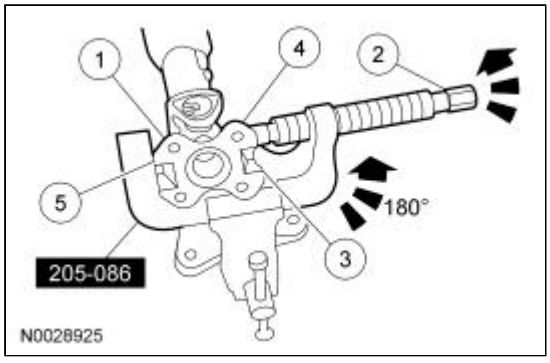


5. Remove the snap rings from the universal joint.



6. **NOTE:** If necessary, use a pair of pliers to remove a bearing cup if it cannot be pressed out all the way.

   Remove the driveshaft flange yoke.
   1. Position the driveshaft flange in the special tool.
   2. Press out the bearing cup.
   3. Rotate the driveshaft flange yoke.
   4. Press on the spider to remove the remaining bearing cup.
   5. Remove the driveshaft flange yoke.



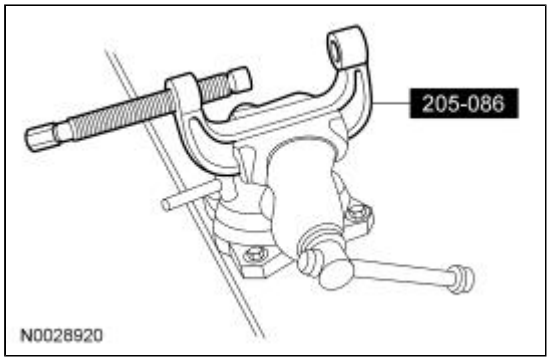
7. Repeat the previous step to remove the remaining bearing cups and spider from the driveshaft.

8. Clean the yoke area at the end of the driveshaft and flange yoke.

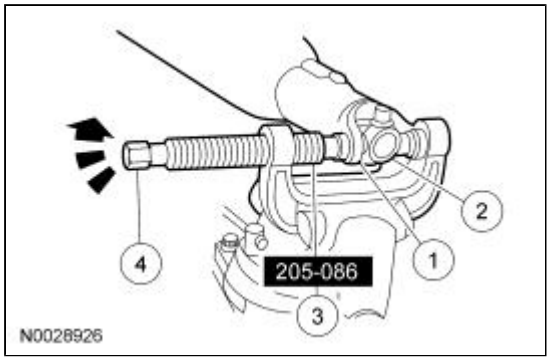
Assembly

NOTE: Universal joint service kits are to be installed as complete assemblies only. Do not use components from other universal joints.

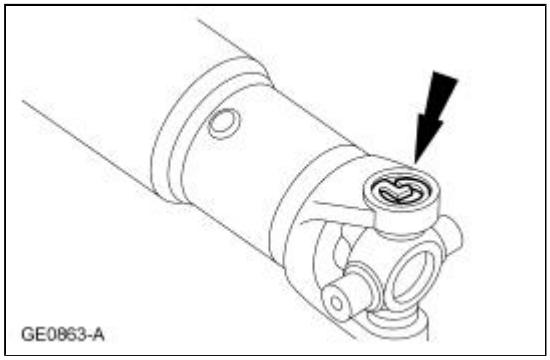
1. Clamp the special tool in a vise.



2. Install a new bearing cup.
    1. Start a new bearing cup into the driveshaft yoke.
    2. Position a new spider in the driveshaft yoke.
    3. Install the driveshaft into the special tool.
    4. Press the bearing cup below the yoke surface.



3. Remove the driveshaft from the special tool and install the snap ring.



4. Repeat the previous steps to install the remaining bearing cups.

5. **NOTE:** Do not strike the bearings. If binding, strike the yoke with a brass or plastic hammer.

   Check the universal joint for freedom of movement.

Rear Drive Axle and Differential

Printable View (63 KB)

- The differential housing consists of a cast iron housing and a cast aluminum differential housing cover. The differential housing cover uses silicone sealant as a gasket.
- The hypoid-design gearset consists of a 9.75-inch differential ring gear and a drive pinion gear. Two opposed pinion bearings support the drive pinion gear in the differential housing.
- A drive pinion collapsible spacer, located on the drive pinion gear shaft, maintains pinion bearing preload. The pinion nut adjusts the preload.
- Differential bearing shims, located between the differential bearing cups and the differential housing, adjust the differential ring gear backlash and the differential bearing preload.
- The differential case is a 1-piece design with 2 openings to allow for assembly of the internal components and lubricant flow. Two opposed differential bearings support the differential case in the differential housing. Removable differential bearing caps retain the differential assembly in the differential housing.
- Inside the differential case, the differential pinion shaft supports 2 differential pinion gears. The pinion gears engage the differential side gears, to which the halfshafts are splined. The differential pinion shaft lock bolt retains the differential pinion shaft in the differential case.
- A circlip, located on the stub shaft, holds the halfshaft in the differential case. When installed, the circlip engages a groove in the differential side gear.
- The rear axle requires SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL (US); CXY-75W140-1L (Canada); or equivalent meeting Ford specification WSL-M2C192-A. If equipped with a Traction-Lok®, 4 ounces of Friction Modifier XL-3 (US); CXL-3 (Canada); or equivalent meeting Ford specification EST-M2C118-A must be added.
- An embossed metal tag, bolted to the differential housing cover, contains rear axle identification. Refer to Section 205-00.

 ST1348-A	Gauge, Clutch Housing 308-021 (T75-4201-A)

Inspection and Verification

The technician should have a thorough knowledge of driveline system operation and accepted general driveline guidelines to detect any problems.

A gear driven unit will produce a certain amount of noise. Some noise is acceptable and audible at certain speeds or under various driving conditions. Certain conditions, such as road conditions and weather, will amplify normal vehicle noise.

Certain rear axle and driveline concern symptoms are also common to the engine, transmission, rear wheel bearings and tire. For this reason, be sure the cause of the concern is in the axle before repairing or installing any axle components.

The following is a guide to diagnose a driveline concern:

- Verify and document the customer concern.
- Perform a preliminary investigation.
- Road test the vehicle.
- Find the cause of the problem.
- Inspect the components.

1. Verify and document the customer concern.
    1. When was it first noticed?
    2. Did it appear suddenly or gradually?
    3. Did anything unusual occur that would coincide with it or precede it?
    4. Has the driveline system been repaired before or new components installed?

- Check the vehicle service record. Note any repairs other than driveline, such as brakes or suspension.

5. Are there any special conditions affecting the concern or will alter the concern? For example,
   - road speed.
   - type of road.
   - drive mode.
   - temperature.
   - vehicle loaded or unloaded.
6. Is the condition constant or intermittent? Can the concern be duplicated at any time?
7. Check for TSBs, SSM and OASIS messages.

2. **NOTE:** If the inspection reveals an obvious concern, repair the vehicle.

   Do a preliminary investigation. Visually inspect for obvious signs of damage.
   1. Inspect the driveshaft:
      - for build up of any foreign material.
      - for damage, such as a bent tube or missing weights.
      - U-joints, CV joints or flex couplers for wear or damage.
   2. Inspect the axle:
      - for signs of leakage at the drain or fill plug, differential seal, vent or halfshaft seals.
        - a plugged vent or vent tube will cause a leak.
      - for damage, such as cracks, bent halfshafts or dented rear cover.
      - for missing fasteners.
   3. Inspect other suspect components/systems:
      - inspect the suspension for broken springs, damaged shock absorbers and worn suspension bushings.
      - inspect the rear brake components — lines, cables and calipers.
      - inspect the tires; are they in good condition and do they match?

3. **NOTE:** A road test is necessary for any customer concern of noise or vibration.

   Road test the vehicle.
   1. During the road test, use the following driving methods to diagnose the problem. Is the concern most noticeable:
      - from a stop?
      - on shifts from REVERSE to DRIVE?
      - on turns?
        - sweeping type turn.
        - tight turn (to the stop).
      - in DRIVE?
        - accelerating the vehicle, definite throttle depression, applying engine torque?
      - in CRUISE?
        - maintain a constant speed with the throttle applied?
      - in COAST?
        - decelerating with the throttle closed?
   2. Record when the concern occurs. Write down the kph (mph) range at which the noise/vibration occurs.

4. Find the cause of the problem.
   1. Compare the inspection and road test results with the following chart.
   2. Use the following diagnostic routine chart to identify the probable cause and know what corrective actions should be taken to repair the component/vehicle and to prevent a reoccurrence.

Diagnostic Routine Chart

Condition	Action
· Fluid loss	· GO to Diagnostic Routine — Fluid Loss
· Noise louder on turns (sweeping turn)	· GO to Diagnostic Routine — Noise Louder on Turns (Sweeping)
· Axle noise (growl) [a] in tight turn	· GO to Diagnostic Routine — Noise (Growl) In Tight Turn
· Axle noise (chatter/shudder) [a] in tight turn, limited slip differential	· GO to Diagnostic Routine — Noise (Chatter/Shudder) In Tight Turns, Limited Slip Differential
· Axle noise (whine) [a] in all or more than one drive mode	· GO to Diagnostic Routine — Noise (Whine) In All Or More Than One Drive Modes
· Axle noise (tick/click) [a] in all or more than one drive mode (drive, cruise, coast)	· GO to Diagnostic Routine — Noise (Tick/Click) In All Or More Than One Drive Modes
· Axle noise (howl/moan) [a] in all or more than one drive mode (drive, cruise, coast)	· GO to Diagnostic Routine — Noise (Howl/Moan) In All Or More Than One Drive Modes
· Axle noise (clunk) [a] on changes in speed or direction of power	· GO to Diagnostic Routine — Noise (Clunk) On Changes In Speed Or Direction Of Power
· Front axle will not engage/disengage	· GO to Diagnostic Routine — Front Axle Will Not Engage/Disengage
· Vibration	· REFER to Section 100-04 .

a. Refer to Section 100-04 for a glossary of noise-related terms.

5. **NOTE:** If the conclusion of the road test points to an axle assembly section (ring and pinion or differential case) concern, carry out a visual inspection of the rear axle.

   Inspect the axle components.
   1. Remove the axle assembly.
   2. Remove the differential housing cover. Drain the axle lubricant through a white cloth. Check the fluid for:
      - any foreign material.
      - metal particles.
      - burnt odor.
   3. **NOTE:** When inspecting the axle, do not clean the components immediately. Cleaning may remove diagnostic evidence.

      Inspect the axle components.
      - Look for:
        - loose fasteners.
        - notches or visible steps or grooves created by wear.
        - pitting or cracking along gear contact lines.
        - scuffing or deformations.
        - discolorations.
        - nicks or ridges on gear teeth.
      - Clean the axle components for inspection.
        - Remove as much lubricant as possible with clean solvent. Wipe the components or blow them dry with compressed air.
      - Re-inspect for:
        - loose fasteners.
        - notches or visible steps or grooves created by wear.
        - pitting or cracking along gear contact lines.

- scuffing or deformations.
- discolorations.
- nicks or ridges on gear teeth.

- Check backlash and carry out a ring and pinion pattern test. Refer to Checking Differential Ring Gear Backlash and Checking Tooth Contact Pattern and Condition of the Ring and Pinion in this section.

Diagnostic Routines

Diagnostic Routine — Fluid Loss

Possible Component	Reference/Action
· Vent	· CLEAN the axle vent and vent hose.
· Overfilled axle	· CHECK the lubricant level for specific amount.
· Fill plug	· CLEAN the area around the plug. REMOVE the plug. APPLY pipe sealant and INSTALL the plug.
· Halfshaft oil seal	· INSTALL a new halfshaft oil seal.
· Pinion seal	· INSTALL a new pinion seal.
· Differential housing cover	· RESEAL the differential housing cover.

Diagnostic Routine — Noise Louder On Turns (Sweeping)

Possible Component	Reference/Action
· Wheel end bearing	· CHECK the wheel end bearing for wear or damage. INSTALL a new bearing.

Diagnostic Routine — Noise (Growl) In Tight Turn, Conventional Differential

Possible Component	Reference/Action
· Differential side gears and differential pinion gears	· DISASSEMBLE the differential carrier. INSPECT the differential case assembly. INSTALL new side gears and differential pinion gears or case assembly.

Diagnostic Routine — Noise (Chatter/Shudder) In Tight Turns, Limited Slip Differential

Possible Component	Reference/Action
· Clutch pack	· VERIFY the condition. With the vehicle in cold startup, MAKE SURE that the vehicle is in two wheel drive (2WD), to isolate the rear axle. TURN the wheel fully right (or fully left) and then ACCELERATE the vehicle. If the condition is verified to be in the rear axle, REMOVE and INSTALL new clutch packs.

Diagnostic Routine — Noise (Whine) In All Or More Than One Drive Modes

Possible Component	Reference/Action

· Axle ring and pinion	· REMOVE and INSTALL a new gear set and bearings.

Diagnostic Routine — Noise (Tick/Click) In All Or More Than One Drive Modes

Possible Component	Reference/Action
· Axle ring and pinion	· REMOVE and INSTALL a new ring gear, pinion and bearings.

Diagnostic Routine — Noise (Howl/Moan) In All Or More Than One Drive Modes

Possible Component	Reference/Action
· Axle bearings	· INSPECT differential and pinion bearings. INSTALL new bearings.

Diagnostic Routine — Noise (Clunk) On Changes In Speed Or Direction Of Power

Possible Component	Reference/Action
· Axle and pinion system	· MEASURE total backlash. If end play and total backlash are not within specification, INSTALL a new differential case assembly.
· Differential pinion shaft	· INSTALL a new differential pinion shaft and pin.
· Pinion bearings	· INSTALL new pinion and differential bearings and bearing cups.

Diagnostic Routine — Front Axle Will Not Engage/Disengage

Possible Component	Reference/Action
· Mode switch Wiring Shift motor	· REFER to Section 308-07A .

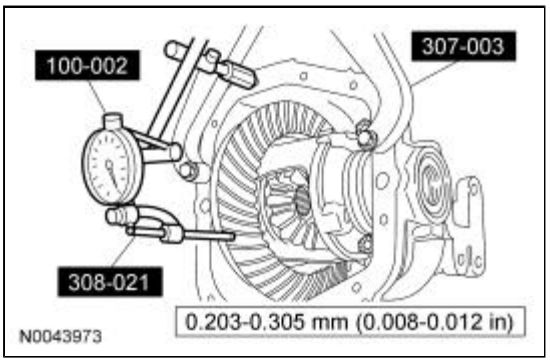
Diagnostic Routine — Vibration

Possible Component	Reference/Action
· For driveline vibration, REFER to Section 100-04 .	

Checking Differential Ring Gear Backlash

1. Remove the differential assembly.
2. Remove the differential housing cover.
3. Secure the differential assembly in a holding fixture.

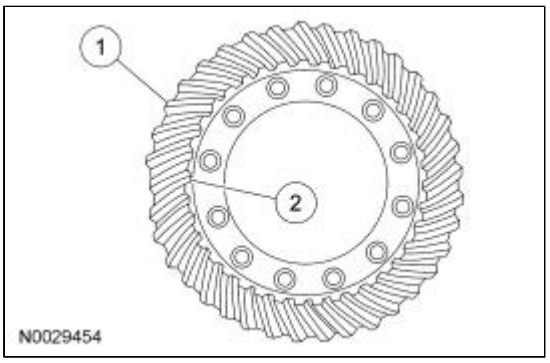
4. Using a suitable dial indicator and the special tool, measure and record the differential ring gear backlash in 4 opposing points on the ring gear.



Checking Tooth Contact Pattern and Condition of the Ring and Pinion

There are 2 basic types of conditions that will produce ring and pinion noise. The first type is a howl or chuckle produced by broken, cracked, chipped, scored or forcibly damaged gear teeth and is usually quite audible over the entire speed range. The second type of ring and pinion noise pertains to the mesh pattern of the gear pattern. This gear noise can be recognized as it produces a constant pitch or whine. Ring and pinion noise tends to peak in a narrow speed range or ranges, and will tend to remain constant in pitch.

NOTE: In the following steps, the movement of the contact pattern along the length is indicated as toward the "heel" or "toe" of the differential ring gear.



Item	Description
1	Heel
2	Toe

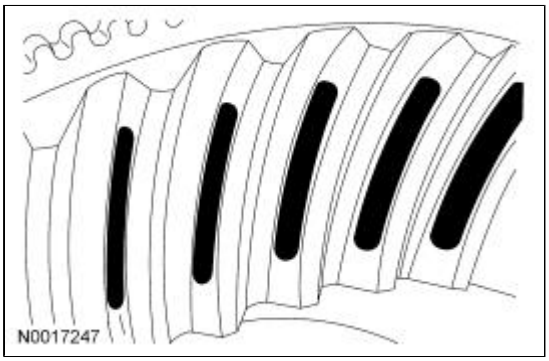
Apply a marking compound to a third of the gear teeth on the differential ring gear. Rotate the differential ring gear several complete turns in both directions until a good, clear tooth pattern is obtained. Compare the contact patterns on the ring gear teeth with the following illustrations.

Good Contact Pattern

Pattern inspection allows the technician to detect gross errors in set up prior to complete assembly of the differential assembly. Pattern contact should be within the primary area of the ring gear tooth section. Avoid narrow or hard contact with the outer perimeter of the ring gear tooth. Pattern inspection should be on the drive side of the tooth. Correct assembly of the drive pattern will result in satisfactory coast performance.

NOTE: If a gross pattern error is detected with the correct backlash, check the pinion shim selection.

Good Contact Pattern



Low Contact Pattern That Is Contacting More Toward the Heel

Gross Pattern Error

Stub Shaft Pilot Bearing and Seal

Printable View (171 KB)

Special Tool(s)

 ST1200-A	Remover, Bearing Cup 308-047 (T77F-1102-A)
 ST1721-A	Installer, Halfshaft Pilot Bearing 205-504
ST1326-A	Adapter for 303-224 (Handle) 205-153 (T80T-4000-W)
ST1185-A	Slide Hammer 100-001 (T50T-100-A)
ST2369-A	Installer, Wheel Speed Sensor Ring 206-034 (T88P-20202-A)

Material

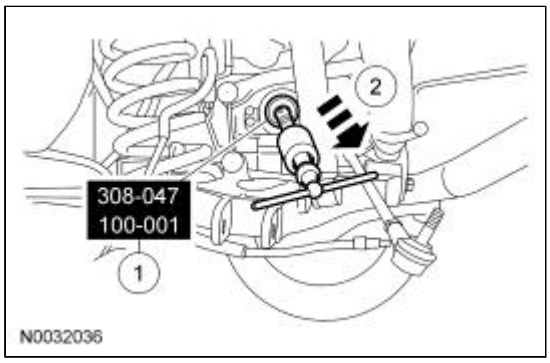
Item	Specification
Motorcraft SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL (US); CXY-75W140-1L (Canada)	WSL-M2C192-A

NOTE: The stub shaft seals must be replaced whenever the halfshafts are removed.

1. Remove the halfshaft assembly. For additional information, refer to Section 205-05 .
2. **NOTE:** If removing the stub shaft pilot bearing oil seal only, engage the tangs of the special tool on the stub shaft pilot bearing oil seal.

Using the special tools, remove and discard the stub shaft pilot bearing and the stub shaft pilot bearing oil seal.

1. Firmly engage the tangs of the special tool on the stub shaft pilot bearing.
2. Remove and discard the bearing and the stub shaft pilot bearing oil seal.

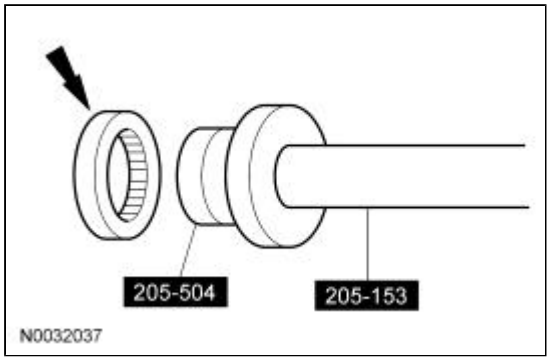


3. Inspect the seal journal for rust, nicks and scratches. Polish the seal journal surface with fine crocus cloth, if necessary.

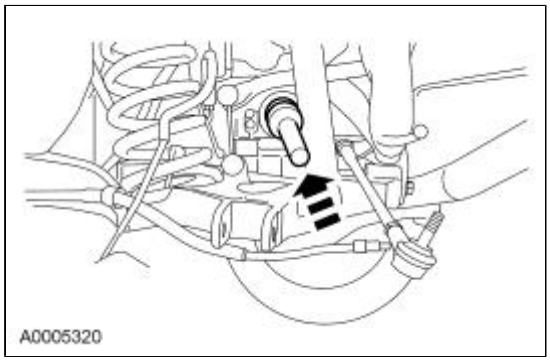
4. Lubricate the new stub shaft pilot bearing with axle lubricant.

5. **CAUTION: Installation of the stub shaft pilot bearing or stub shaft oil seal without the correct tools can result in early bearing or seal failure. If the stub shaft pilot bearing becomes cocked in the bore during installation, remove it and install a new one.**

   Place the stub shaft pilot bearing onto the special tools.

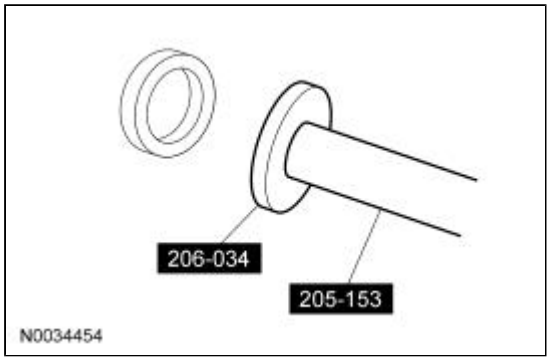


6. Install the stub shaft pilot bearing into the rear axle housing bore.

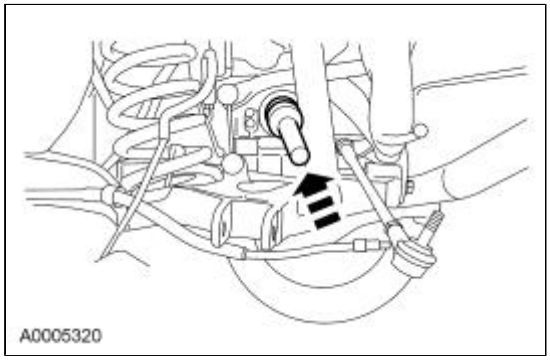


7. **NOTE:** Do not disassemble the new oil seal.

   Install the new seal onto the special tools.



8. Carefully align the stub shaft pilot bearing seal with the housing bore and install the stub shaft pilot bearing seal flush in the differential housing.
    - Strike only the handle. Directly striking the installer tool will damage the seal.



9. **CAUTION: Inspect the stub shaft seal journal for rust, nicks or scratches prior to installing the halfshaft. Polish the seal journal with fine crocus cloth, if required.**

    Install the halfshaft. For additional information, refer to Section 205-05 .

Drive Pinion Flange and Drive Pinion Seal

Printable View (250 KB)

Special Tool(s)

ST2026-A	2-Jaw Puller 205-D072 (D97L-4221-A) or equivalent
ST1257-A	Holding Fixture, Drive Pinion Flange 205-126 (T78P-4851-A)
ST1734-A	Installer, Drive Pinion Flange 205-233 (T85T-4851-AH)
ST1325-A	Installer, Drive Pinion Oil Seal 205-208 (T83T-4676-A)

Material

Item	Specification
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B
Threadlock and Sealer TA-25	WSK-M2G351-A5 (type II)
Motorcraft SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL (US); CXY-75W140-1L (Canada)	WSL-M2C192-A

Removal

CAUTION: Remove the rear wheel and tire assemblies, brake calipers and brake discs to prevent brake drag during the drive pinion bearing preload adjustment.

1. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH rear quarter trim panel. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations. Failure to follow these instructions may result in personal injury and vehicle damage.**

   NOTE: If equipped, turn the air suspension switch to the OFF position.

   With the vehicle in NEUTRAL, position the vehicle on a hoist. For additional information, refer to Section 100-02 .

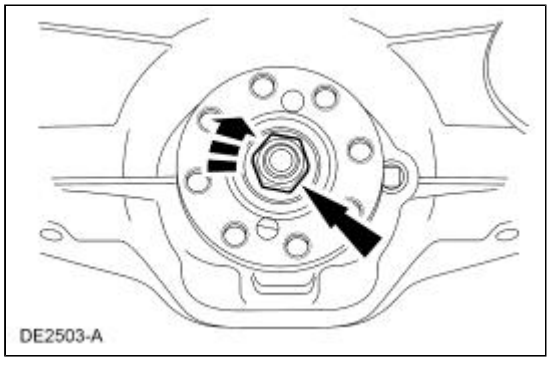
2. Remove the rear wheel and tire assemblies. For additional information, refer to Section 204-04 .

3. **CAUTION: Do not allow the brake caliper to hang from the brake hose. Provide a suitable support.**

   Remove the rear brake calipers and the brake discs. Position the brake calipers aside. For additional information, refer to Section 206-04 .

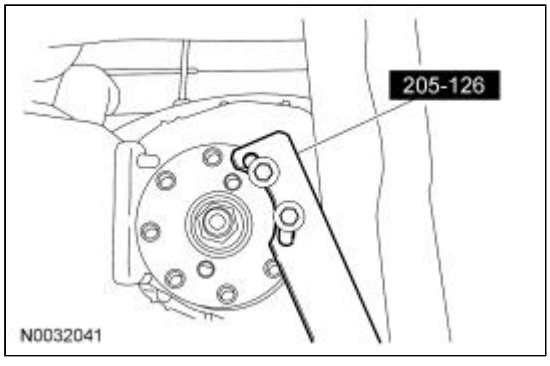
4. Remove the rear driveshaft assembly. For additional information, refer to Section 205-01 .

5. Install a Nm (lb-in) torque wrench on the nut and record the torque necessary to maintain rotation of the drive pinion gear through several revolutions.

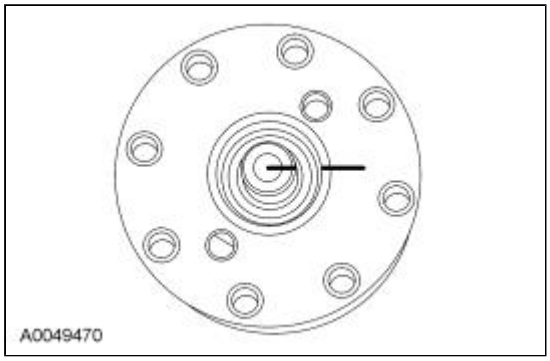


6. **CAUTION: After removing the pinion nut, discard it. Use a new nut for installation.**

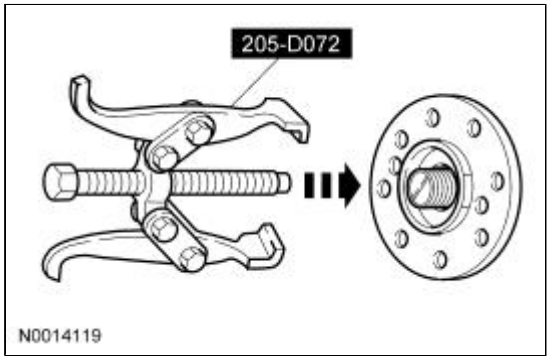
   Use the special tool to hold the pinion flange while removing the pinion nut.



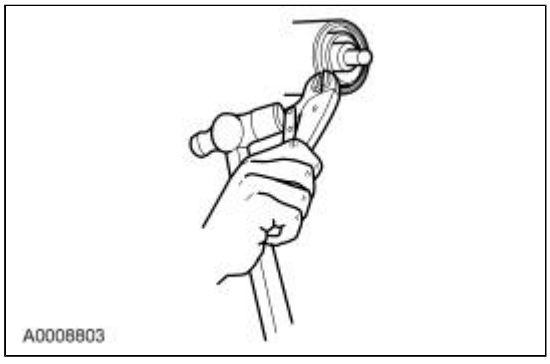
7. Index-mark the drive pinion flange and the drive pinion gear stem to maintain initial balance during installation.



8. Using the special tool, remove the drive pinion flange.



9. Force up on the metal flange of the drive pinion seal. Install gripping pliers and strike with a hammer until the pinion seal is removed.

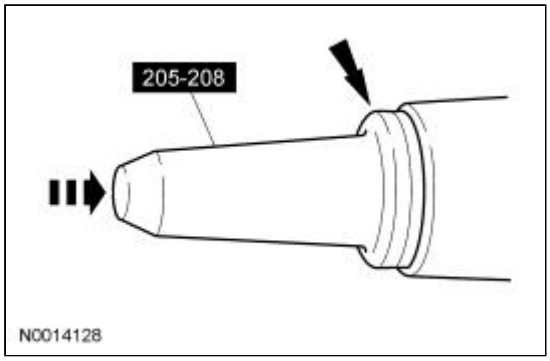


Installation

1. Lubricate the lips of the new drive pinion seal with grease.

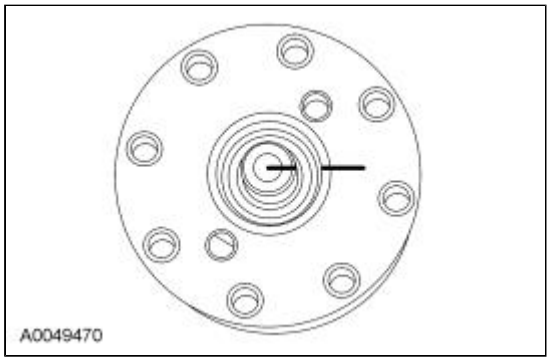
2. **CAUTION: If the drive pinion seal becomes misaligned during installation, remove it and install a new seal.**

   Using the special tool, install the drive pinion seal.

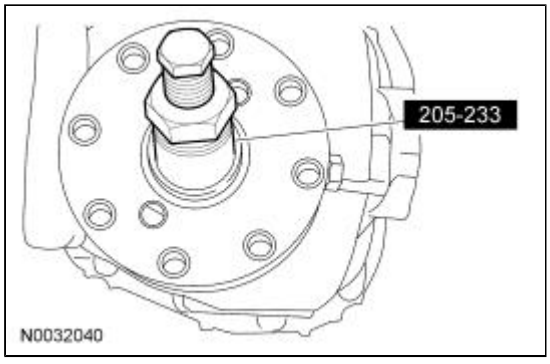


3. Lubricate the drive pinion flange splines with rear axle lubricant.
4. **NOTE:** Disregard the index marks if installing a new drive pinion flange.

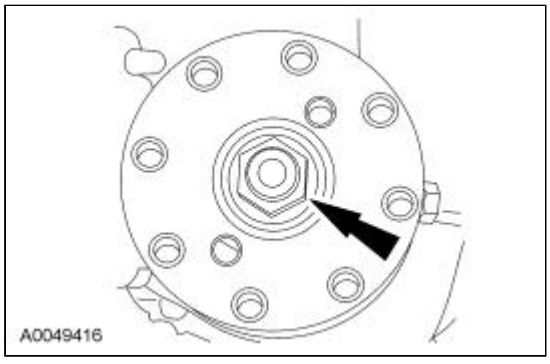
   Position the drive pinion flange.



5. Using the special tool, install the drive pinion flange.



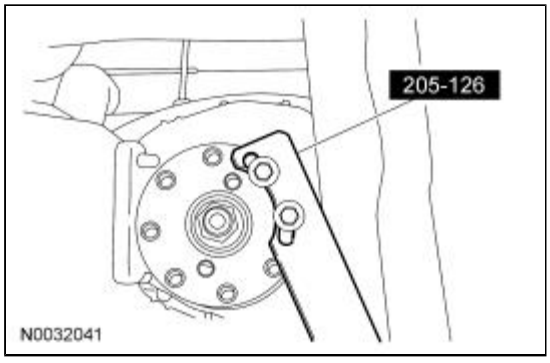
6. Position the new drive pinion nut.



7. **CAUTION: Do not under any circumstance loosen the nut to reduce preload. If it is necessary to reduce preload, install a new drive pinion collapsible spacer and nut.**

   CAUTION: Remove the special tool while taking preload readings with the Nm (inch-pound) torque wrench.

   Use the special tool to hold the pinion flange while tightening the nut.
   - Rotate the pinion occasionally to make sure the pinion bearings seat correctly. Take frequent pinion bearing torque preload readings by rotating the drive pinion gear with a Nm (lb-in) torque wrench.
   - If the preload recorded prior to disassembly is lower than the specification for used bearings, tighten the nut to specification. If the preload recorded prior to disassembly is higher than the specification for used bearings, tighten the nut to the original reading as recorded.
   - Refer to the torque specification for used pinion bearings in the Specifications portion of this section.



8. **CAUTION: Install the driveshaft with new bolts. If new bolts are not available, apply sealer to the threads of the original bolts.**

   CAUTION: Align the index marks.

   CAUTION: The driveshaft flange yoke fits tightly on the pinion flange pilot. To make sure that the yoke seats squarely on the flange, tighten the bolts evenly in a cross pattern as shown.

   Install the rear driveshaft. For additional information, refer to Section 205-01 .

9. Install the rear brake discs and the brake calipers. For additional information, refer to Section 206-04 .

10. Install the rear wheel and tire assemblies. For additional information, refer to Section 204-04 .

11. Lower the vehicle.

12. If equipped with air suspension, reactivate the system.

Rear Axle Housing Support Insulator

Printable View (219 KB)

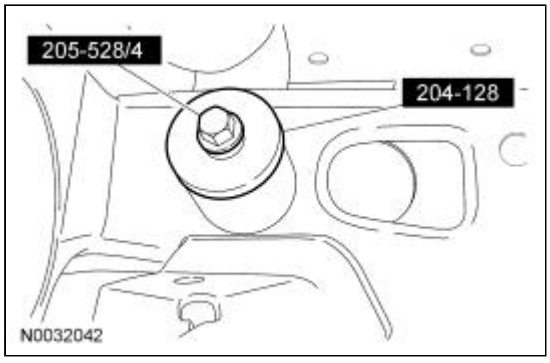
Special Tool(s)

ST2668-A	Forcing Screw, Rear Differential Housing Bushing 205-528/4
ST1970-A	Installer, Rear Differential Housing Bushing 205-528/2
ST2669-A	Receiver Cup, Rear Differential Housing Bushing 205-528/3
ST1965-A	Remover, Rear Differential Housing Bushing 205-528/1
ST1569-A	Adapter for 204-S127 204-128 (T86P-5638-AH1)
ST1367-A	Installer, Drive Pinion Bearing 205-488
 ST1254-A	Plate, Bearing/Oil Seal 205-090 (T75L-1165-B)

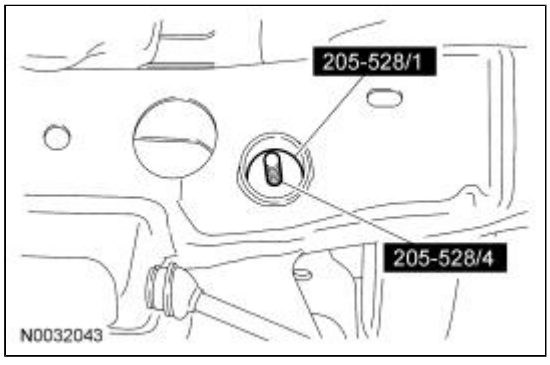
Removal

1. Remove the rear axle assembly. For additional information, refer to Axle Assembly — Air Suspension or Axle Assembly — Coil Suspension in this section.

2. Insert the forcing screw through the adapter and the frame support insulator.

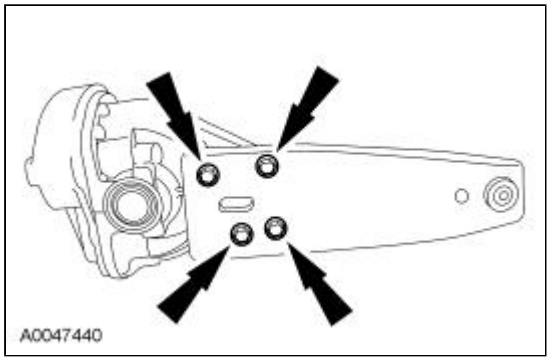


3. Thread the bushing remover on the forcing screw.

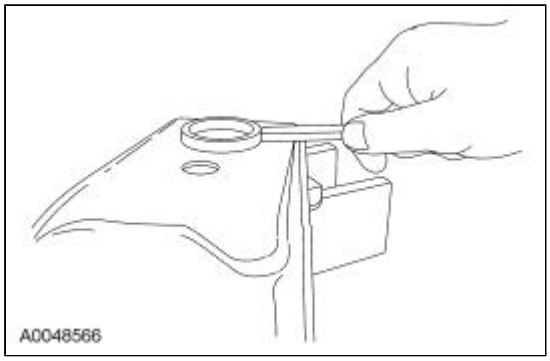


4. Tighten the special tool to remove the frame support insulator.

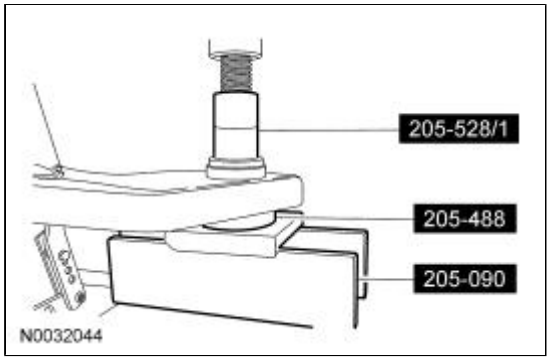
5. Remove the 4 bolts attaching the torque arm to the axle housing.



6. Measure and record the distance the insulator extends from the face of the torque arm.

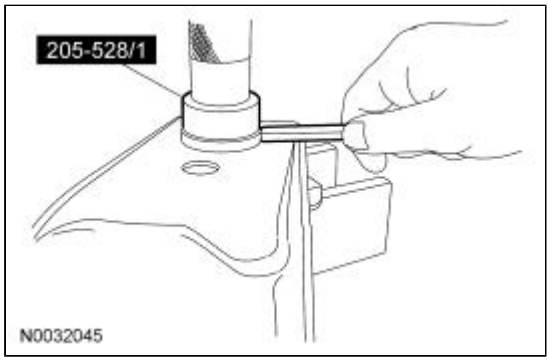


7. Using a suitable press and the special tools, remove the torque arm insulator from the torque arm.

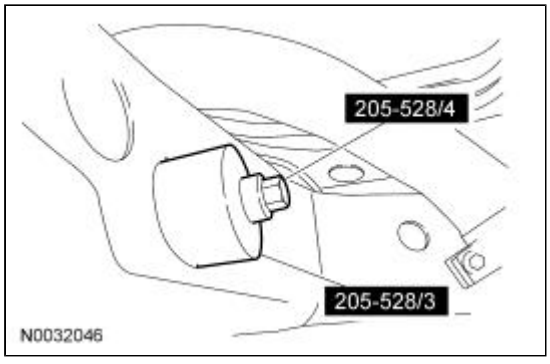


Installation

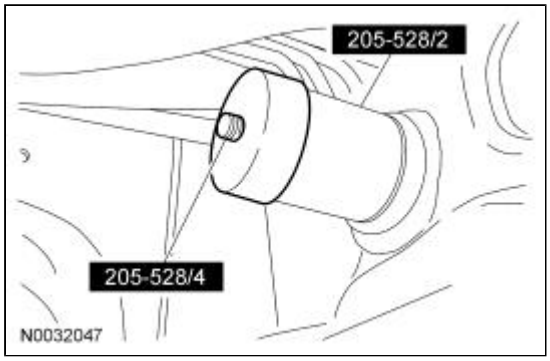
1. Using a suitable press and the special tools, install the new torque arm insulator to the previously recorded depth.



2. Position the special tools on the rear of the crossmember.

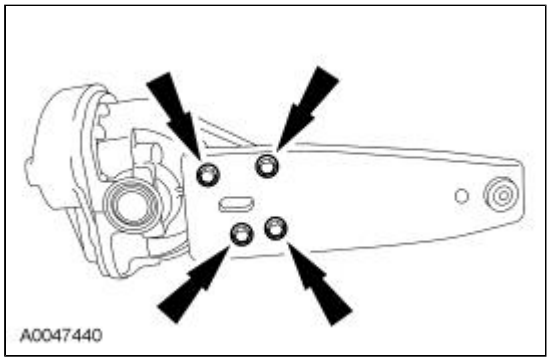


3. Position the new insulator and thread the special tools together.



4. Tighten the forcing screw to seat and position the new insulator.

5. Install the torque arm on the rear axle housing.
   - Tighten to 205 Nm (150 lb-ft).



6. Install the rear axle assembly. For additional information, refer to Axle Assembly — Air Suspension or Axle Assembly — Coil Suspension in this section.

Axle Assembly — Air Suspension

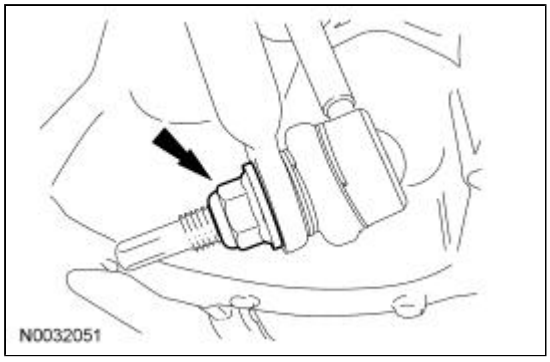
Printable View (220 KB)

Special Tool(s)

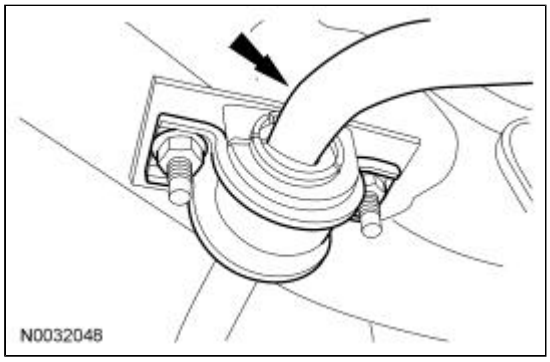
 ST1927-A	Hi-Lift Transmission Jack 164-R3508 or equivalent

Removal and Installation

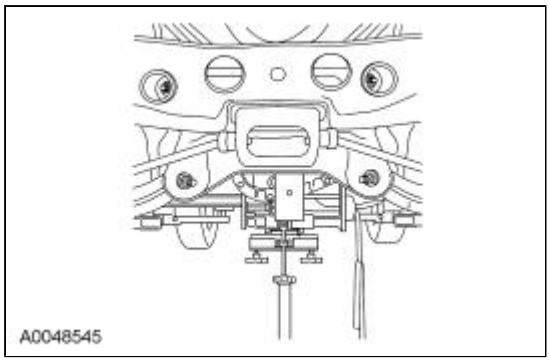
1. With the vehicle in NEUTRAL, position the vehicle on a hoist. For additional information, refer to Section 100-02 .
2. Deflate the rear air springs. For additional information, refer to Section 204-05 .
3. Remove the rear driveshaft assembly. For additional information, refer to Section 205-01 .
4. Remove the axle halfshafts. For additional information, refer to Section 205-05 .
5. Remove the lower rear sway bar links.
   - To install, tighten to 90 Nm (66 lb-ft).



6. Remove the 4 bracket bolts and remove the rear sway bar.
   - To install, tighten to 40 Nm (30 lb-ft).

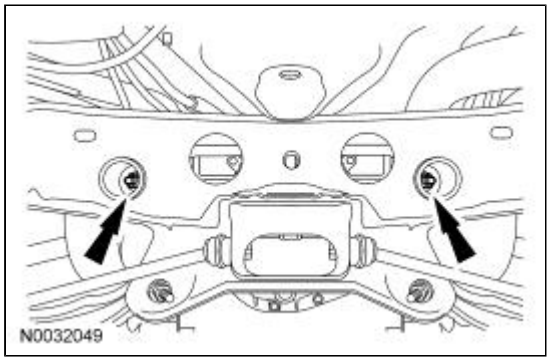


7. Using a suitable jack, support the axle housing.

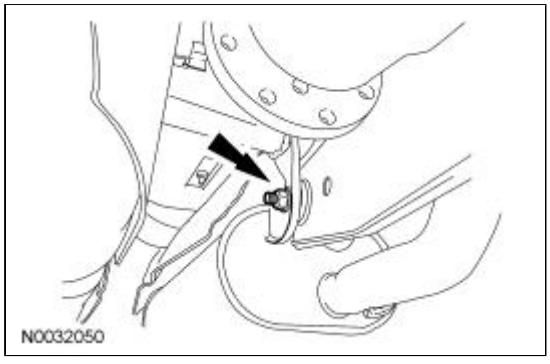


8. **NOTE:** Spare wheel removed for clarity.

   Remove the upper axle housing stud nuts.
   - To install, tighten to 135 Nm (100 lb-ft).

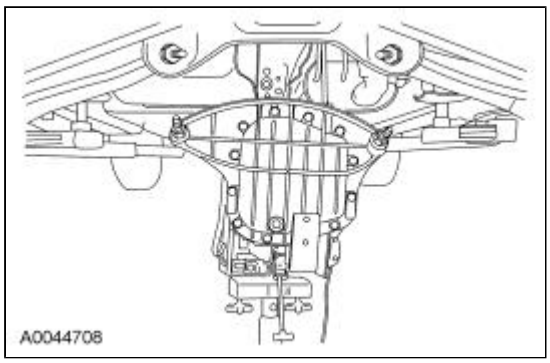


9. Remove the front torque arm bolt.
   - To install, tighten to 135 Nm (100 lb-ft).



10. **NOTE:** Move the axle housing forward to clear the rear mounting studs from the bushings.

    Lower the axle housing from the vehicle.

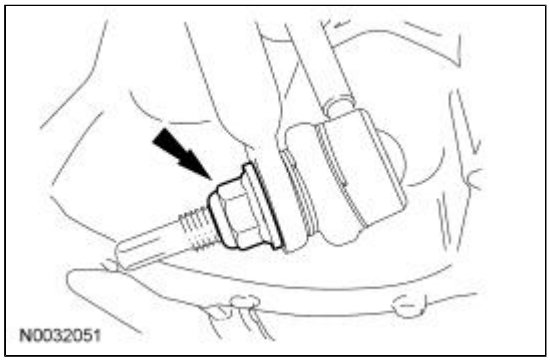


11. To install, reverse the removal procedure.

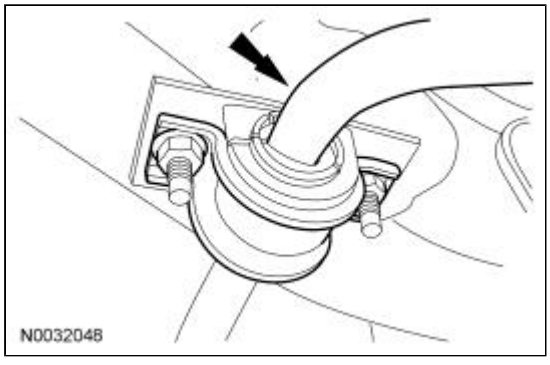
Axle Assembly — Coil Suspension

Printable View (214 KB)

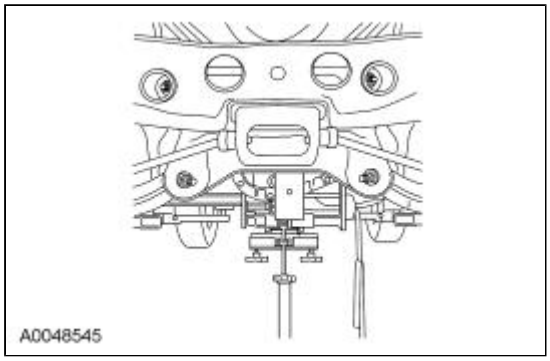
1. Position the vehicle on a hoist. For additional information, refer to Section 100-02 .
2. Remove the rear wheel and tire assemblies. For additional information, refer to Section 204-04 .
3. Remove the rear driveshaft assembly. For additional information, refer to Section 205-01 .
4. Remove the rear halfshafts. For additional information, refer to Section 205-05 .
5. Remove the lower rear sway bar links.
   - To install, tighten to 90 Nm (66 lb-ft).



6. Remove the 4 bracket bolts and remove the rear sway bar.
   - To install, tighten to 40 Nm (30 lb-ft).

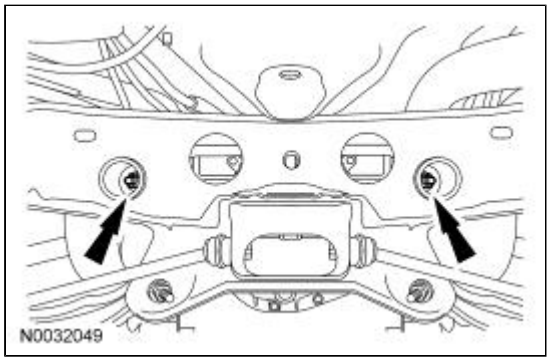


7. Using a suitable jack, support the axle housing.

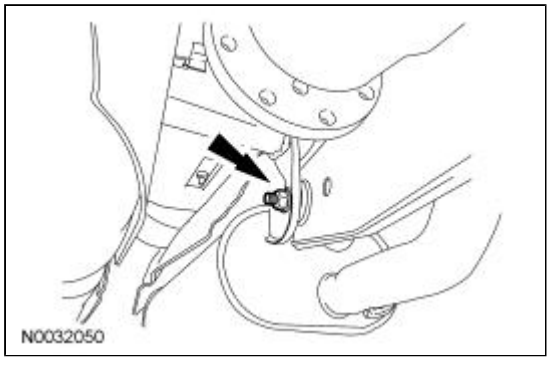


8. **NOTE:** Spare wheel removed for clarity.

   Remove the upper axle housing stud nuts.
   - To install, tighten to 135 Nm (100 lb-ft).

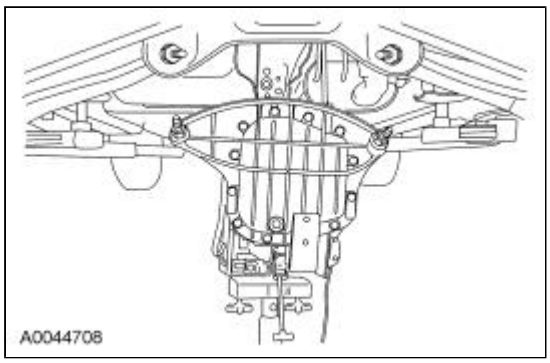


9. Remove the front torque arm bolt.
   - To install, tighten to 135 Nm (100 lb-ft).



10. **NOTE:** Move the axle housing forward to clear the rear mounting studs from the bushings.

    Lower the axle housing from the vehicle.



11. To install, reverse the removal procedure.

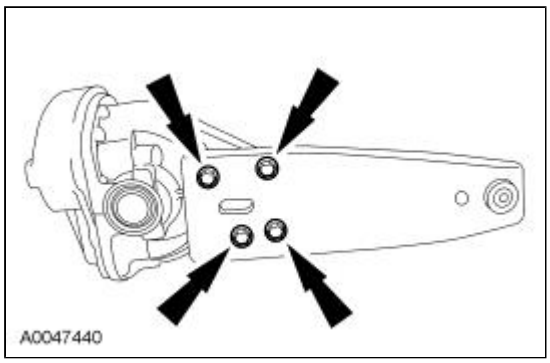
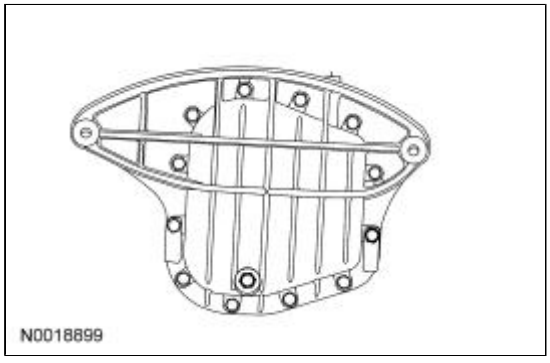
Removal

1. Remove the rear axle assembly. For additional information, refer to Axle Assembly — Air Suspension or Axle Assembly — Coil Suspension in this section.

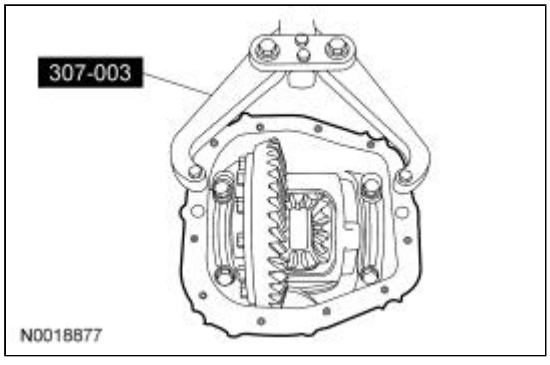
2. Remove the 4 bolts retaining the torque arm to the rear axle housing.



3. Remove the differential housing cover and drain the lubricant.

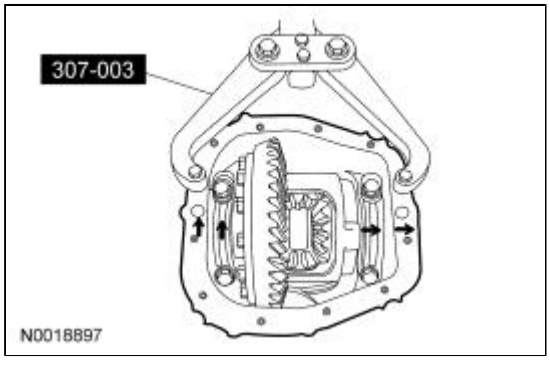


4. Using the special tools, mount the differential housing to a work bench.



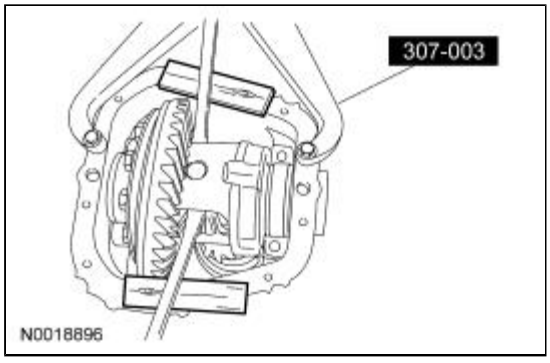
5. **CAUTION: Mark the position and location of the differential bearing caps as the arrows may not be visible. Always install the differential bearing caps in their original locations and positions.**

   Remove the differential bearing caps.

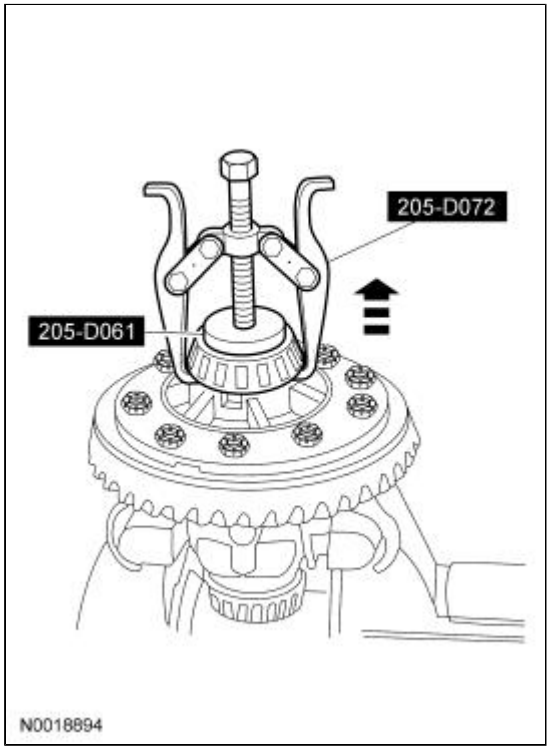


6. **CAUTION: Use wood blocks to avoid damaging the differential housing.**

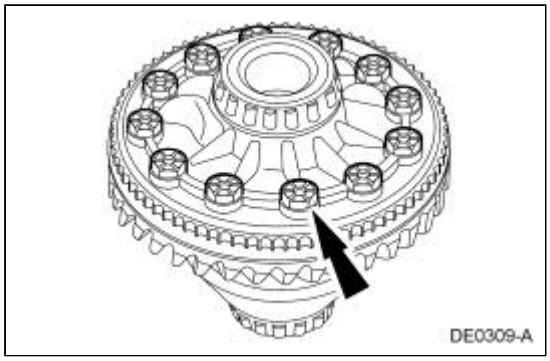
   Remove the differential assembly.
   - Position wood blocks at the top and bottom of the differential assembly.
   - Pry the differential assembly and the differential bearing shims out of the differential housing.



7. Using the special tools, remove the differential bearing.
   - Repeat for the other side.

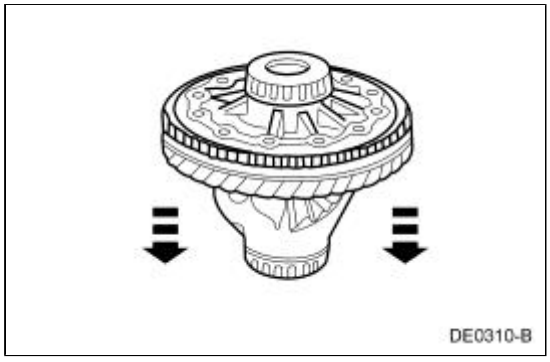


8. Remove the 12 ring gear bolts.



9. **CAUTION: Do not damage the ring gear bolt hole threads.**

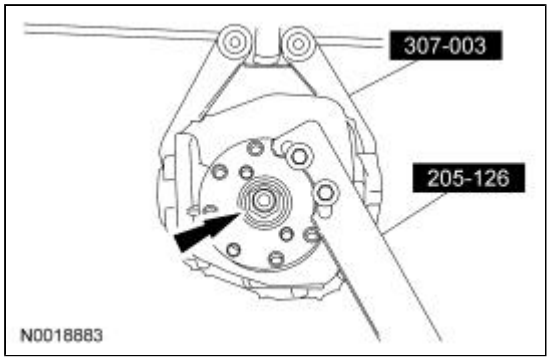
   Insert a punch in the ring gear bolt holes and drive the differential ring gear off.



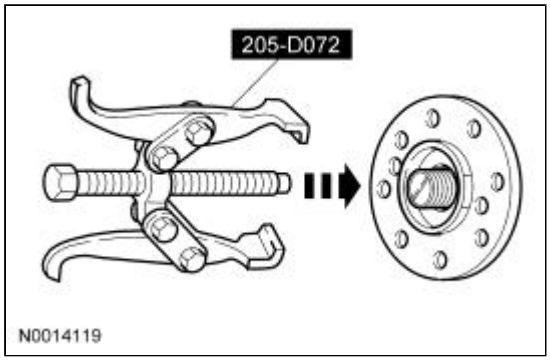
10. **WARNING: The speed sensor ring cannot be reused once removed. Remove the speed sensor ring only if damaged.**

    If necessary, remove the speed sensor ring.

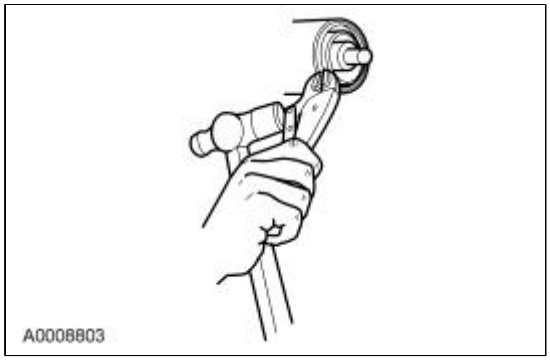
11. Using the special tool, hold the pinion flange to remove and discard the pinion nut.



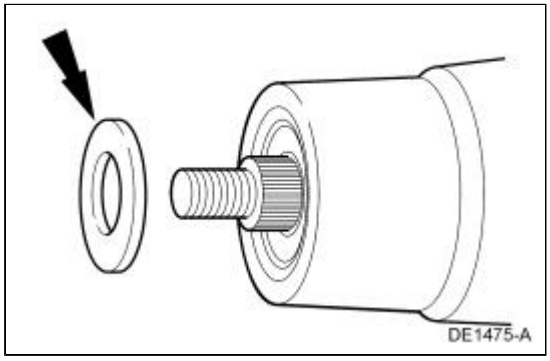
12. Using the special tool, remove the pinion flange.



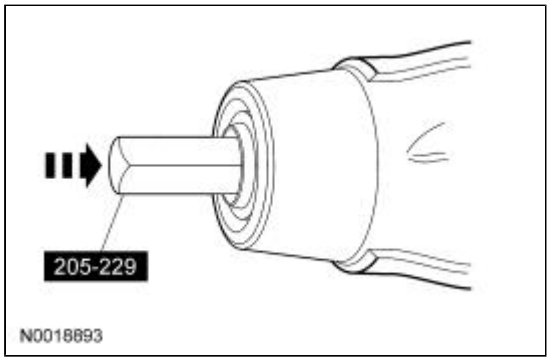
13. Use a screwdriver to force up the metal flange of the drive pinion oil seal. Install gripping pliers and strike with a hammer to remove the drive pinion oil seal.



14. Remove the drive pinion oil seal deflector, drive pinion oil seal slinger and the outer pinion bearing.

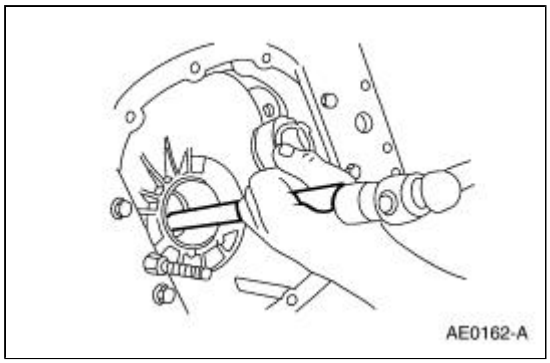


15. Using the special tool and a soft-faced hammer, remove the differential pinion gear from the differential housing.



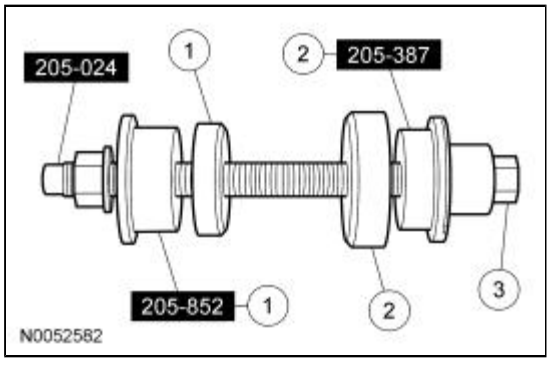
16. Using a brass drift and a hammer, remove any damaged differential drive pinion bearing cups from the differential housing. Tap alternately on each side of the cup to prevent it from cocking in

the bore.

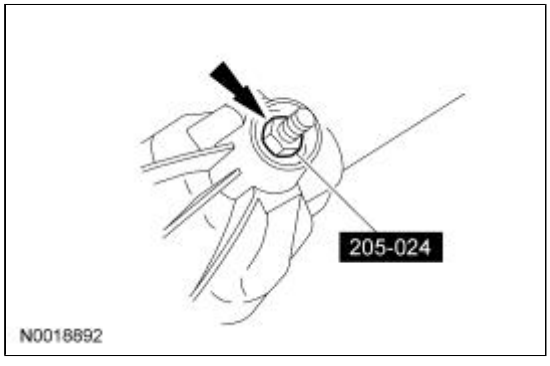


Installation

1. Position the special tools and the inner and outer drive pinion bearing cups in their respective bores.
    1. Place the special tool on the outer drive pinion bearing cup.
    2. Place the special tool on the inner drive pinion bearing cup.
    3. Install the special tool.

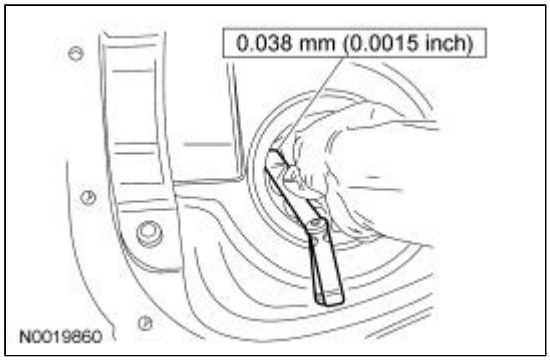


2. Tighten the special tool to fully seat the differential drive pinion bearing.



3. **NOTE:** If a feeler gauge of the specification shown can be inserted between a cup and the bottom of its bore at any point around the cup, the cup is not correctly seated.

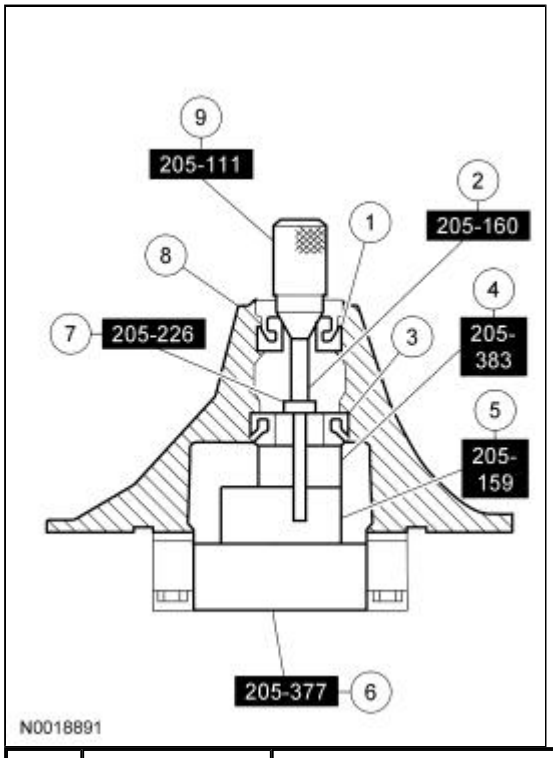
   Make sure the differential pinion bearing cups are correctly seated.



4. **CAUTION: Use the same drive pinion bearings and the drive pinion bearing adjustment shim from the drive pinion bearing adjustment shim selection procedure for final assembly.**

   NOTE: Install new drive pinion bearings without any additional lubricant since the anti-rust oil provides adequate lubricant without upsetting the drive pinion bearing preload settings.

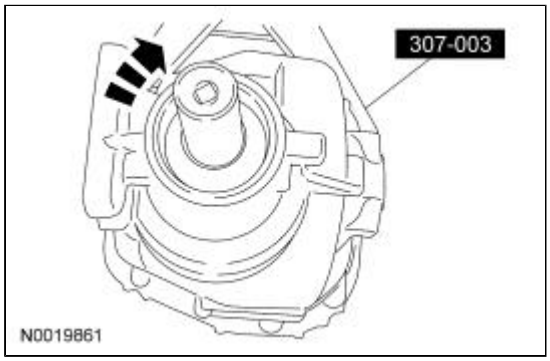
   Install the new drive pinion bearings and special tools as shown.



Item	Part Number	Description
1	4621	Outer pinion bearing
2	205-160	Adapter for 205-S127
3	4630	Inner pinion bearing
4	205-383	Depth Gauge/Aligner, Drive Pinion
5	205-159	Adapter for 205-S127
6	205-377	Drive Pinion Gauge Tube
7	205-226	Depth Gauge/Aligner, Drive Pinion
8	4010	Rear axle housing outer (front) pinion bearing
9	205-111	Adapter for 205-S127

5. **NOTE:** This step duplicates drive pinion bearing preload.

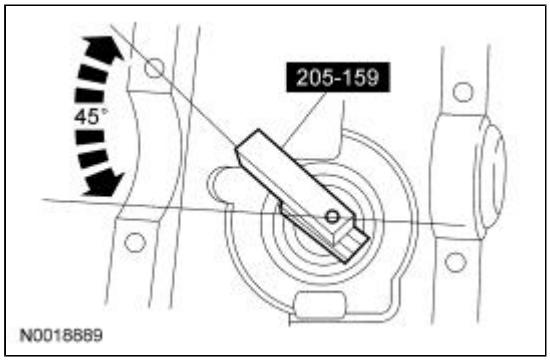
   Thread the special tool onto the screw.
   - Tighten to 2.2 Nm (20 lb-in) rotational torque.



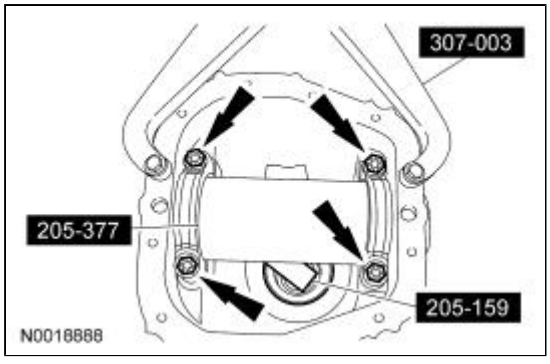
6. **CAUTION: Position the adapter so it does not contact the housing.**

   CAUTION: Offset the special tool to obtain an accurate reading.

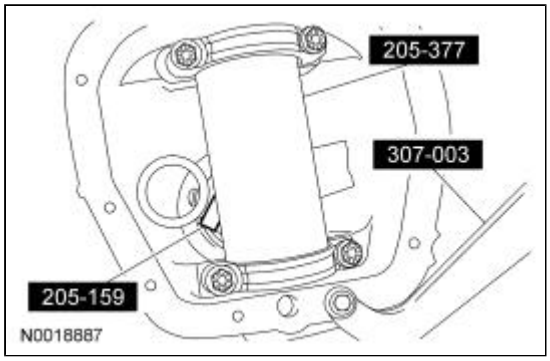
   Rotate the special tool several half turns to seat the drive pinion bearings. Position the special tool as shown.



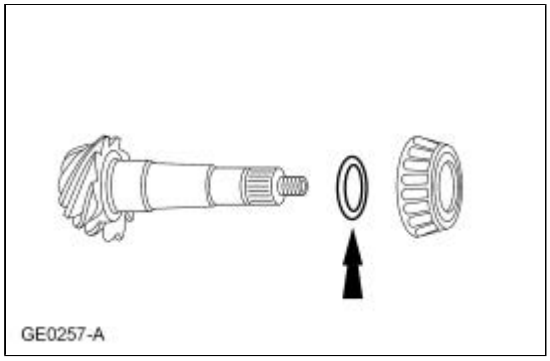
7. Install the special tool and bearing caps.
   - Tighten to 105 Nm (77 lb-ft).



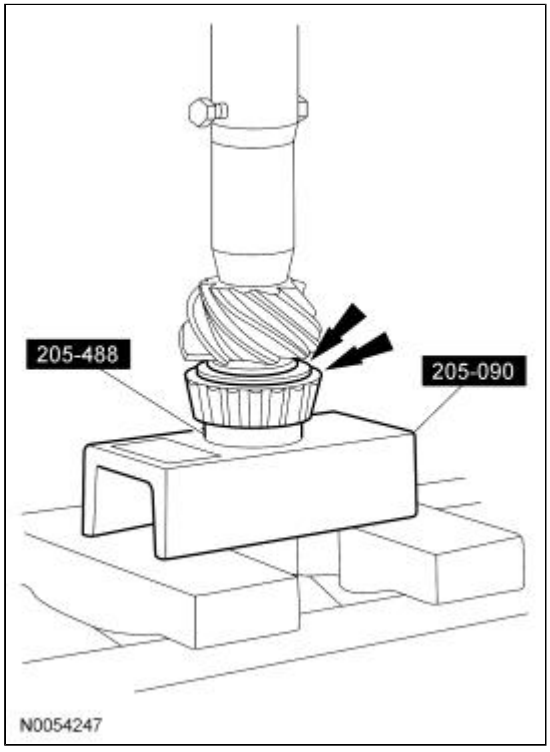
8. Use a drive pinion bearing adjustment shim as a gauge for shim selection. Check the drive pinion bearing adjustment shim thickness between the gauge block and the gauge tube. A slight drag indicates correct shim selection.



9. Position the drive pinion bearing adjustment shim and the inner pinion bearing on the drive pinion gear stem.



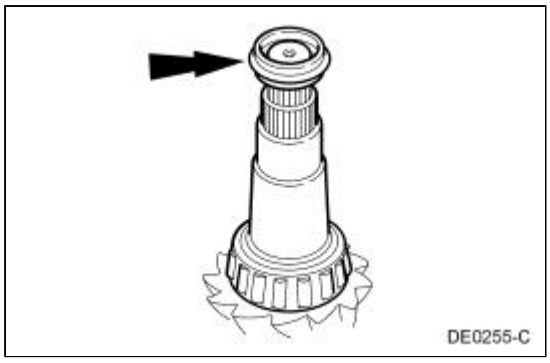
10. Using the special tools and a suitable press, firmly seat the drive pinion bearing adjustment shim and inner pinion bearing on the drive pinion gear stem.



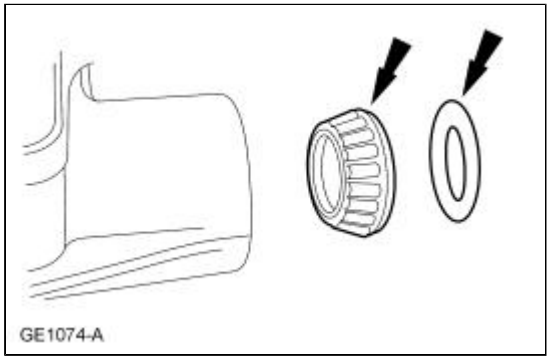
11. **CAUTION: Make sure the splines on the drive pinion gear stem are free of burrs. If burrs are evident, remove them using a fine crocus cloth.**

    Place a new differential drive pinion collapsible spacer on the drive pinion gear stem against the

pinion stem shoulder.



12. Install the outer pinion bearing and the drive pinion oil seal slinger.

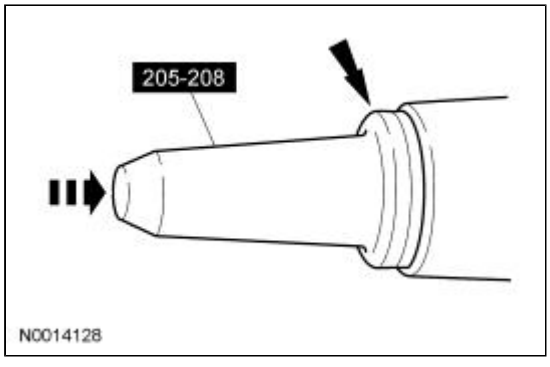


13. **CAUTION: Installation without the correct tool can result in early drive pinion seal failure.**

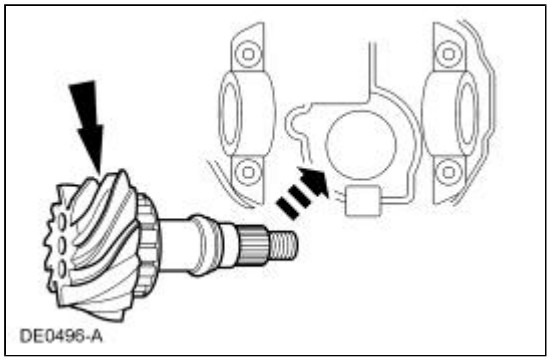
CAUTION: If the drive pinion seal becomes misaligned during installation, remove it and install a new drive pinion seal.

NOTE: Coat the drive pinion seal lips with long-life grease.

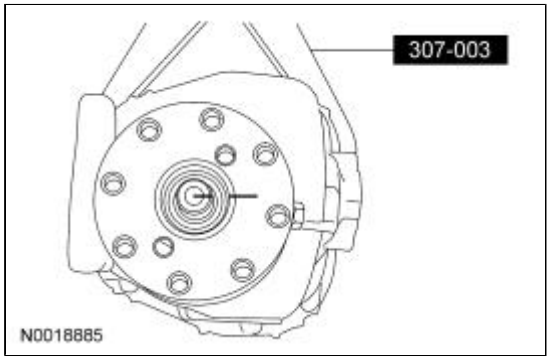
Using the special tool, install the new drive pinion seal.



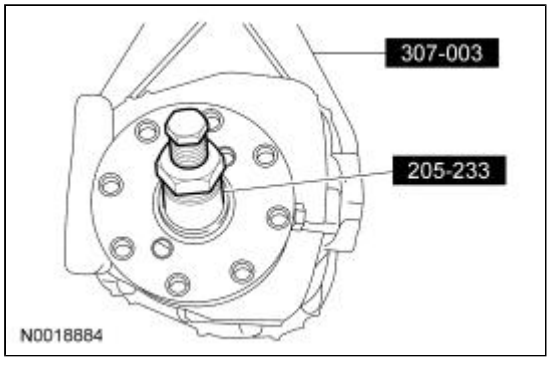
14. Install the drive pinion gear with the differential drive pinion collapsible spacer in the differential housing.



15. Position the pinion flange.



16. Using the special tool, install the pinion flange.

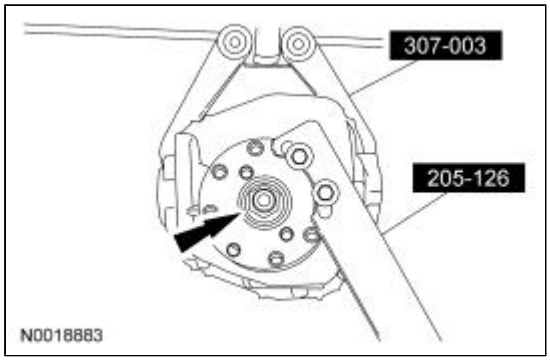


17. **CAUTION: Do not, under any circumstance, loosen the pinion nut to reduce drive pinion bearing preload. If it is necessary to reduce drive pinion bearing preload, install a new differential drive pinion collapsible spacer and pinion nut.**

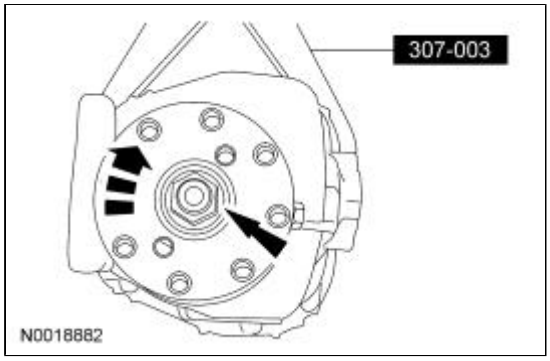
CAUTION: Remove the special tool while taking drive pinion bearing preload readings with the Nm (lb-in) torque wrench.

Use the special tool to hold the pinion flange while tightening the pinion nut.

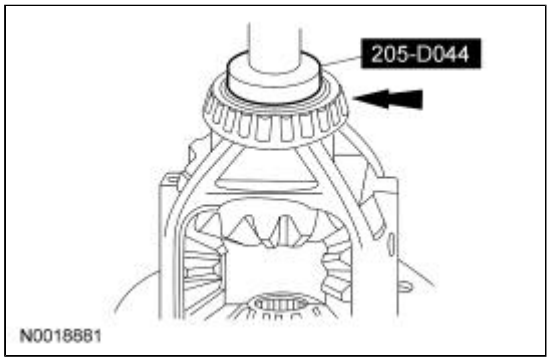
- Rotate the drive pinion gear occasionally to make sure the drive pinion bearings seat correctly. Take frequent drive pinion bearing preload readings by rotating the drive pinion gear with a Nm (lb-in) torque wrench.



18. Tighten the pinion nut to set the drive pinion bearing preload. Refer to the torque specification for drive pinion bearings in the Specifications portion of this section.

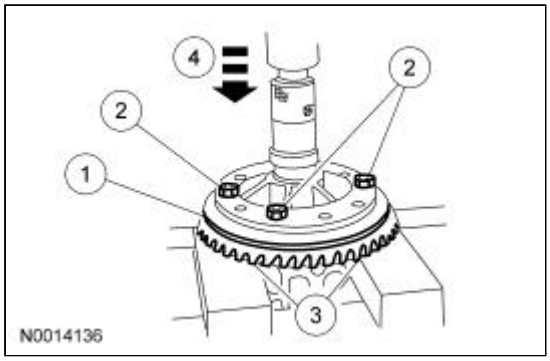


19. Press the left and right differential bearing on the differential assembly.

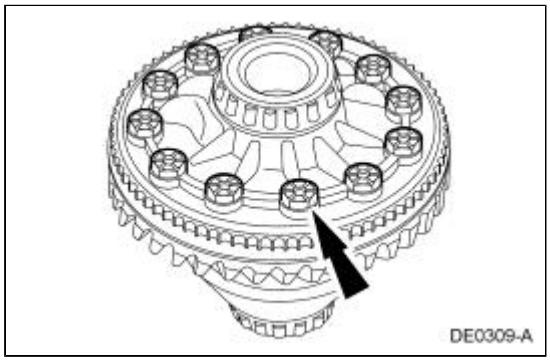


20. **NOTE:** If removed, press the speed sensor ring on with the differential ring gear.

    Install the differential ring gear.
    1. Place the differential ring gear on the differential assembly.
    2. Hand-start 3 ring gear bolts to align the holes in the differential ring gear and the differential assembly.
    3. Place the differential assembly and differential ring gear onto the press bed blocks with the differential ring gear teeth facing downward.
    4. Press the differential ring gear into place.



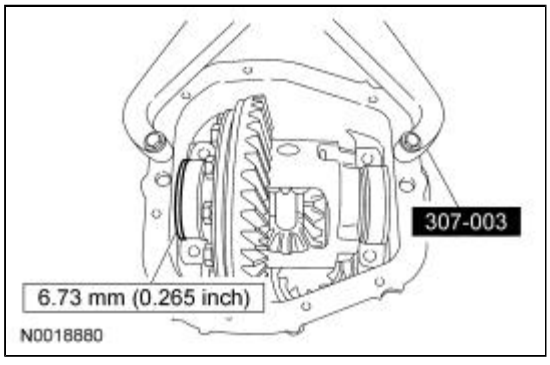
21. Install the remaining ring gear bolts after applying stud and bearing mount to the bolt threads.
    - Tighten to 150 Nm (111 lb-ft).



22. Install the differential assembly.
    1. Position the differential bearing cups on the differential bearings.
    2. Lower the differential assembly in place.

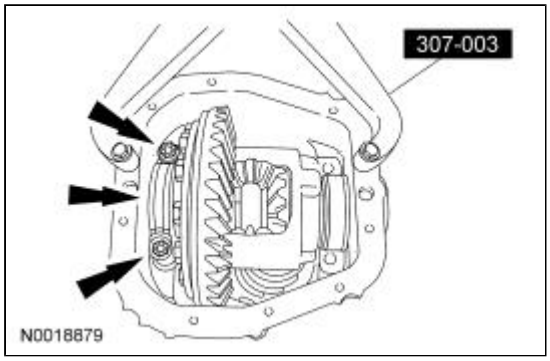
23. **NOTE:** Differential bearing shims are to be installed with the chamfer facing outboard.

    Install a differential bearing shim of the thickness shown on the LH side of the differential case.



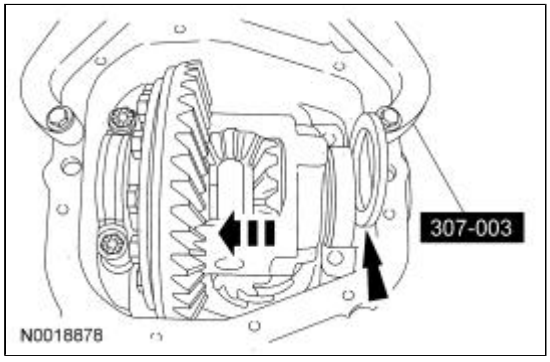
24. **NOTE:** Apply pressure toward the left side to make sure the left bearing cap is seated.

    Install the left bearing cap and loosely install the bearing cap bolts.



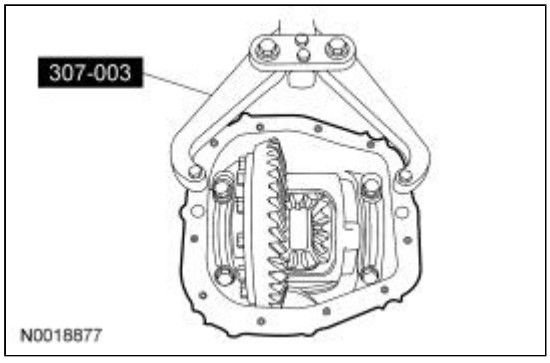
25. **NOTE:** Apply pressure toward the left side to make sure the left bearing cap is seated.

    Install progressively thicker differential bearing shims on the right side until the thickest differential bearing shim can be inserted by hand.

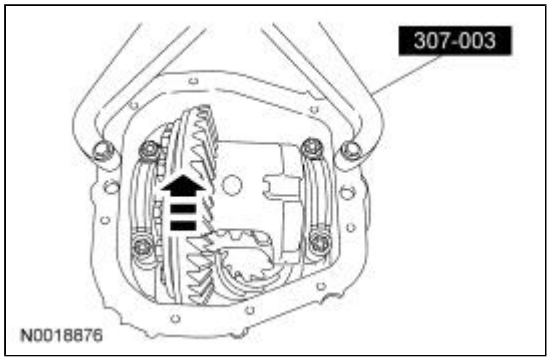


26. Install the right bearing cap and bolts.

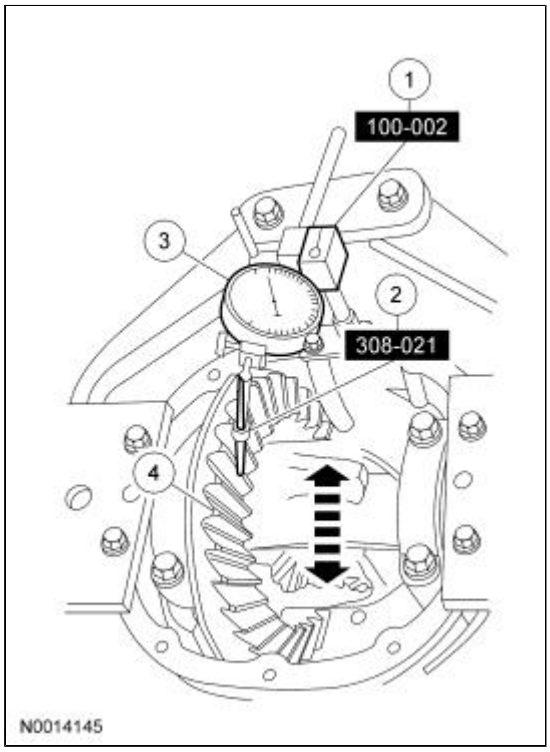
27. Tighten the 4 differential bearing cap bolts.
    - Tighten to 105 Nm (77 lb-ft).



28. Rotate the differential case to make sure it turns freely.



29. Using the special tools, measure the differential ring gear backlash.
    1. Attach the special tool.
    2. Position the special tool tip centrally on a drive tooth.
    3. Zero the indicator.
    4. Turn the differential ring gear without turning the drive pinion gear. Record the indicator reading. The allowable backlash is mm (0.008 in) to 0.305 mm (0.012 in).
        - To correct for a high or low backlash, proceed as follows.



30. To correct for high or low backlash, increase the thickness of one differential bearing shim and decrease the thickness of the other differential bearing shim by the same amount. Refer to the following tables when adjusting the backlash.

Backlash Change Required		Thickness Change Required	
mm	In	mm	In
0.025	0.001	0.050	0.002

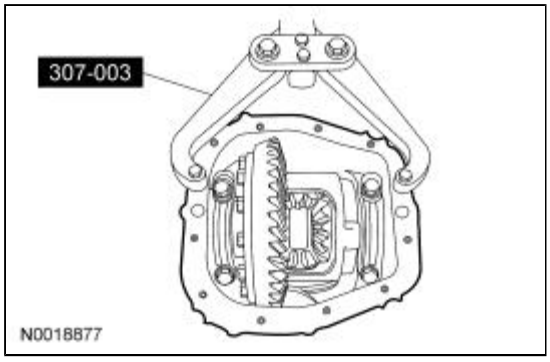
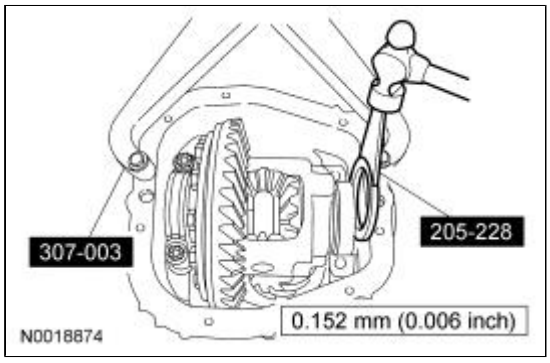
31. Remove the 4 differential bearing cap bolts.
    - Remove the differential assembly.



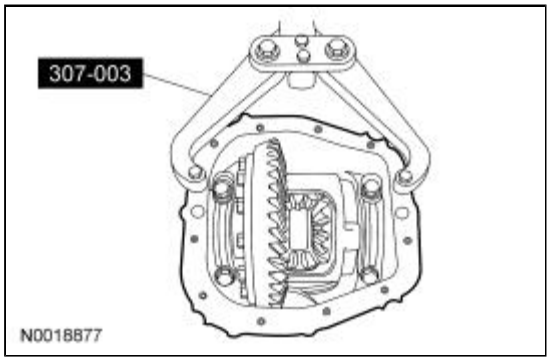
32. Measure the thickness of the selected right and left bearing shims.

33. **NOTE:** Differential bearing shims are to be installed with the chamfer facing outboard.

    To establish differential bearing preload, increase both the left and right differential bearing shim thickness by 0.152 mm (0.006 inch).

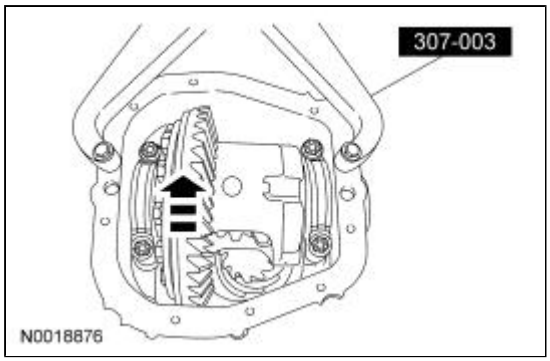


34. Install the bearing caps and bolts.
    - Tighten to 105 Nm (77 lb-ft).

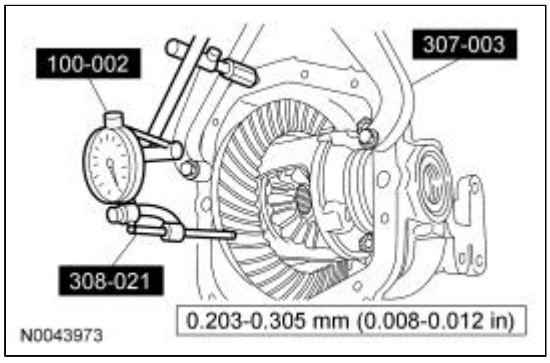


35. Rotate the differential assembly several time to verify the differential bearings have seated

correctly.



36. Recheck the differential ring gear backlash.



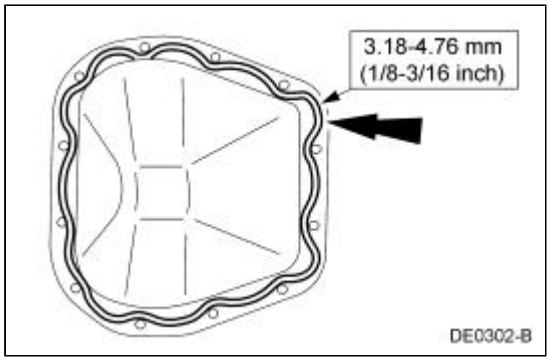
37. Verify an acceptable pattern check. For additional information, refer to Diagnosis and Testing in this section.

38. **CAUTION: The machined surfaces on the differential housing and the differential housing cover must be clean and free of oil before applying the new silicone sealant. Cover the inside of the axle before cleaning the machined surface to prevent contamination.**

    CAUTION: Install the differential housing cover within 15 minutes of applying the silicone material.

    CAUTION: Allow the sealant to cure for one hour before filling the axle with lubricant.

    Apply a continuous bead of sealant, of the specified thickness, to the differential housing cover mounting surface.
    - Use silicone gasket and sealant.



39. Install the differential housing cover.

40. Fill the axle assembly with the specified lubricant.

41. Install the rear axle assembly. For additional information, refer to Axle Assembly — Air Suspension or Axle Assembly — Coil Suspension in this section.

Differential Bearings

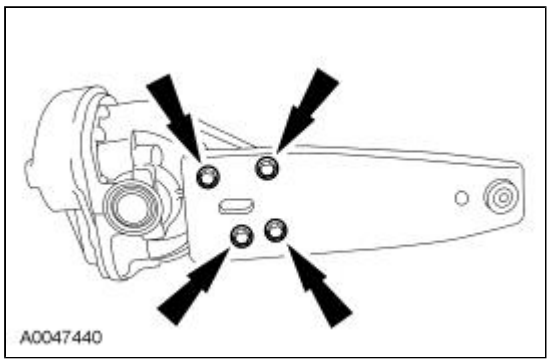
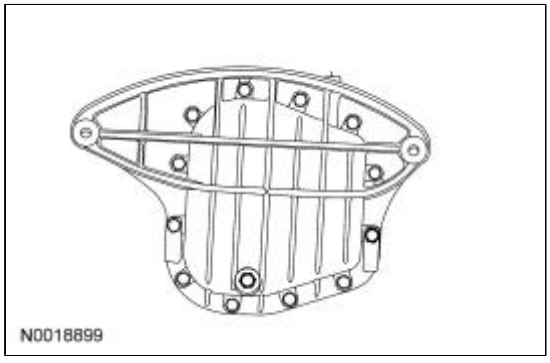
Removal

1. Remove the rear axle assembly. For additional information, refer to Axle Assembly — Air Suspension or Axle Assembly — Coil Suspension in this section.

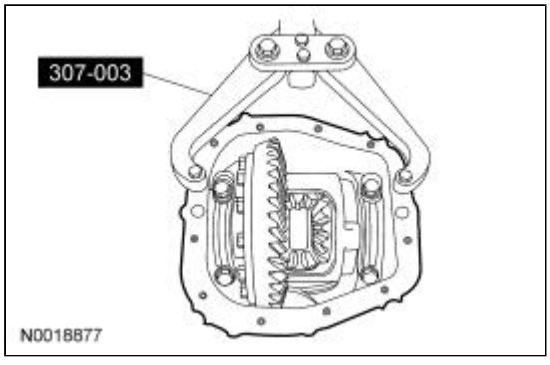
2. Remove the 4 bolts retaining the torque arm to the rear axle housing.



3. Remove the differential housing cover and drain the lubricant.

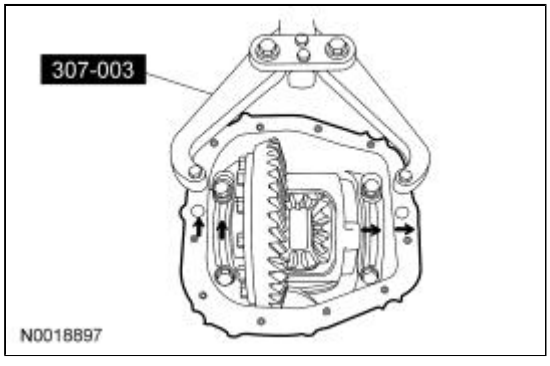


4. Using the special tools, mount the differential housing to a work bench.



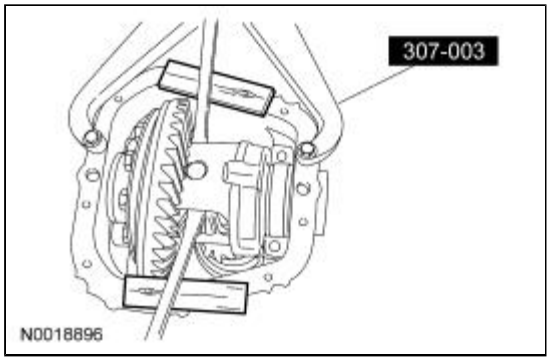
5. **CAUTION: Mark the position and location of the differential bearing caps as the arrows may not be visible. Always install the differential bearing caps in their identical locations and positions.**

   Remove the differential bearing caps.

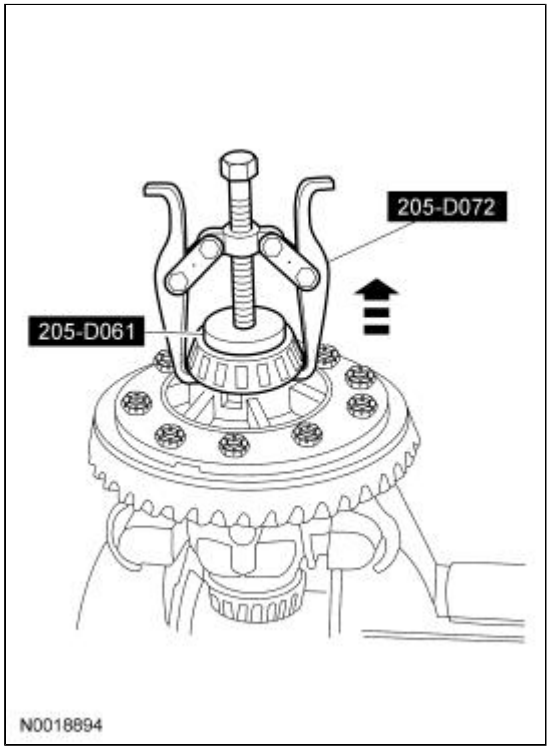


6. **CAUTION: Use wood blocks to avoid damaging the differential housing.**

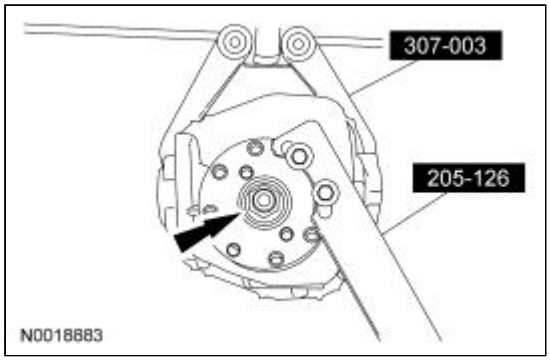
   Remove the differential assembly.
   - Position wood blocks at the top and bottom of the differential assembly.
   - Pry the differential assembly and the differential bearing shims out of the differential housing.



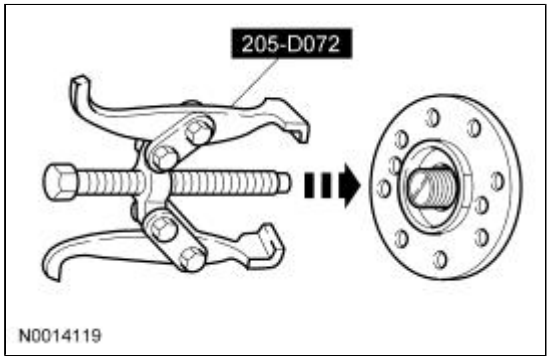
7. Using the special tools, remove the differential bearing.
   - Repeat for the other side.



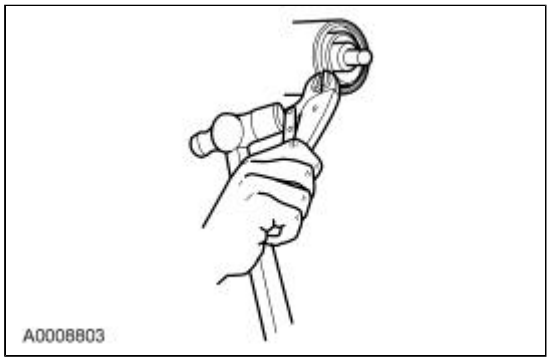
8. Using the special tool, hold the pinion flange to remove and discard the pinion nut.



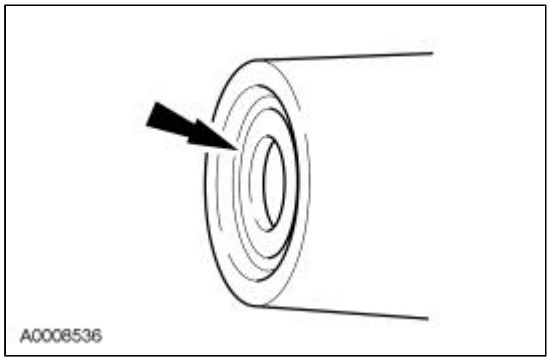
9. Using the special tool, remove the pinion flange.



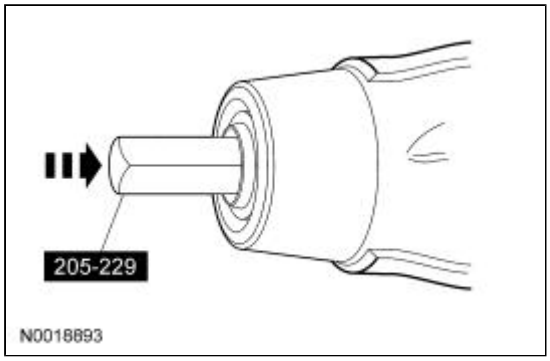
10. Use a screwdriver to force up the metal flange of the drive pinion oil seal. Install gripping pliers and strike with a hammer to remove the drive pinion oil seal.



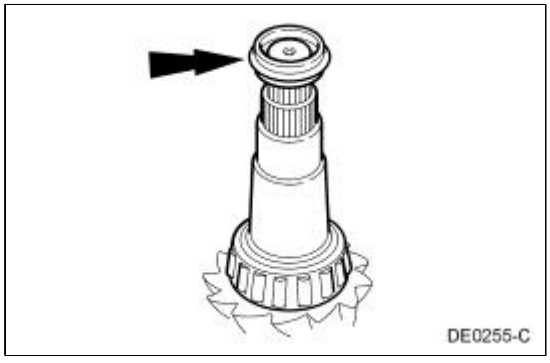
11. Remove the drive pinion oil seal deflector, drive pinion oil seal slinger and the outer pinion bearing. Discard the outer drive pinion bearing.



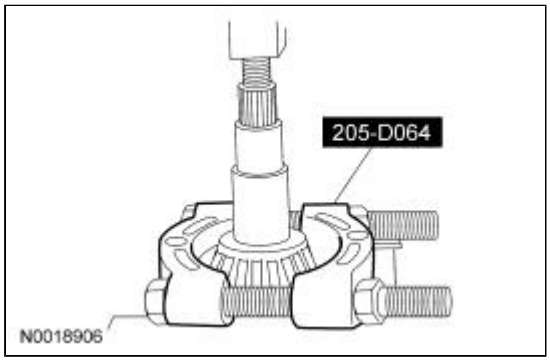
12. Using the special tool and a soft-faced hammer, remove the differential pinion gear from the differential housing.



13. Remove and discard the drive pinion collapsible spacer.

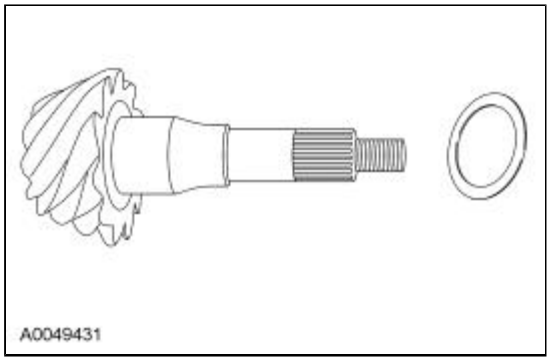


14. Using the special tools and a suitable shop press, remove and discard the inner drive pinion bearing.

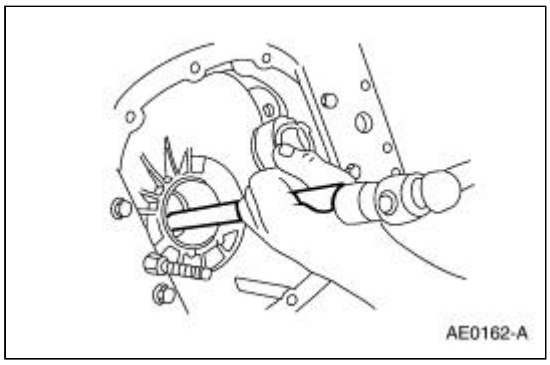


15. **NOTE:** Using a micrometer, measure the drive pinion bearing adjustment shim thickness. Use this measurement as a reference to compare to the shim gauge reading taken prior to installing the pinion bearing.

    Remove the drive pinion bearing adjustment shim.

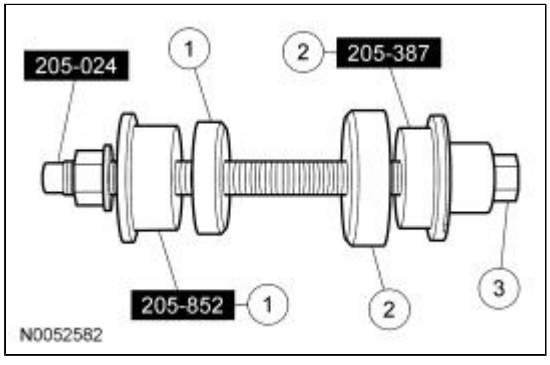


16. Using a brass drift and a hammer, remove any damaged differential drive pinion bearing cups from the differential housing. Tap alternately on each side of the cup to prevent it from cocking in the bore.

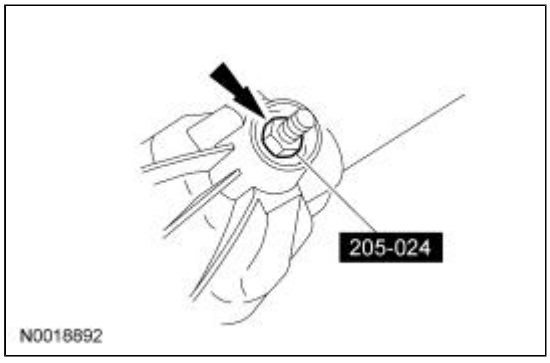


Installation

1. Position the special tools and the inner and outer drive pinion bearing cups in their respective bores.
    1. Place the special tool on the outer drive pinion bearing cup.
    2. Place the special tool on the inner drive pinion bearing cup.
    3. Install the special tool.

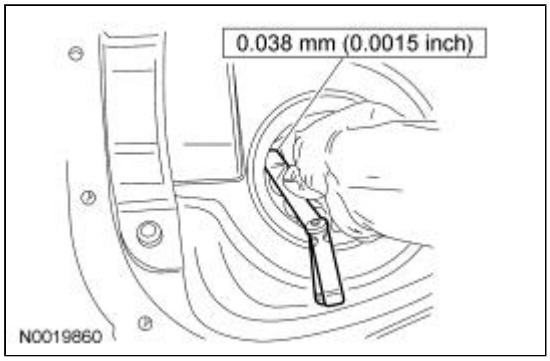


2. Tighten the special tool to fully seat the differential drive pinion bearing.



3. **NOTE:** If a feeler gauge of the specification shown can be inserted between a cup and the bottom of its bore at any point around the cup, the cup is not correctly seated.

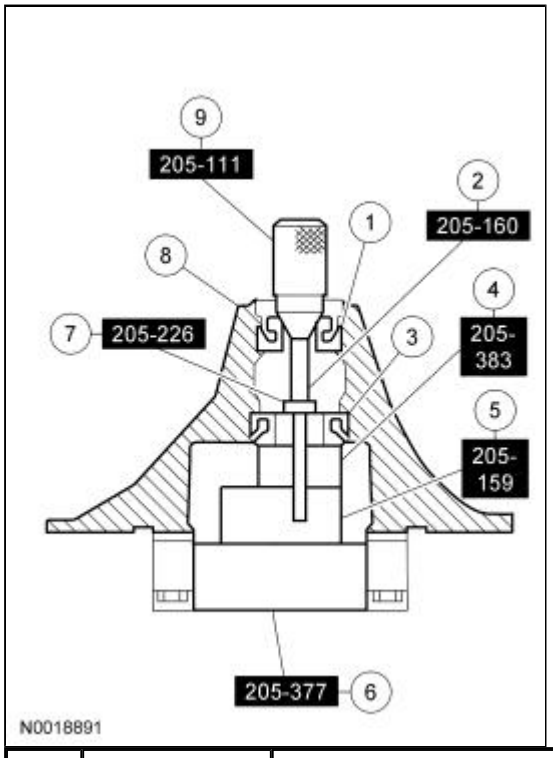
   Make sure the differential pinion bearing cups are correctly seated.



4. **CAUTION: Use the same drive pinion bearings and the drive pinion bearing adjustment shim from the drive pinion bearing adjustment shim selection procedure for final assembly.**

   NOTE: Install new drive pinion bearings without any additional lubricant since the anti-rust oil provided adequate lubricant without upsetting the drive pinion bearing preload settings.

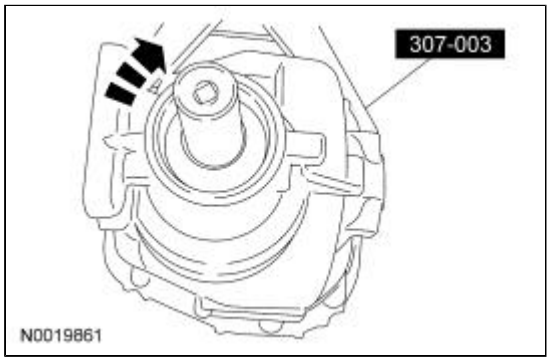
   Install the new drive pinion bearings and special tools as shown.



Item	Part Number	Description
1	4621	Outer pinion bearing
2	205-160	Adapter for 205-S127
3	4630	Inner pinion bearing
4	205-383	Depth Gauge/Aligner, Drive Pinion
5	205-159	Adapter for 205-S127
6	205-377	Drive Pinion Gauge Tube
7	205-226	Depth Gauge/Aligner, Drive Pinion
8	4010	Rear axle housing outer (front) pinion bearing
9	205-111	Adapter for 205-S127

5. **NOTE:** This step duplicates drive pinion bearing preload.

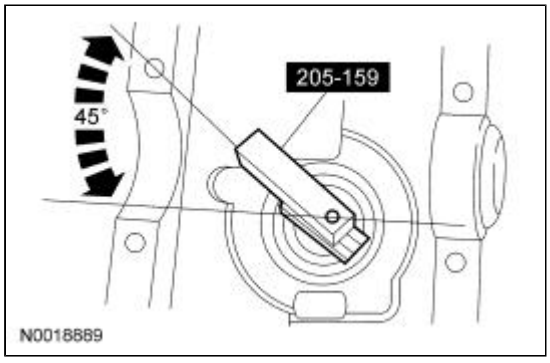
   Thread the special tool onto the screw.
   - Tighten to 2.2 Nm (20 lb-in) rotational torque.



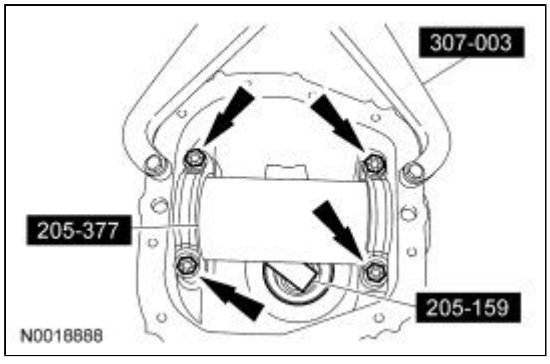
6. **CAUTION: Position the adapter so it does not contact the housing.**

   CAUTION: Offset the special tool to obtain an accurate reading.

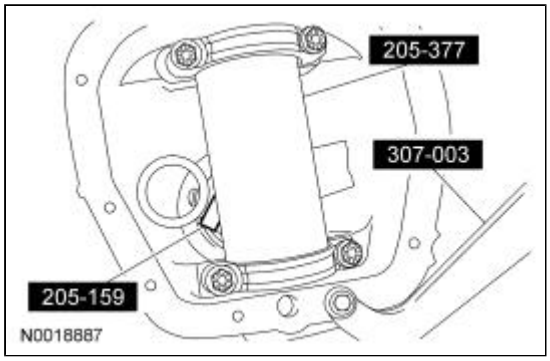
   Rotate the special tool several half turns to seat the drive pinion bearings. Position the special tool as shown.



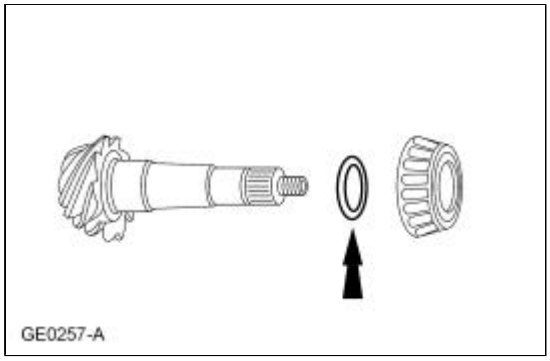
7. Install the special tool and the bearing caps.
   - Tighten to 105 Nm (77 lb-ft).



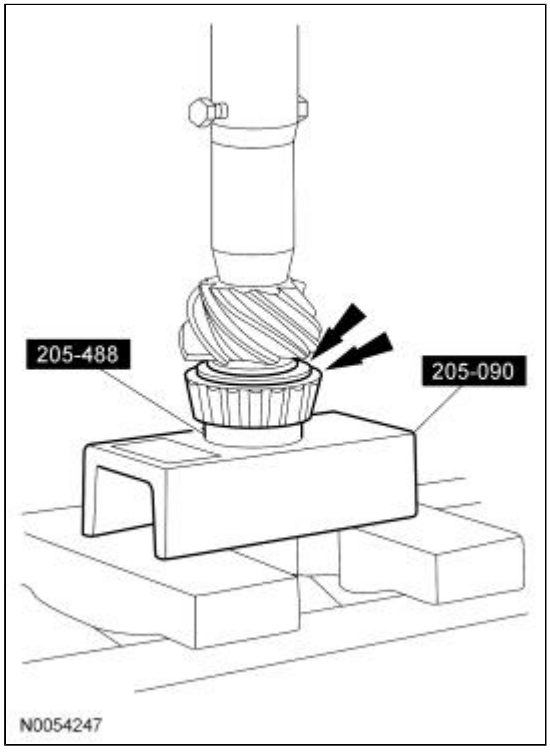
8. Use a drive pinion bearing adjustment shim as a gauge for shim selection. Check the drive pinion bearing adjustment shim thickness between the gauge block and the gauge tube. A slight drag indicates correct shim selection.



9. Position the drive pinion bearing adjustment shim and the inner pinion bearing on the drive pinion gear stem.



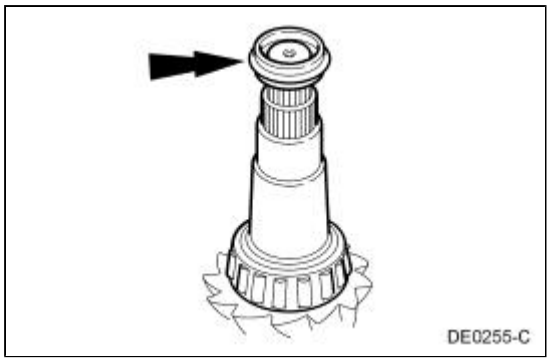
10. Using the special tools and a suitable press, firmly seat the drive pinion bearing adjustment shim and inner pinion bearing on the drive pinion gear stem.



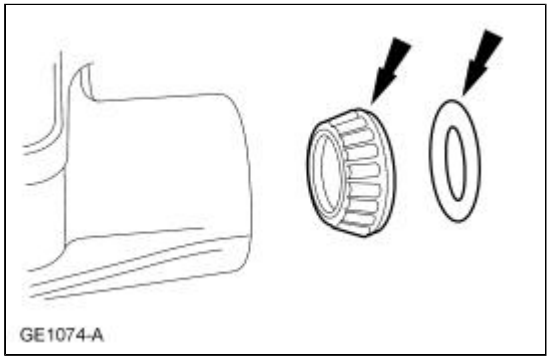
11. **CAUTION: Make sure the splines on the drive pinion gear stem are free of burrs. If burrs are evident, remove them using a fine crocus cloth.**

    Place a new differential drive pinion collapsible spacer on the drive pinion gear stem against the

pinion stem shoulder.



12. Install the outer pinion bearing and the drive pinion oil seal slinger.

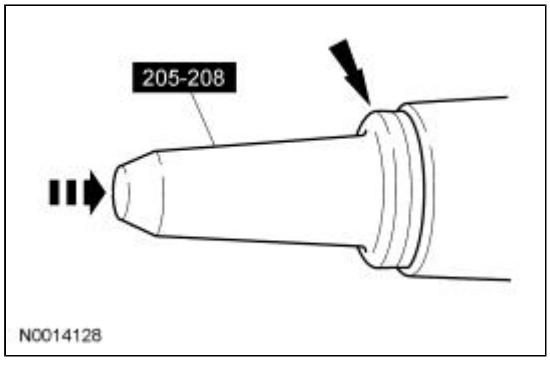


13. **CAUTION: Installation without the correct tool can result in early drive pinion seal failure.**

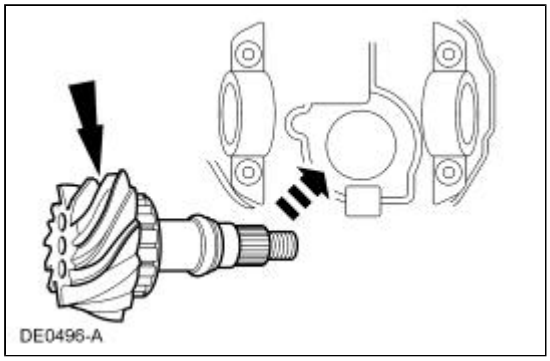
CAUTION: If the drive pinion seal becomes misaligned during installation, remove it and install a new drive pinion seal.

NOTE: Coat the drive pinion seal lips with long-life grease.

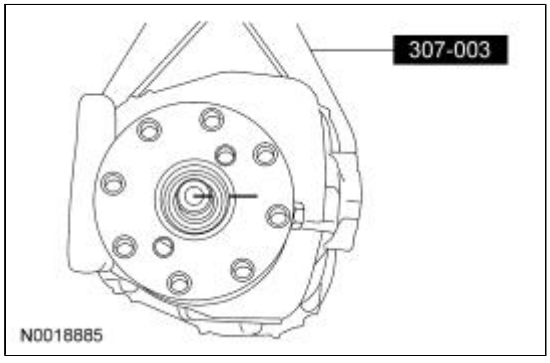
Using the special tool, install the new drive pinion seal.



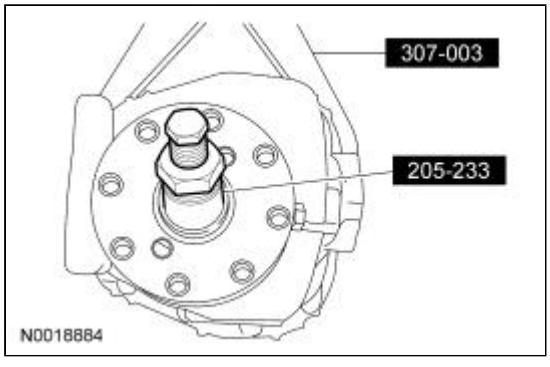
14. Install the drive pinion gear with the differential drive pinion collapsible spacer in the differential housing.



15. Align the pinion flange to the pinion index marks.



16. Using the special tool, install the pinion flange.

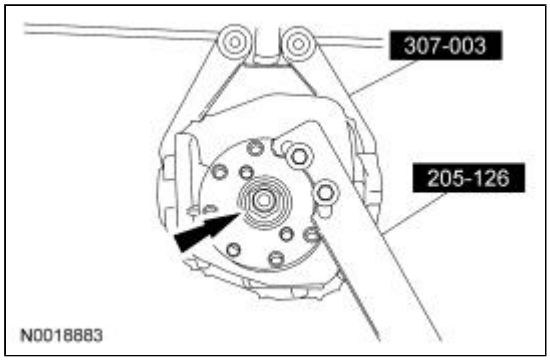


17. **CAUTION: Do not, under any circumstance, loosen the pinion nut to reduce drive pinion bearing preload. If it is necessary to reduce drive pinion bearing preload, install a new differential drive pinion collapsible spacer and pinion nut.**

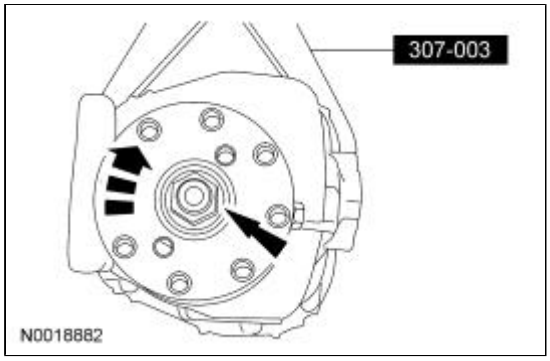
CAUTION: Remove the special tool while taking drive pinion bearing preload readings with the Nm (lb-in) torque wrench.

Use the special tool to hold the pinion flange while tightening the pinion nut.

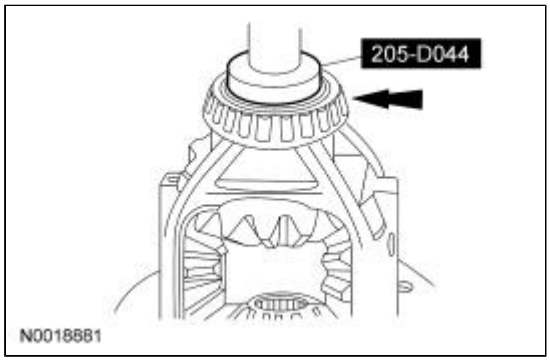
- Rotate the drive pinion gear occasionally to make sure the drive pinion bearings seat correctly. Take frequent drive pinion bearing preload readings by rotating the drive pinion gear with a Nm (lb-in) torque wrench.



18. Tighten the pinion nut to set the drive pinion bearing preload. Refer to the torque specification for drive pinion bearings in the Specifications portion of this section.



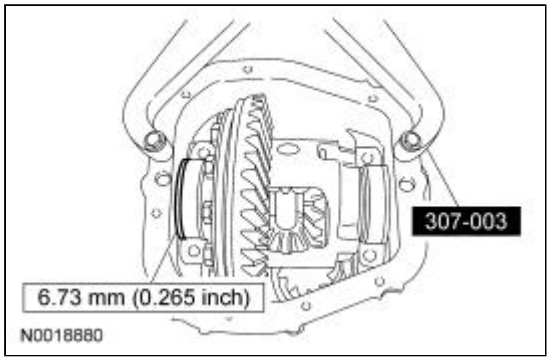
19. Press the left and right differential bearing on the differential assembly.



20. Install the differential assembly.
    1. Position the differential bearing cups on the differential bearings.
    2. Lower the differential assembly in place.

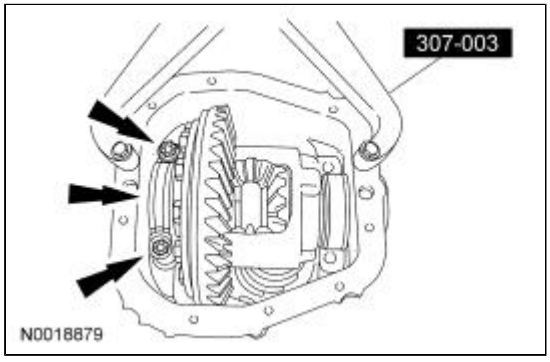
21. **NOTE:** Differential bearing shims are to be installed with the chamfer facing outboard.

    Install a differential bearing shim of the thickness shown on the LH side of the differential case.



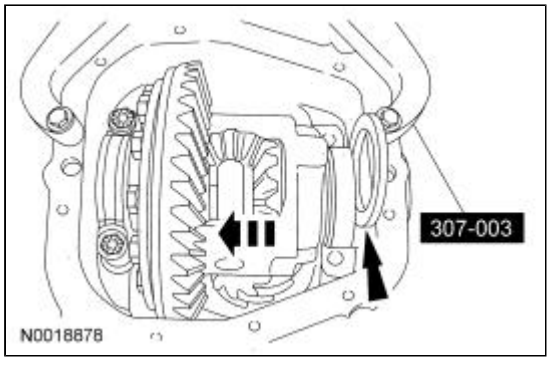
22. **NOTE:** Apply pressure toward the left side to make sure the left bearing cap is seated.

    Install the left bearing cap and loosely install the bearing cap bolts.



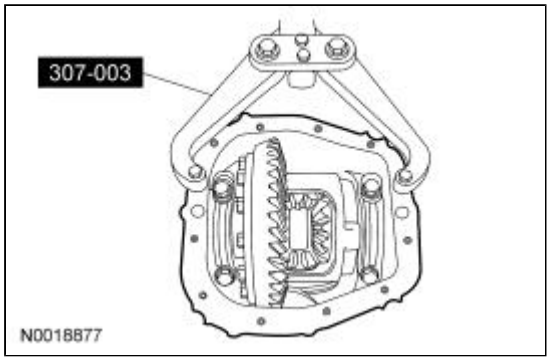
23. **NOTE:** Apply pressure toward the left side to make sure the left bearing cap is seated.

    Install progressively thicker differential bearing shims on the right side until the thickest differential bearing shim can be inserted by hand.

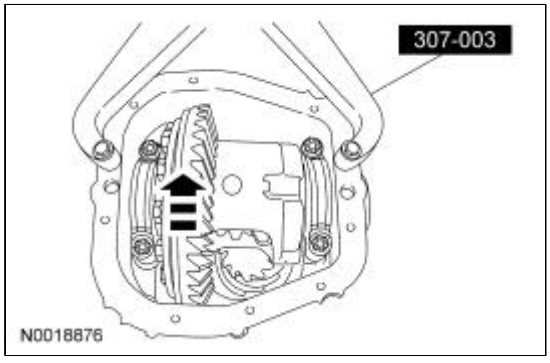


24. Install the right bearing cap and bolts.

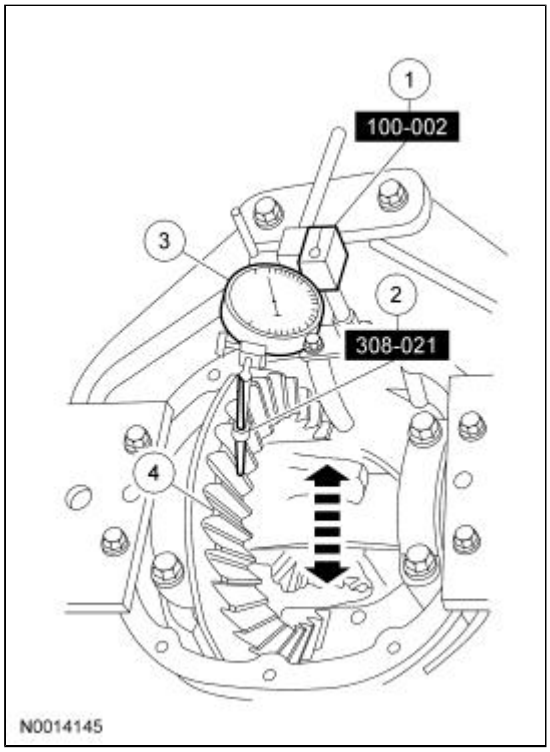
25. Tighten the 4 differential bearing cap bolts.
    - Tighten to 105 Nm (77 lb-ft).



26. Rotate the differential case to make sure it turns freely.



27. Using the special tools, measure the differential ring gear backlash at 4 equally spaced points.
    1. Attach the special tool.
    2. Position the special tool tip centrally on a drive tooth.
    3. Zero the indicator.
    4. Turn the differential ring gear without turning the drive pinion gear. Record the indicator reading. The allowable backlash is mm (0.008 in) to 0.305 mm (0.012 in).
        - To correct for a high or low backlash, proceed as follows.



28. To correct for high or low backlash, increase the thickness of one differential bearing shim and

decrease the thickness of the other differential bearing shim by the same amount. Refer to the following tables when adjusting the backlash.

Backlash Change Required		Thickness Change Required	
mm	In	mm	In
0.025	0.001	0.050	0.002

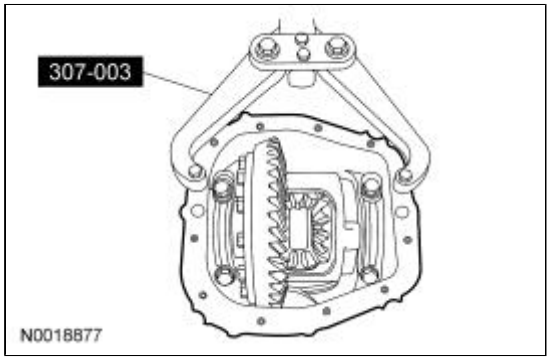
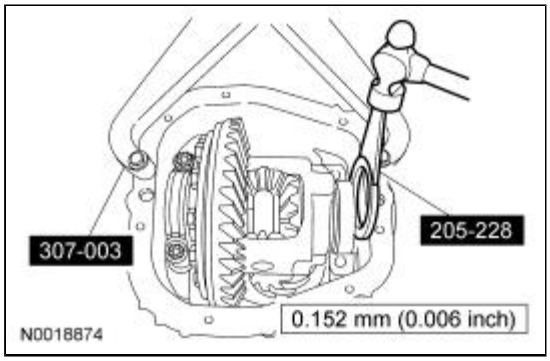
29. Remove the 4 differential bearing cap bolts.
    - Remove the differential assembly.



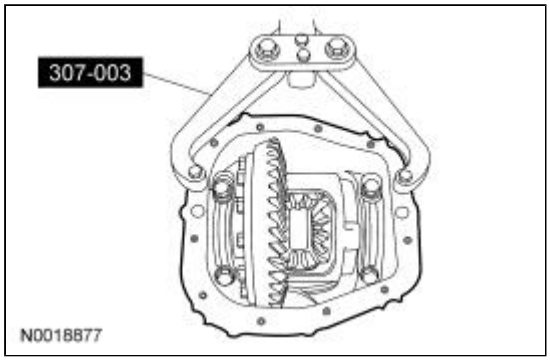
30. Measure the thickness of the selected right and left bearing shims.

31. **NOTE:** Differential bearing shims are to be installed with the chamfer facing outboard.

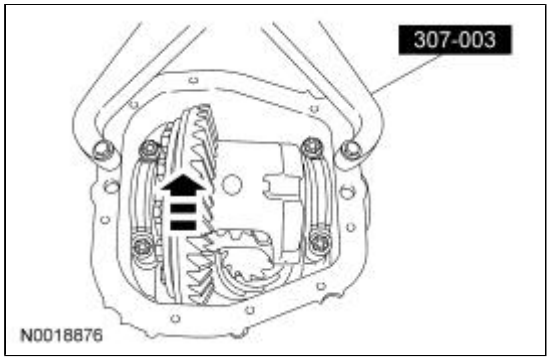
    To establish differential bearing preload, increase both the left and right differential bearing shim thickness by 0.152 mm (0.006 inch).



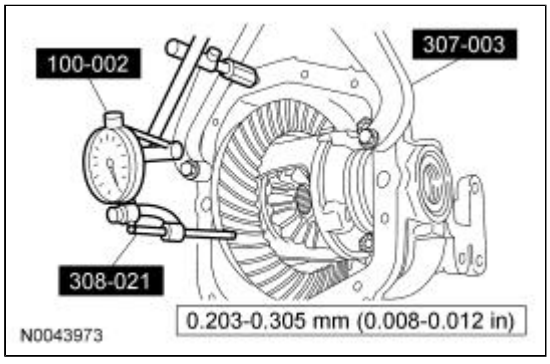
32. Install the bearing caps and bolts.
    - Tighten to 105 Nm (77 lb-ft).



33. Rotate the differential assembly several time to verify the differential bearings have seated correctly.



34. Recheck the differential ring gear backlash.



35. Verify an acceptable pattern check. For additional information, refer to Diagnosis and Testing in this section.

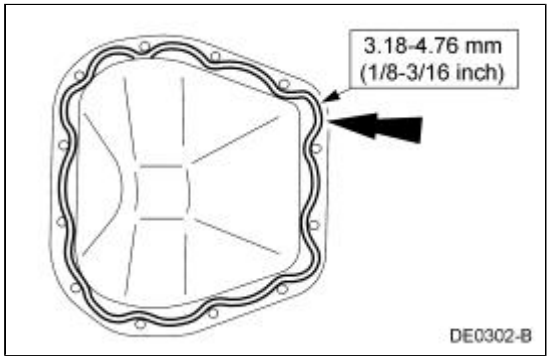
36. **CAUTION: The machined surfaces on the differential housing and the differential housing cover must be clean and free of oil before applying the new silicone sealant. Cover the inside of the axle before cleaning the machined surface to prevent contamination.**

    CAUTION: Install the differential housing cover within 15 minutes of applying the silicone material.

    CAUTION: Allow the sealant to cure for one hour before filling the axle with lubricant.

    Apply a continuous bead of sealant, of the specified thickness, to the differential housing cover mounting surface.

- Use silicone gasket and sealant.



37. Install the differential housing cover.

38. Fill the axle assembly with the specified lubricant.

39. Install the rear axle assembly. For additional information, refer to Axle Assembly — Air Suspension or Axle Assembly — Coil Suspension in this section.

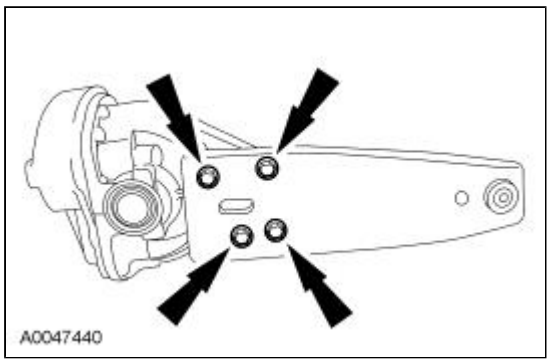
Disassembly

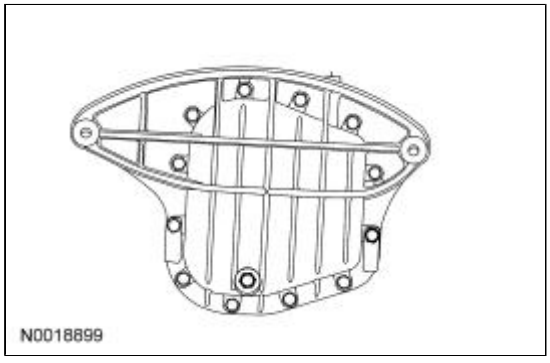
All Axles

1. Remove the axle assembly from the vehicle. For additional information, refer to Axle Assembly — Air Suspension or Axle Assembly — Coil Suspension in this section.

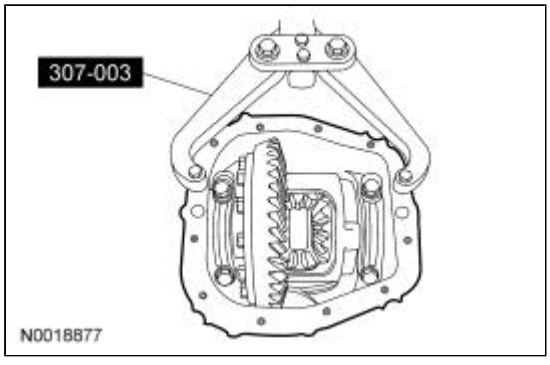
2. Remove the 4 bolts retaining the torque arm to the rear axle housing.



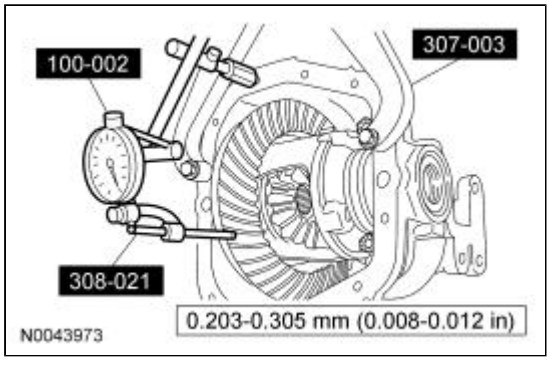
3. Drain the rear axle lubricant and remove the rear axle cover.



4. Using the special tools, mount the differential housing to a work bench.



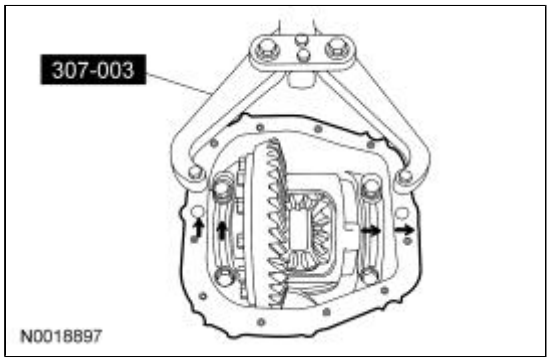
5. Using the special tool, measure and record the differential ring gear backlash between teeth in 4 equally spaced places around the ring gear.
    - Remove the dial indicator.



6. **CAUTION: Mark the position and location of the differential bearing caps as the arrows may not be visible. Always install the differential bearing caps in their identical**

location and position.

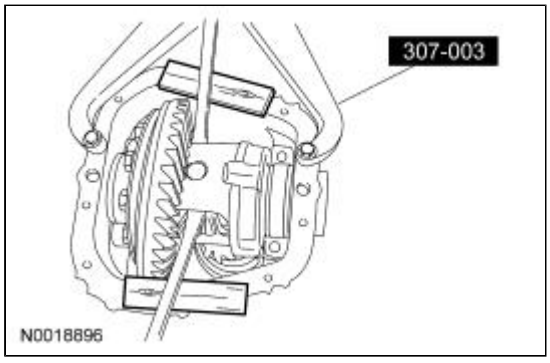
Remove the differential bearing caps.



7. **CAUTION: Use wood blocks to avoid damaging the differential housing.**

NOTE: Tag the bearing caps and shims for location as removed.

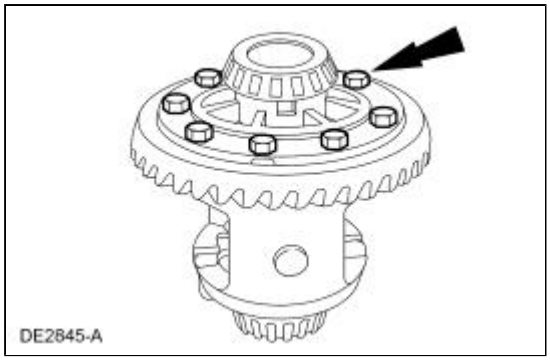
Remove the differential assembly.
1. Position wood blocks at the top and bottom of the differential case.
2. Pry the differential assembly and the differential bearing shims out of the differential housing.



Excessive differential ring gear backlash between teeth

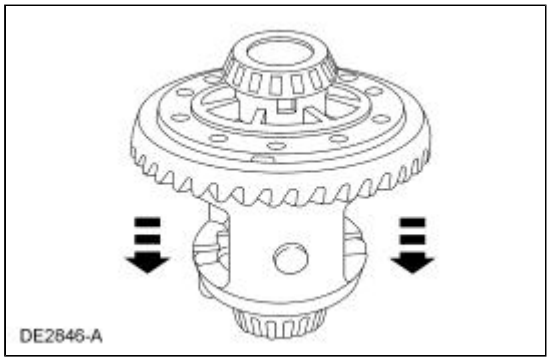
NOTE: If the differential ring gear backlash between teeth measurement, taken at the beginning of this procedure, did not exceed the specification, proceed to Final disassembly in this procedure. If the differential ring gear backlash between teeth measurement exceeds the specification, the cause may be a warped differential ring gear, a damaged differential case or loss of differential bearing preload. Verify the cause of the excessive runout.

8. Remove the ring gear bolts.



9. **CAUTION: Do not damage the bolt hole threads.**

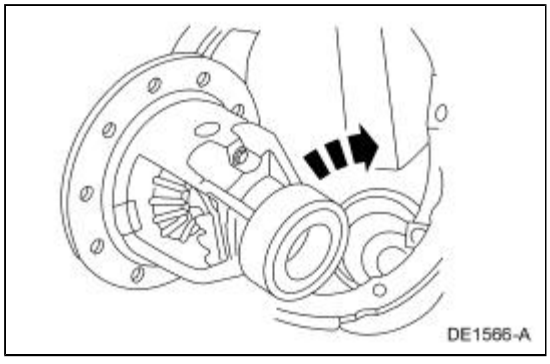
   Insert a punch in the bolt holes and drive off the differential ring gear.



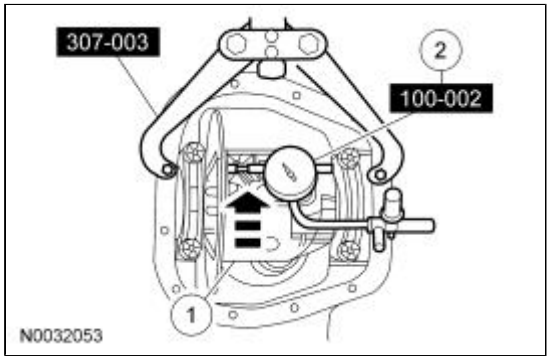
10. **NOTE:** Visually inspect the differential carrier bearings and cups for discoloration or other signs of bearing failure.

    NOTE: Install the differential bearing cups and shims in the same locations they were in before disassembly.

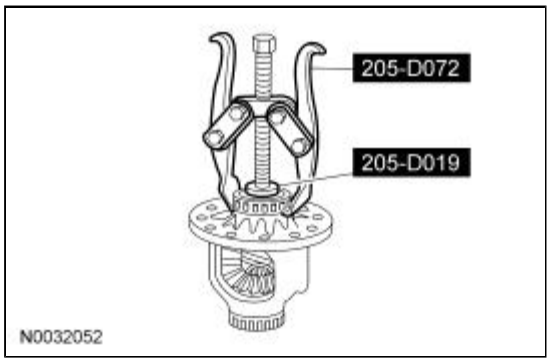
    Install the differential case. Rotate the differential case to seat the differential bearings.



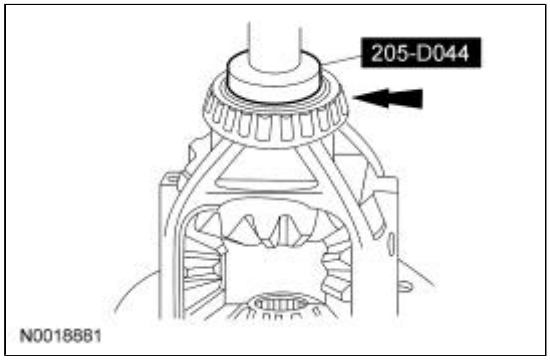
11. Using the special tool, measure the differential case flange runout.
    1. Rotate the differential case to make sure the differential bearings are seated.
    2. Position the special tool.
    - If the runout does not exceed the specification, the cause of the original excessive runout is the differential ring gear. Remove the differential case. Discard the differential ring gear and the drive pinion gear. Proceed to Final disassembly in this procedure.
    - If the runout exceeds the specification, the differential ring gear is true and the concern is due to either differential case/differential bearing damage.
        - Remove the special tool.



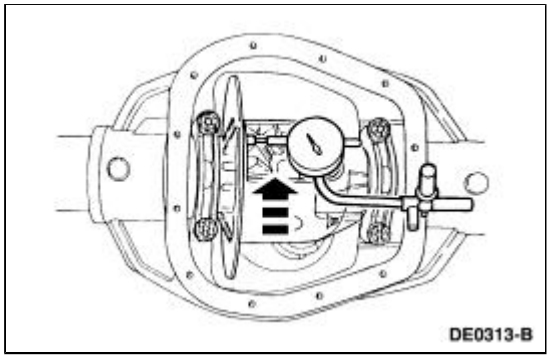
12. Remove the differential case from the rear axle housing, and remove the differential bearings using the special tools.



13. Using the special tool, install the new differential bearings on the differential case.

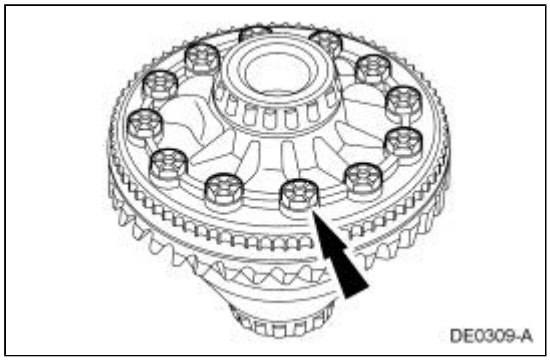


14. Measure the differential case runout without the differential ring gear.
    - Check the differential case flange runout again with the new differential bearings. If the runout is now within the specification shown, use the new differential bearings for assembly. If the runout is still excessive, the differential case is damaged and must be installed new.



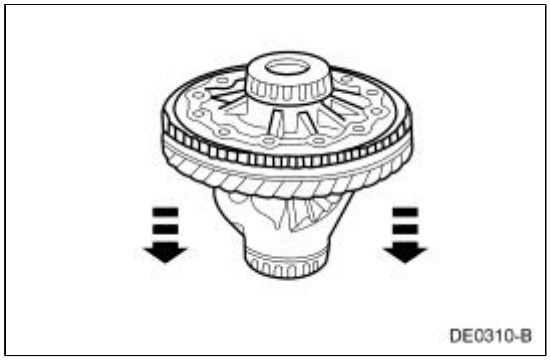
Final Disassembly, Differential Case and Ring Gear — Traction-Lok®

15. Remove the differential ring gear bolts



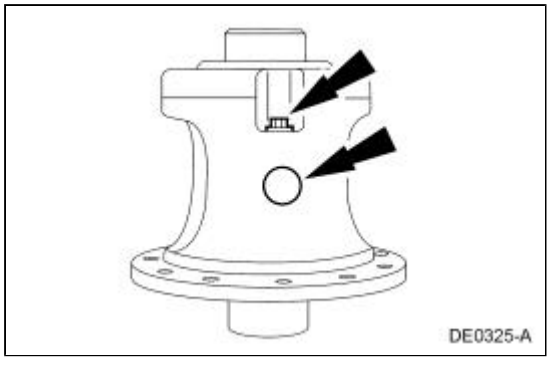
16. **CAUTION: Do not damage the ring gear bolt hole threads.**

    Insert a punch in the bolt holes and drive the differential ring gear off the differential case.

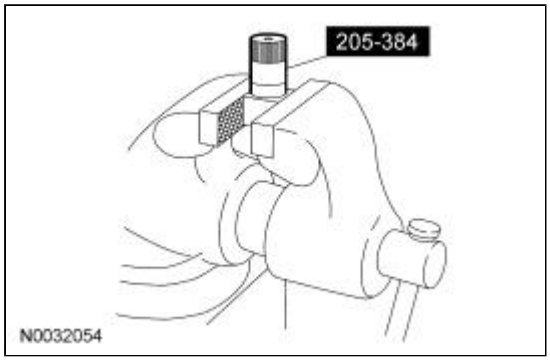


17. **NOTE:** The differential bearings do not need to be removed to overhaul the Traction-Lok® differential. If bearing removal is required, use special tool 205-D072 and special tool 205-D019 for the differential case bearings.

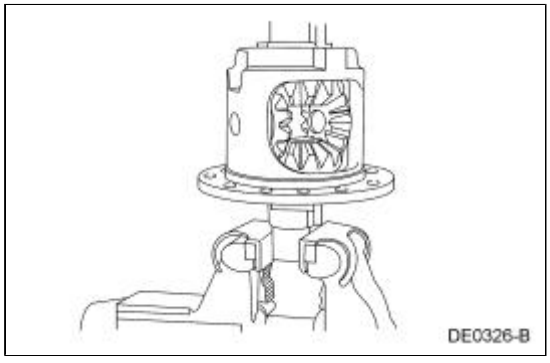
    Remove the differential pinion shaft lock bolt and remove the differential pinion shaft.



18. Install the special tool in a suitable vise.

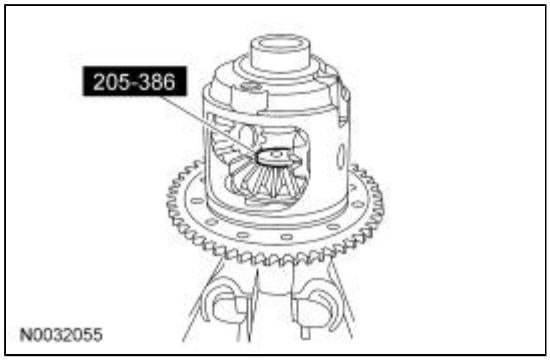


19. Install the differential case on the tool.

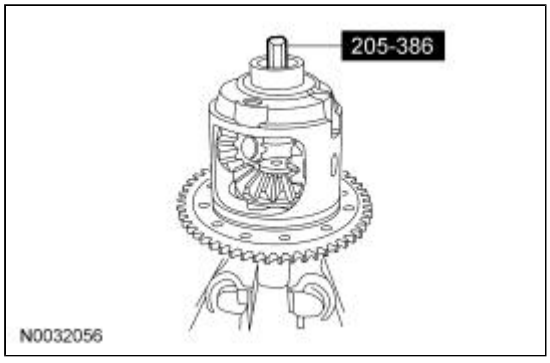


20. **NOTE:** Apply a small amount of grease to the centering hole of the special tool.

    Install the special tool in the bottom side gear bore.

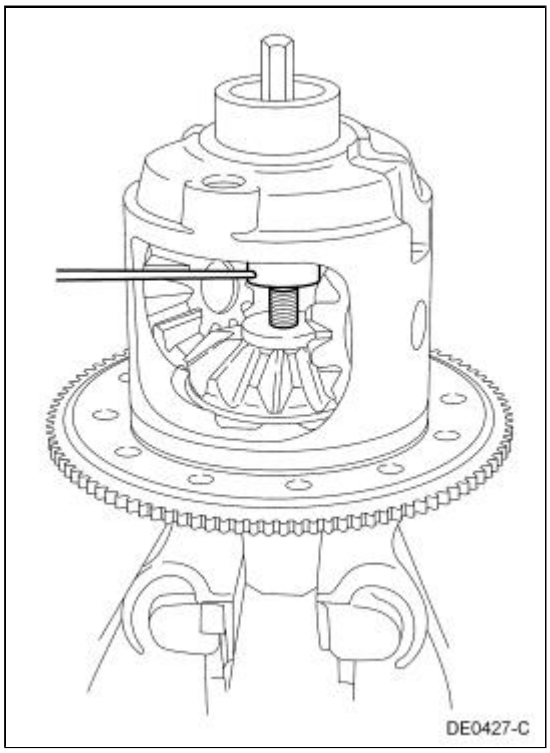


21. Install the nut in the upper differential side gear. Hold the nut in position while installing the hex screw. Tighten the hex nut until contact is made with the step plate.

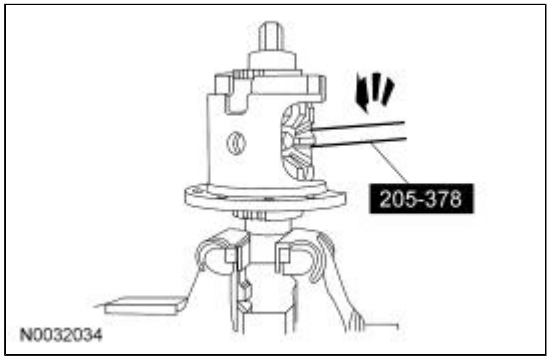


22. **NOTE:** The dowel bar is used to keep the nut from turning when the forcing screw is tightened.

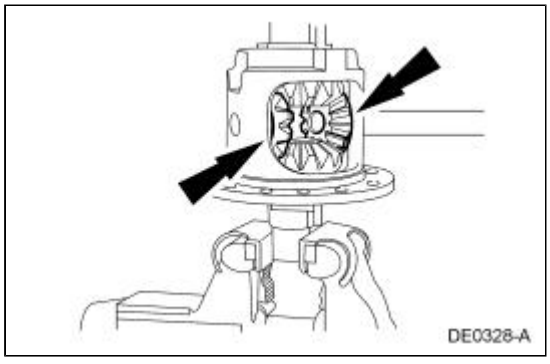
Insert a suitable dowel bar in the hole of the nut. Tighten the forcing screw to force the differential side gear away from the differential pinion gears.



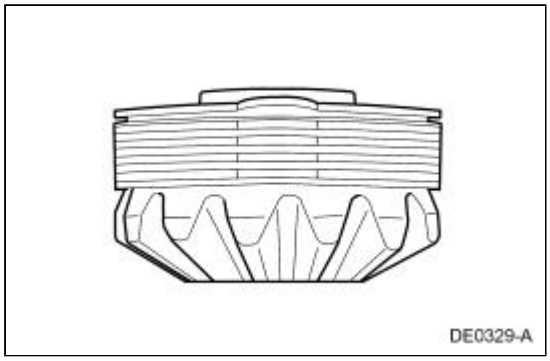
23. Insert the special tool in the pinion shaft bore and turn the differential case to move the differential pin gears and thrust washers to the differential case opening.



24. Remove the differential pinion gears and differential pinion gear thrust washers.



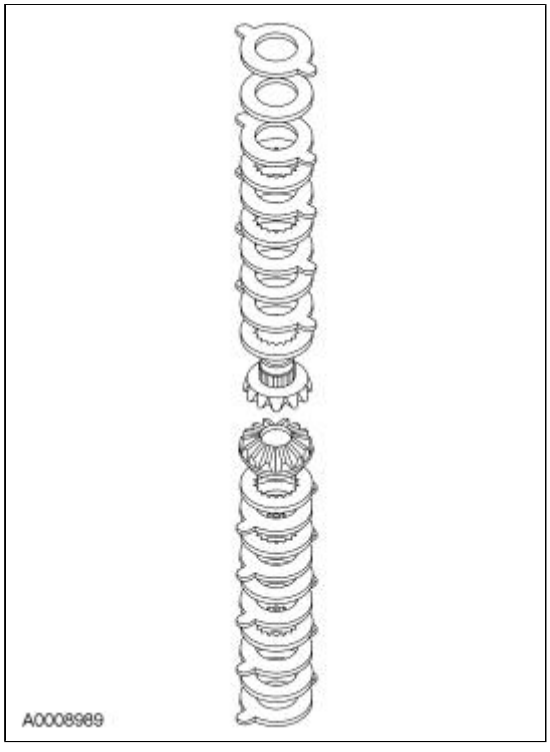
25. Remove the differential side gears and differential clutch packs. Tag the gears, clutch packs and shims for location.



26. **CAUTION: When separating the clutch plates and clutch discs, note the sequence in which they are disassembled. They must be reassembled in the same sequence.**

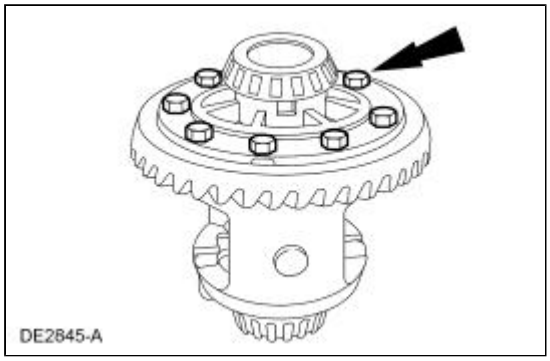
    CAUTION: Do not use acids or solvents to clean the differential clutch components. Use a clean, lint-free cloth only.

    Separate the differential clutch packs for cleaning and inspection.



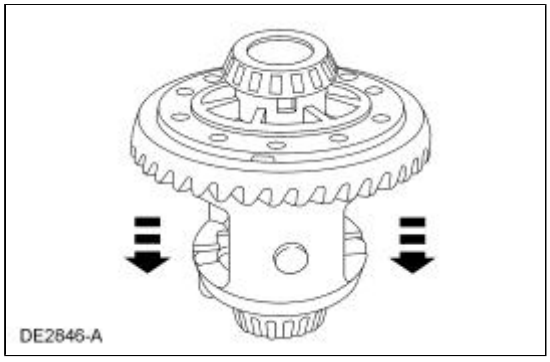
Final Disassembly, Differential Case and Ring Gear — Conventional

27. Remove the differential ring gear bolts.

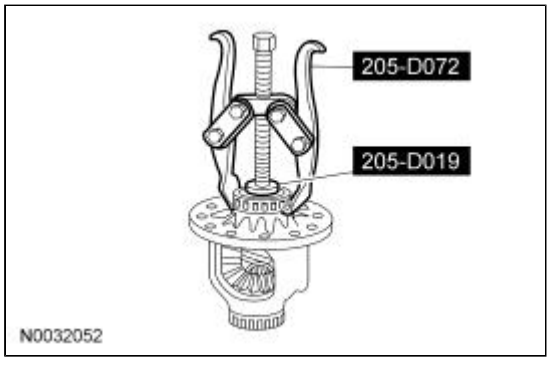


28. **CAUTION: Do not damage the ring gear bolt hole threads.**

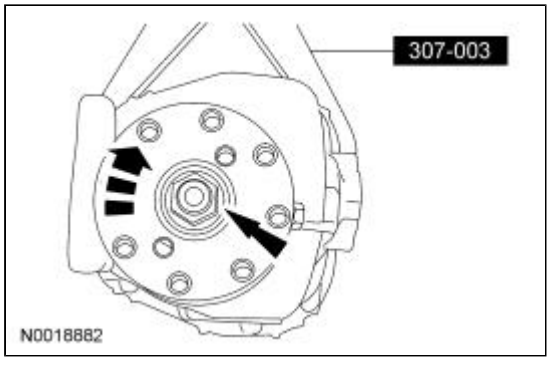
    Insert a punch in the bolt holes and drive off the differential ring gear.



29. Using the special tools, remove the differential bearing.
    - Repeat for the other side.

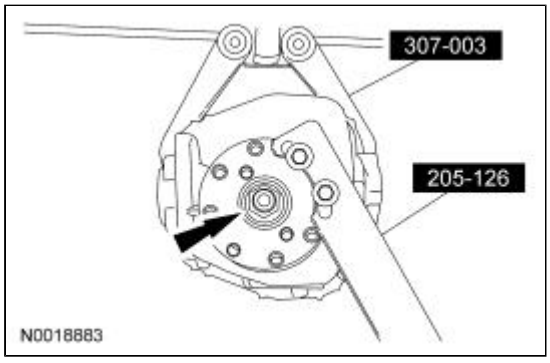


30. Record the torque necessary to maintain rotation of the drive pinion gear through several revolutions prior to removing the drive pinion flange.



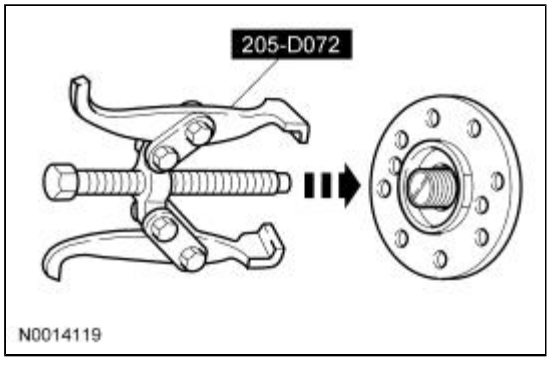
31. **CAUTION: After removing the drive pinion nut, discard it. Use a new nut for installation.**

    Using the special tool, remove the drive pinion nut.

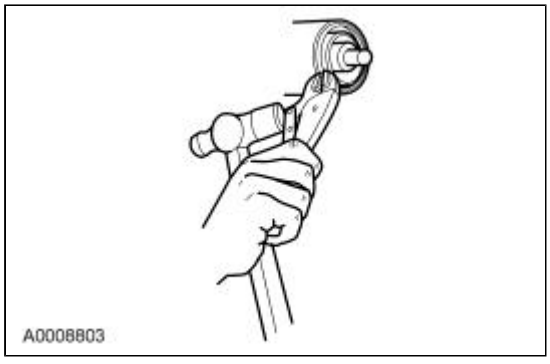


32. Index-mark the drive pinion flange and drive pinion gear stem to maintain initial balance during installation.

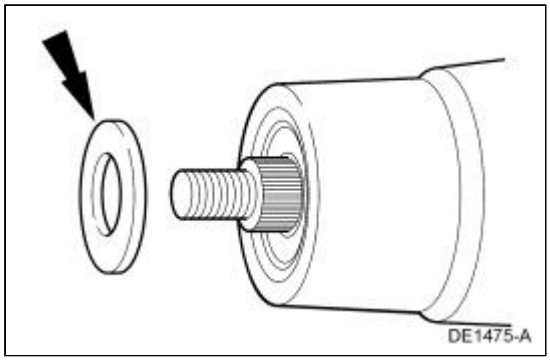
33. Using the special tool, remove the drive pinion flange.



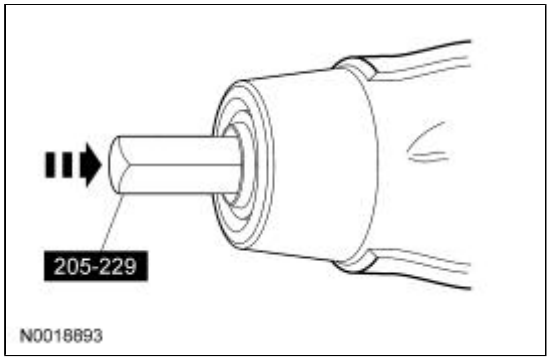
34. Force up on the metal flange of the drive pinion seal. Install gripping pliers and strike with a hammer until the pinion seal is removed.



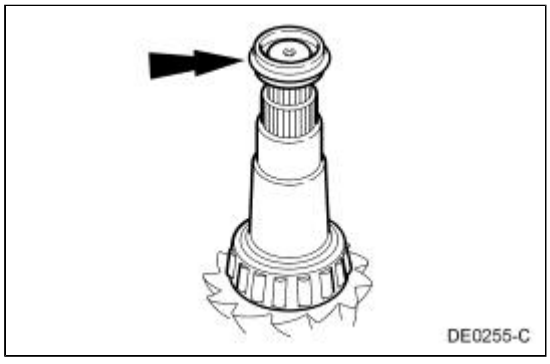
35. Remove the drive pinion shaft oil slinger.



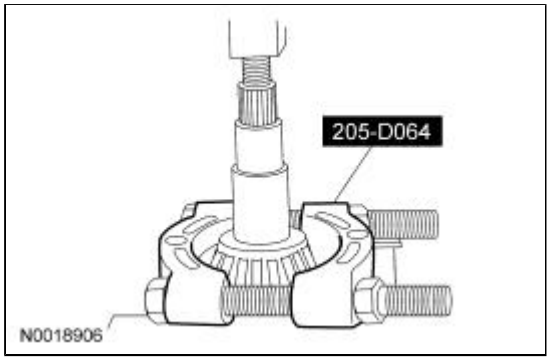
36. Using the special tool and a soft-faced hammer, drive the drive pinion gear out of the front pinion bearing and remove it through the rear of the differential housing.



37. Remove and discard the drive pinion collapsible spacer.

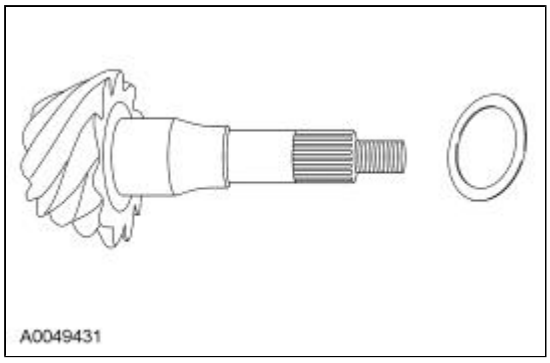


38. Using the special tool and a suitable press, remove the drive pinion bearing.



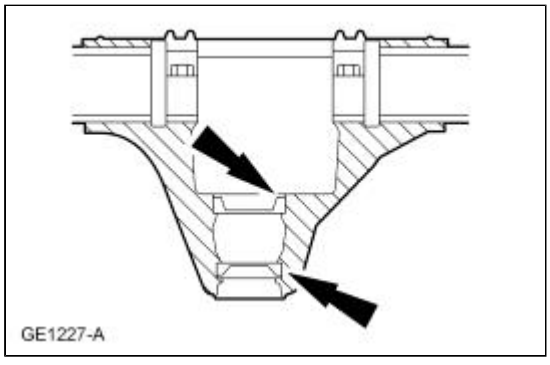
39. **NOTE:** Using a micrometer, measure the drive pinion bearing adjustment shim thickness. Use this measurement as a reference to compare to the shim gauge reading taken prior to installing the pinion bearing.

Remove the drive pinion bearing adjustment shim.



40. **NOTE:** Tap alternately on opposite sides of the cups to prevent them from cocking in the bore.

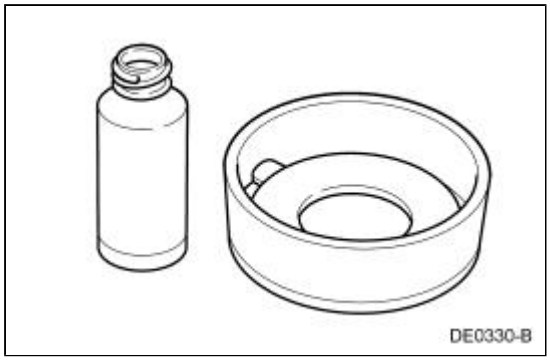
    Use a suitable brass drift to remove the differential bearing cups.



Assembly

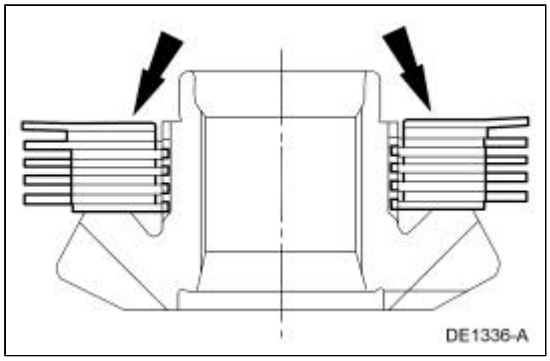
Assembly, Differential Case and Ring Gear — Traction-Lok®

1. Prelubricate each steel clutch plate and soak all friction plates with 118 ml (4 ounces) of friction modifier for at least 15 minutes.

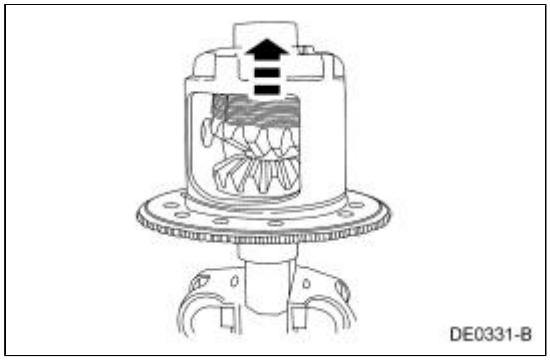


2. **NOTE:** The concave side of the Belleville spring must face up and against the thrust face of the differential case.

   Place the shim and the Belleville spring on the differential clutch pack.

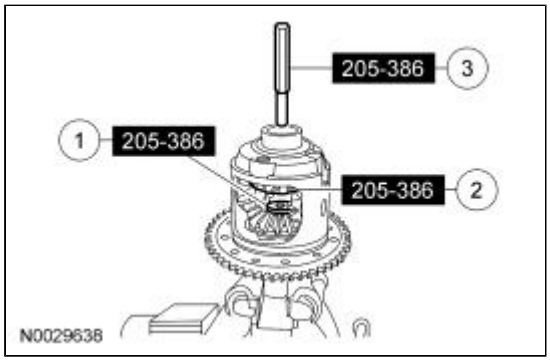


3. Insert the differential clutch packs with the shims and Belleville springs and differential side gears into the differential case.



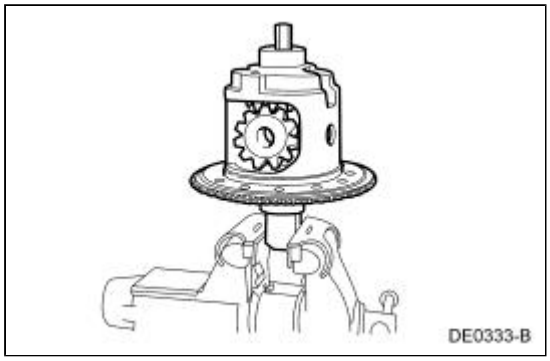
4. **NOTE:** If necessary, insert the dowel bar in the nut bore to keep the nut from turning as the hex screw is tightened.

   Assemble the special tool in the differential case.
   1. Position the special tool in the bottom side gear bore.
   2. Position the special tool in the top side gear bore and hold it in place.
   3. Install the special tool and tighten it 2 turns after it contacts the bottom step plate.



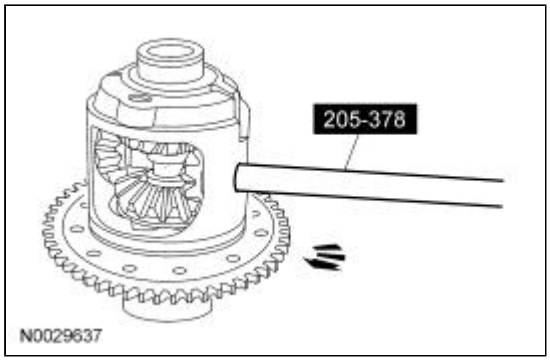
5. **NOTE:** Coat both sides of the differential pinion thrust washers with rear axle lubricant.

   Position the differential pinion gears and thrust washers in the differential case window so they mesh with the differential side gear teeth.

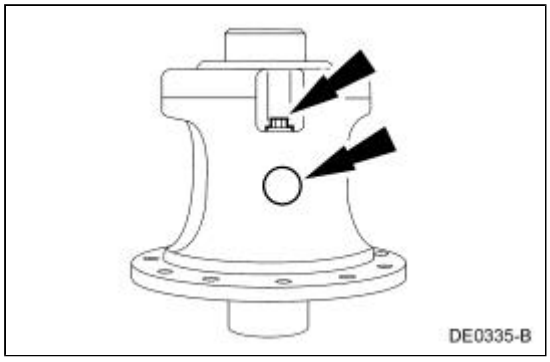


6. **NOTE:** It may be necessary to loosen or tighten the special tool forcing screw to allow the differential side gears to rotate.

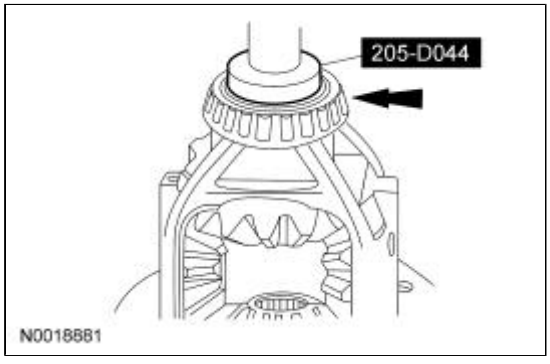
   Insert the special tool into the pinion shaft bore and turn the differential case. This will move the differential side gears and position them in the differential case. Rotate the differential case until the pinion mating shaft holes are aligned with the differential pinion gears.



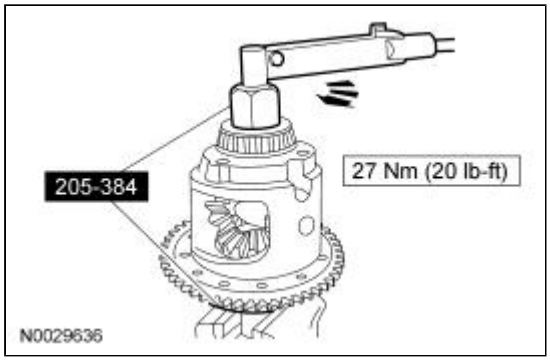
7. Loosen the special tool forcing screw and remove the special tool from the differential case. Install a new differential pinion shaft and bolt in the differential case.



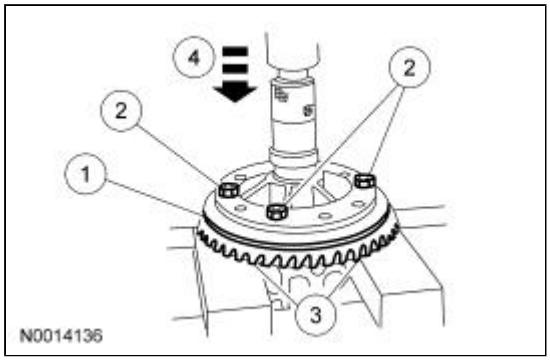
8. If removed, install new differential carrier bearings.



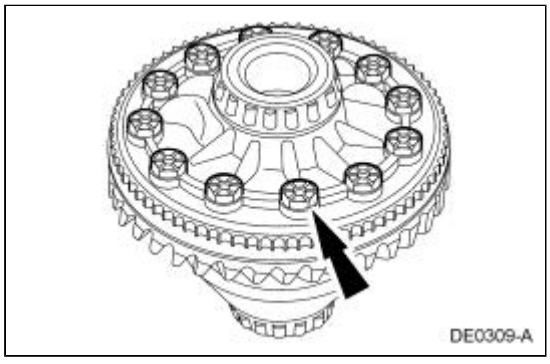
9. Using the special tools, check the torque required to rotate on differential side gear.
    - Install the special tools as shown.
    - If the original clutch plates are used, the initial breakaway torque must be within specification. The rotating torque required to turn the differential side gear with new clutch plates, may vary.



10. Install the differential ring gear.
    1. Place the differential ring gear on the differential case.
    2. Hand start 3 bolts to align the ring gear to the differential case.
    3. Place the differential case and ring gear on the press bed with the ring gear teeth facing down.
    4. Press the ring gear into place on the differential case.



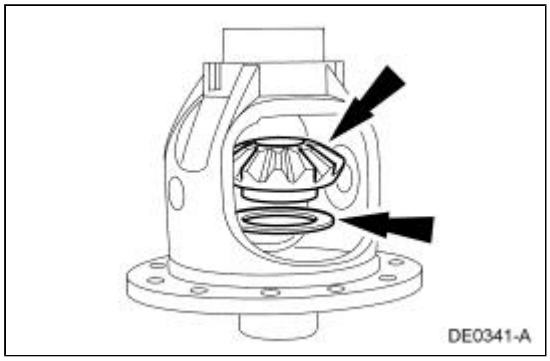
11. Install the ring gear bolts and tighten.
    - Tighten to 150 Nm (111 lb-ft).



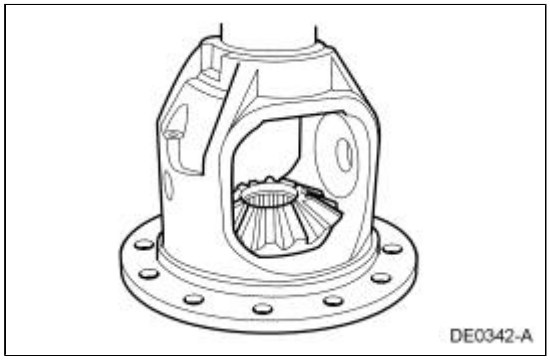
Assembly, Differential Case and Ring Gear — Conventional

12. **NOTE:** Coat the differential side gears and differential side gear thrust washers with rear axle lubricant.

    Position the differential thrust washers on the differential side gears.

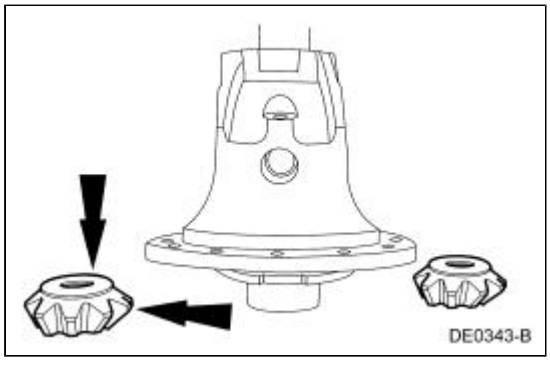


13. Position the differential side gears and thrust washers in the differential case.

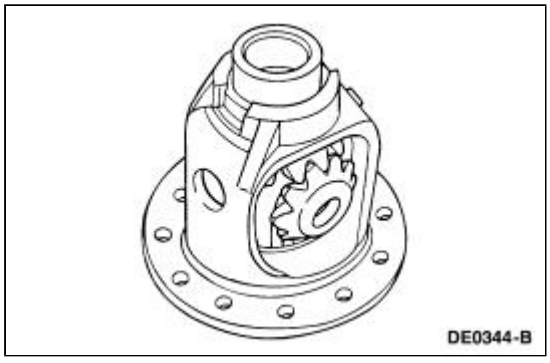


14. **NOTE:** Coat the differential pinion thrust washers and differential pinion gears with rear axle lubricant.

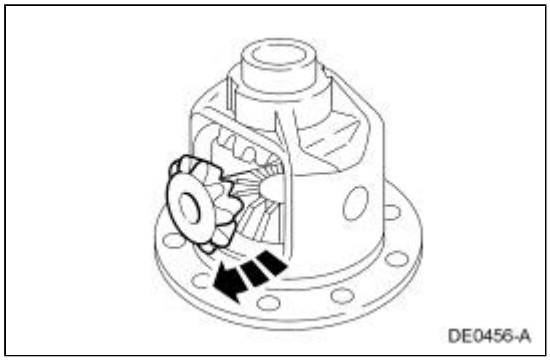
    Assemble the differential pinion thrust washers and the differential pinion gears.



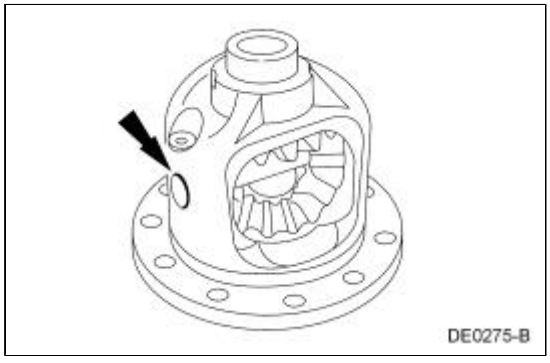
15. Engage the differential pinion gears opposite the differential side gears.



16. Rotate the differential pinion gears to align with the differential pinion shaft bore.

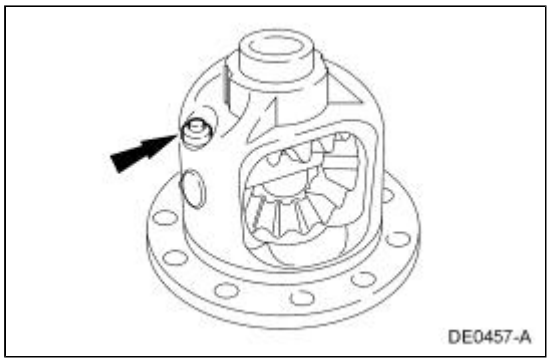


17. Insert the differential pinion shaft.

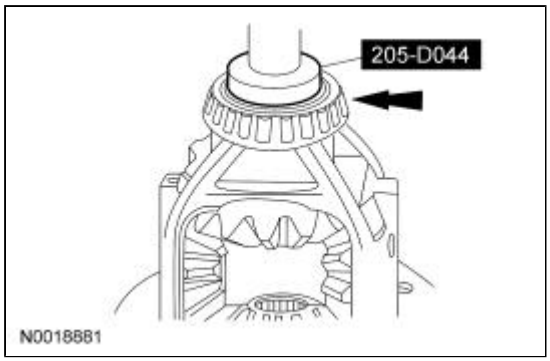


18. **NOTE:** If a new pinion shaft lock bolt is unavailable, coat the threads with sealer prior to installation.

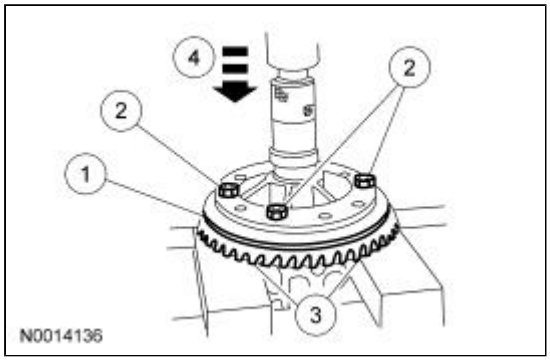
    Install a new differential shaft lock bolt.
    - Tighten to 30 Nm (22 lb-ft).



19. Using the special tool, install the differential bearings.

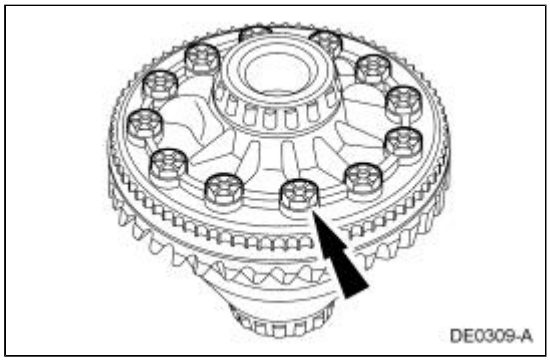


20. Install the differential ring gear.
    1. Place the differential ring gear on the differential case.
    2. Hand start 3 bolts to align the holes in the differential ring gear and the differential case.
    3. Place the differential case and the differential ring gear on the press bed with the ring gear facing down.
    4. Press the ring gear into place.



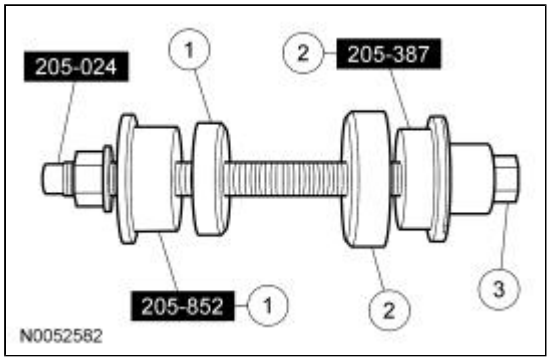
21. **NOTE:** Apply sealer to the threads of the ring gear bolts.

    Install the differential ring gear bolts and tighten.
    - Tighten to 150 Nm (111 lb-ft).

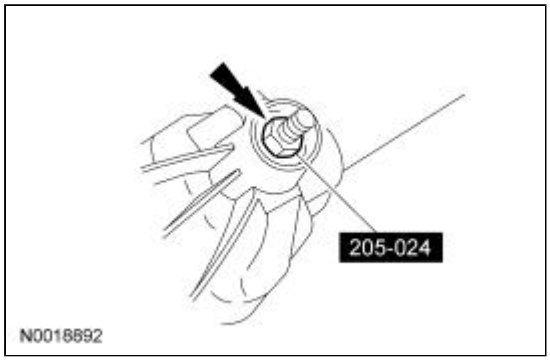


Final Assembly — All Differentials

22. Position the inner and outer bearing cups in their respective bores.
    1. After positioning the bearing cups in the bores, place the special tool on the inner bearing cup.
    2. Place the special tool on the outer bearing cup.
    3. Install the special tools.

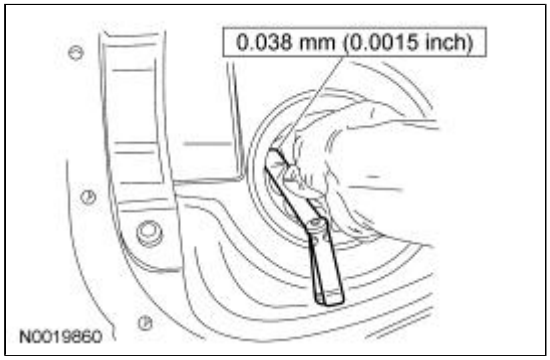


23. Tighten the special tool to seat the bearing cups in the bores.



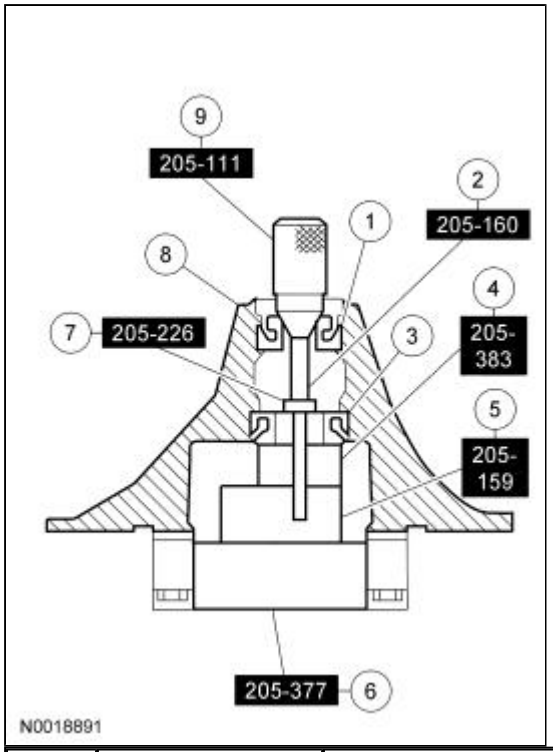
24. **NOTE:** If a feeler gauge of the specification shown can be inserted between a cup and the bottom of its bore at any point around the cup, the cup is not correctly seated.

    Make sure the differential pinion bearing cups are correctly seated.



25. **NOTE:** Apply a light film of lubricant on the front and rear pinion bearings.

    Install the pinion bearings and special tools as shown.

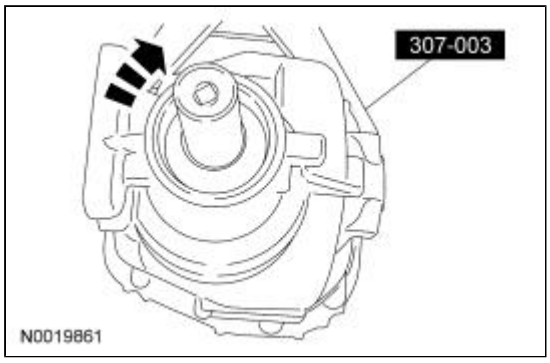


Item	Part Number	Description
1	4621	Outer pinion bearing

2	205-160	Adapter for 205-S127
3	4630	Inner pinion bearing
4	205-383	Depth Gauge/Aligner, Drive Pinion
5	205-159	Adapter for 205-S126
6	205-377	Drive Pinion Gauge Tube
7	205-226	Depth Gauge/Aligner, Drive Pinion
8	4010	Rear axle housing
9	205-111	Adapter for 205-S127

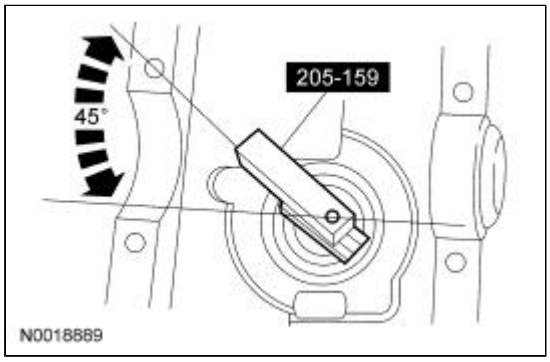
26. **NOTE:** This step duplicates pinion bearing preload.

    Thread the special tool onto the screw and tighten.
    - Tighten to 2.2 Nm (20 lb-in) rotational torque.

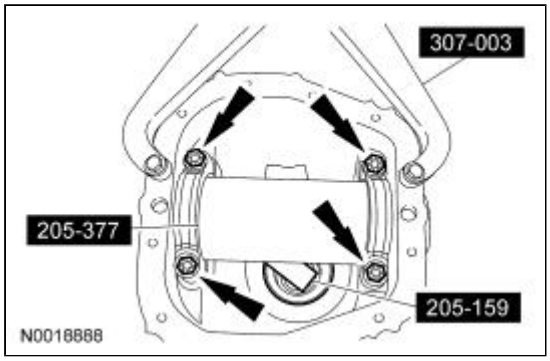


27. **NOTE:** The special tool must be offset to obtain an accurate reading.

    Position the special tool.



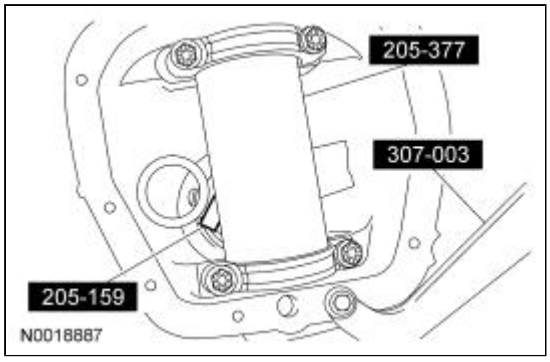
28. Install the special tool.
    - Tighten to 105 Nm (77 lb-ft).



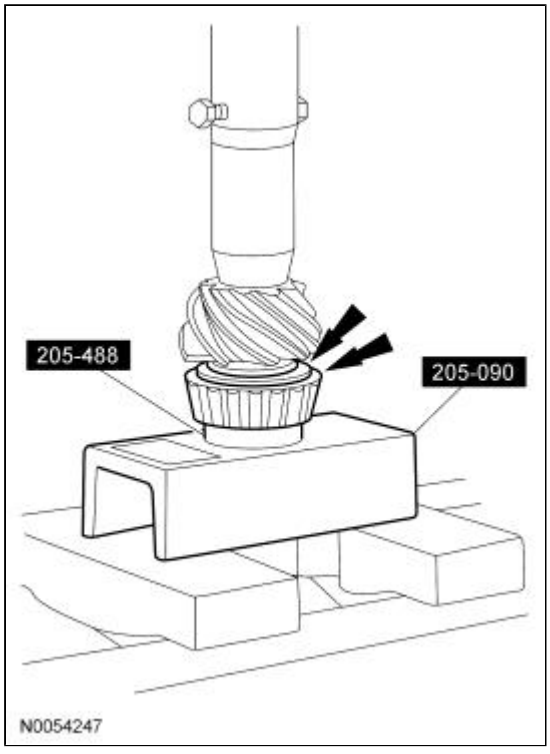
29. **NOTE:** Drive pinion bearing adjustment shims must be flat and clean.

    NOTE: A slight drag should be felt for correct shim selection. Do not attempt to force the pinion shim between the Gauge Block and the Gauge Tube. This will minimize selection of a pinion shim thicker than required, which results in a deep tooth contact in the final assembly of integral rear axle assemblies.

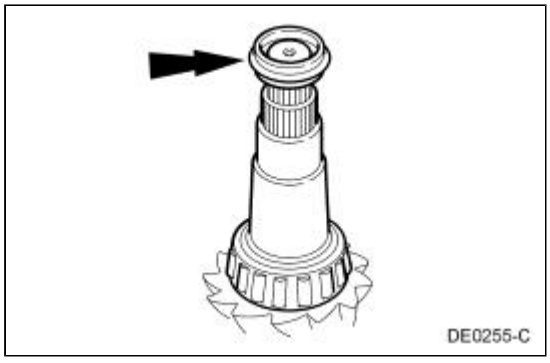
    Use a drive pinion bearing adjustment shim as a gauge for shim selection.
    - After the correct shim thickness has been determined, remove the special tools.



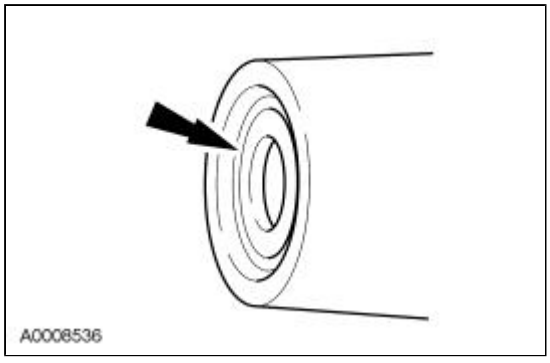
30. Using the special tools, press the inner pinion bearing and pinion shim until they are firmly seated on the pinion.



31. Place a new drive pinion collapsible spacer on the pinion shaft against the pinion stem shoulder.



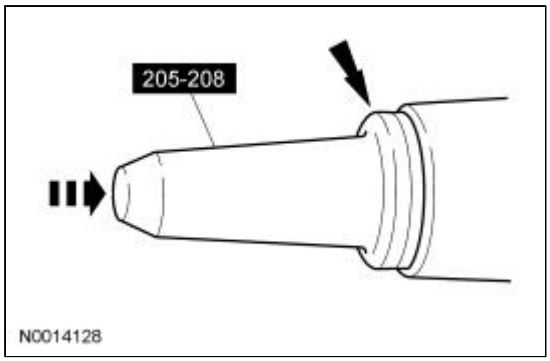
32. Install a new outer pinion bearing and rear axle drive pinion shaft oil slinger.



33. **CAUTION: Installation without the correct tool can result in early seal failure. If the rear axle drive pinion seal becomes cocked during installation, remove it and install a new one.**

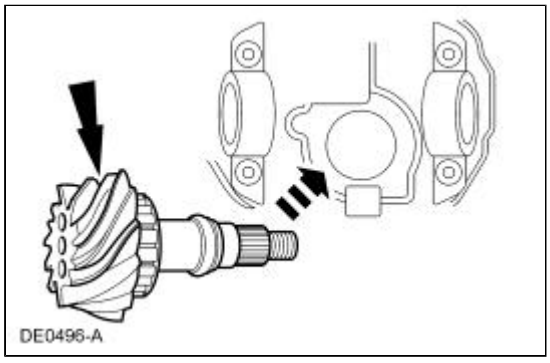
CAUTION: Coat the lips of the rear axle drive pinion seal with grease.

Place the drive pinion oil seal on the special tool and drive the seal into place.



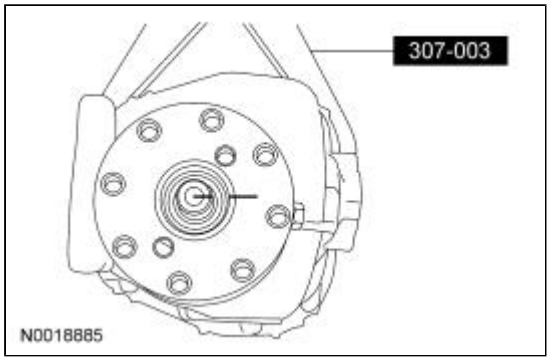
34. **NOTE:** Lubricate the pinion flange splines with rear axle lubricant.

    Install the drive pinion in the drive pinion carrier bore from inside the rear axle housing. Seat the drive pinion with a plastic hammer.

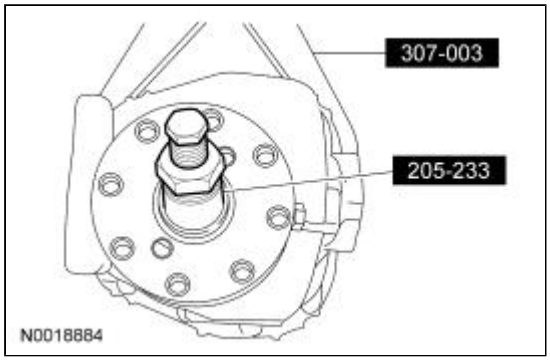


35. **NOTE:** Disregard the scribe marks if a new pinion flange is being installed.

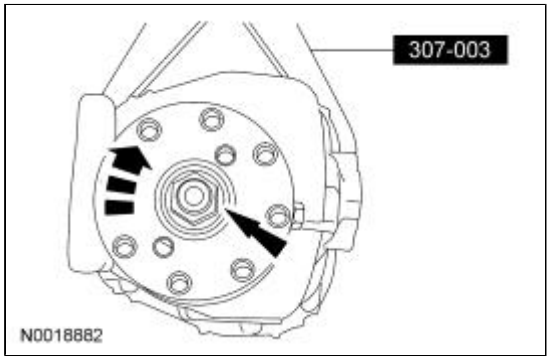
    Align the pinion flange with the drive pinion shaft.



36. With the drive pinion in the axle housing, install the pinion flange using the special tool.



37. Position the new pinion nut.

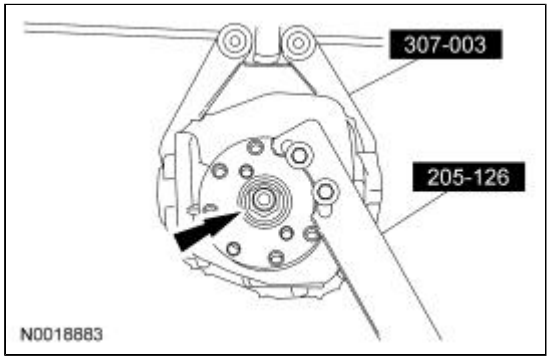


38. **CAUTION: Under no circumstances is the pinion nut to be backed off to reduce preload. If reduced preload is required, a new drive pinion collapsible spacer and pinion nut must be installed.**

CAUTION: The pinion flange holding tool must be removed before preload readings can be taken.

Using the special tool, tighten the pinion nut.

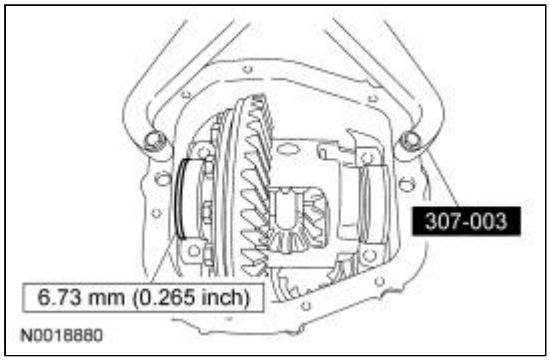
- Rotate the pinion occasionally to make sure the drive pinion bearings are seating correctly.
- Install a Nm (lb-in) torque wrench on the pinion nut.
- Rotating the pinion through several revolutions, take frequent drive pinion bearing torque preload readings until the preload reading is obtained.



39. With the pinion depth set and the pinion installed, place the differential case in the rear axle housing.

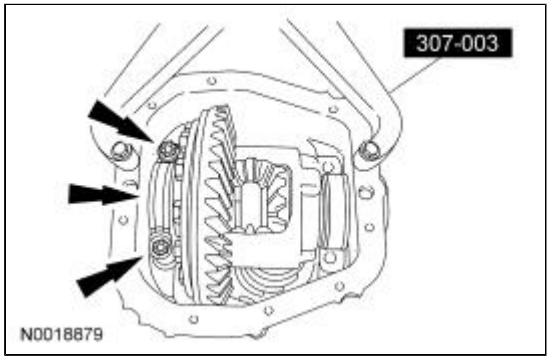
40. **NOTE:** Differential bearing shims are to be installed with the chamfer facing outboard.

Install a shim as shown on the left side.

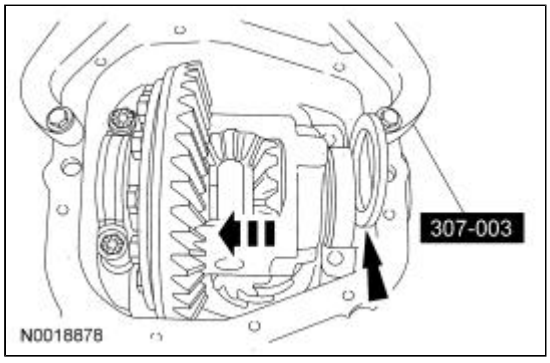


41. **NOTE:** Apply pressure toward the left side to make sure the left bearing cup is seated.

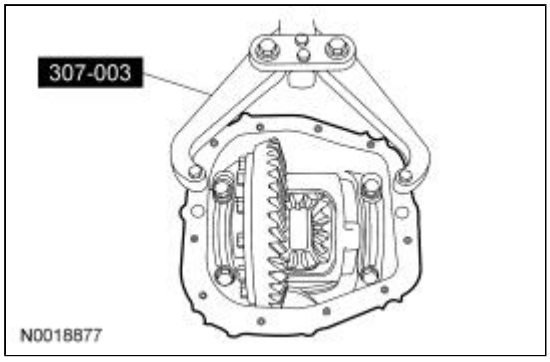
    Install the left bearing cap and loosely install the bearing cap bolts.



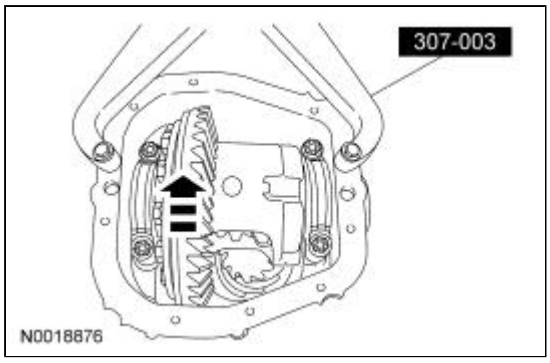
42. Install progressively larger shims on the right side until the largest shim selected can be installed by hand.



43. Install the right side bearing cap and tighten the bolts.
    - Tighten to 105 Nm (77 lb-ft).



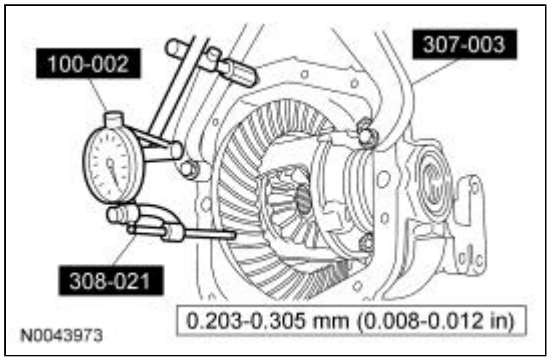
44. Rotate the differential case to make sure it rotates freely.



Measuring backlash

45. Using the special tools, measure and note the differential ring gear backlash.
    - If backlash is within the specification, refer to Backlash within specification in this procedure.
    - If a zero backlash condition occurs, refer to Zero backlash in this procedure.
    - If backlash is not within the specification, refer to Backlash not within specification in this procedure.

Backlash Change Required		Thickness Change Required	
mm	Inch	mm	Inch
0.025	0.001	0.050	0.002
0.050	0.002	0.050	0.002
0.076	0.003	0.101	0.004
0.101	0.004	0.152	0.006
0.127	0.005	0.152	0.006
0.152	0.006	0.203	0.008
0.177	0.007	0.254	0.010
0.203	0.008	0.254	0.010
0.228	0.009	0.304	0.012
0.254	0.010	0.355	0.014
0.279	0.011	0.355	0.014
0.304	0.012	0.406	0.016
0.330	0.013	0.457	0.018
0.335	0.014	0.457	0.018
0.381	0.015	0.508	0.020



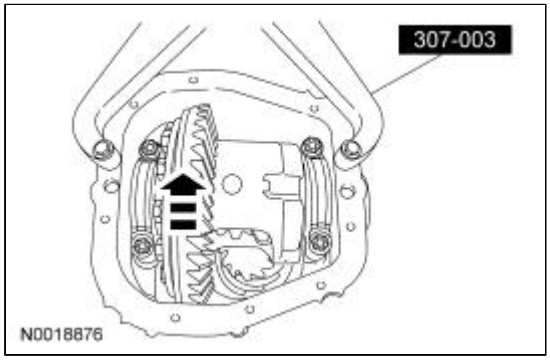
Zero backlash

46. If a zero backlash condition occurs, add 0.51 mm (0.020 inch) to the RH side and subtract 0.51 mm (0.020 inch) from the LH side to allow backlash indication. Measure the backlash. Refer to Measuring backlash in this procedure.

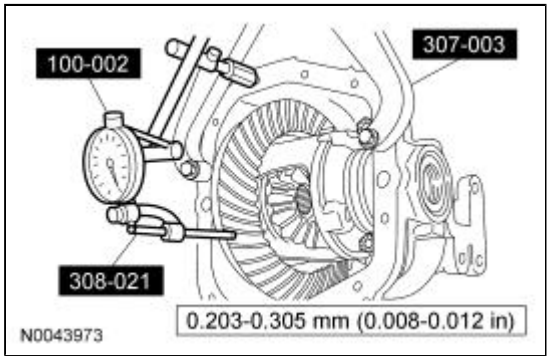
Backlash not within specification

47. To increase or decrease backlash, remove the differential bearing caps and install a thicker shim and a thinner shim accordingly.
    - If backlash is not within the specification, increase the thickness of one differential bearing shim and decrease the thickness of the other differential bearing shim by the same amount.

48. Rotate the differential assembly several times to verify that the differential bearings seated correctly.



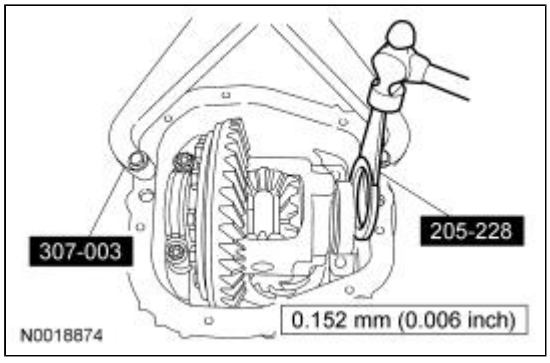
49. Using the special tools, recheck the backlash.
    - If backlash is within the specification, refer to Backlash within specification in this procedure. If backlash is not within the specification, repeat Backlash not within specification in this procedure.



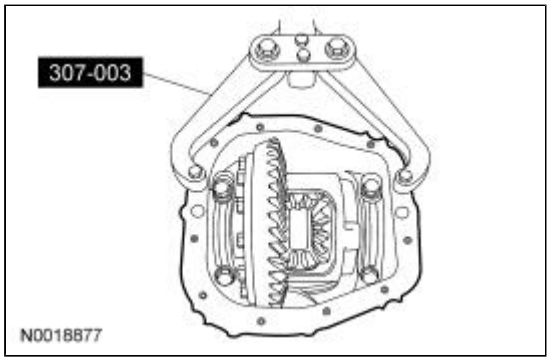
Backlash within specification

50. Remove the bolts and the differential bearing caps.

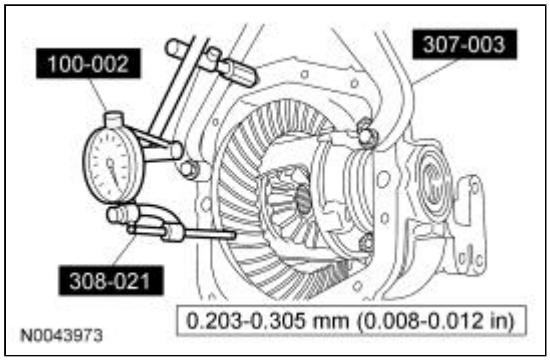
51. To establish differential bearing preload, increase both left and right differential bearing shim sizes by the specification shown.



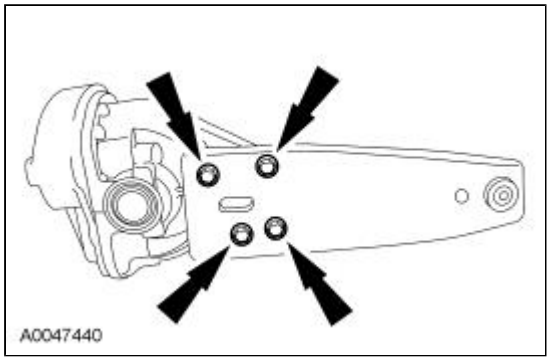
52. Install the differential bearing caps and bolts.
    - Tighten to 105 Nm (77 lb-ft).



53. Using the special tools, recheck the backlash.

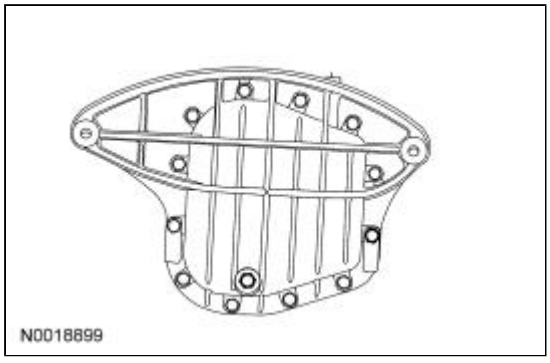


54. Remove the axle assembly from the holding fixture and install the torque arm.
    - Tighten to 205 Nm (150 lb-ft).



55. **NOTE:** The differential housing cover must be installed within 15 minutes of application of the silicone, or new sealant must be applied. If possible, allow 1 hour before filling with lubricant to make sure the silicone sealant has cured correctly.

    Install the differential housing cover and tighten the differential housing cover bolts.
    - Tighten to 32 Nm (24 lb-ft).



56. Fill with axle lubricant. For additional information, refer to Specifications in this section.

General Specifications

Item	Specification
Lubricants and Sealants	
Motorcraft 80W-90 Premium Rear Axle Lubricant XY-80W90-QL (US); CXY-80W90-IL (Canada) (Model 60/70 axles)	WSP-M2C197-A
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Threadlock and Sealer TA-25	WSK-M2G351-A5
Stud and Bearing Mount TA-27	WSK-M2G349-A1
Lubricant Fill Level Checks	
Front axle	1.70L (3.6 pints)
Lubricant level	9.56 mm (0.38 in) below bottom of differential housing fill hole
Backlash Specifications	
Ring gear backlash	0.204-0.305 mm (0.008-0.012 in)
Ring gear maximum backlash between teeth	0.101mm (0.004 in)
Rotational Torque Ranges	
Pinion bearing torque preload	1.8-3.3 Nm (16-29 lb-in)
Clearance Specifications	
Maximum differential housing spread	0.762 mm (0.030 in)
Differential case maximum runout	0.076 mm (0.003 in)
Housing spreader adapter thread engagement	12.5 mm (0.500 in)

Torque Specifications

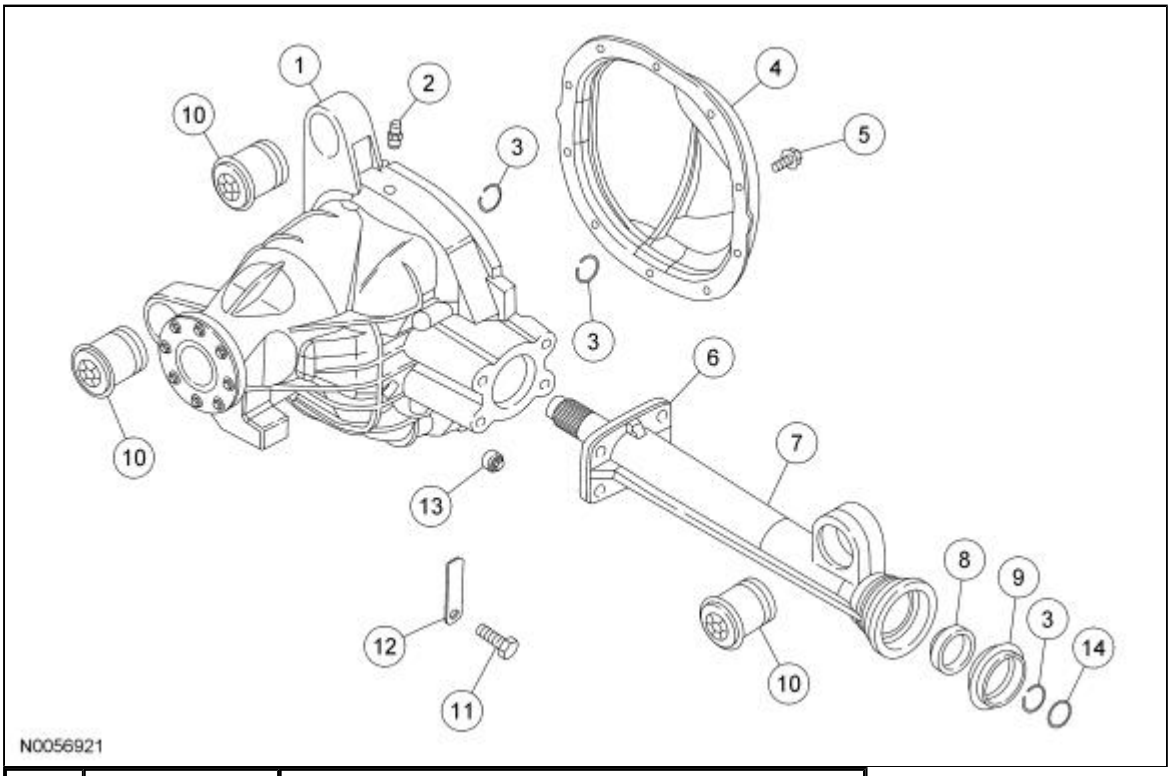
Description	Nm	lb-ft
Axle tube bolts	73	54
Crossmember bolts	90	66
Differential bearing cap bolts	105	77
Differential housing cover bolts	32	24
Differential pinion shaft lock bolt	30	22
Drain plug	25	18
Driveshaft retaining bolts	112	83
Fill plug	25	18
Halfshaft bolts	82	60
Isolator bolt and nut	150	111
Lower steering column shaft-to-steering gear bolt	30	22

Ring gear bolts	105	77

Front Drive Axle and Differential

Printable View (160 KB)

Front Axle Assembly — Disassembled View



Item	Part Number	Description
1	3C202	Differential carrier assembly
2	4338	Axle housing vent
3	4B422	Circlips
4	3N136	Differential housing cover
5	390919	Differential housing cover bolt (10 required)
6	—	Intermediate shaft
7	3B210	Axle housing tube
8	4B413	Axle shaft bearing assembly (outer)
9	4B416	Axle shaft dust seal
10	3A443	Front axle support isolators (3 required)
11	N808703	Axle housing tube bolt (4 required)
12	4121	Axle identification tag
13	373098	Fill plug
14	4369	O-ring

- The axle housing assembly consists of a cast-aluminum center section, a removable cast-aluminum axle housing tube and a differential housing cover. Both the axle housing tube and the differential housing cover use silicone sealant as a gasket.

- The hypoid-design gearset consists of an 8.8-inch ring gear and a pinion gear. Two opposed tapered roller bearings support the drive pinion in the axle housing.
- A drive pinion collapsible spacer, located on the pinion shaft, maintains pinion bearing preload. The pinion nut adjusts the preload.
- Differential bearing shims, located between the differential bearing cups and the axle housing, adjust the differential bearing preload and the ring gear backlash.
- The differential case is a 1-piece design with 2 openings to allow for assembly of the internal components and lubricant flow. Two opposed tapered roller bearings (differential bearings) support the differential case in the axle housing. Removable differential bearing caps retain the differential assembly in the axle housing.
- Inside the differential case, the differential pinion shaft supports 2 differential pinion gears. The pinion gear speed is synchronized by a differential clutch spring. The pinion gears engage the differential side gears, to which the left axle shaft and the right axle shaft are splined. The differential pinion shaft bolt retains the differential pinion shaft in the differential case.
- An embossed metal tag, bolted to the rear face of the RH axle tube, contains front axle identification information.

 ST1348-A	Gauge, Clutch Housing 308-021 (T75L-4201-A)

Inspection and Verification

The technician should have a thorough knowledge of driveline system operation and accepted general driveline guidelines to detect any problems.

A gear driven unit will produce a certain amount of noise. Some noise is acceptable and audible at certain speeds or under various driving conditions. Certain conditions, such as road conditions and weather, will amplify normal vehicle noise.

Certain axle and driveline concern symptoms are also common to the engine, transmission, wheel bearings and tire. For this reason, be sure the cause of the concern is in the axle before repairing or installing any axle components.

The following is a guide to diagnose a driveline concern:

- Verify and document the customer concern.
- Perform a preliminary investigation.
- Road test the vehicle.
- Find the cause of the problem.
- Inspect the components.

1. Verify and document the customer concern.
    1. When was it first noticed?
    2. Did it appear suddenly or gradually?
    3. Did anything unusual occur that would coincide with it or precede it?
    4. Has the driveline system been repaired before or new components installed?
        - Check the vehicle service record. Note any repairs other than driveline, such as brakes or suspension.
    5. Are there any special conditions affecting the concern or will alter the concern? For example:
        - Road speed
        - Type of road
        - Drive mode

- Temperature
- Vehicle loaded or unloaded

6. Is the condition constant or intermittent? Can the concern be duplicated at any time?
7. Check for TSBs, SSM and OASIS messages.

2. **NOTE:** If the inspection reveals an obvious concern, repair the vehicle.

   Do a preliminary investigation. Visually inspect for obvious signs of damage.
   1. Inspect the driveshaft:
      - for build up of any foreign material.
      - for damage, such as a bent tube or missing weights.
      - U-joints, CV joints or flex couplers for wear or damage.
   2. Inspect the axle:
      - for signs of leakage at the drain or fill plug, differential seal, vent or halfshaft seals.
        - a plugged vent or vent tube will cause a leak.
      - for damage, such as cracks, bent halfshafts or dented cover.
      - for missing fasteners.
   3. Inspect other suspect components/systems:
      - inspect the suspension for broken springs, damaged shock absorbers and worn suspension bushings.
      - inspect the brake components — lines, cables and calipers.
      - inspect the tires; are they in good condition and do they match?

3. **NOTE:** A road test is necessary for any customer concern of noise or vibration.

   Road test the vehicle.
   1. During the road test, use the following driving methods to diagnose the problem. Is the concern most noticeable:
      - from a stop?
      - on shifts from REVERSE to DRIVE?
      - on turns?
        - sweeping type turn.
        - tight turn (to the stop).
      - in DRIVE?
        - accelerating the vehicle, definite throttle depression, applying engine torque.
      - in CRUISE?
        - maintain a constant speed with the throttle applied.
      - in COAST?
        - decelerating with the throttle closed.
   2. Record when the concern occurs. Write down the kph (mph) range at which the noise/vibration occurs.

4. Find the cause of the problem.
   1. Compare the inspection and road test results with the following chart.
   2. Use the following diagnostic routine chart to identify the probable cause and know what corrective actions should be taken to repair the component/vehicle and to prevent a reoccurrence.

Diagnostic Routine Chart

Condition	Action
· Fluid loss	· GO to Diagnostic Routine — Fluid Loss
· Noise louder on turns (sweeping turn)	· GO to Diagnostic Routine — Noise Louder on Turns (Sweeping)
· Axle noise (growl) [a] in tight turn	· GO to Diagnostic Routine — Noise (Growl) In Tight Turn

· Axle noise (whine) [a] in all or more than one drive mode	· GO to Diagnostic Routine — Noise (Whine) In All Or More Than One Drive Modes
· Axle noise (tick/click) [a] in all or more than one drive mode (drive, cruise, coast)	· GO to Diagnostic Routine — Noise (Tick/Click) In All Or More Than One Drive Modes
· Axle noise (howl/moan) [a] in all or more than one drive mode (drive, cruise, coast)	· GO to Diagnostic Routine — Noise (Howl/Moan) In All Or More Than One Drive Modes
· Axle noise (clunk) [a] on changes in speed or direction of power	· GO to Diagnostic Routine — Noise (Clunk) On Changes In Speed Or Direction Of Power
· Front axle will not engage/disengage	· GO to Diagnostic Routine — Front Axle Will Not Engage/Disengage
· Vibration	· For driveline vibration diagnostics, REFER to Section 100-04 .

a. Refer to Section 100-04 for a glossary of noise-related terms.

5. **NOTE:** If the conclusion of the road test points to an axle assembly section (ring and pinion or differential case) concern, carry out a visual inspection of the axle.

   Inspect the axle components.
   1. Remove the differential housing cover. Drain the axle lubricant through a white cloth. Check the fluid for:
      - any foreign material.
      - metal particles.
      - burnt odor.
   2. **NOTE:** When inspecting the axle, do not clean the components immediately. Cleaning may remove diagnostic evidence.

      Inspect the axle components.
      - Look for:
        - loose fasteners.
        - notches or visible steps or grooves created by wear.
        - pitting or cracking along gear contact lines.
        - scuffing or deformations.
        - discolorations.
        - nicks or ridges on gear teeth.
      - Clean the axle components for inspection.
        - Remove as much lubricant as possible with clean solvent. Wipe the components or blow them dry with compressed air.
      - Re-inspect for:
        - loose fasteners.
        - notches or visible steps or grooves created by wear.
        - pitting or cracking along gear contact lines.
        - scuffing or deformations.
        - discolorations.
        - nicks or ridges on gear teeth.
      - Check backlash and carry out a ring and pinion pattern test. Refer to Checking Differential Ring Gear Backlash and Checking Tooth Contact Pattern and Condition of the Ring and Pinion in this section.

Diagnostic Routines

Diagnostic Routine — Fluid Loss

Possible Component	Reference/Action
· Vent	· CLEAN the axle vent and vent hose.
· Overfilled axle	· CHECK the lubricant level for specific amount.
· Fill plug	· CLEAN the area around the plug. REMOVE the plug. APPLY pipe sealant and INSTALL the plug.
· Halfshaft oil seal	· INSTALL a new halfshaft oil seal, O-ring and circlip.
· Pinion seal	· INSTALL a new pinion seal.
· Differential housing cover	· RESEAL the differential housing cover.

Diagnostic Routine — Noise Louder on Turns (Sweeping)

Possible Component	Reference/Action
· Wheel end bearing	· CHECK the wheel end bearing for wear or damage. INSTALL a new bearing.

Diagnostic Routine — Noise (Growl) in Tight Turn, Conventional Differential

Possible Component	Reference/Action
· Differential side gears and differential pinion gears	· DISASSEMBLE the differential carrier. INSPECT the differential case assembly. INSTALL new side gears and differential pinion gears or case assembly.

Diagnostic Routine — Noise (Whine) in All or More Than One Drive Modes

Possible Component	Reference/Action
· Axle ring and pinion	· REMOVE and INSTALL a new gear set and bearings.

Diagnostic Routine — Noise (Tick/Click) in All or More Than One Drive Modes

Possible Component	Reference/Action
· Axle ring and pinion	· REMOVE and INSTALL a new ring gear, pinion and bearings.

Diagnostic Routine — Noise (Howl/Moan) in All or More Than One Drive Modes

Possible Component	Reference/Action
· Axle bearings	· INSPECT differential and pinion bearings. INSTALL new bearings.

Diagnostic Routine — Noise (Clunk) on Changes in Speed or Direction of Power

Possible	

Component	Reference/Action
· Axle and pinion system	· MEASURE total backlash. If end play and total backlash are within specification, INSTALL a new differential case assembly.
· Differential pinion shaft	· INSTALL a new differential pinion shaft and pin.
· Pinion bearings	· INSTALL new pinion and differential bearings and bearing cups.

Diagnostic Routine — Front Axle Will Not Engage/Disengage

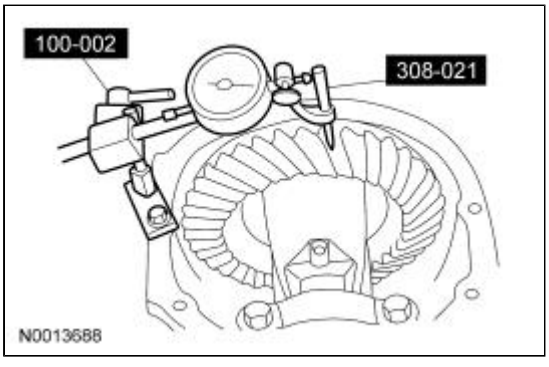
Possible Component	Reference/Action
· Mode switch Wiring Shift motor	· REFER to Section 308-07A .

Diagnostic Routine — Vibration

Possible Component	Reference/Action
· For driveline vibration, REFER to Section 100-04 .	

Checking Differential Ring Gear Backlash

1. Remove the differential housing cover.
2. Using a suitable dial indicator and the special tool, measure and record the differential ring gear backlash in 4 opposing points on the ring gear.

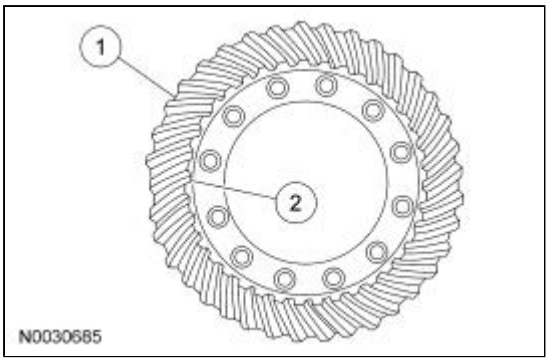


Checking Tooth Contact Pattern and Condition of the Ring and Pinion

There are 2 basic types of conditions that will produce ring and pinion noise. The first type is a howl or chuckle produced by broken, cracked, chipped, scored or forcibly damaged gear teeth and is usually quite audible over the entire speed range. The second type of ring and pinion noise pertains to the mesh pattern of the gear pattern. This gear noise can be recognized as it produces a constant pitch or whine. Ring and pinion noise tends to peak in a narrow speed range or ranges, and will tend to remain constant in pitch.

NOTE: In the following steps, the movement of the contact pattern along the length is indicated as

toward the "heel" or "toe" of the differential ring gear.



Item	Description
1	Heel
2	Toe

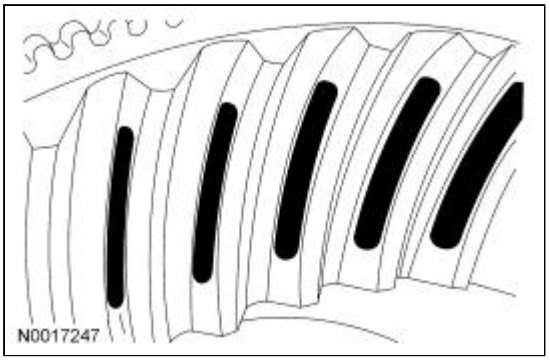
Apply a marking compound to a third of the gear teeth on the differential ring gear. Rotate the differential ring gear several complete turns in both directions until a good, clear tooth pattern is obtained. Compare the contact patterns on the ring gear teeth with the following illustrations.

Good Contact Pattern

Pattern inspection allows the technician to detect gross errors in set up prior to complete assembly of the differential assembly. Pattern contact should be within the primary area of the ring gear tooth section. Avoid narrow or hard contact with the outer perimeter of the ring gear tooth. Pattern inspection should be on the drive side of the tooth. Correct assembly of the drive pattern will result in satisfactory coast performance.

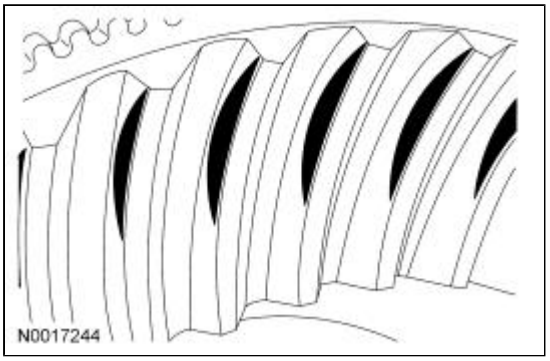
NOTE: If a gross pattern error is detected with the correct backlash, check the pinion shim selection.

Good Contact Pattern



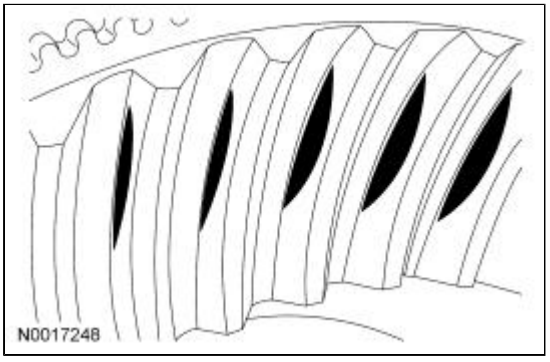
Low Contact Pattern That Is Contacting More Toward the Heel

Gross Pattern Error



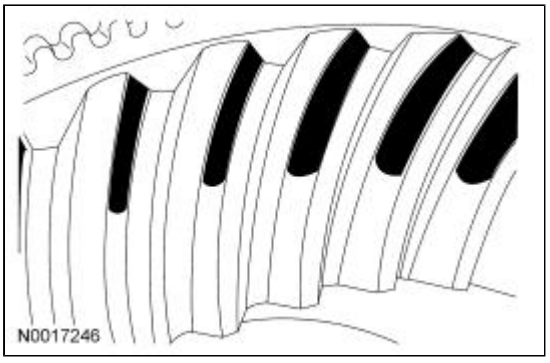
High, Thin Contact Pattern In the Center Of the Tooth

Gross Pattern Error



Thick Contact Pattern That Is Contacting Tooth Toward the Heel

Gross Pattern Error



Thick Contact Pattern That Is Contacting Tooth Toward the Toe

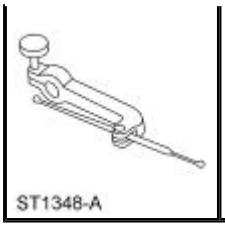
Differential Case Runout Check

Printable View (308 KB)

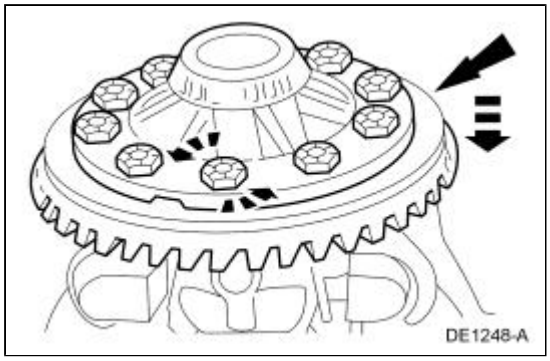
Special Tool(s)

 ST1321-A	2-Jaw Puller 205-D072 (D97L-4221-A) or equivalent
ST1214-A	Dial Indicator With Holding Fixture 100-002 (TOOL-4201-C)
ST1259-A	Spreader, Differential Carrier 205-001 (TOOL-4000-E)
ST1344-A	Spreader, Differential Housing (Plate) 205-335 (T93P-4000-A)
ST1437-A	Installer, Differential Side Bearing 205-010 (T57L-4221-A2)
ST1186-A	Holding Fixture, Transmission 307-003 (T57L-500-B)
ST2043-A	Step Plate 205-D061 (D83T-4205-C2)
	Gauge, Clutch Housing 308-021 (T75L-4201-A)



1. Remove the differential carrier. For additional information, refer to Differential Carrier in this section.

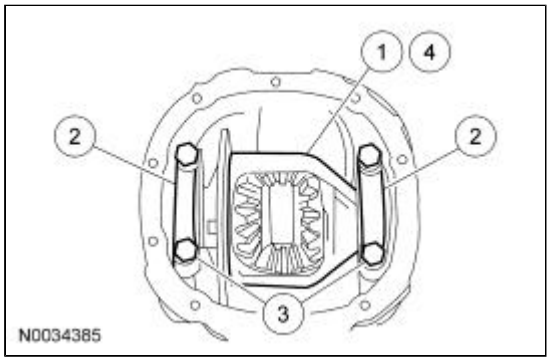
2. Remove the ring gear.
   - Remove the 10 bolts.
   - Use a drift punch to separate the ring gear from the differential case.



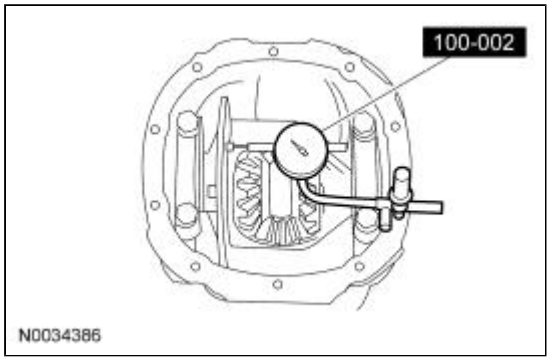
3. **NOTE:** Visually inspect the differential bearing cups and cones for discoloration indicating bearing overheating or failure.

   NOTE: It may be necessary to use the Differential Carrier Spreader to carry out this step.

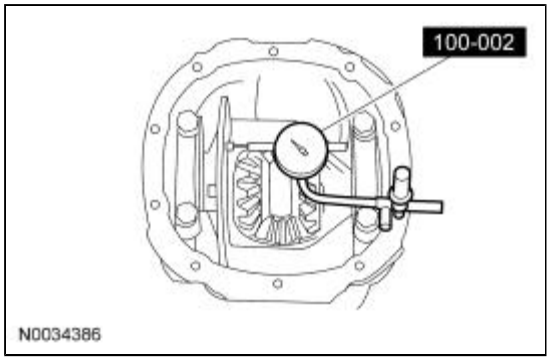
   Install the differential case with the bearing cups and all the shims in the housing.
   1. Position the differential case with the bearing cups and shims in their original location.
   2. Install the bearing caps.
   3. Install the bolts.
   4. Rotate the differential case to make sure the bearings have seated correctly.



4. Install the special tool.

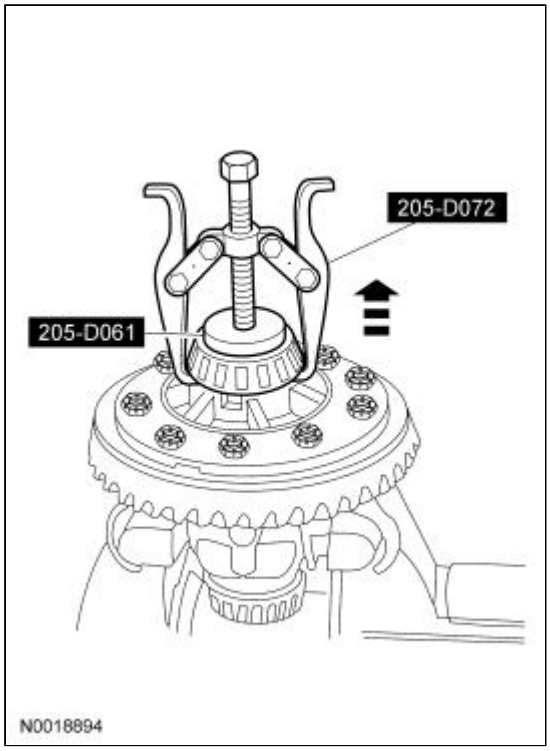


5. Rotate the differential case and check the differential case runout.
    - If the runout does not exceed the specification, install a new ring gear and pinion.
    - If runout exceeds the specification, the ring gear is true and the condition is due to differential case/differential bearing damage.
        - Inspect the differential bearings and the differential case. Always install new differential bearings when installing a new differential case, or if a bearing condition is questionable.



6. Remove the bearing caps and the differential case with the bearing cups and shims from the housing.

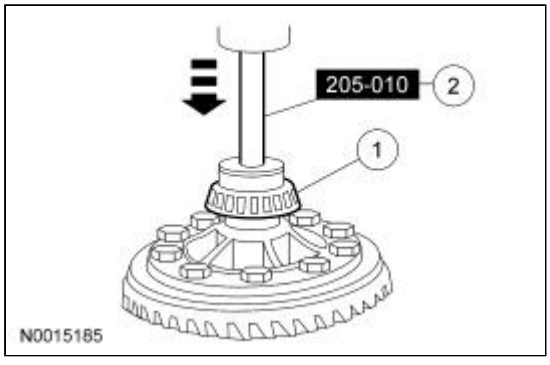
7. If necessary, using the special tools, remove the differential bearings.



8. **CAUTION: Press against the differential bearing inner cone only.**

Install the new differential bearings.

1. Position the appropriate differential bearing (RH or LH).
2. Using a suitable press and the special tool, install the differential bearing.
   - Repeat the steps for the other differential bearing.

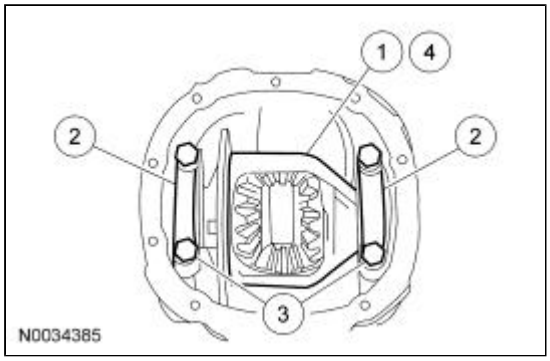


9. **NOTE:** It may be necessary to use the Differential Carrier Spreader to carry out this step.

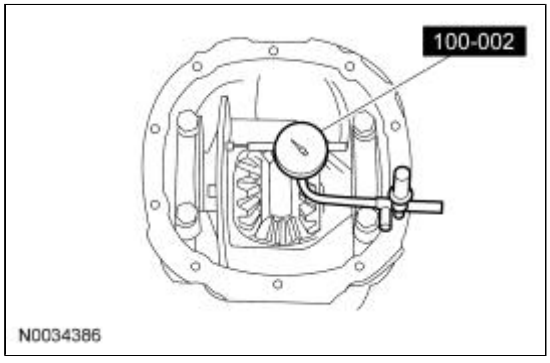
NOTE: Recheck the flange runout.

Install the differential case with the bearing cups and the shims in the housing.

1. Position the differential case with the bearing cups and shims in their original locations.
2. Install the bearing caps.
3. Install the bolts.
4. Rotate the differential case to make sure the bearings have seated correctly.

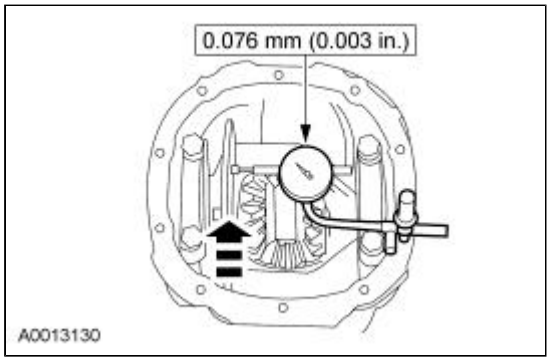


10. Install the special tool.

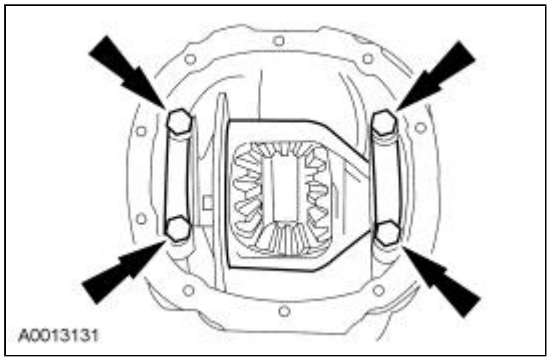


11. **NOTE:** If the runout is still excessive, install a new differential case.

    Check the runout with the new differential bearings. If the runout does not exceed the specification, use the new differential bearings for assembly.

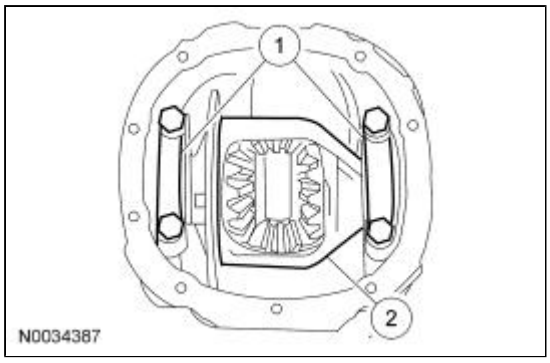


12. Remove the bolts.



13. Remove the differential case with the bearing cups and the shims from the housing.
    1. Remove the bearing caps.

2. Remove the differential case with the bearing cups and the shims from the housing.



14. Install the ring gear. For additional information, refer to Differential Ring And Pinion in this section.
15. Install the differential carrier. For additional information, refer to Differential Carrier in this section.

Drive Pinion Seal

Printable View (106 KB)

Special Tool(s)

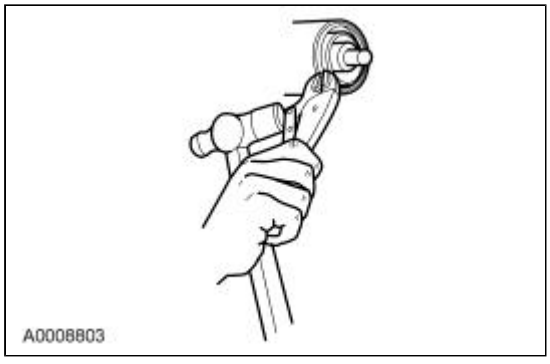
ST1358-A	Installer, Drive Pinion Oil Seal 205-208 (T83T-4676-A)

Removal

1. Remove the front axle universal joint flange. For additional information, refer to Universal Joint Flange in this section.

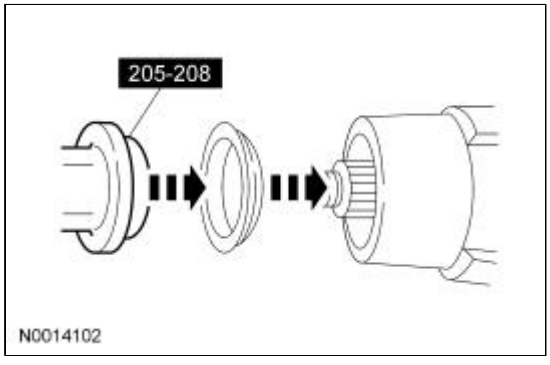
2. **CAUTION: Do not damage the front axle housing.**

   Force up on the metal flange of the rear axle drive pinion seal. Install gripping pliers and strike with a hammer to remove the pinion seal.



Installation

1. Clean the pinion seal bore and use the Drive Pinion Oil Seal Installer to install the pinion seal.



2. Install the front axle universal joint flange. For additional information, refer to Universal Joint Flange in this section.

Stub Shaft Pilot Bearing and Seal

Printable View (189 KB)

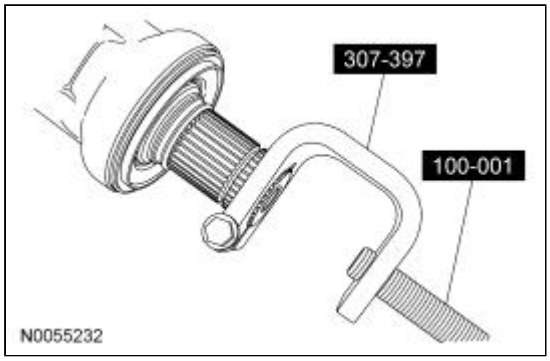
Special Tool(s)

ST1185-A	Slide Hammer 100-001 (T50T-100-A)
 ST1200-A	Remover, Bearing Cup 308-047 (T77F-1102-A)
ST1326-A	Handle 205-D055 (D81L-4000-A)
ST2369-A	Installer, Wheel Speed Sensor Ring 206-034 (T88P-20202-B)
 ST1513A	Installer, Axle Shaft Oil Seal 205-123 (T78P-1177-A)
ST2891-A	Remover, Transmission Fluid Pump 307-397

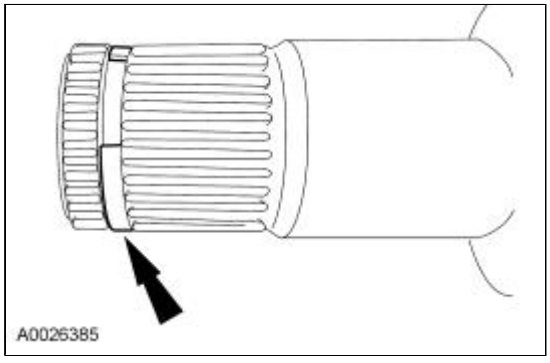
Removal

NOTE: Install a new stub shaft seal whenever a halfshaft is removed.

1. Remove the front drive halfshafts. For additional information, refer to Section 205-03 .
2. Using the special tools, remove the intermediate shaft.

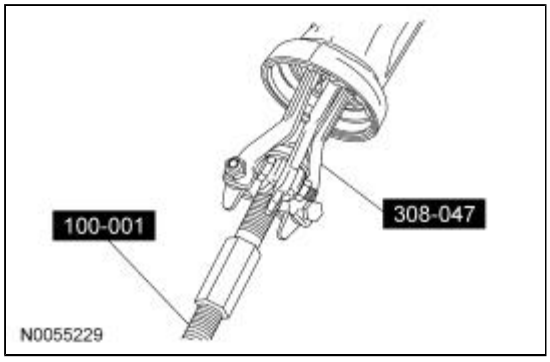


3. Remove and discard the intermediate shaft circlip and O-ring.



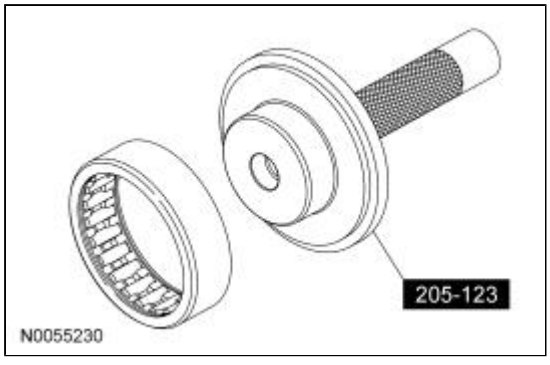
4. Using a suitable seal remover, remove and discard the stub shaft pilot bearing oil seal.

5. Using the special tools, remove and discard the stub shaft pilot bearing.

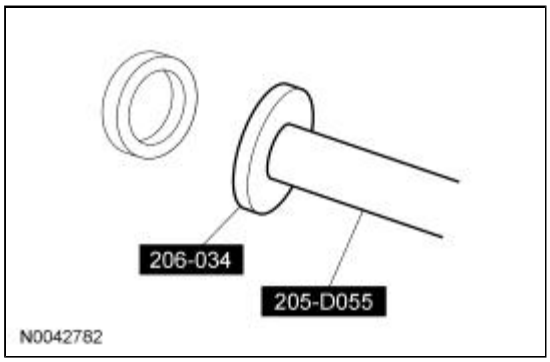


Installation

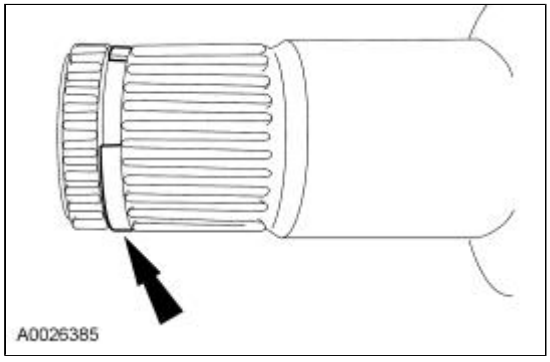
1. Position the stub shaft pilot bearing in the axle tube or differential housing bore and using the special tool, install the bearing.



2. Carefully align the stub shaft pilot bearing oil seal with the housing bore and install the stub shaft bearing oil seal flush in the housing using the special tools.



3. Install a new O-ring and new circlips on the intermediate shaft ends.



4. Insert the intermediate shaft and engage the circlip with the differential side gear.

5. Install the front drive halfshafts. For additional information, refer to Section 205-04 .

Universal Joint Flange

Printable View (275 KB)

Special Tool(s)

 ST1321-A	2-Jaw Puller 205-D072 (D97L-4221-A) or equivalent
ST1257-A	Holding Fixture, Drive Pinion Flange 205-126 (T78P-4851-A)
ST1800-A	Installer, Drive Pinion Flange 205-002 (TOOL-4858-E)

Material

Item	Specification
Motorcraft 80W-90 Premium Rear Axle Lubricant XY-80W90-QL (US); CXY-80W90-IL (Canada) (Model 60/70 axles)	WSP-M2C197-A

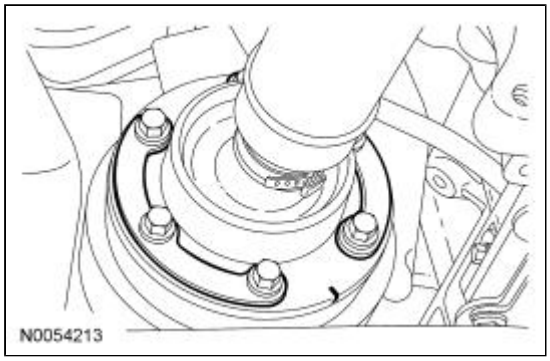
Removal

CAUTION: This operation disturbs the pinion bearing preload. Carefully reset the preload during assembly.

1. Position the vehicle on a hoist. For additional information, refer to Section 100-02 .
2. **CAUTION: Remove the front brake caliper to prevent drag during the drive pinion bearing preload adjustment.**

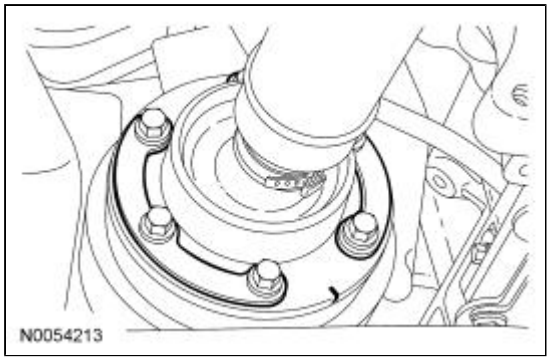
   CAUTION: Do not allow the calipers to hang from the brake hoses.

   Remove the front brake calipers. Wire the caliper aside. For additional information, refer to Section 206-03 .
3. Index-mark the front driveshaft to the axle universal joint flange.

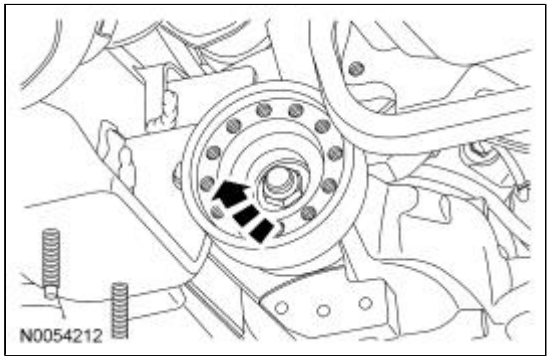


4. **CAUTION: Do not allow the driveshaft to hang unsupported.**

   Disconnect and support the front driveshaft.
   - Remove and discard the 6 bolts and 3 washers.
   - Carefully disconnect and support the front driveshaft.

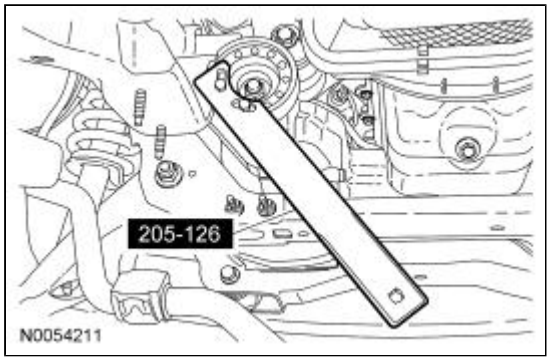


5. Using a Nm (inch/pound) torque wrench, measure the torque necessary to maintain pinion rotation. Record the measurement for reference during installation.

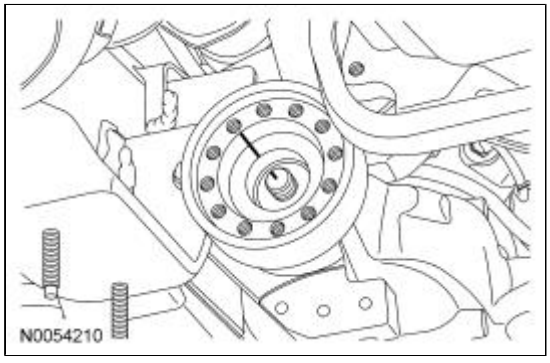


6. **CAUTION: After removing the pinion nut, discard it. Use a new pinion nut for installation.**

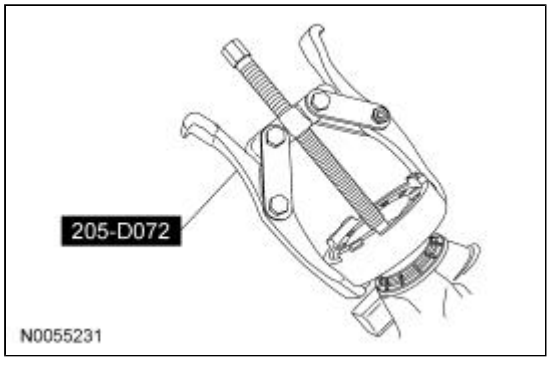
   Install the special tool and remove the pinion nut.



7. Index-mark the axle universal joint flange to the pinion stem.



8. Using the special tool, separate the axle universal joint flange from the pinion gear.



9. Remove the flange.

10. Inspect the axle universal joint flange for burrs, the nut counterbore and the seal contact surface for nicks, and the bearing cone contact area for damage. Install a new flange if necessary.

11. Check the pinion stem splines for burrs. If burrs are evident, remove them with a fine crocus cloth.

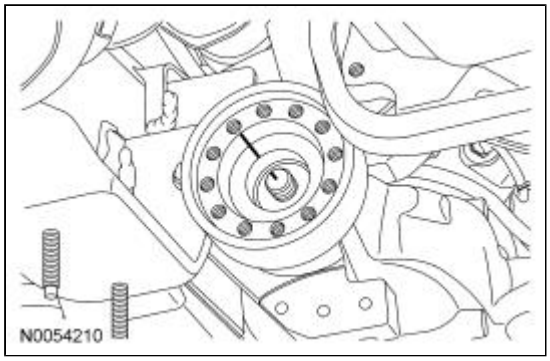
Installation

1. Lubricate the axle universal joint flange splines and the pinion seal.
   - Use front axle lubricant.

2. **CAUTION: Never install the axle universal joint flange with a hammer or power tools.**

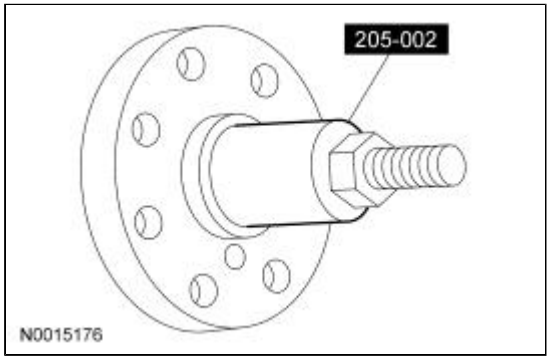
   NOTE: Disregard the scribe marks if installing a new flange.

   Align the index marks and position the axle universal joint flange on the pinion shaft.



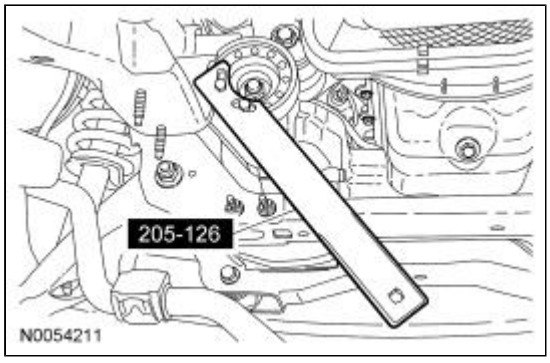
3. **NOTE:** Rotate the pinion gear occasionally to make sure the pinion bearings seat correctly.

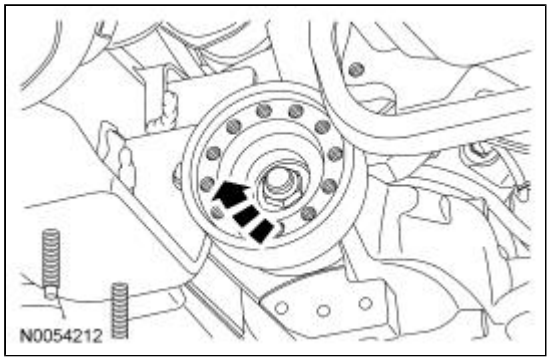
   Using the special tool, install the axle universal joint flange.



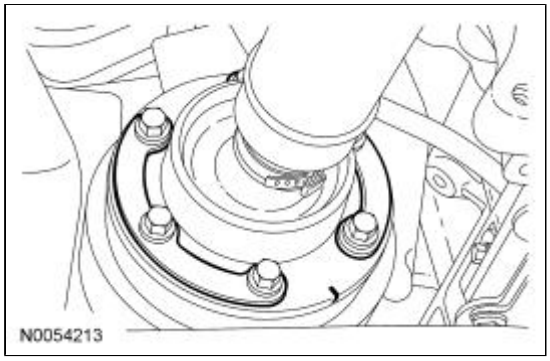
4. **CAUTION: Do not loosen the pinion nut to reduce preload under any circumstance. If it is necessary to reduce preload, install a new drive pinion collapsible spacer and pinion nut.**

   Install the special tool and tighten the pinion nut. Refer to the torque specifications for used bearings in the Specifications portion of this section.
   - Rotate the pinion gear occasionally to make sure the pinion bearings are seating correctly. Take frequent pinion bearing torque preload readings by rotating the pinion gear with a Nm (inch/pound) torque wrench.
   - If the preload recorded prior to disassembly is lower than the specification for used bearings, then tighten the pinion nut to the specification. If the preload recorded prior to disassembly is higher than the specification for used bearings, then tighten the pinion nut to the original reading as recorded.





5. Align the index marks then attach the front driveshaft. Refer to Section 205-01 for driveshaft fastener tightening specifications.



6. Inspect and, if necessary, fill the differential.
   - Use rear axle lubricant.

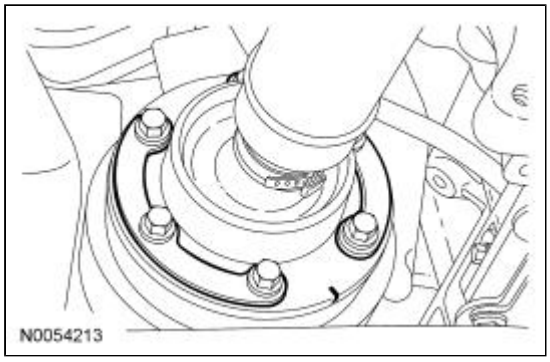
7. Lower the vehicle.

Axle Assembly

Printable View (280 KB)

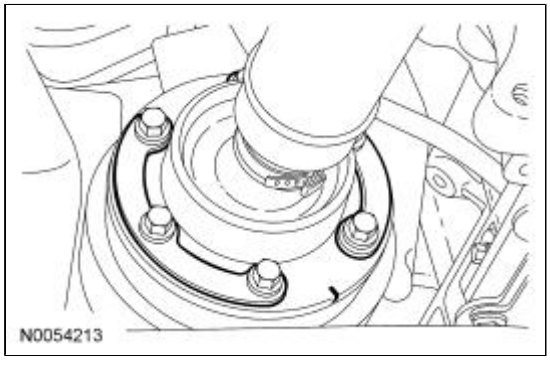
Removal

1. Position the vehicle on a hoist. For additional information, refer to Section 100-02 .
2. Index-mark the front driveshaft to the universal joint drive pinion flange.



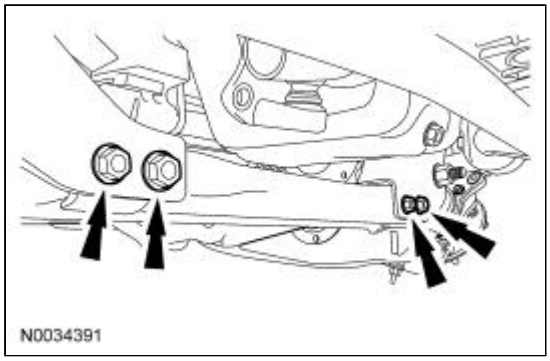
3. **CAUTION: Do not allow the driveshaft to hang unsupported.**

   Disconnect and support the front driveshaft. Discard the bolts and washers.
   - To install, tighten to 112 Nm (83 lb-ft).

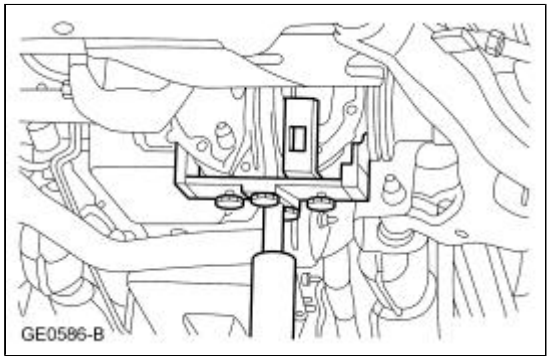


4. **CAUTION: Do not allow the halfshaft to hang unsupported.**

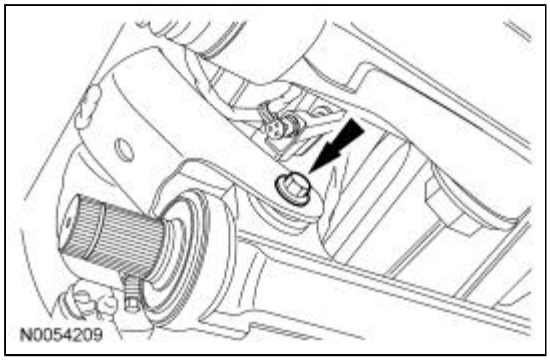
   Remove the halfshafts. Refer to Section 205-04 .
5. Remove the 4 crossmember bolts and the crossmember.
   - To install, tighten to 90 Nm (66 lb-ft).



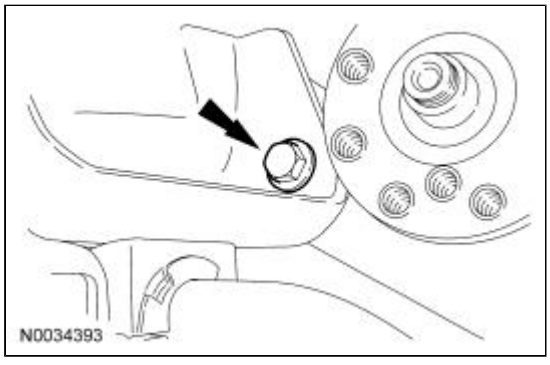
6. Use a high-lift jack to support the axle assembly.



7. Remove the axle housing tube isolator nut and bolt.
    - To install, tighten to 150 Nm (111 lb-ft).

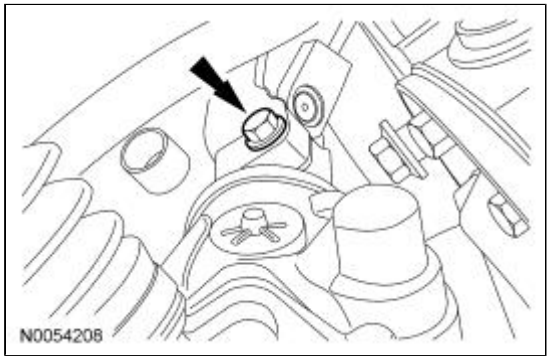


8. Remove the front mounting isolator bolt.
    - To install, tighten to 150 Nm (111 lb-ft).

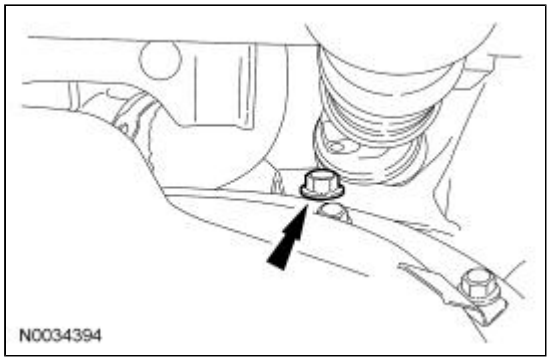


9. Remove the bolt from the lower steering shaft-to-steering gear and disconnect the coupler from the rack.

- To install, tighten to 30 Nm (22 lb-ft).



10. Remove the upper mounting insolator bolt.
    - To install, tighten to 150 Nm (111 lb-ft).



11. Carefully lower the front drive axle assembly.

12. Disconnect the vent hose from the axle vent barbed fitting.

Installation

NOTE: Make sure the axle vent hose is connected.

1. To install, reverse the removal procedure.

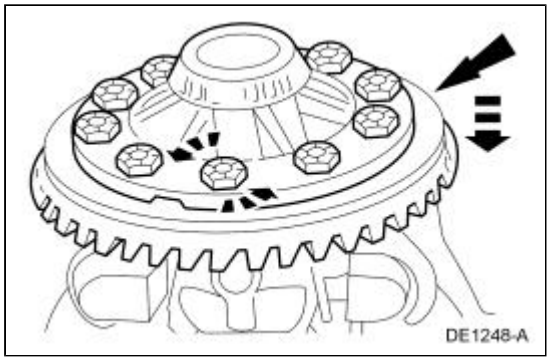
Material

Item	Specification
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B
Motorcraft 80W-90 Premium Rear Axle Lubricant XY-80W90-QL (US); CXY-80W90-IL (Canada); (Model 60/70 axles)	WSP-M2C197-A
Stud and Bearing Mount TA-27	WSK-M2G349-A1

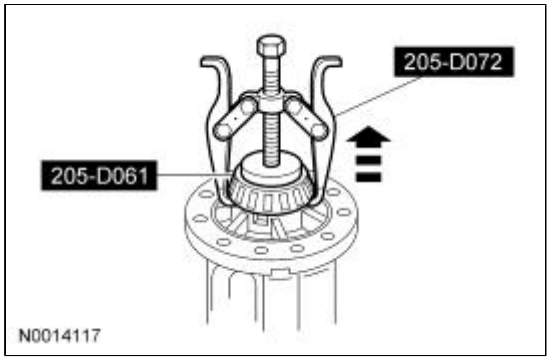
Removal

1. Remove the differential carrier. For additional information, refer to Differential Carrier in this section.

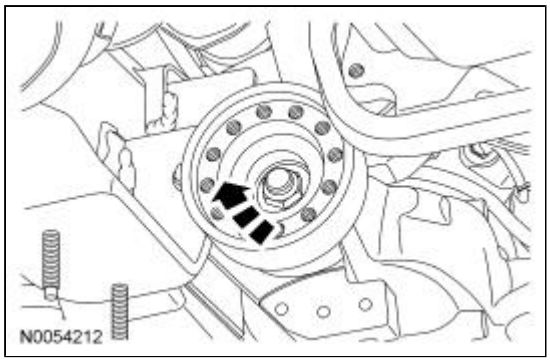
2. Remove the 10 differential ring gear bolts and the differential ring gear.
   - Use a drift punch to separate the differential ring gear from the differential case.



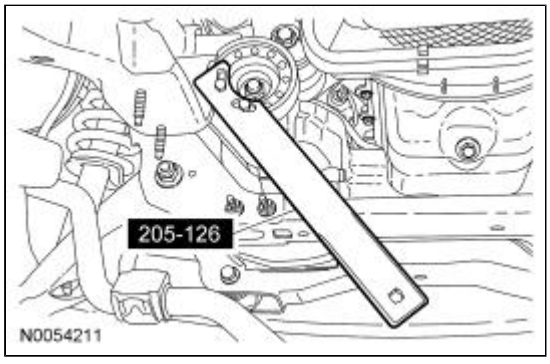
3. Using the special tools, remove the 2 differential bearings.



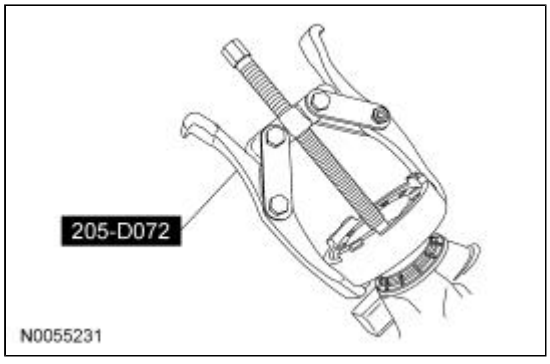
4. Index-mark the pinion flange to the drive pinion gear.



5. Install the special tool and loosen, but do not remove, the pinion nut.
    - Remove the special tool.



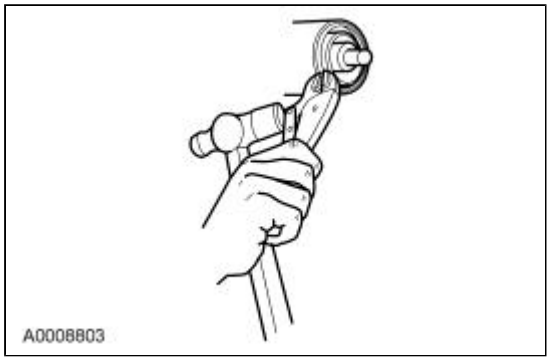
6. With the pinion nut still engaged by a few threads, use the special tool to separate the pinion flange from the drive pinion gear.



7. Remove the pinion nut and the pinion flange.

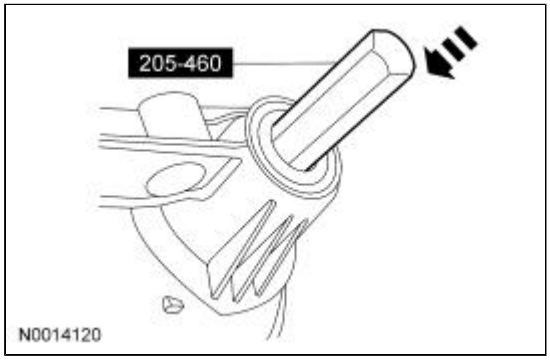
8. **CAUTION: Do not damage the axle housing while removing the drive pinion seal.**

    Remove the drive pinion seal and drive pinion oil slinger.
    - Pry up on the drive pinion seal flange. Install gripping pliers, and strike with a hammer to remove the drive pinion seal.

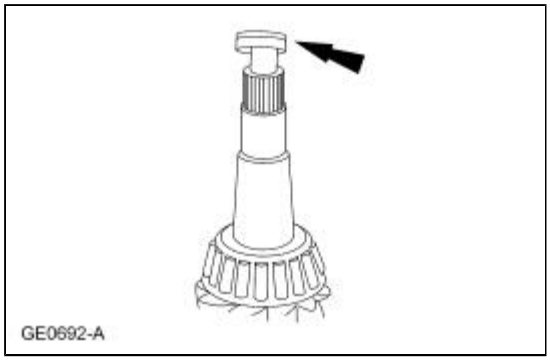


9. Remove the outer drive pinion bearing.

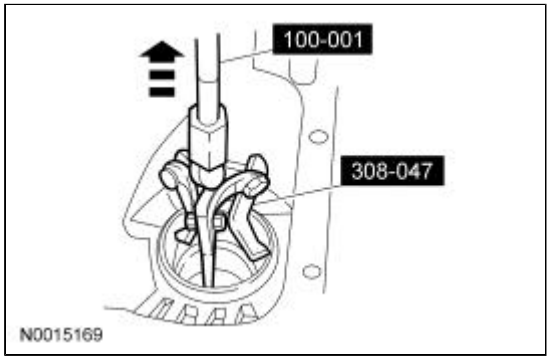
10. Using the special tool and a soft hammer, remove the drive pinion gear.



11. Remove and discard the drive pinion collapsible spacer.

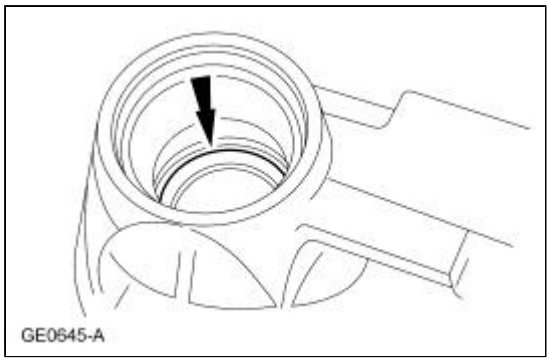


12. Using the special tools, remove the inner drive pinion bearing cup.

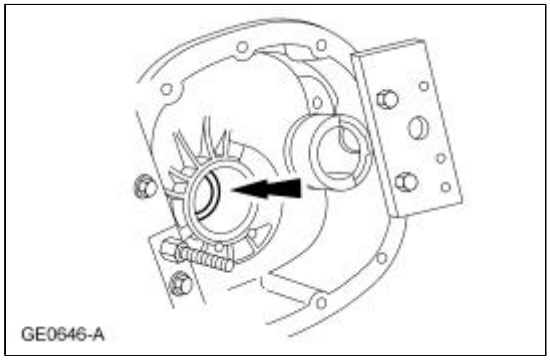


13. **NOTE:** The pinion bearing oil baffle aids in bearing lubrication. Normally, it is not necessary to remove the baffle.

If necessary, remove the pinion bearing oil baffle.



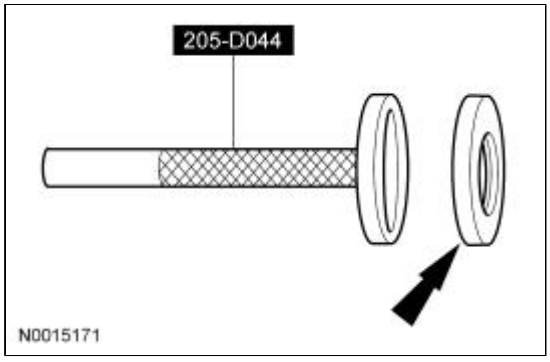
14. Remove the outer drive pinion bearing cup by tapping alternately on each side to prevent the drive pinion bearing cup from becoming misaligned.



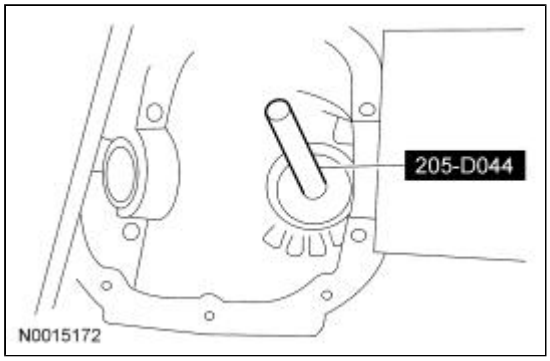
Installation

1. **CAUTION: Do not omit the drive pinion bearing oil baffle or drive pinion bearing failure can result.**

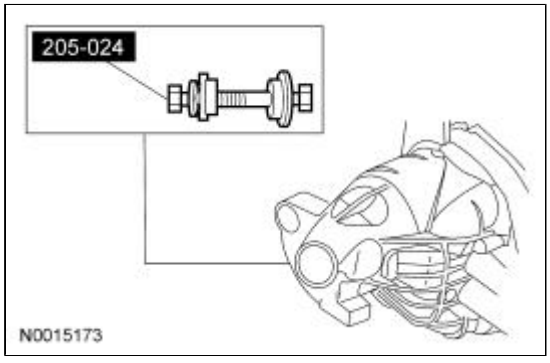
   If removed, position the drive pinion bearing oil baffle on the special tool.



2. Using the special tool, install the drive pinion bearing oil baffle.



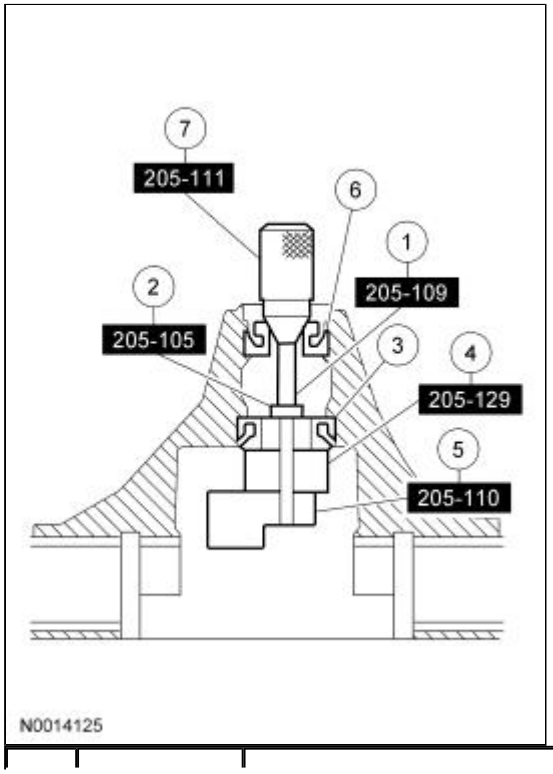
3. Using the special tool, install the drive pinion bearing cups.



4. **CAUTION: Use the same drive pinion bearings and the drive pinion bearing adjustment shim from the drive pinion bearing adjustment shim selection procedure for final assembly.**

   NOTE: Install new drive pinion bearings without any additional lubricant since the anti-rust oil provides adequate lubricant without upsetting the drive pinion bearing preload settings.

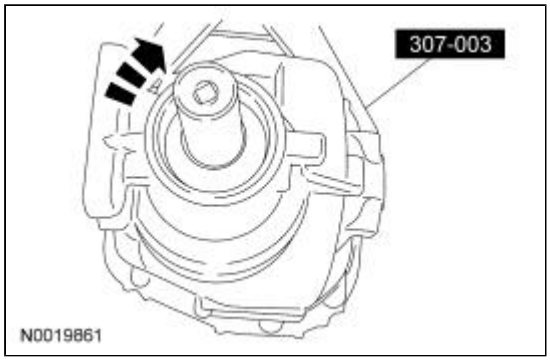
   Assemble and position the special tools.



Item	Part Number	Description
1	205-109	Adapter for 205-S127 (T76P-4020-A9)
2	205-105	Adapter for 205-S127 (1.612 inch O.D.) (T76P-4020-A3)
3	4630	Drive pinion bearing (inner)
4	205-129	Adapter for 105-S127 (1.1884 inch thick) (T79P-4020-A18)
5	205-110	Adapter for 205-S127 (1.7 inch thick) (T76P-4020-A10)
6	4621	Drive pinion bearing (outer)
7	205-111	Adapter for 205-S127 (T76P-4020-A11)

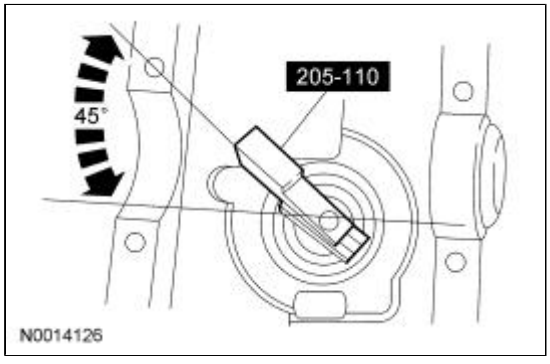
5. **NOTE:** This step duplicates final drive pinion bearing preload.

   Tighten the special tool.
   - Tighten to 2.2 Nm (20 lb-in).

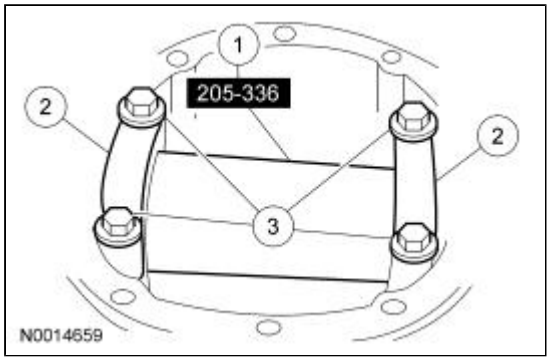


6. **NOTE:** The special tool must be offset to obtain an accurate reading.

   Rotate the special tool several half-turns to make sure of correct seating of the drive pinion bearings and position the special tool.



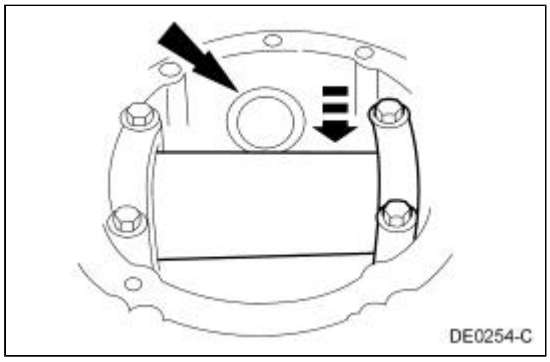
7. Install the special tool.
   1. Position the special tool.
   2. Install the differential bearing caps.
   3. Install the 4 differential bearing cap bolts.
      - Tighten to 105 Nm (77 lb-ft).



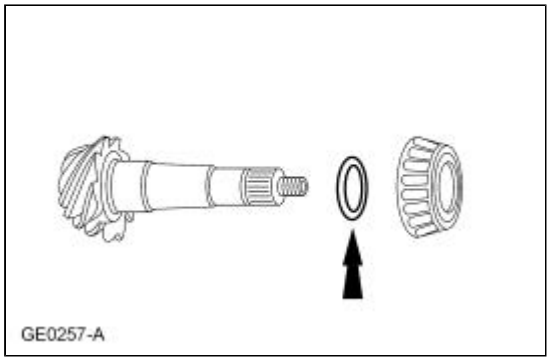
8. **NOTE:** Drive pinion bearing adjustment shims must be flat and clean.

   NOTE: A slight drag should be felt for correct drive pinion bearing adjustment shim selection. Do not attempt to force the drive pinion bearing adjustment shim between the gauge block and the gauge tube. This will minimize selection of a drive pinion bearing adjustment shim thicker than required, which results in a deep tooth contact in final assembly of integral axle assemblies.

   Use a drive pinion bearing adjustment shim as a gauge for drive pinion bearing adjustment shim selection.
   - After the correct drive pinion bearing adjustment shim thickness has been determined, remove all of the special tools.

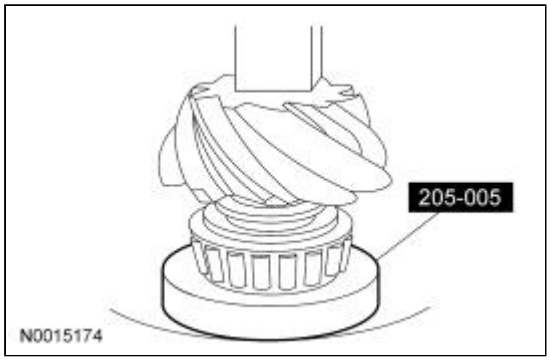


9. Position the drive pinion bearing adjustment shim and the inner pinion bearing on the drive pinion gear stem.

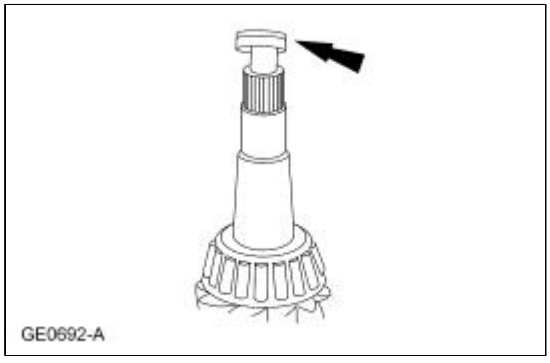


10. **NOTE:** You must use the same drive pinion bearings from the previous steps.

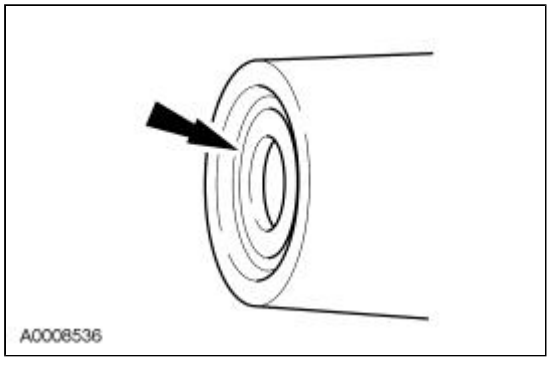
    Install the inner drive pinion bearing.
    - Place the drive pinion bearing adjustment shim on the drive pinion gear.
    - Using a suitable press and the special tool, press the inner drive pinion bearing until it is firmly seated on the pinion gear.



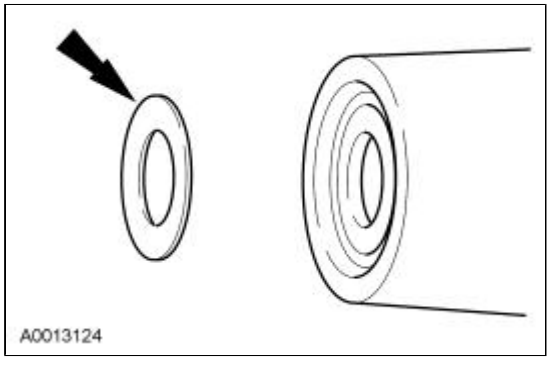
11. Place a new drive pinion collapsible spacer on the drive pinion gear.



12. Install the outer drive pinion bearing.

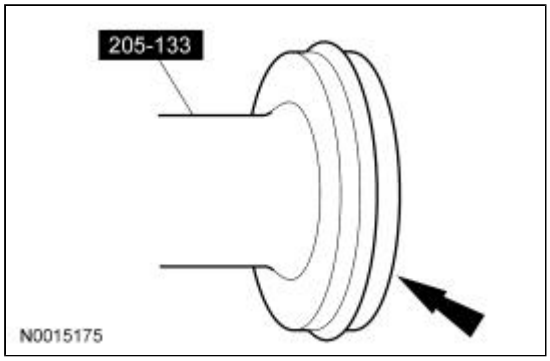


13. Install the drive pinion oil slinger.



14. **NOTE:** Coat the drive pinion seal lips with long-life grease.

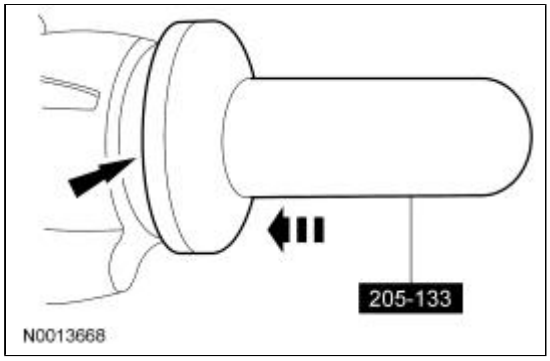
    Install the drive pinion seal on the special tool.



15. **CAUTION: Installation without the correct tool can result in early drive pinion seal failure.**

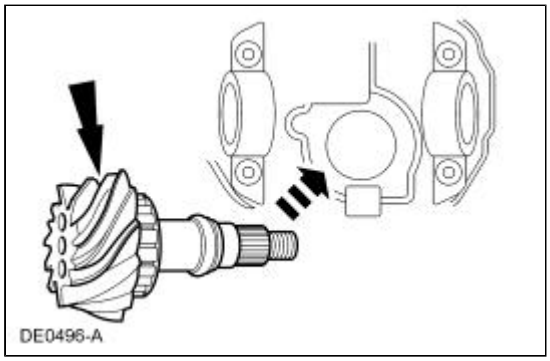
    CAUTION: If the drive pinion seal becomes misaligned during installation, remove it and install a new drive pinion seal.

    Using the special tool, install the drive pinion seal.



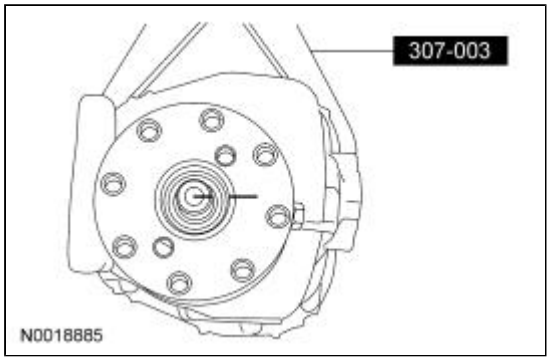
16. Lightly lubricate the drive pinion gear splines with axle lubricant.

17. Position the drive pinion gear in the axle housing.

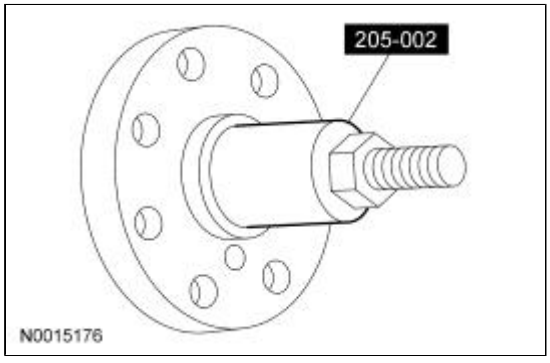


18. **CAUTION: Never install the pinion flange with a hammer or power tools.**

    Position the pinion flange.
    - Position the pinion flange on the drive pinion gear.



19. Using the special tool, install the pinion flange.

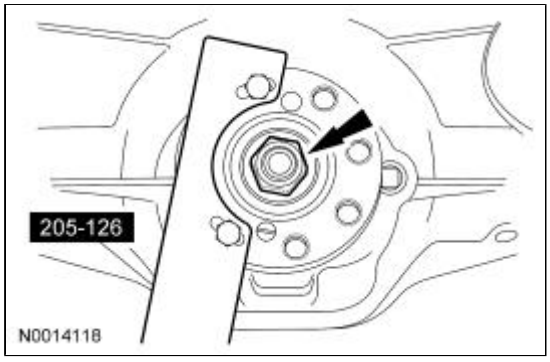


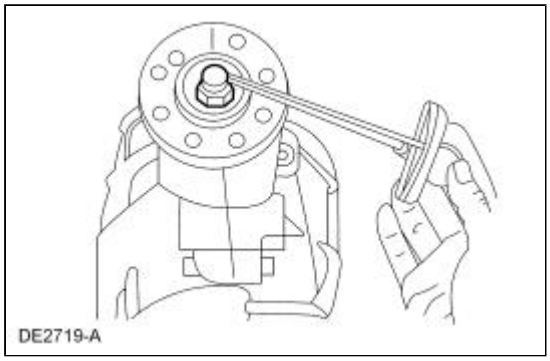
20. Apply a small amount of axle lubricant to the washer side of the new pinion nut and install the new pinion nut.

21. **CAUTION: Do not loosen the pinion nut to reduce drive pinion bearing preload under any circumstance. If it is necessary to reduce drive pinion bearing preload, install a new drive pinion collapsible spacer and pinion nut.**

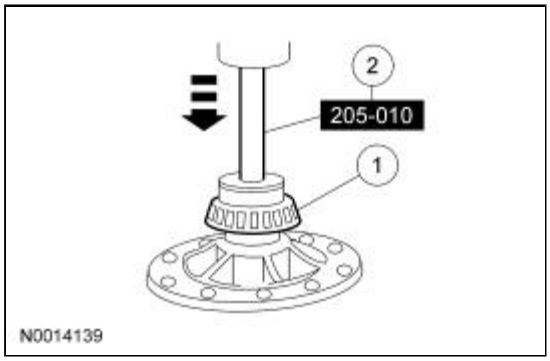
    Install the special tool and tighten the pinion nut. Refer to the torque specifications in the Specifications portion of this section.

    - Rotate the drive pinion gear occasionally to make sure the drive pinion bearings are seating correctly. Take frequent drive pinion bearing preload readings by rotating the drive pinion gear with a Nm (lb-in) torque wrench.



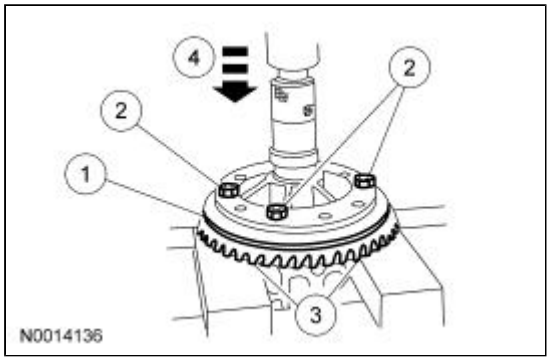


22. Press the left and right differential bearing on the differential carrier.
    1. Position the differential bearing.
    2. Using the special tool, press the differential bearing on the differential carrier.

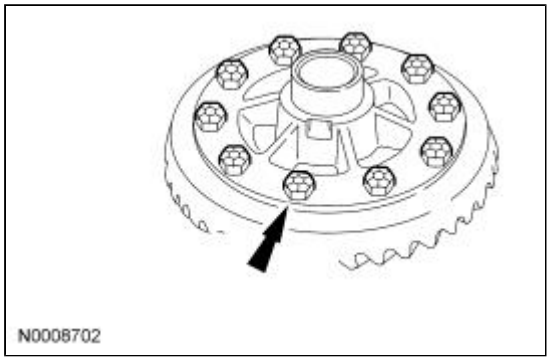


23. **NOTE:** If removed, press the speed sensor ring on with the differential ring gear.

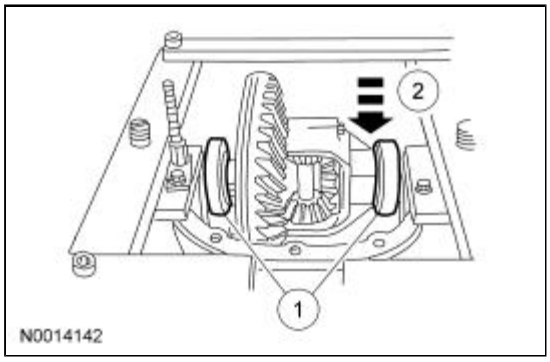
    Install the differential ring gear.
    1. Place the differential ring gear on the differential assembly.
    2. Hand-start 3 ring gear bolts to align the holes in the differential ring gear and the differential assembly.
    3. Place the differential carrier and differential ring gear onto the press bed blocks with the differential ring gear teeth facing downward.
    4. Press the differential ring gear into place.



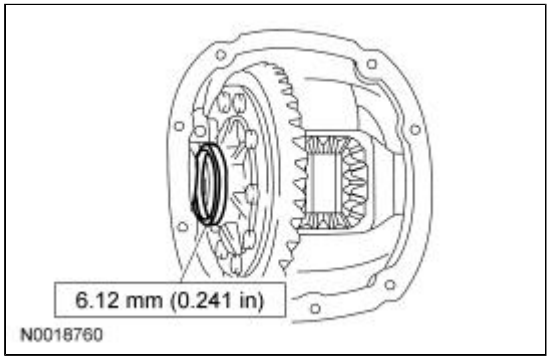
24. Install the ring gear bolts after applying sealer to the bolt threads.
    - Use stud and bearing mount.
    - Tighten to 105 Nm (77 lb-ft).



25. Install the differential carrier.
    1. Position the differential bearing cups on the differential bearings.
    2. Lower the differential carrier in place.

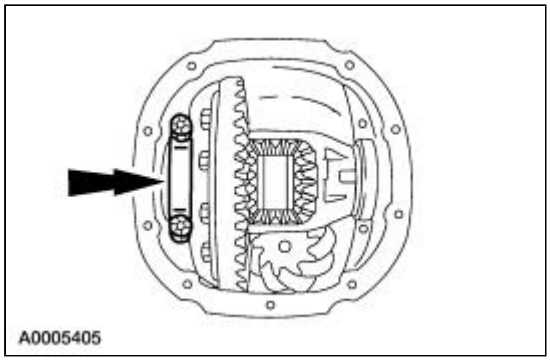


26. Install a differential bearing shim of the thickness shown on the LH side of the differential bearing.



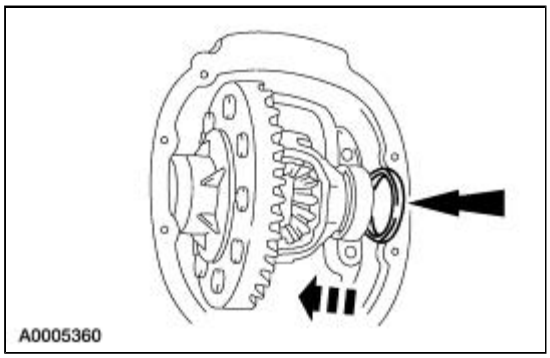
27. **NOTE:** Apply pressure toward the left side to make sure the left bearing cup is seated.

    Install the left bearing cap and loosely install the bearing cap bolts.



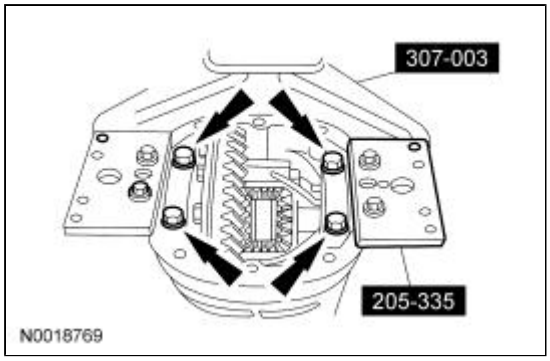
28. **NOTE:** Apply pressure toward the left side to make sure the left bearing cap is seated.

Install progressively thicker differential bearing shims on the right side until the thickest differential bearing shim can be inserted by hand.

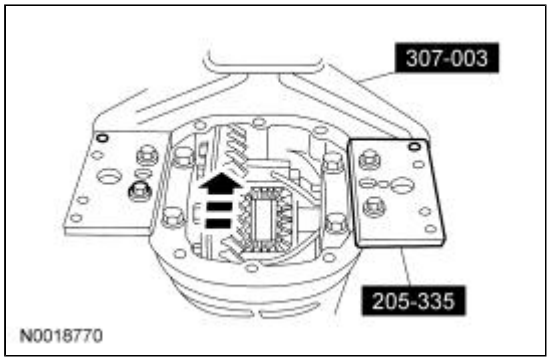


29. Install the right bearing cap and bolts.

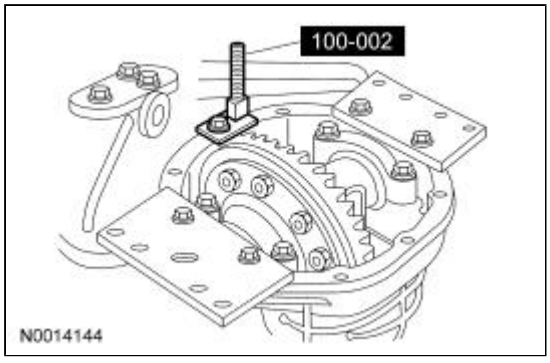
30. Tighten the 4 differential bearing cap bolts.
    - Tighten to 105 Nm (77 lb-ft).



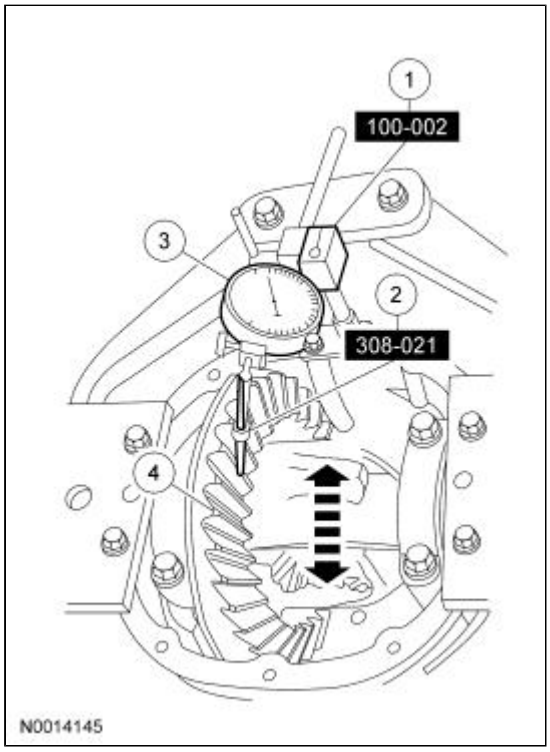
31. Rotate the differential carrier to make sure it turns freely.



32. Install the special tool at the 12 o'clock position.



33. Using the special tools, measure the differential ring gear backlash at 4 equally spaced points.
    1. Attach the special tool.
    2. Position the special tool tip centrally on a drive tooth.
    3. Zero the indicator.
    4. Turn the differential ring gear without turning the drive pinion gear. Record the indicator reading. The allowable backlash is 0.203 mm (0.008 in) to 0.305 mm (0.012 in) and must not vary more than 0.101 mm (0.004 in) between points measured. A backlash variation of more than 0.101 mm (0.004 in) between points checked indicates gear/case runout.
        - To correct for a high or low backlash, proceed as follows.



34. To correct for high or low backlash, increase the thickness of one differential bearing shim and decrease the thickness of the other differential bearing shim by the same amount. Refer to the following tables when adjusting the backlash.

Backlash Change Required		Thickness Change Required	
mm	**Inch**	**mm**	**Inch**
0.025	0.001	0.050	0.002
0.050	0.002	0.050	0.002

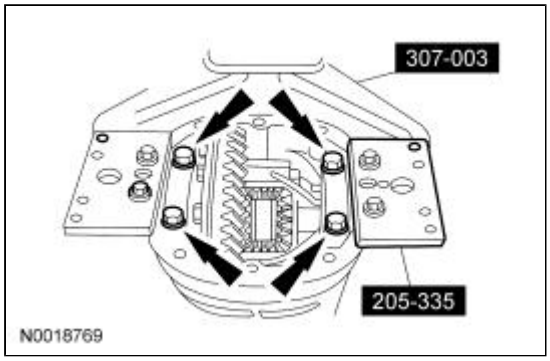
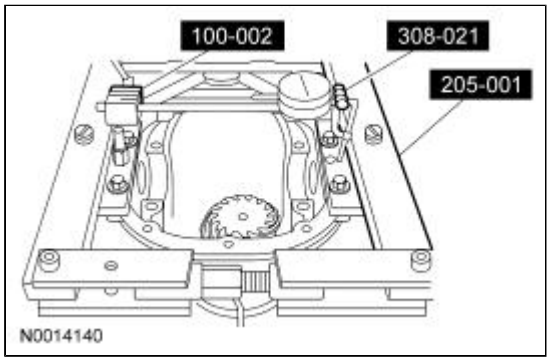
35. Remove the 4 differential bearing cap bolts.
    - Remove the differential carrier.



36. Measure the thickness of the selected right and left bearing shims.

37. To establish differential bearing preload, increase both the left and right differential bearing shim thickness by 0.203 mm (0.008 in).

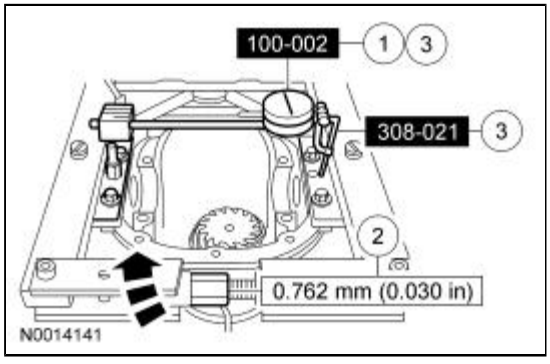
38. Install the special tools.



39. **CAUTION: Overspreading may damage the differential housing.**

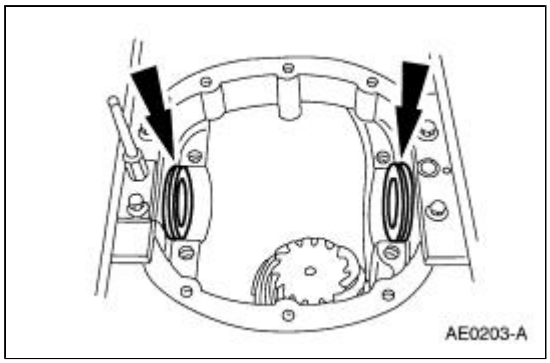
NOTE: Tighten and loosen the differential carrier spreader screw to normalize the housing spreader adapters prior to taking the final dial indicator reading.

Spread the differential housing to the specification.
1. Adjust the special tool to zero.
2. Tighten the screw until spreading the differential housing to the specification.
3. Remove the special tools.

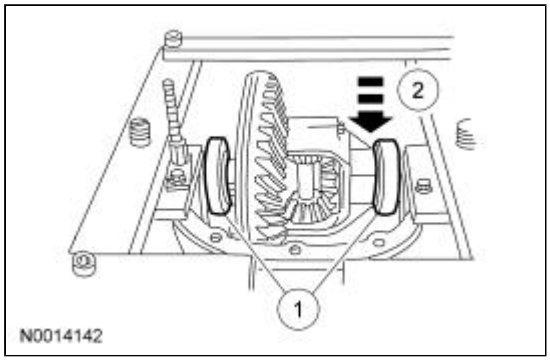


40. **CAUTION: To avoid galling the case, insert shims with a light coating of grease before installing the differential assembly. If not carried out in this order, the aluminum housing can be damaged.**

Place the differential bearing shims in the differential housing.

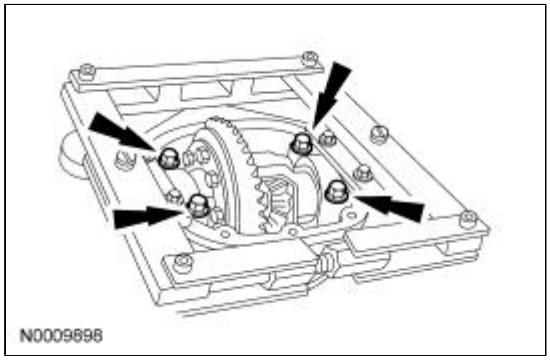


41. Install the differential carrier.
    1. Position the differential bearing cups on the differential bearings.
    2. Lower the differential carrier in place between the differential bearing shims.

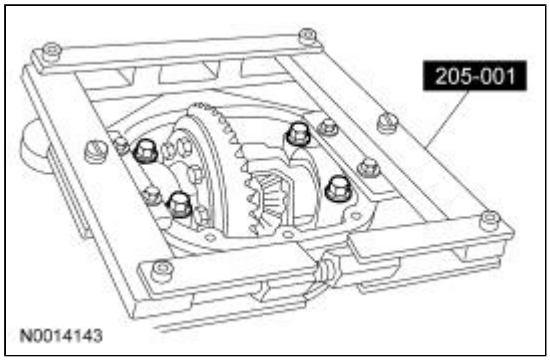


42. **NOTE:** Hand-tighten the differential bearing cap bolts prior to releasing the carrier spreader.

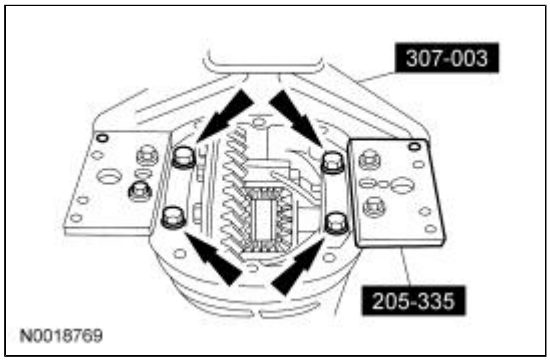
    Install the differential bearing caps and the differential bearing cap bolts in their original locations and positions.



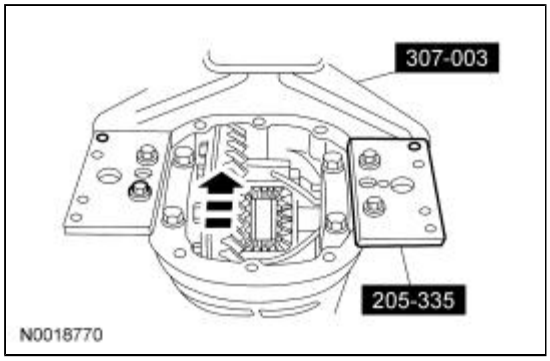
43. Loosen and remove the special tool.



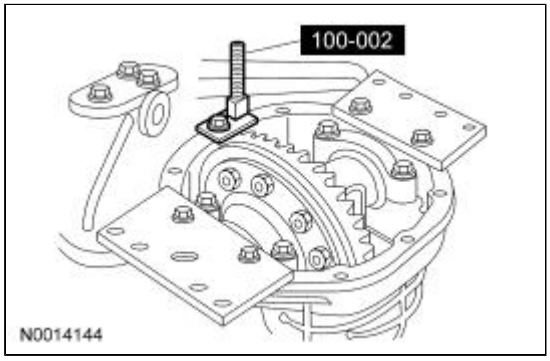
44. Tighten the 4 differential bearing cap bolts.
    - Tighten to 105 Nm (77 lb-ft).



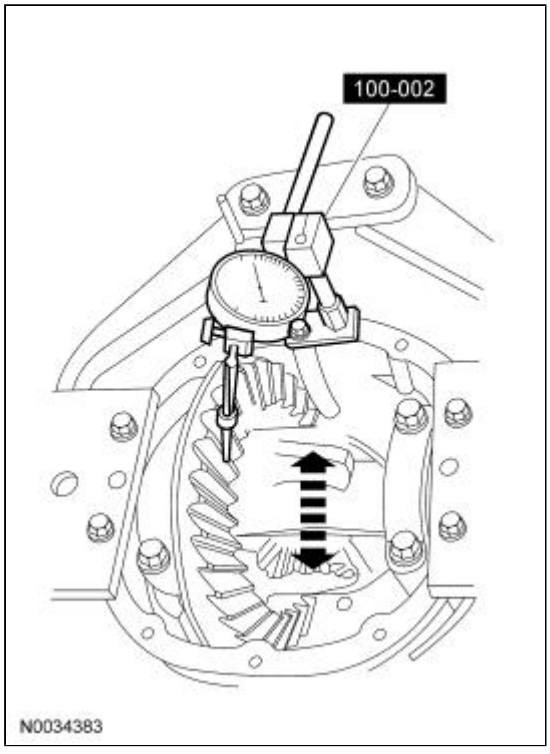
45. Rotate the differential carrier to make sure it turns freely.



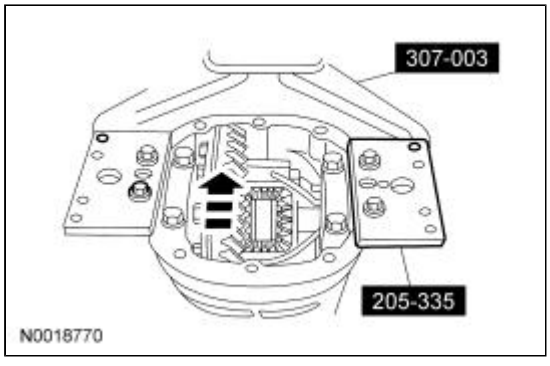
46. Install the special tool at the 12 o'clock position.



47. Using the special tools, recheck the ring gear backlash.

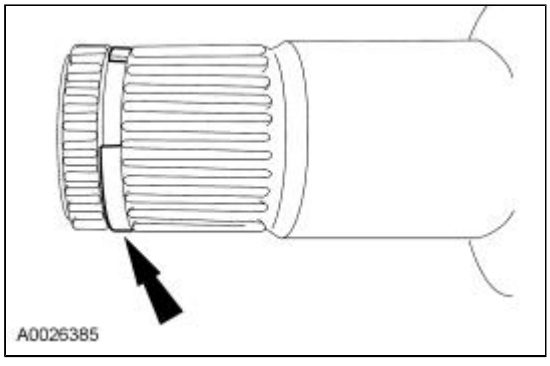


48. Apply marking compound and rotate the differential assembly 5 complete revolutions.

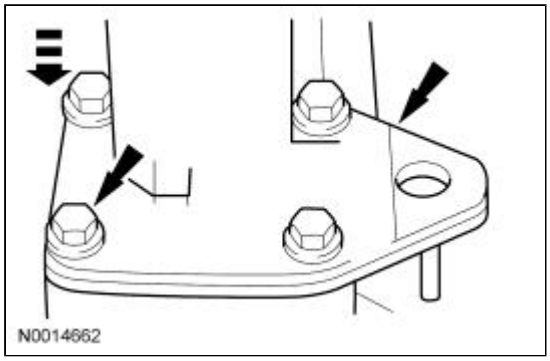


49. Verify an acceptable pattern check. For additional information, refer to Diagnosis and Testing in this section.

50. Install a new O-ring and new circlips on the intermediate shaft ends.



51. Install the axle housing tube.
    - Tighten to 73 Nm (54 lb-ft).



52. Install a new stub shaft seal. For additional information, refer to Stub Shaft Pilot Bearing and Seal in this section.

53. Insert the intermediate shaft and engage the circlip with the differential side gear.

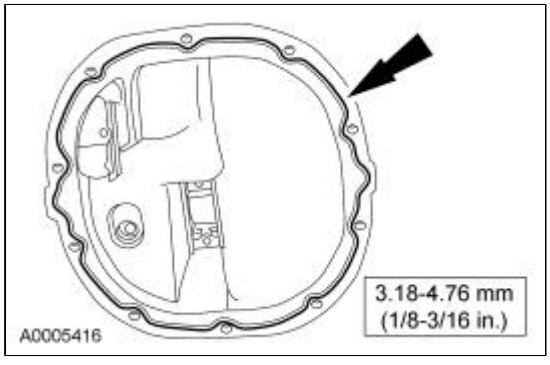
54. Remove the axle assembly from the special tool and place it on the bench.

55. **CAUTION: The machined surfaces on the differential housing and the differential housing cover must be clean and free of oil before applying the new silicone sealant. Cover the inside of the axle before cleaning the machined surface to prevent contamination.**

    CAUTION: Install the differential housing cover within 15 minutes of applying the silicone material.

    CAUTION: Allow the sealant to cure for 1 hour before filling the axle with lubricant.

    Apply a continuous bead of sealant, of the specified thickness, to the differential housing cover mounting surface.
    - Use silicone gasket and sealant.



56. Install the differential housing cover.

57. Fill the axle assembly with the specified amount any type of axle lubricant.

58. Install the rear axle assembly. For additional information, refer to Axle Assembly in this section.

Differential Bearings

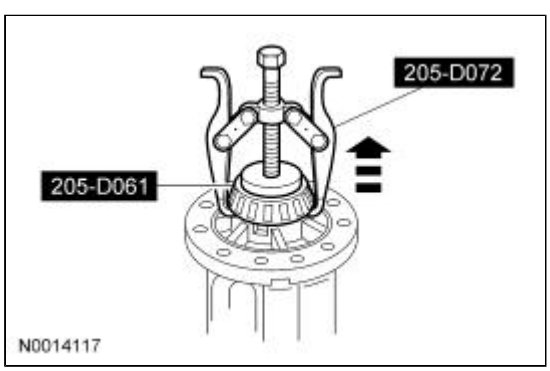
Material

Item	Specification
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B
Motorcraft 80W-90 Premium Rear Axle Lubricant XY-80W90-QL (US); CXY-80W90-IL (Canada); (Model 60/70 axles)	WSP-M2C197-A

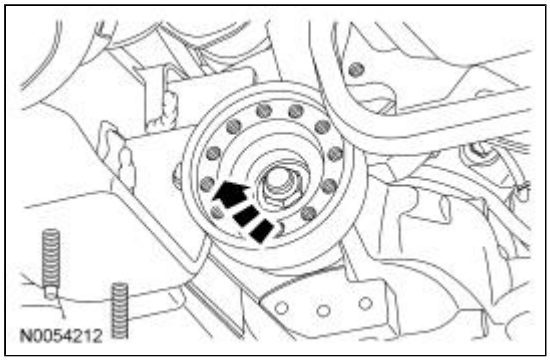
Removal

1. Remove the differential carrier. For additional information, refer to Differential Carrier in this section.

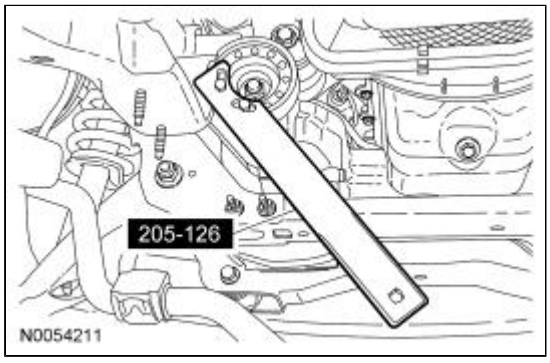
2. Using the special tools, remove the 2 differential bearings.



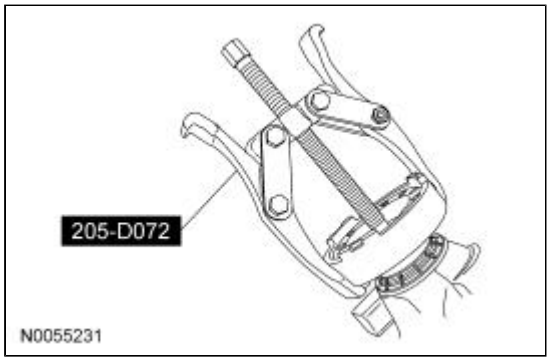
3. Index-mark the pinion flange to the drive pinion gear.



4. Install the special tool and loosen, but do not remove, the pinion nut.
    - Remove the special tool.



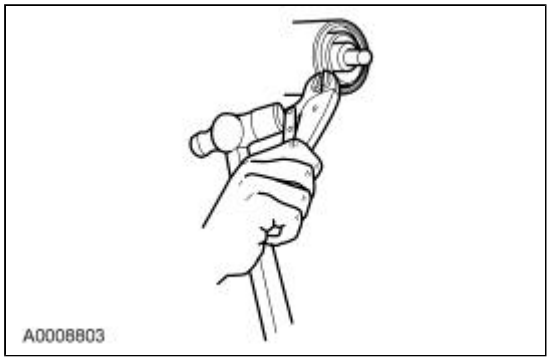
5. With the pinion nut still engaged by a few threads, use the special tool to separate the pinion flange from the drive pinion gear.



6. Remove the pinion nut and the pinion flange.

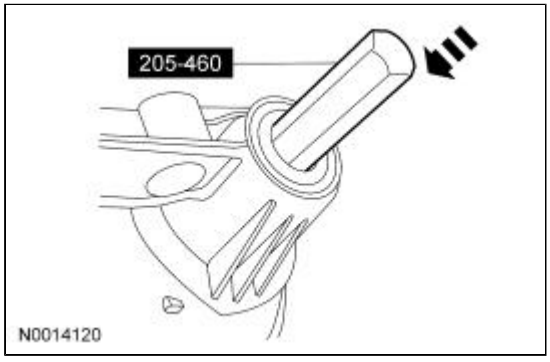
7. **CAUTION: Do not damage the axle housing while removing the drive pinion seal.**

   Remove the drive pinion seal and drive pinion oil slinger.
    - Pry up on the drive pinion seal flange. Install gripping pliers, and strike with a hammer to remove the drive pinion seal.

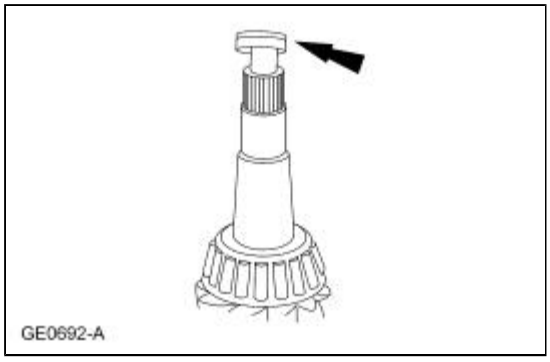


8. Remove the outer drive pinion bearing.

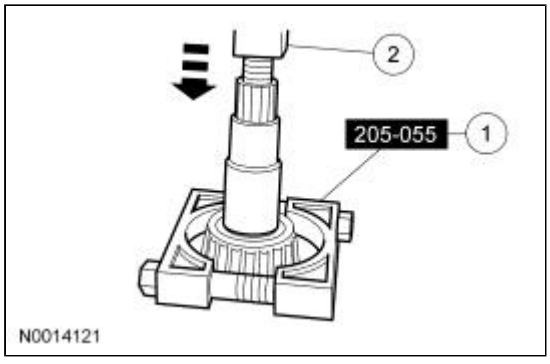
9. Using the special tool and a soft hammer, remove the drive pinion gear.



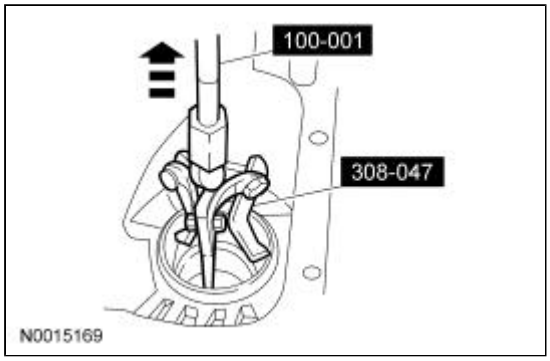
10. Remove and discard the drive pinion collapsible spacer.



11. Using the special tool and a press, remove the drive pinion inner bearing.
    1. Position the special tool under the drive pinion inner bearing.
    2. Using a press, remove the inner drive pinion bearing and shim.

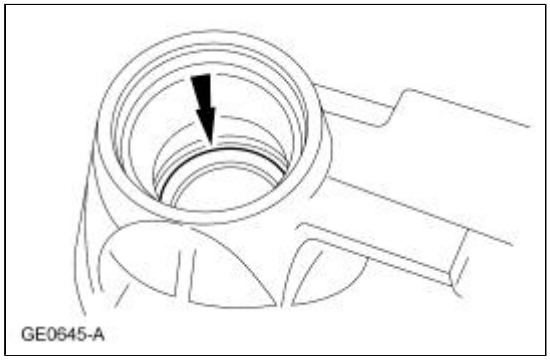


12. Using the special tools, remove the inner drive pinion bearing cup.

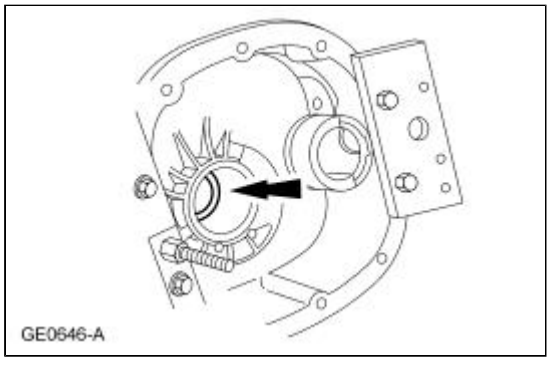


13. **NOTE:** The pinion bearing oil baffle aids in bearing lubrication. Normally, it is not necessary to remove the baffle.

    If necessary, remove the pinion bearing oil baffle.



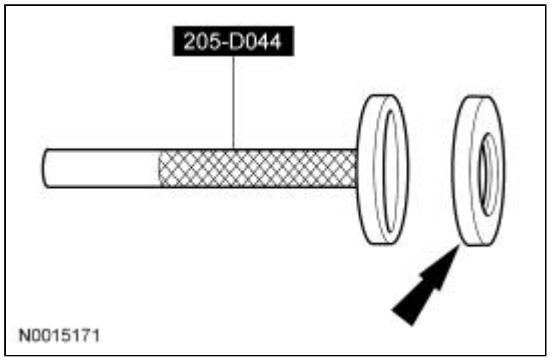
14. Remove the outer drive pinion bearing cup by tapping alternately on each side to prevent the drive pinion bearing cup from becoming misaligned.



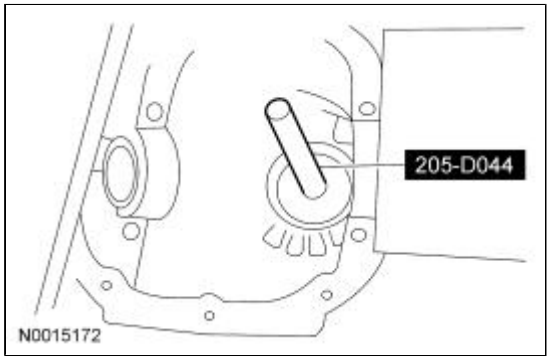
Installation

1. **CAUTION: Do not omit the drive pinion bearing oil baffle or drive pinion bearing failure can result.**

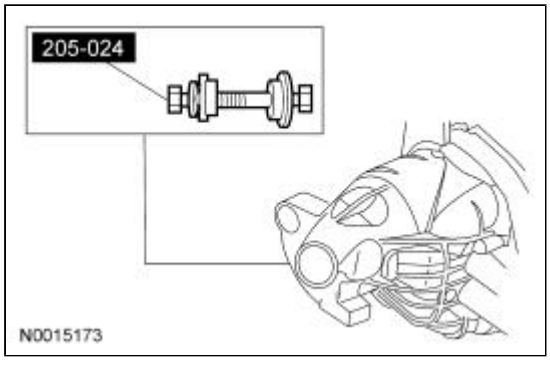
   If removed, position the drive pinion bearing oil baffle on the special tool.



2. Using the special tool, install the drive pinion bearing oil baffle.



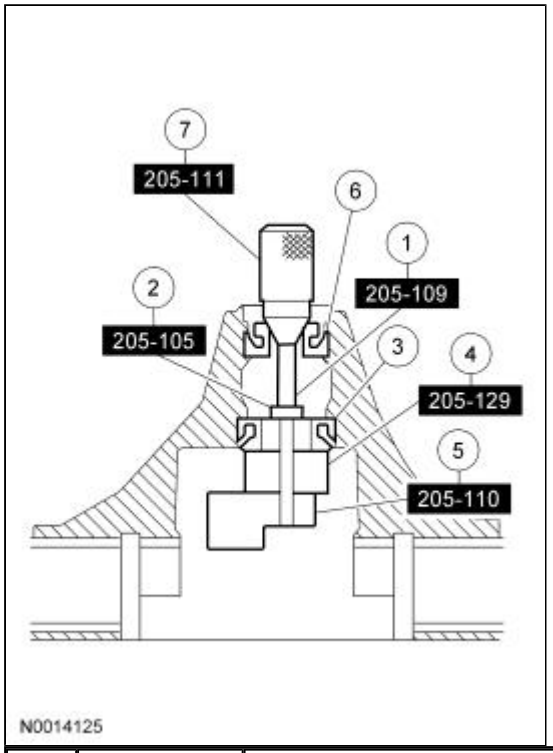
3. Using the special tool, install the drive pinion bearing cups.



4. **CAUTION: Use the same drive pinion bearings and the drive pinion bearing adjustment shim from the drive pinion bearing adjustment shim selection procedure for final assembly.**

   NOTE: Install new drive pinion bearings without any additional lubricant since the anti-rust oil provides adequate lubricant without upsetting the drive pinion bearing preload settings.

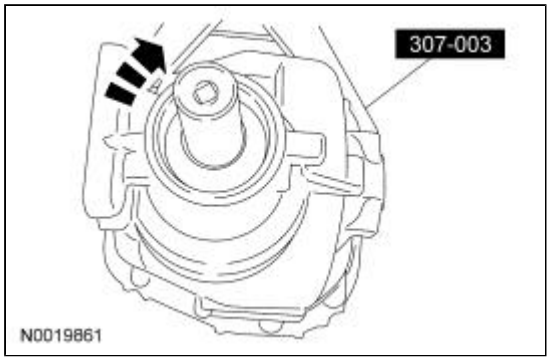
   Assemble and position the special tools.



Item	Part Number	Description
1	205-109	Adapter for 205-S127 (T76P-4020-A9)
2	205-105	Adapter for 205-S127 (1.612 inch O.D.) (T76P-4020-A3)
3	4630	Drive pinion bearing (inner)
4	205-129	Adapter for 105-S127 (1.1884 inch thick) (T79P-4020-A18)
5	205-110	Adapter for 205-S127 (1.7 inch thick) (T76P-4020-A10)
6	4621	Drive pinion bearing (outer)
7	205-111	Adapter for 205-S127 (T76P-4020-A11)

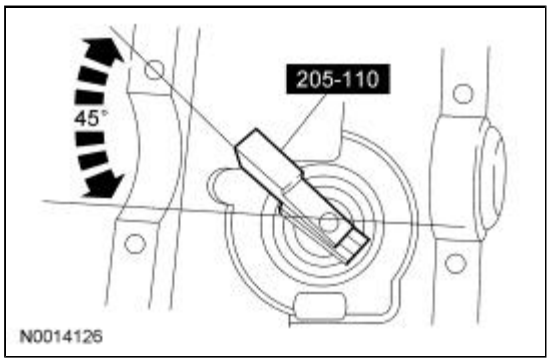
5. **NOTE:** This step duplicates final drive pinion bearing preload.

   Tighten the special tool.
   - Tighten to 2.2 Nm (20 lb-in).

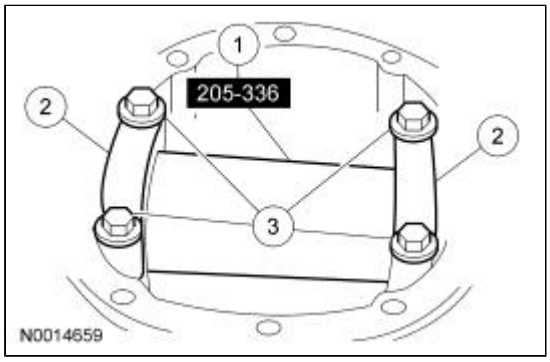


6. **NOTE:** The special tool must be offset to obtain an accurate reading.

Rotate the special tool several half-turns to make sure of correct seating of the drive pinion bearings and position the special tool.



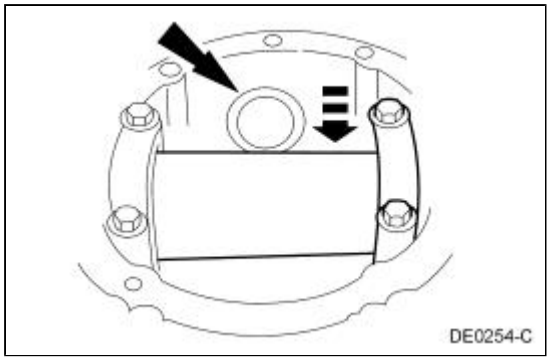
7. Install the special tool.
    1. Position the special tool.
    2. Install the differential bearing caps.
    3. Install the 4 differential bearing cap bolts.
        - Tighten to 105 Nm (77 lb-ft).



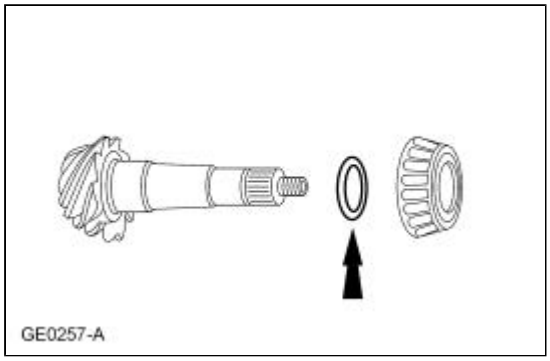
8. **NOTE:** Drive pinion bearing adjustment shims must be flat and clean.

    NOTE: A slight drag should be felt for correct drive pinion bearing adjustment shim selection. Do not attempt to force the drive pinion bearing adjustment shim between the gauge block and the gauge tube. This will minimize selection of a drive pinion bearing adjustment shim thicker than required, which results in a deep tooth contact in final assembly of integral axle assemblies.

    Use a drive pinion bearing adjustment shim as a gauge for drive pinion bearing adjustment shim selection.
    - After the correct drive pinion bearing adjustment shim thickness has been determined, remove all of the special tools.

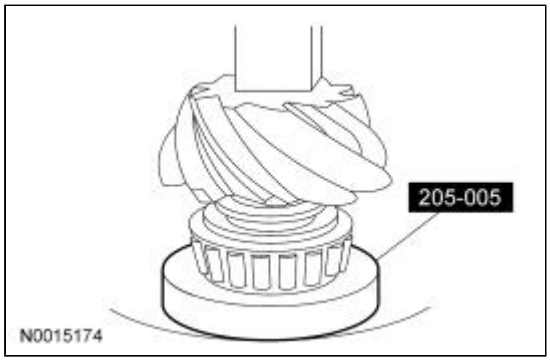


9. Position the drive pinion bearing adjustment shim and the inner pinion bearing on the drive pinion gear stem.

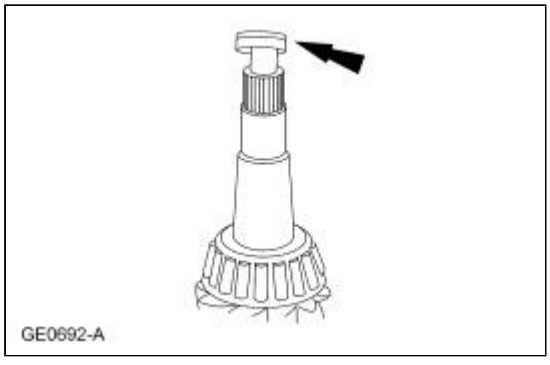


10. **NOTE:** You must use the same drive pinion bearing from the previous steps.

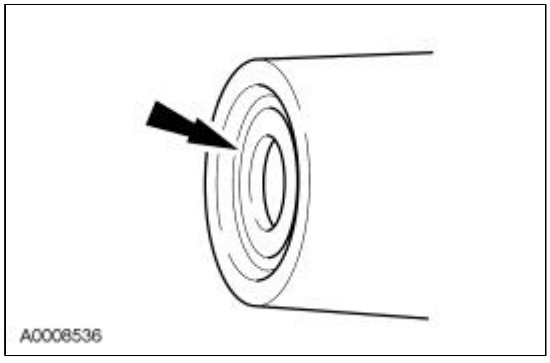
    Install the inner drive pinion bearing.
    - Place the drive pinion bearing adjustment shim on the drive pinion gear.
    - Using a suitable press and the special tool, press the inner drive pinion bearing until it is firmly seated on the pinion gear.



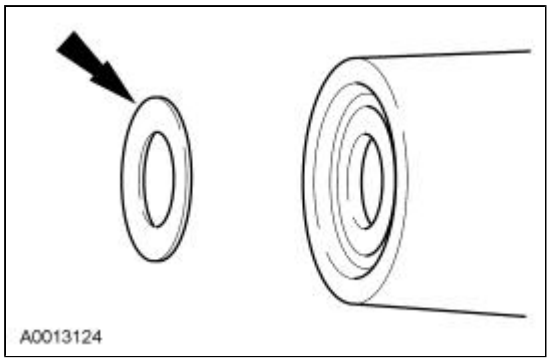
11. Place a new drive pinion collapsible spacer on the drive pinion gear.



12. Install the outer drive pinion bearing.

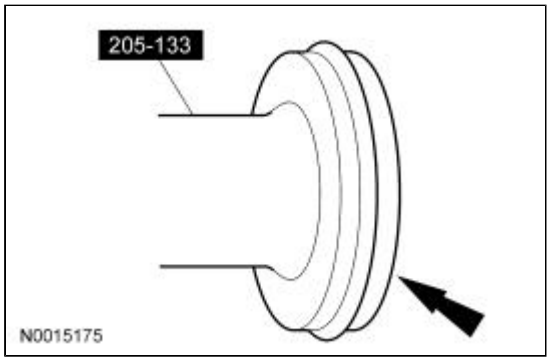


13. Install the drive pinion oil slinger.



14. **NOTE:** Coat the drive pinion seal lips with long-life grease.

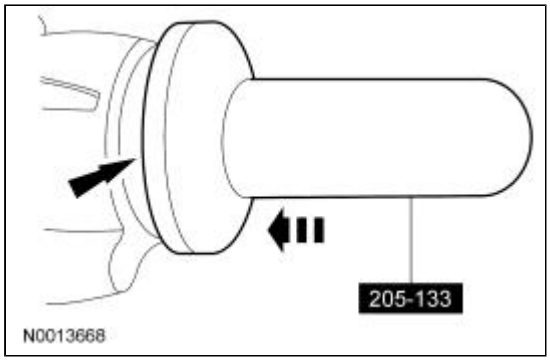
    Install the drive pinion seal on the special tool.



15. **CAUTION: Installation without the correct tool can result in early drive pinion seal failure.**

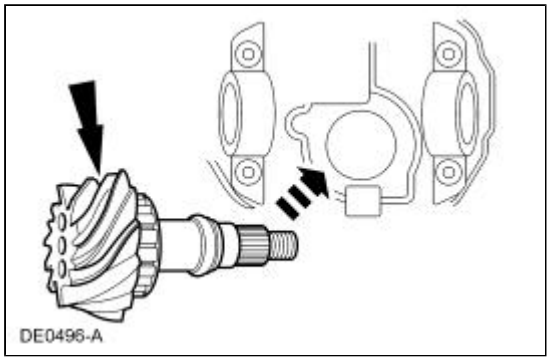
    CAUTION: If the drive pinion seal becomes misaligned during installation, remove it and install a new drive pinion seal.

    Using the special tool, install the drive pinion seal.



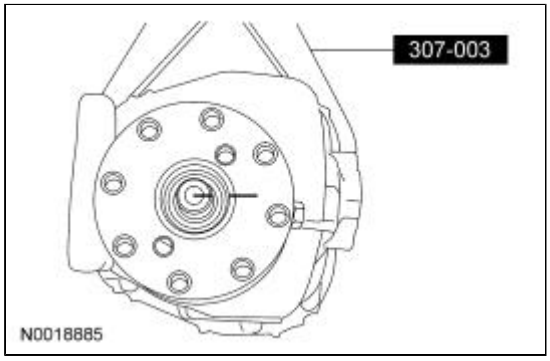
16. Lightly lubricate the drive pinion gear splines with rear axle lubricant.

17. Position the drive pinion gear in the axle housing.

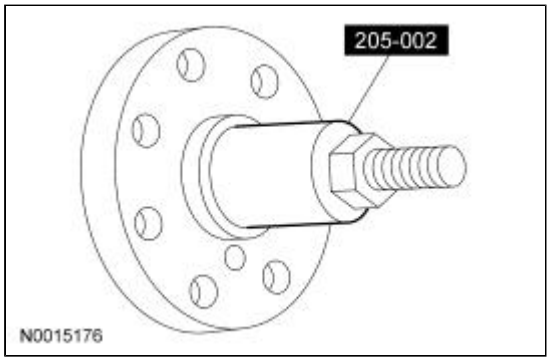


18. **CAUTION: Never install the pinion flange with a hammer or power tools.**

    Position the pinion flange.
    - Position the pinion flange on the drive pinion gear.



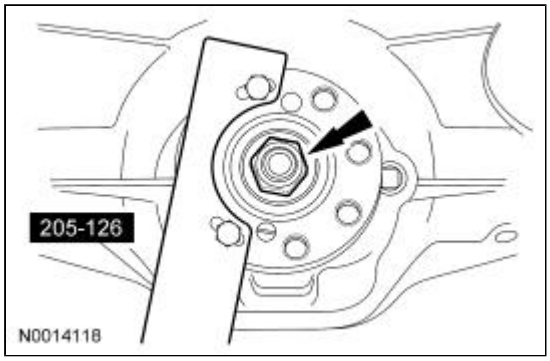
19. Using the special tool, install the pinion flange.

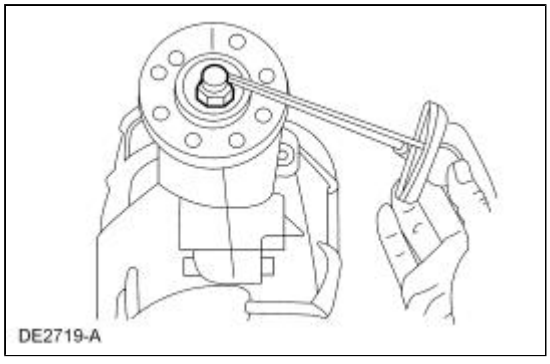


20. Apply a small amount of axle lubricant to the washer side of the new pinion nut and install the new pinion nut.

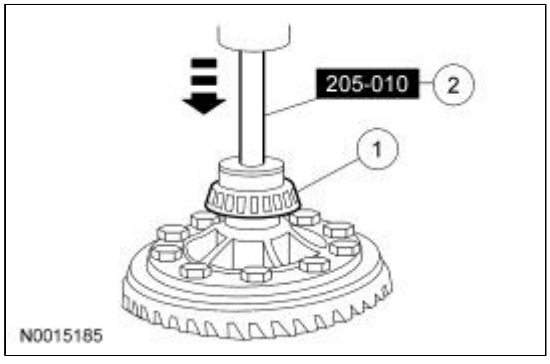
21. **CAUTION: Do not loosen the pinion nut to reduce drive pinion bearing preload under any circumstance. If it is necessary to reduce drive pinion bearing preload, install a new drive pinion collapsible spacer and pinion nut.**

    Install the special tool and tighten the pinion nut. Refer to the torque specifications in the Specifications portion of this section.
    - Rotate the drive pinion gear occasionally to make sure the drive pinion bearings are seating correctly. Take frequent drive pinion bearing preload readings by rotating the drive pinion gear with a Nm (lb-in) torque wrench.

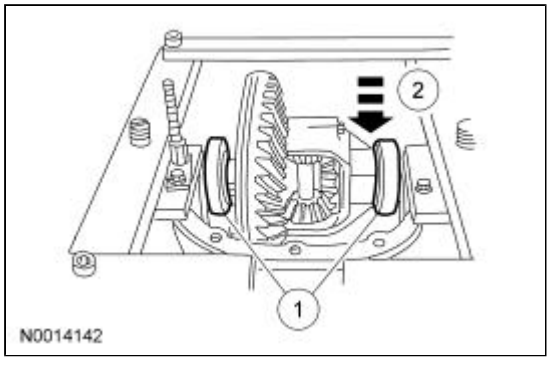




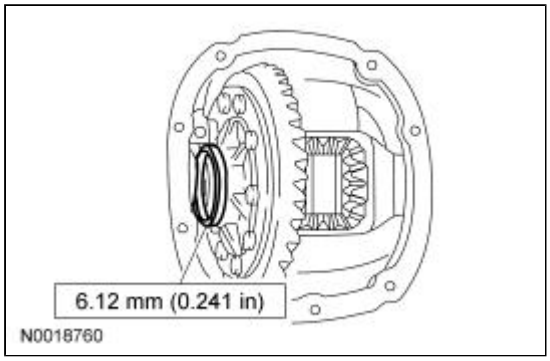
22. Press the left and right differential bearing on the differential case.
    1. Position the differential bearing.
    2. Using the special tool, press the differential bearing on the differential case.



23. Install the differential carrier.
    1. Position the differential bearing cups on the differential bearings.
    2. Lower the differential carrier in place.

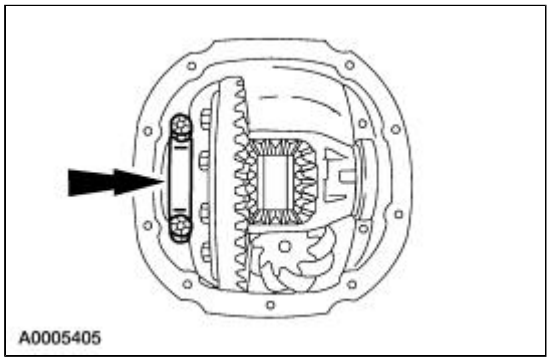


24. Install a differential bearing shim of the thickness shown on the LH side of the differential bearing.



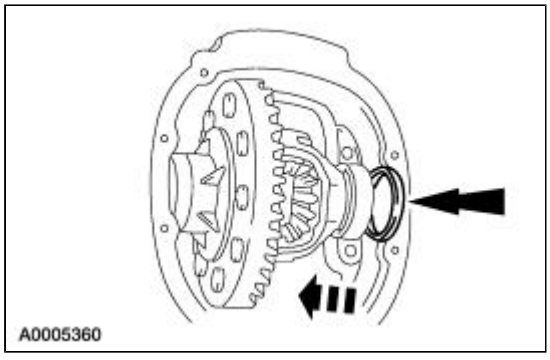
25. **NOTE:** Apply pressure toward the left side to make sure the left bearing cap is seated.

    Install the left bearing cap and loosely install the bearing cap bolts.



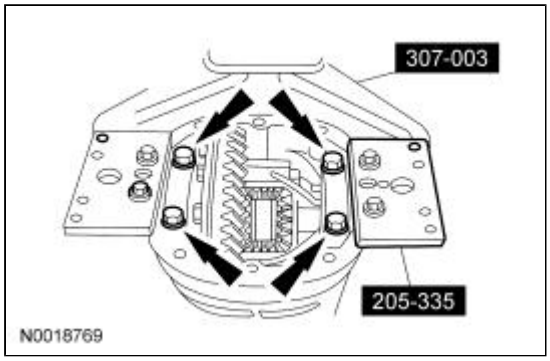
26. **NOTE:** Apply pressure toward the left side to make sure the left bearing cap is seated.

    Install progressively thicker differential bearing shims on the right side until the thickest differential bearing shim can be inserted by hand.

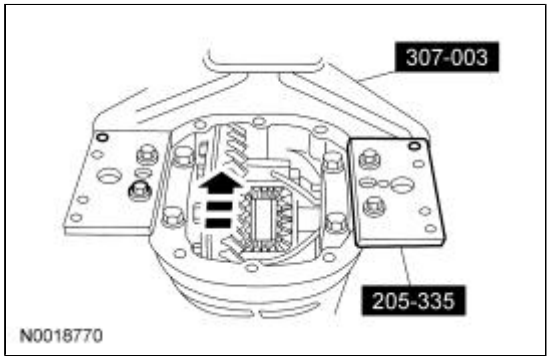


27. Install the right bearing cap and bolts.

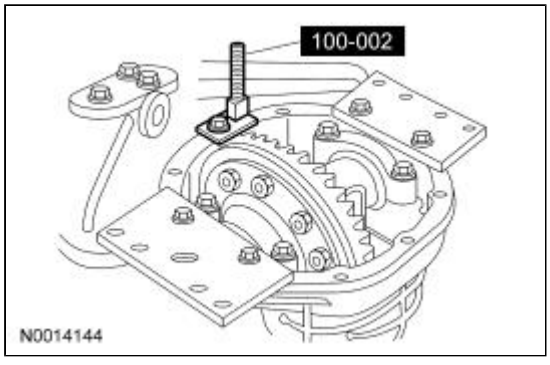
28. Tighten the 4 differential bearing cap bolts.
    - Tighten to 105 Nm (77 lb-ft).



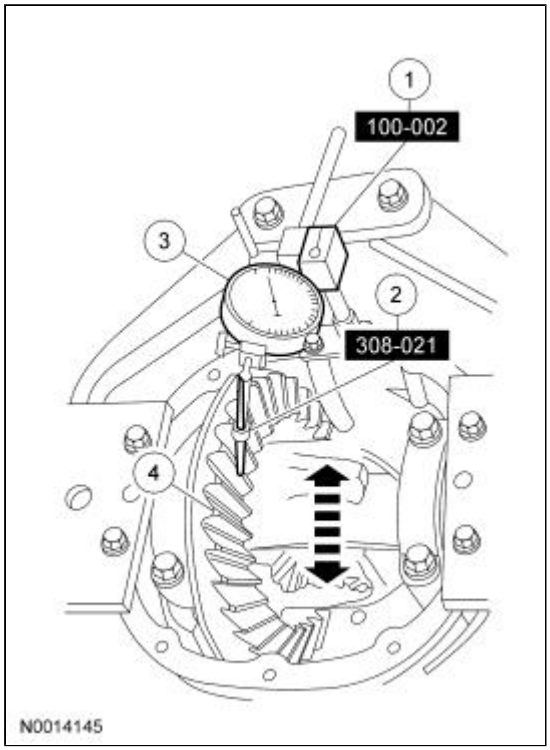
29. Rotate the differential carrier to make sure it turns freely.



30. Install the special tool at the 12 o'clock position.



31. Using the special tools, measure the differential ring gear backlash at 4 equally spaced points.
    1. Attach the special tool.
    2. Position the special tool tip centrally on a drive tooth.
    3. Zero the indicator.
    4. Turn the differential ring gear without turning the drive pinion gear. Record the indicator reading. The allowable backlash is 0.203 mm (0.008 in) to 0.305 mm (0.012 in) and must not vary more than 0.101 mm (0.004 in) between points measured.
        - To correct for a high or low backlash, proceed as follows.



32. To correct for high or low backlash, increase the thickness of one differential bearing shim and decrease the thickness of the other differential bearing shim by the same amount. Refer to the following tables when adjusting the backlash.

Backlash Change Required		Thickness Change Required	
mm	Inch	mm	Inch
0.025	0.001	0.050	0.002
0.050	0.002	0.050	0.002

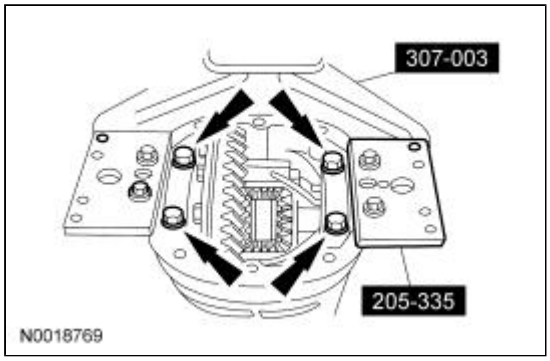
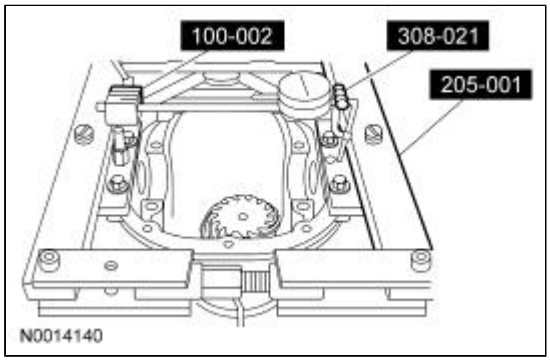
33. Remove the 4 differential bearing cap bolts.
    - Remove the differential carrier.



34. Measure the thickness of the selected right and left bearing shims.

35. To establish differential bearing preload, increase both the left and right differential bearing shim thickness by 0.203 mm (0.008 in).

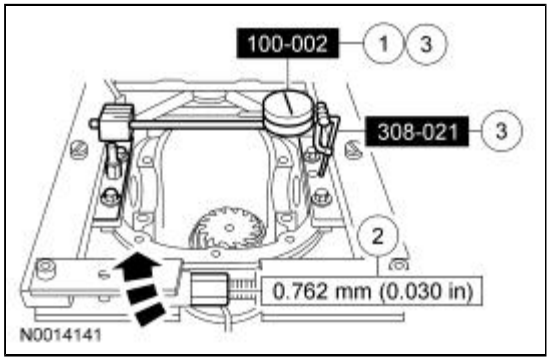
36. Install the special tools.



37. **CAUTION: Overspreading may damage the differential housing.**

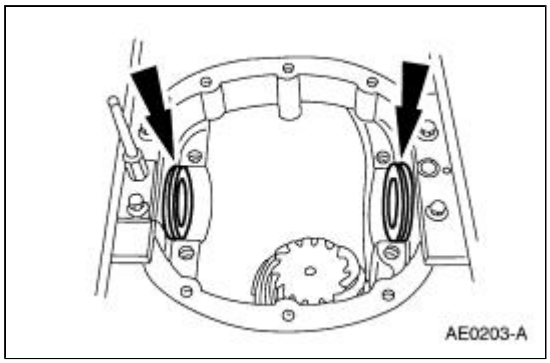
NOTE: Tighten and loosen the differential carrier spreader screw to normalize the housing spreader adapters prior to taking the final dial indicator reading.

Spread the differential housing to the specification.
1. Adjust the special tool to zero.
2. Tighten the screw until spreading the differential housing to the specification.
3. Remove the special tools.

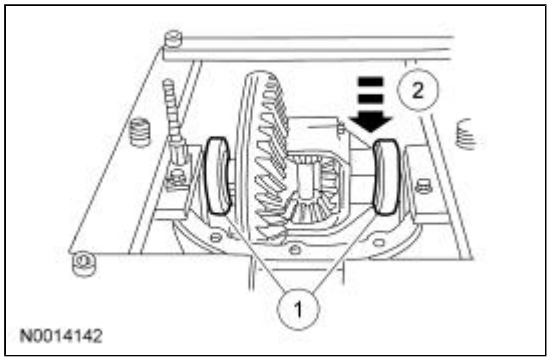


38. **CAUTION: To avoid galling the case, insert shims with a light coating of grease before installing the differential assembly. If not carried out in this order, the aluminum housing can be damaged.**

Place the differential bearing shims in the differential housing.

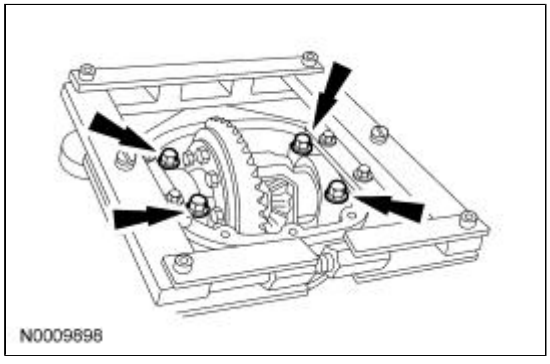


39. Install the differential carrier.
    1. Position the differential bearing cups on the differential bearings.
    2. Lower the differential carrier in place between the differential bearing shims.

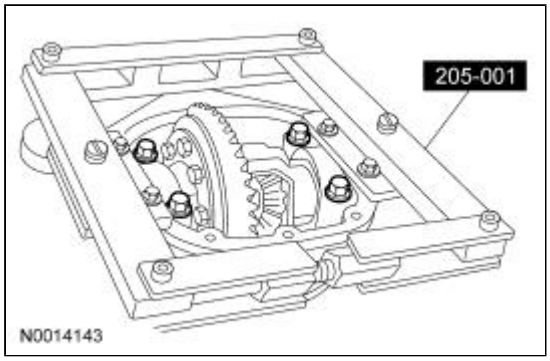


40. **NOTE:** Hand-tighten the differential bearing cap bolts prior to releasing the special tool.

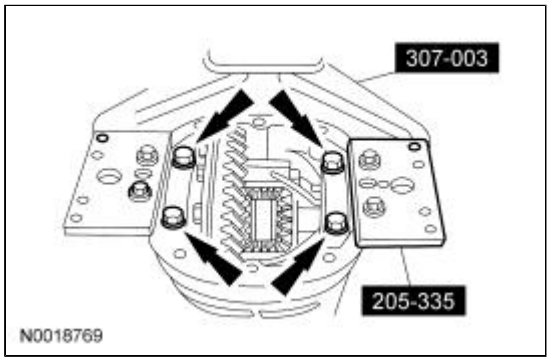
    Install the differential bearing caps and the differential bearing cap bolts in their original locations and positions.



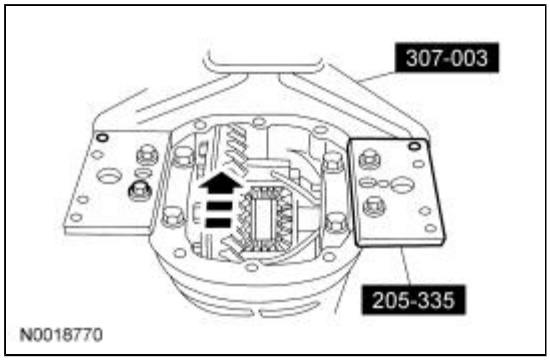
41. Loosen and remove the special tool.



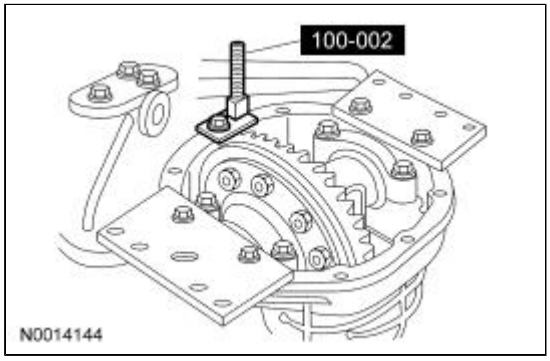
42. Tighten the 4 differential bearing cap bolts.
    - Tighten to 105 Nm (77 lb-ft).



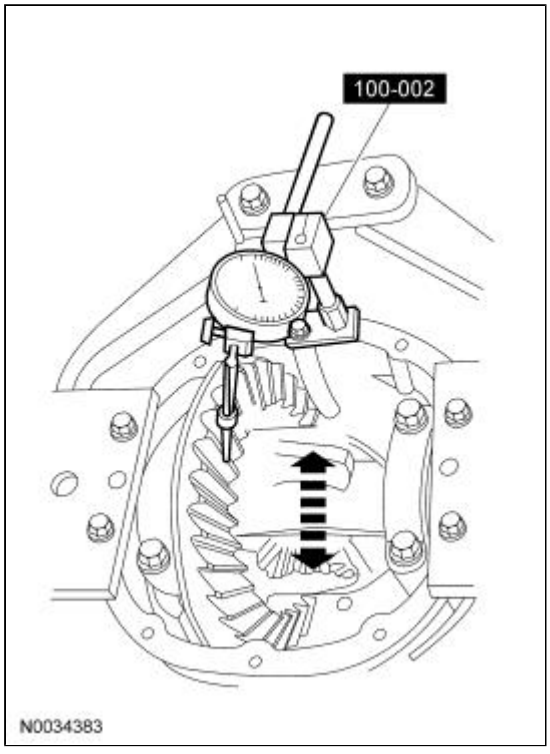
43. Rotate the differential carrier to make sure it turns freely.



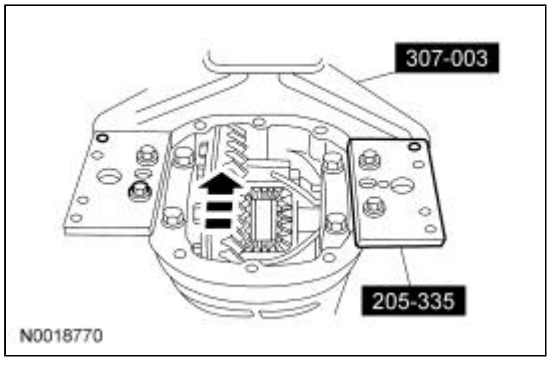
44. Install the special tool at the 12 o'clock position.



45. Using the special tools, recheck the ring gear backlash.

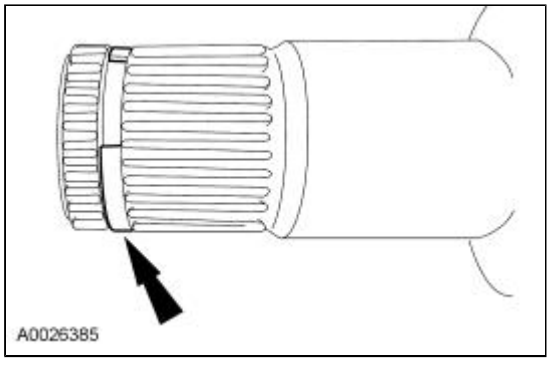


46. Apply marking compound and rotate the differential assembly 5 complete revolutions.

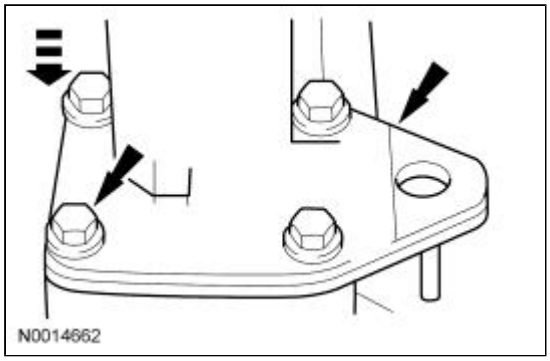


47. Verify an acceptable pattern check. For additional information, refer to Diagnosis and Testing in this section.

48. Install a new O-ring and new circlips on the intermediate shaft ends.



49. Install the axle housing tube.
    - Tighten to 73 Nm (54 lb-ft).



50. Install a new stub shaft seal. For additional information, refer to Stub Shaft Pilot Bearing and Seal in this section.

51. Insert the intermediate shaft and engage the circlip with the differential side gear.

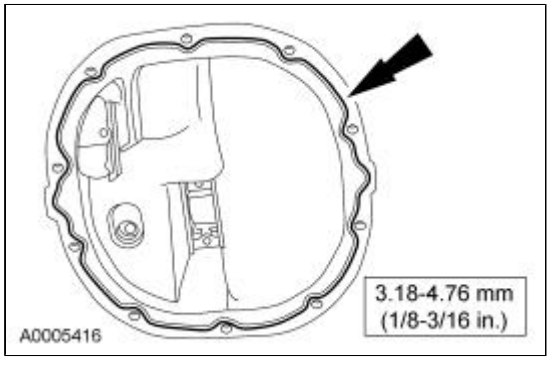
52. Remove the axle assembly from the special tool and place it on the bench.

53. **CAUTION: The machined surfaces on the differential housing and the differential housing cover must be clean and free of oil before applying the new silicone sealant. Cover the inside of the axle before cleaning the machined surface to prevent contamination.**

    CAUTION: Install the differential housing cover within 15 minutes of applying the silicone material.

    CAUTION: Allow the sealant to cure for 1 hour before filling the axle with lubricant.

    Apply a continuous bead of sealant, of the specified thickness, to the differential housing cover mounting surface.
    - Use silicone gasket and sealant.



54. Install the differential housing cover.

55. Fill the axle assembly with the specified type and amount of axle lubricant.

56. Install the rear axle assembly. For additional information, refer to Axle Assembly in this section.

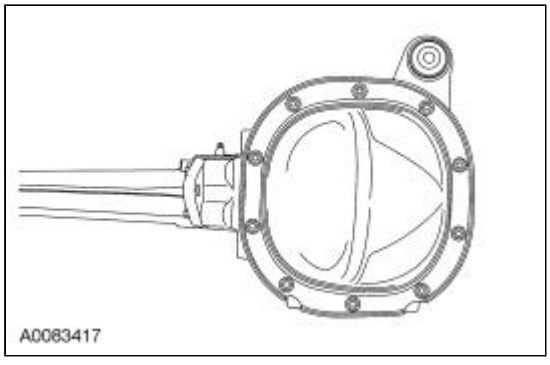
Material

Item	Specification
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B
Motorcraft 80W-90 Premium Rear Axle Lubricant XY-80W90-QL (US); CXY-80W90-1L (Canada); (Model 60/70 axles)	WSP-M2C197-A

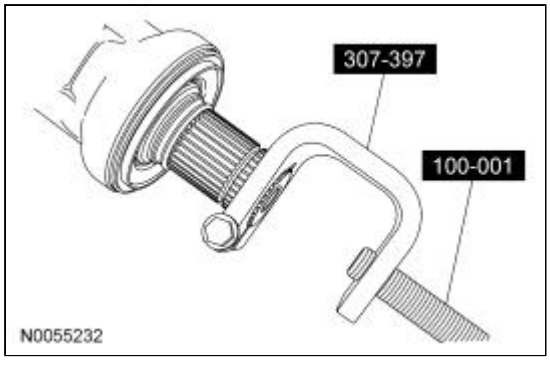
Removal

1. Remove the axle assembly. For additional information, refer to Axle Assembly in this section.

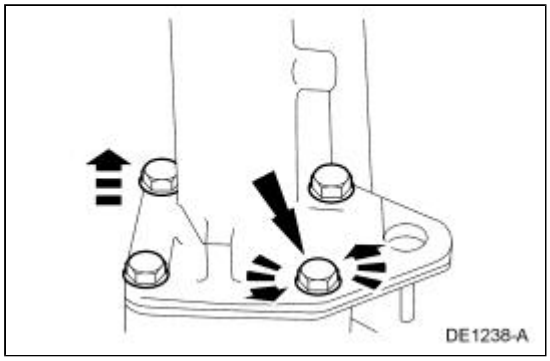
2. Remove the differential housing cover.
   - Drain the fluid.
   - Remove the 10 differential housing cover bolts.
   - Remove the differential housing cover.



3. Using the special tools, remove the intermediate shaft.

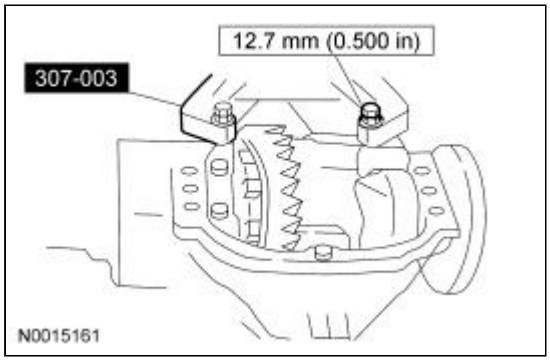


4. Remove the axle housing tube.



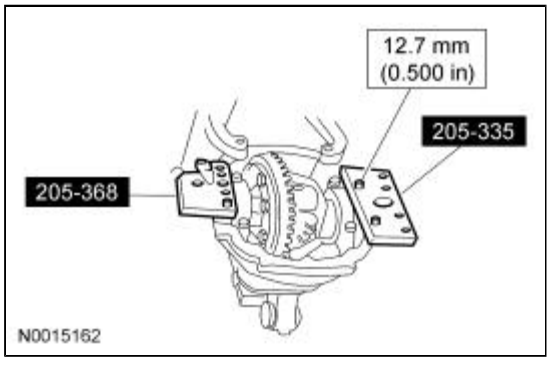
5. **CAUTION: The fixture mounting bolts must have the minimum specified thread engagement in the carrier.**

   Install the special tool.

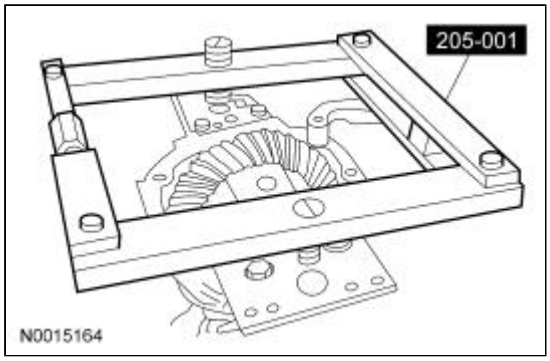


6. **CAUTION: The housing spreader adapter bolts must have the minimum specified thread engagement in the carrier.**

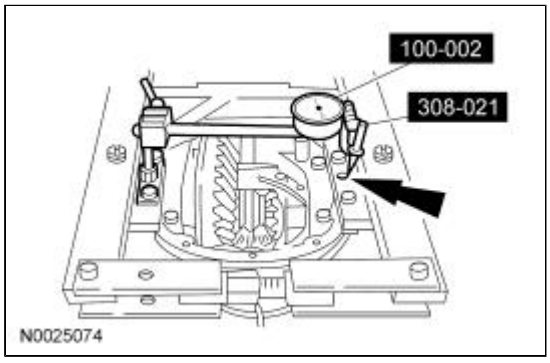
   Install the special tools.



7. Position the special tool on the spreader adapters.

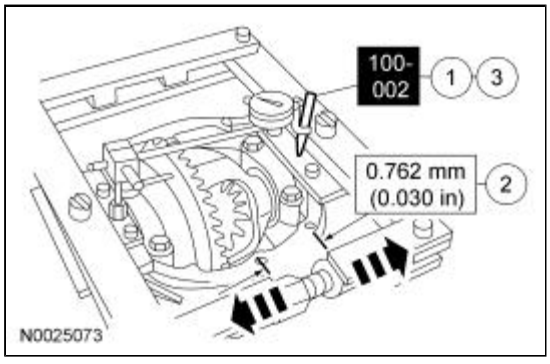


8. Install the special tools.
    - Position the adapter tip in the spreader adapter hole.



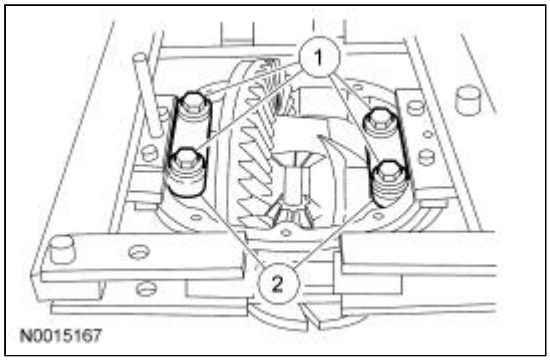
9. **CAUTION: Overspreading can damage the axle housing.**

    Spread the axle housing to the specification.
    1. Adjust the special tool to zero.
    2. Tighten the housing spreader screw to spread the axle housing to the specification.
    3. Remove the special tool.



10. **CAUTION: Mark the differential bearing caps Top or Bottom and LH or RH appropriately before removing them. Always install the differential bearing caps in their original positions.**

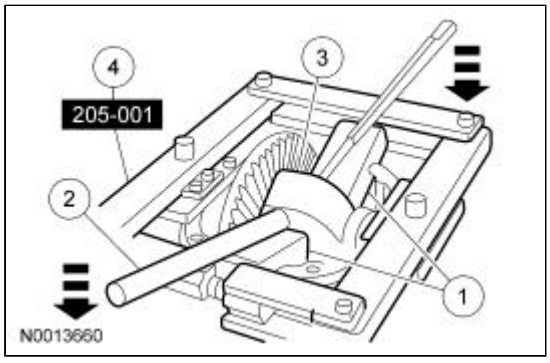
    Mark and remove the differential bearing caps.
    1. Remove the 4 differential bearing cap bolts.
    2. Remove the differential bearing caps.



11. **CAUTION: Use wood blocks to avoid axle housing damage.**

    CAUTION: Index-mark the position of the differential bearing shims. The differential bearing shims must be installed in their original locations and positions.

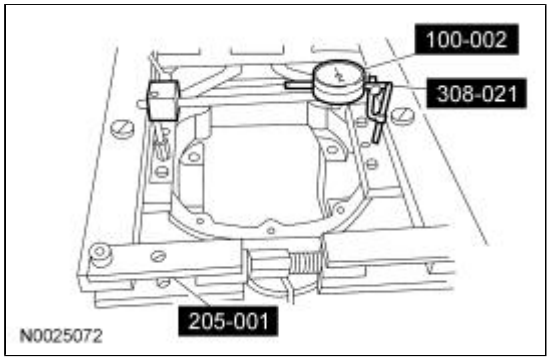
    Remove the differential carrier from the axle housing.
    1. Position the wood blocks.
    2. Position and push down on the 2 pry bars.
    3. Remove the differential carrier.
    4. Remove the special tool.



Installation

1. **NOTE:** Make sure the indicator needle is in the spreader adapter hole.

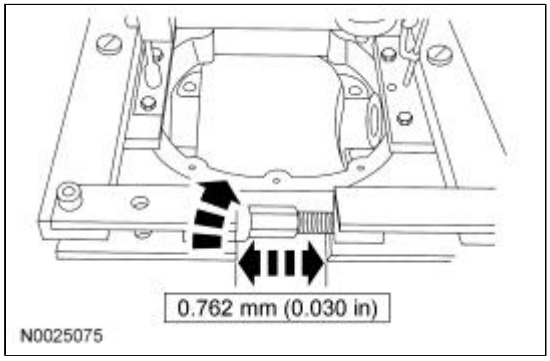
   Install the special tools.



2. **CAUTION: Overspreading can damage the axle housing.**

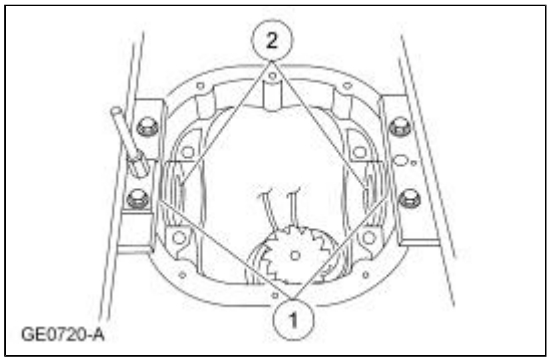
   Spread the axle housing to the specification.

- Remove the dial indicator.



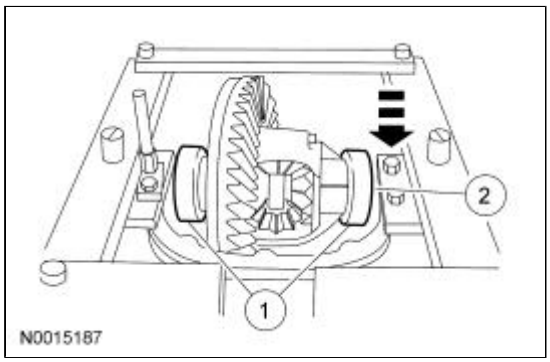
3. **CAUTION: Never attempt to drive the differential bearing shim in place. Permanent damage to the machined axle housing surfaces can occur.**

   Position the differential bearing shims.
   1. Apply a light coating of grease to one side of the differential bearing shims to help hold them in place.
   2. Position the differential bearing shims.



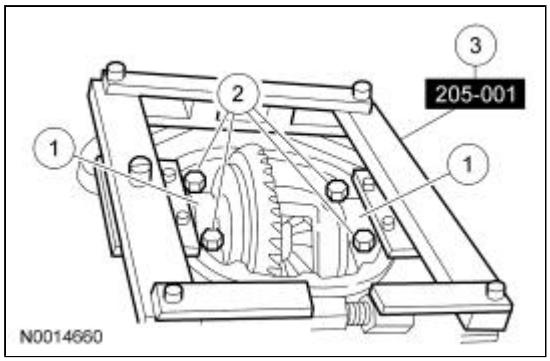
4. **NOTE:** Push the differential carrier downward to fully seat the differential bearing cups in the axle housing.

   Position the differential carrier.
   1. Position the differential bearing cups on the differential bearings.
   2. Lower the differential assembly in place between the differential bearing shims.

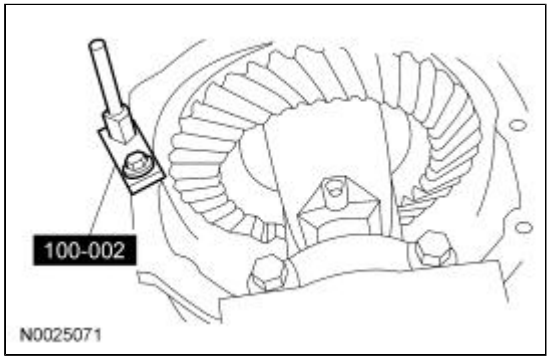


5. Install the differential bearing caps in their original positions and tighten with the housing still spread.
   1. Position the differential bearing caps.
   2. Install the 4 differential bearing cap bolts.
      - Tighten to 105 Nm (77 lb-ft).

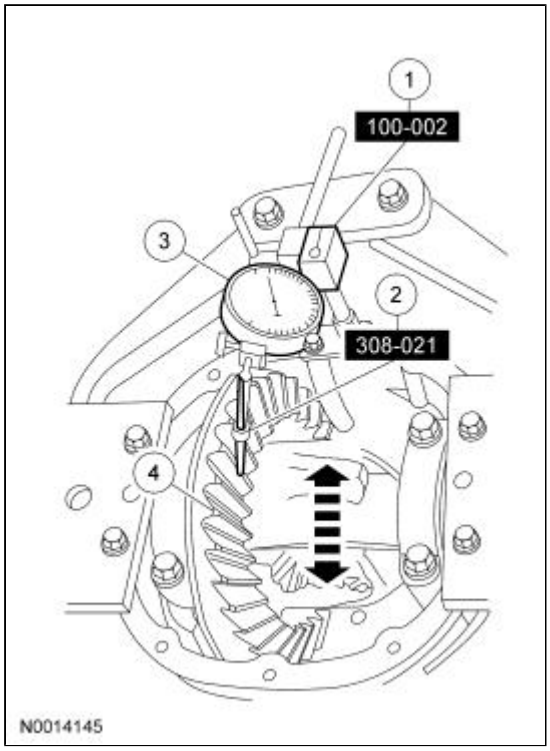
3. Remove the special tool.



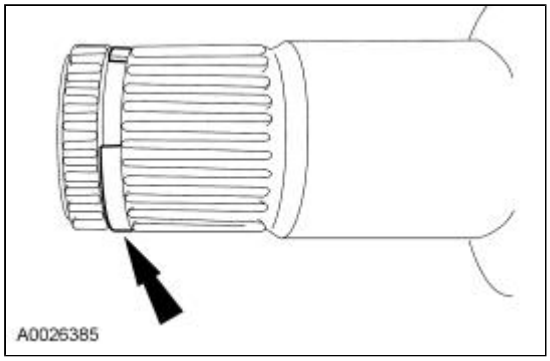
6. Install the special tool.



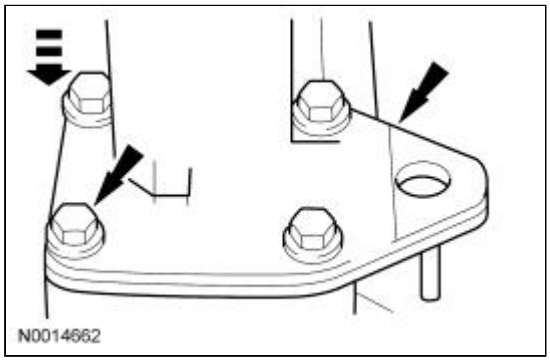
7. Using the special tools, measure the differential ring gear backlash at 4 equally spaced points.
    1. Attach the special tool.
    2. Position the special tool tip centrally on a drive tooth.
    3. Zero the indicator.
    4. Turn the differential ring gear without turning the drive pinion gear.



8. Install a new O-ring and new circlips on the intermediate shaft ends.



9. Install the axle housing tube.
    - Tighten to 73 Nm (54 lb-ft).



10. Install a new stub shaft seal. For additional information, refer to Stub Shaft Pilot Bearing and Seal in this section.

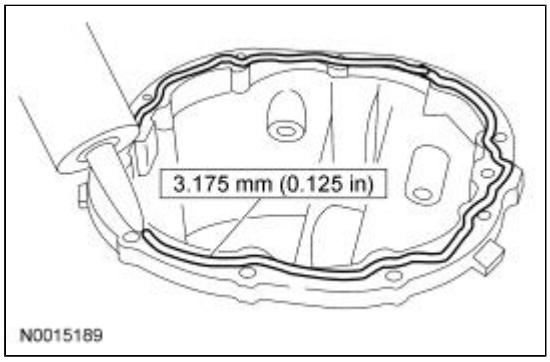
11. Insert the intermediate shaft and engage the circlip with the differential side gear.

12. Remove the axle assembly from the special tool and place it on the bench.

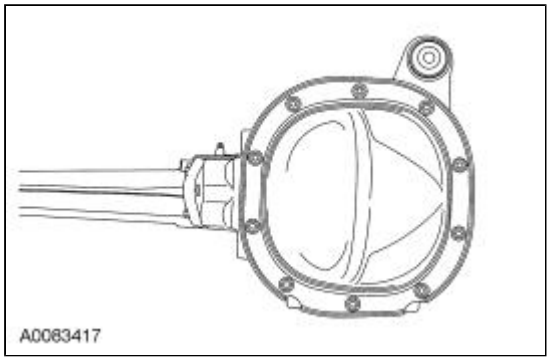
13. **CAUTION: Remove all of the silicone gasket and make sure the machined surfaces are free of oil before applying the new silicone gasket.**

    CAUTION: Install the differential housing cover within 15 minutes of applying the silicone gasket, or it will be necessary to remove and reapply silicone gasket. If possible, allow 1 hour before filling with lubricant to make sure the silicone gasket has cured.

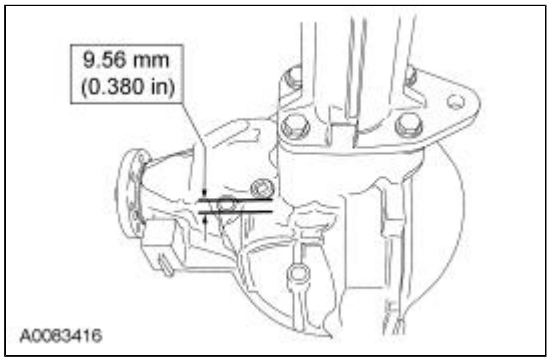
    Fill the sealing groove on the differential housing cover with silicone gasket.



14. Install the differential housing cover and the 10 differential housing cover bolts.
    - Tighten to 32 Nm (24 lb-ft).



15. Fill the axle housing with axle lubricant and install the fill plug.
    - Tighten to 25 Nm (18 lb-ft).



16. Install the axle assembly. For additional information, refer to Axle Assembly in this section.

Axle Carrier Bushing

Special Tool(s)

ST1159-A	Remover, Front Axle Mounting Bushing Cup 205-371 (T96T-5638-E)
ST1464-A	Remover/Installer, Front Differential Housing Bushing 205-527/1
ST2265-A	Installer, Wheel Hub Dust Seal 205-289 (T89P-1249-A)
ST2587-A	Remover, Front Differential Housing Bushing 204-186 (T95T-5638-AH)
ST1155-A	Remover, Front Axle Mounting Bushing 205-376 (T96T-5638-K)
ST2586-A	Installer, Front Differential Mounting Bushing 204-187 (T95T-5638-AH)
ST1162-A	Installer Front Axle Mounting Bushing Drawbolt 205-374 (T96T-5638-H)

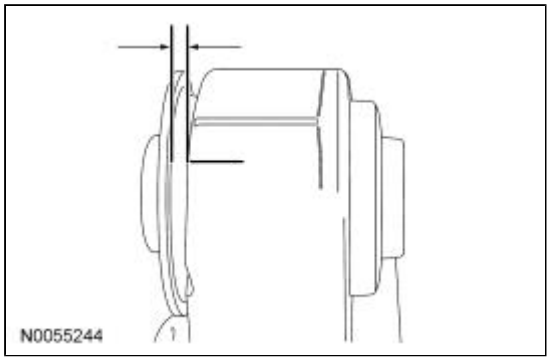
Removal

All bushings

1. **NOTE:** It is not necessary to remove the axle assembly from the jack.

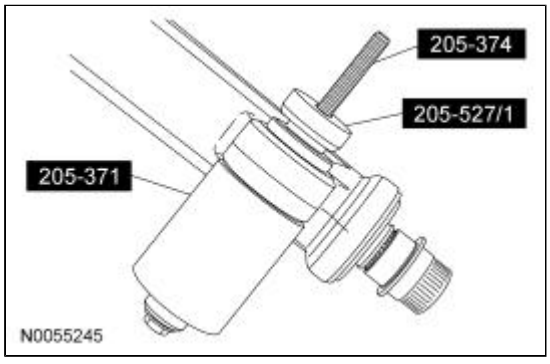
   Remove the front drive axle assembly. For additional information, refer to Axle Assembly in this section.

2. Measure and record the width of the gap between the bushing front lip and the housing. Mark the housing at the point where the measurement was taken.



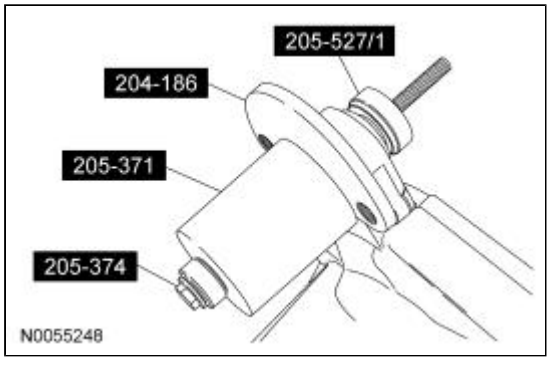
Axle tube bushing

3. Position the special tools as shown. Turn in the drawbar to remove the bushing.



Rear housing bushing

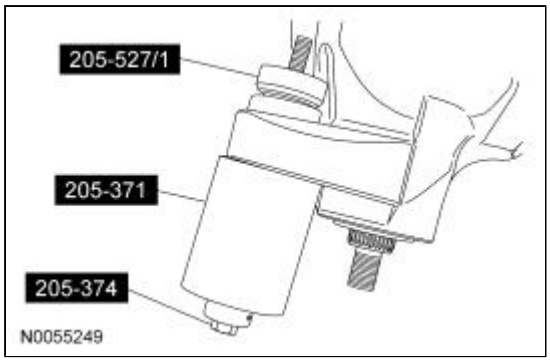
4. Position the special tools as shown. Turn in the drawbar to remove the bushing.



Front housing bushing

5. Remove the universal joint flange. For additional information, refer to Universal Joint Flange in this section.

6. Position the special tools as shown. Turn in the drawbar to remove the bushing.



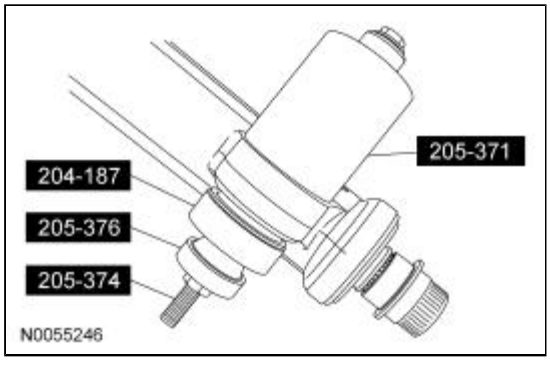
All bushings

7. Inspect the bushing bores for wear or damage.

Installation

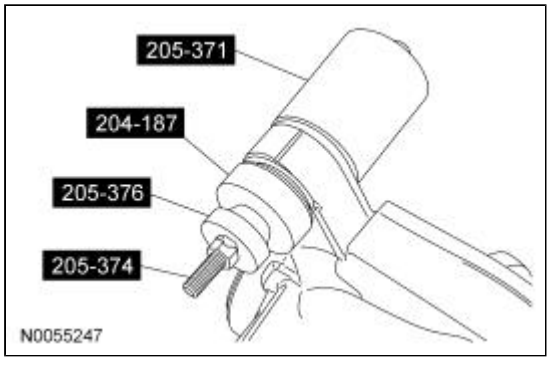
Axle tube bushing

1. Position the bushing and the special tools as shown. Draw the bushing into the bushing bore to the same depth and point measured before removal.



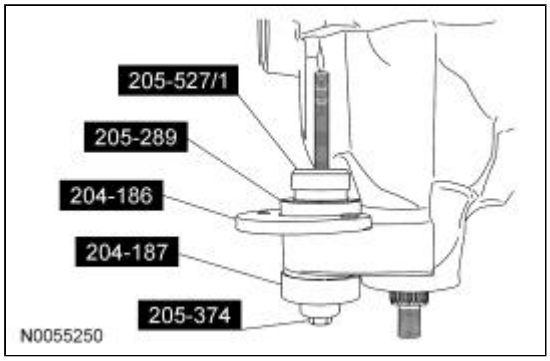
Rear housing bushing

2. Position the bushing and the special tools as shown. Draw the bushing into the bushing bore to the same depth and point measured before removal.



Front housing bushing

3. Position the bushing and the special tools as shown. Draw the bushing into the bushing bore to the same depth and point measured before removal.



4. Install the universal joint flange. For additional information, refer to Universal Joint Flange in this section.

All bushings

5. Install the front drive axle assembly. For additional information, refer to Axle Assembly in this section.

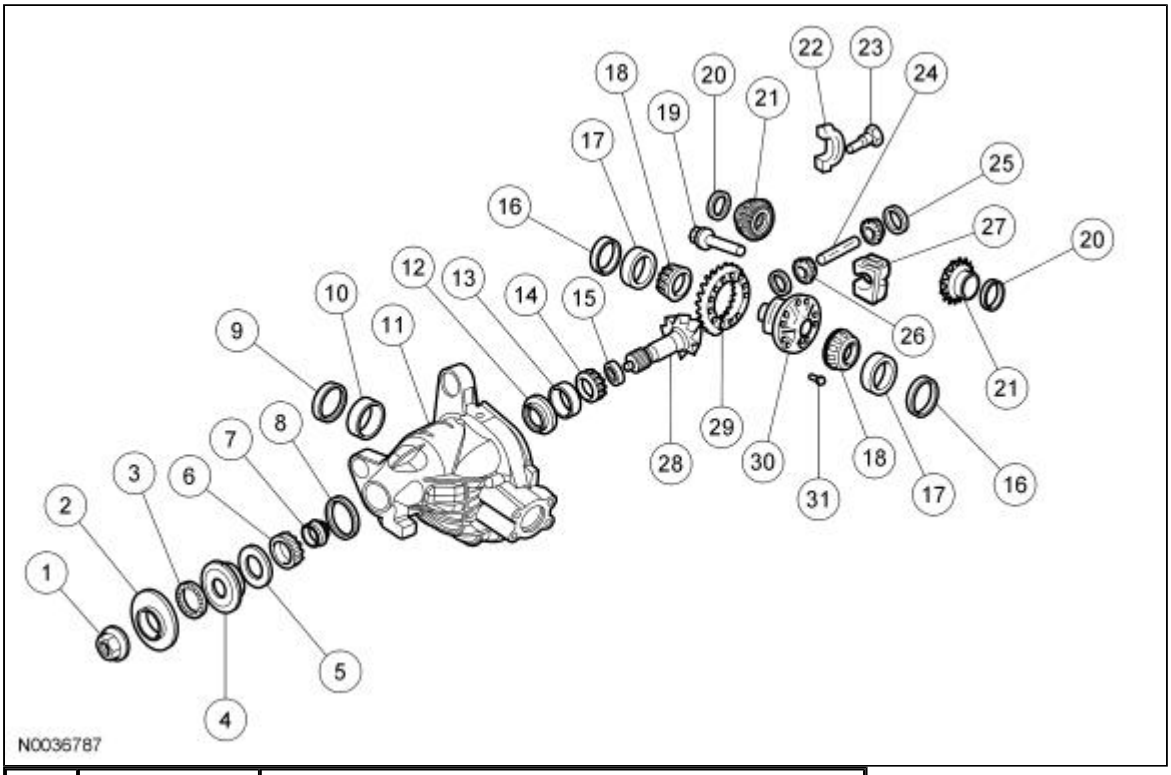
Front Differential — Disassembled View



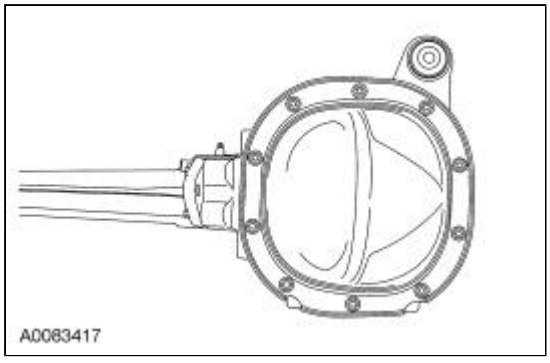
Item	Part Number	Description
1	389546	Drive pinion nut
2	4858	Drive pinion universal joint flange
3	4859	Drive pinion oil seal deflector
4	3N134	Drive pinion seal
5	386989	Drive pinion oil slinger
6	4621	Drive pinion bearing (outer)
7	4662	Drive pinion collapsible spacer
8	4616	Drive pinion bearing cup (outer)
9	4B416	Halfshaft inner dust seal
10	4B413	Halfshaft bearing assembly
11	3A412	Differential carrier
12	4631	Drive pinion bearing oil baffle
13	4628	Drive pinion bearing cup (inner)
14	4630	Drive pinion bearing (inner)
15	4663	Drive pinion bearing adjustment shim
16	4A451	Differential bearing shims (2 required)
17	4221	Differential bearing cups (2 required)
18	4221	Differential bearings (2 required)
19	387426	Differential pinion shaft bolt
20	386984	Differential side gear thrust washers (2 required)
21	4236	Differential side gears (2 required)
22	4224	Differential bearing cap (2 required)
23	391583	Differential bearing cap bolt (4 required)
24	4211	Differential pinion shaft

25	4230	Differential pinion thrust washer (2 required)
26	4215	Differential pinion gear (2 required)
27	4214	Differential clutch spring
28	3N175	Drive pinion gear
29	3A397	Differential ring gear
30	4205	Differential case
31	388056	Differential ring gear bolt (10 required)

Disassembly

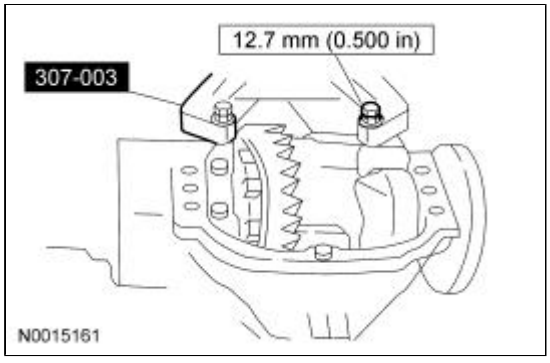
1. Remove the front drive axle assembly. For additional information, refer to Axle Assembly in this section.

2. Remove the differential housing cover.
   - Drain the fluid.
   - Remove the bolts.
   - Remove the differential housing cover.

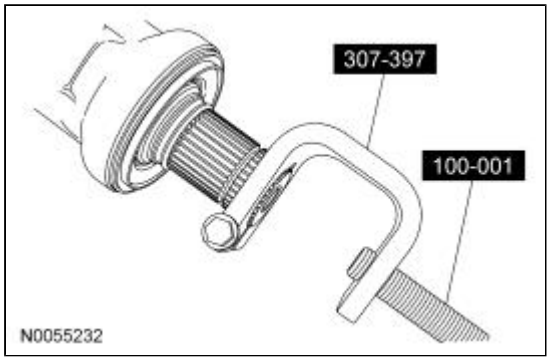


3. **CAUTION: The fixture mounting bolts must have the minimum specified thread engagement in the carrier.**

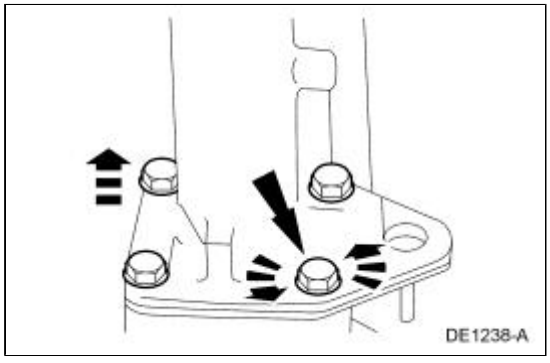
   Install the special tool.



4. Using the special tools, remove the intermediate shaft.

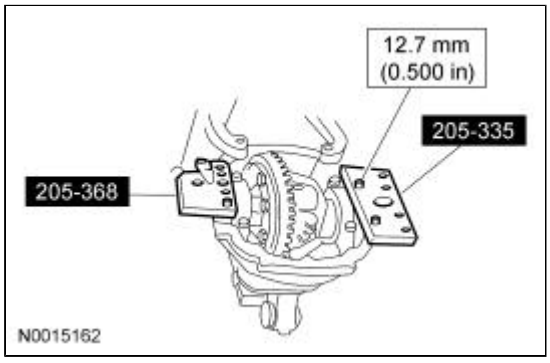


5. Remove the axle housing tube.

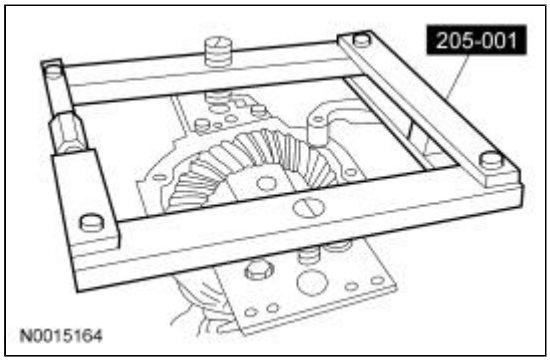


6. **CAUTION: The housing spreader adapter bolts must have the minimum specified thread engagement in the carrier.**

   Install the special tools.

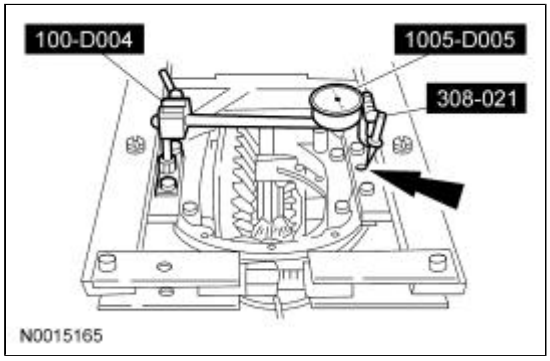


7. Position the special tool on the spreader adapters.



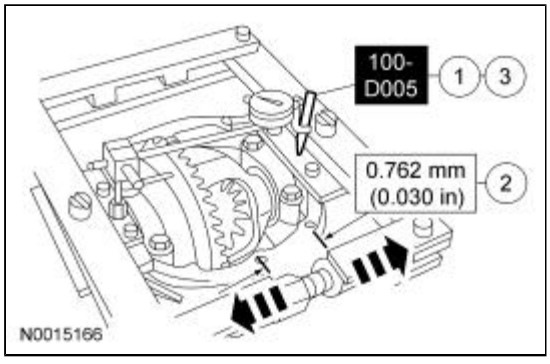
8. Install the special tools.

- Position the adapter tip in the spreader adapter hole.



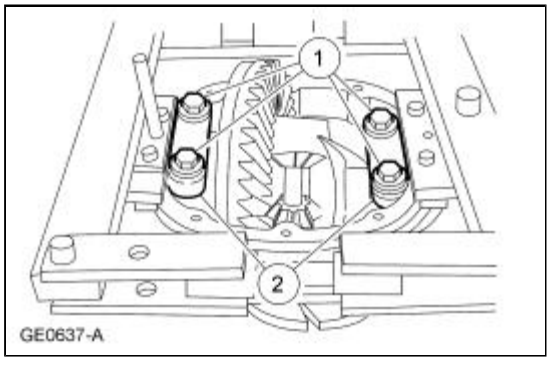
9. **CAUTION: Overspreading can damage the axle housing.**

Spread the axle housing to the specification.
1. Adjust the special tool to zero.
2. Tighten the housing spreader screw to spread the axle housing to the specification.
3. Remove the special tool.



10. **CAUTION: Mark the differential bearing caps Top or Bottom and LH or RH appropriately before removing them. Always install the bearing caps in their original place and position.**

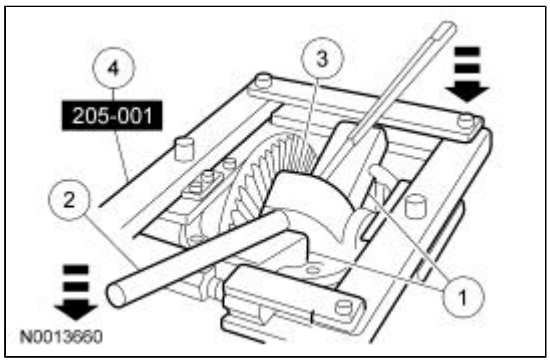
Mark and remove the differential bearing caps.
1. Remove the bolts.
2. Remove the differential bearing caps.



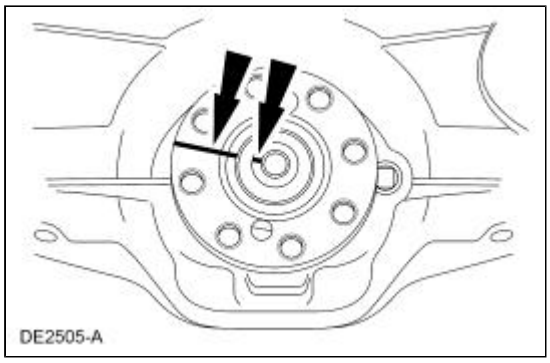
11. **CAUTION: Use wood blocks to avoid axle housing damage.**

Remove the differential assembly from the axle housing.

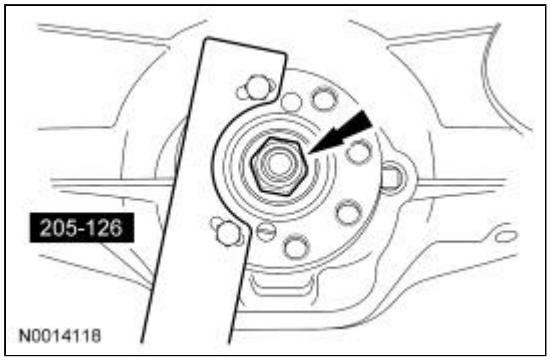
1. Position the wood blocks.
2. Position and push down on the 2 pry bars.
3. Remove the differential assembly.
4. Remove the special tool.



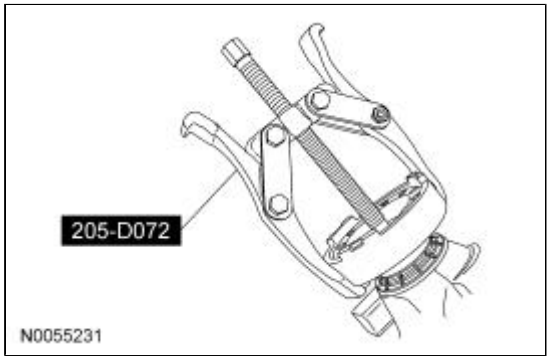
12. Index-mark the axle universal joint flange to the pinion stem.



13. Install the special tool and loosen, but do not remove, the pinion nut.

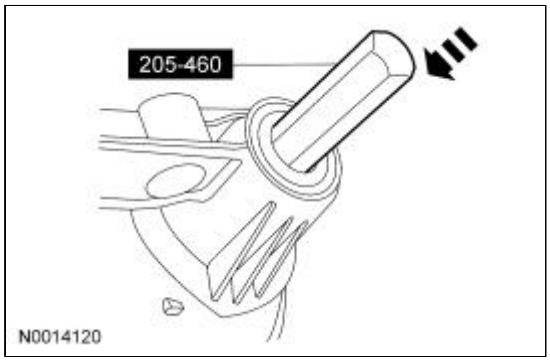


14. With the pinion nut still engaged by a few threads, use the special tool to separate the axle universal joint flange from the pinion gear.

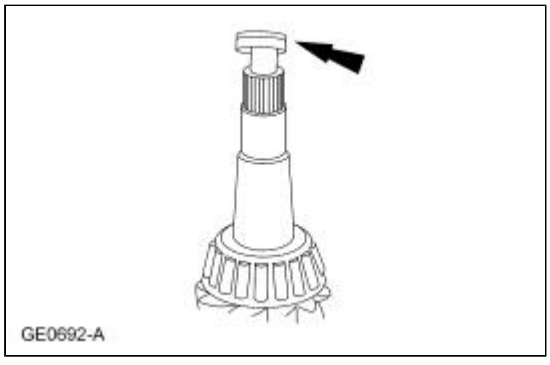


15. Remove the nut and the flange.

16. Using the special tool and a soft hammer, remove the pinion gear.

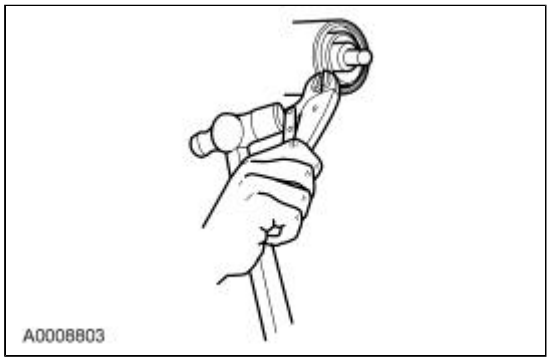


17. Discard the drive pinion collapsible spacer.



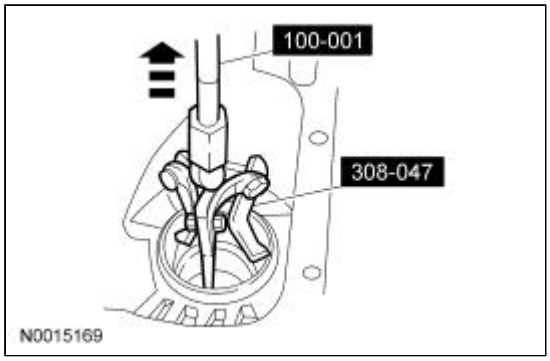
18. **CAUTION: Do not damage the carrier housing while removing the pinion seal.**

    Remove the pinion seal and slinger.
    - Pry up on the seal flange. Install gripping pliers, and strike with a hammer to remove the seal.



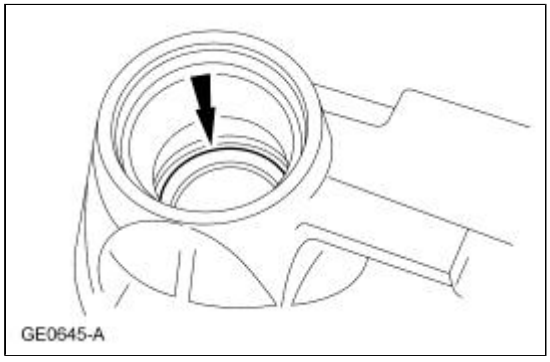
19. Remove the outer pinion bearing.

20. Using the special tools, remove the inner pinion bearing cup.

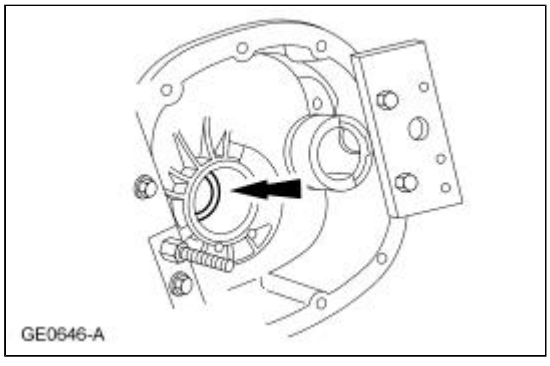


21. **NOTE:** The pinion bearing oil baffle aids in bearing lubrication. Normally, it is not necessary to remove the baffle.

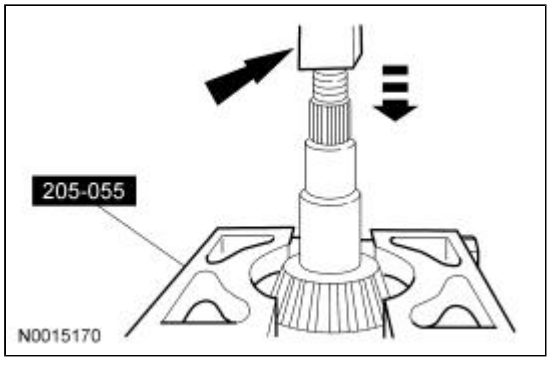
    If necessary, remove the pinion bearing oil baffle.



22. Remove the outer pinion bearing cup by tapping alternately on each side to prevent the cup from cocking.



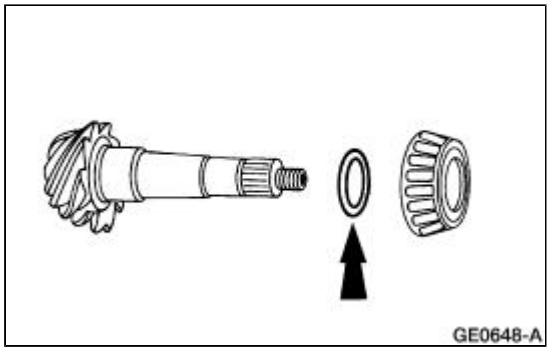
23. Using the special tool and a suitable press, remove the pinion bearing.



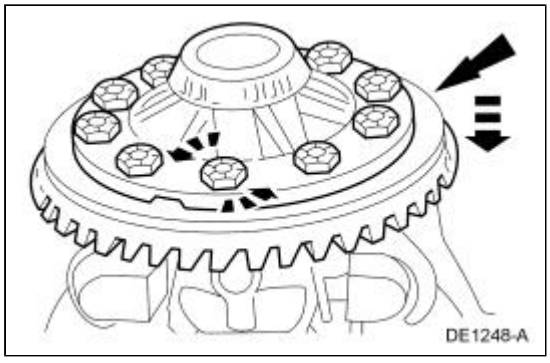
24. **NOTE:** A drive pinion bearing adjustment shim sits under the pinion bearing. Use a micrometer to

measure the shim thickness. Record the measurement for comparison to the shim gauge reading taken prior to installing the pinion bearing.

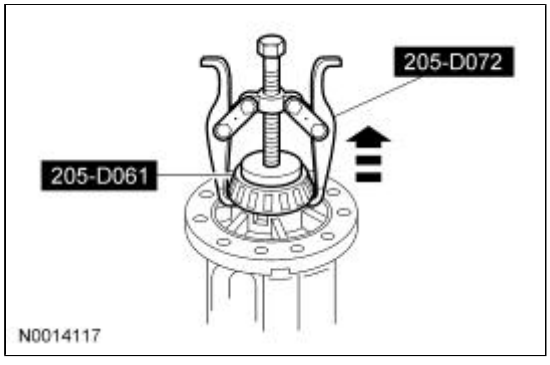
Remove and measure the drive pinion bearing adjustment shim.



25. Remove the 10 bolts and the ring gear.
    - Use a drift punch to separate the ring gear from the differential case.



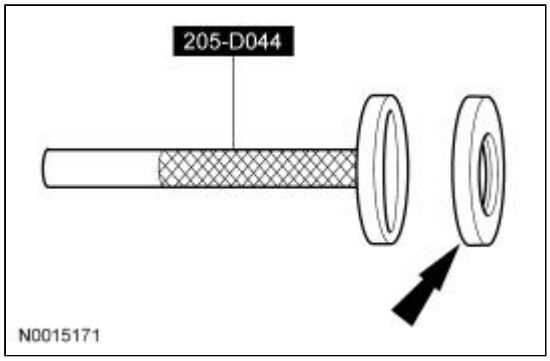
26. Using the special tools, remove the differential bearings.



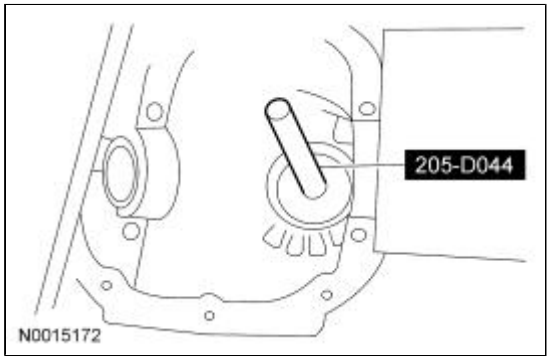
Assembly

1. **CAUTION: Do not omit the pinion bearing oil baffle; bearing failure can result.**

   If removed, position the baffle on the special tool.



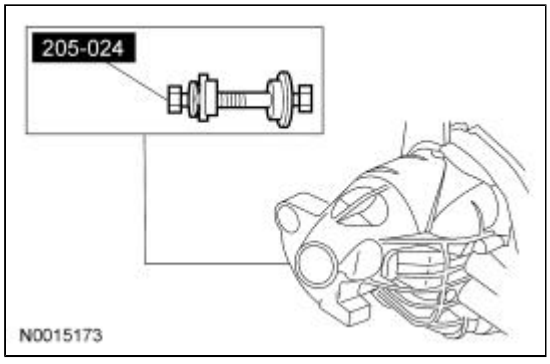
2. Using the special tool, install the baffle.



3. **NOTE:** Always install new pinion bearings when installing new pinion bearing cups.

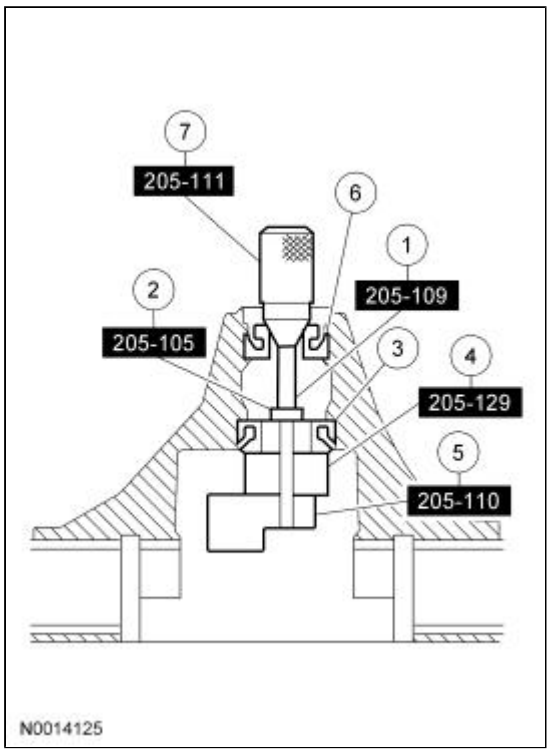
   Lightly oil the new pinion bearing cups and pinion bearings with front axle lubricant.

4. Using the special tool, install the bearing cups.



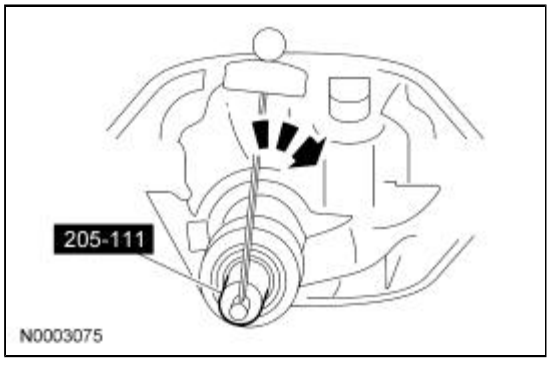
5. **NOTE:** You must use the pinion bearings assembled in this procedure step at final assembly.

   Assemble and position the special tools and the pinion bearings in the carrier housing.
   1. Position the screw adapter.
   2. Position the aligning adapter.
   3. Position the pinion bearing.
   4. Position the gauge disc adapter.
   5. Position the gauge block adapter.
   6. Position the pinion bearing.
   7. Thread on the handle adapter.



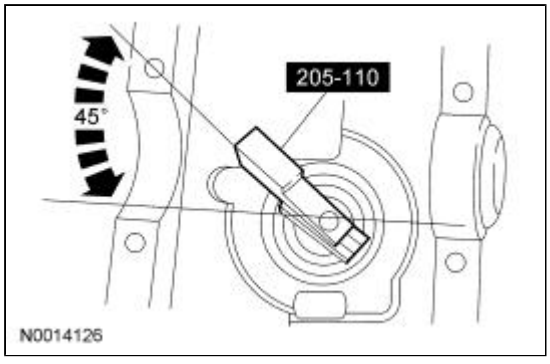
6. **NOTE:** This step duplicates final pinion bearing preload.

   Tighten the special tool to simulate bearing preload.
   - Tighten to 2.2 Nm (20 lb-in).

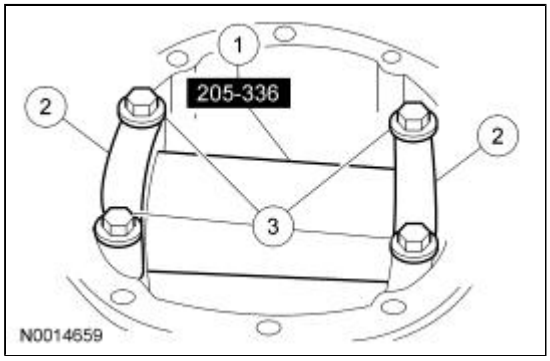


7. **NOTE:** Offset the gauge block adapter to obtain an accurate reading.

   Rotate the gauge block adapter several half-turns to make sure the pinion bearings seat correctly, and position the gauge block adapter.



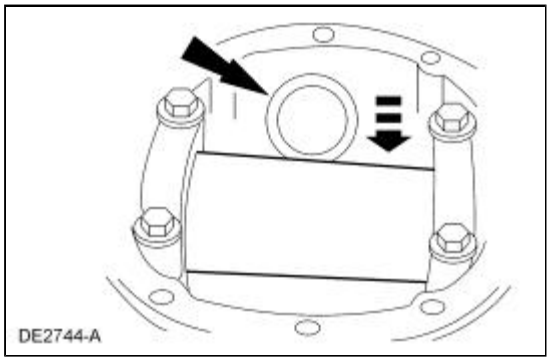
8. Install the special tool.
    1. Position the special tool.
    2. Install the differential bearing caps.
    3. Install the bolts.
        - Tighten to 105 Nm (77 lb-ft).



9. **NOTE:** Use only flat, clean drive pinion bearing adjustment shims.

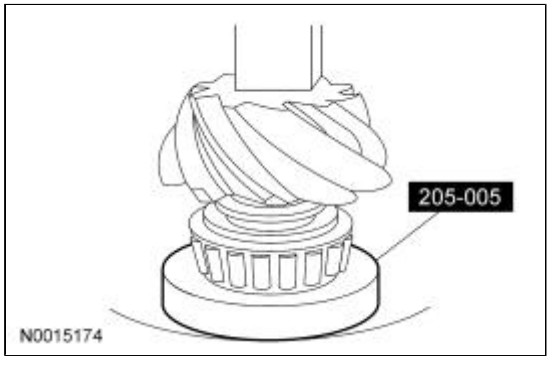
    NOTE: Do not attempt to force the shim between the gauge block adapter and the gauge tube adapter. A slight drag indicates correct shim selection.

    Use a drive pinion bearing adjustment shim as a gauge for shim selection.
    - Check the adjustment shim thickness between the gauge block adapter and the gauge tube adapter.
    - After determining the correct shim thickness, remove the special tools.

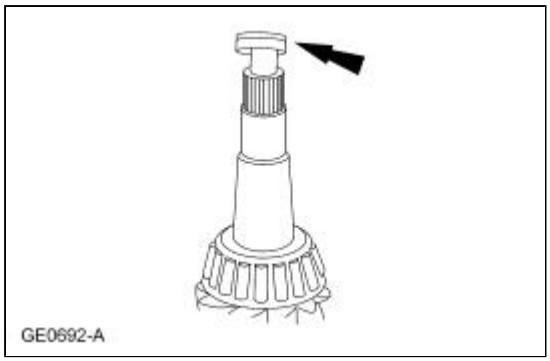


10. **NOTE:** You must use the same pinion bearings from the previous steps.

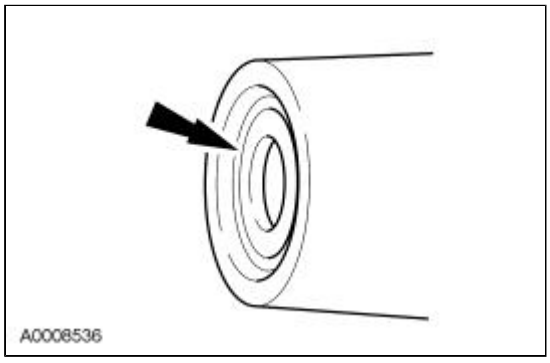
    Install the pinion bearing.
    - Place the drive pinion bearing adjustment shim on the pinion gear.
    - Using a suitable press and the special tool, press the pinion bearing until it is firmly seated on the pinion gear.



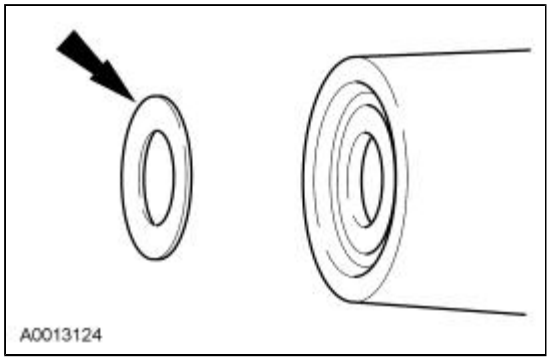
11. Place a new drive pinion collapsible spacer on the pinion stem.



12. Install the outer pinion bearing.

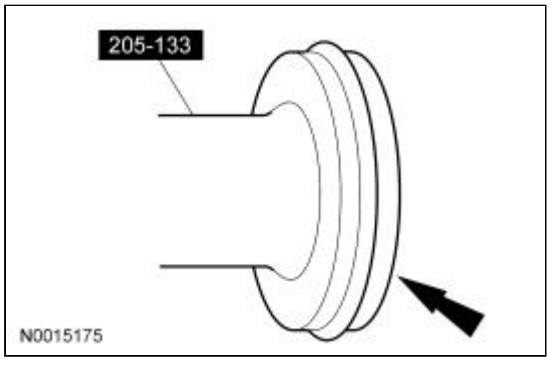


13. Install the slinger.

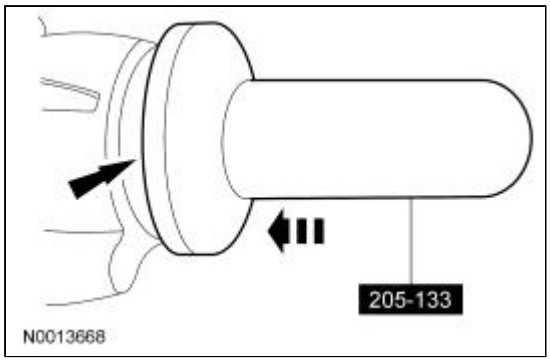


14. **NOTE:** Coat the lips of the pinion seal with front axle lubricant.

    Place the pinion seal on the special tool.

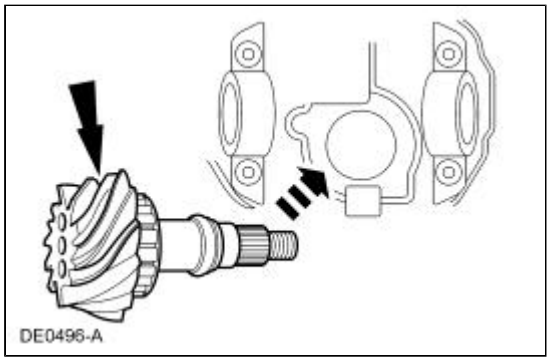


15. Place the special tool and seal in the pinion seal bore and drive the seal into place.



16. Lightly lubricate the pinion gear splines with front axle lubricant.

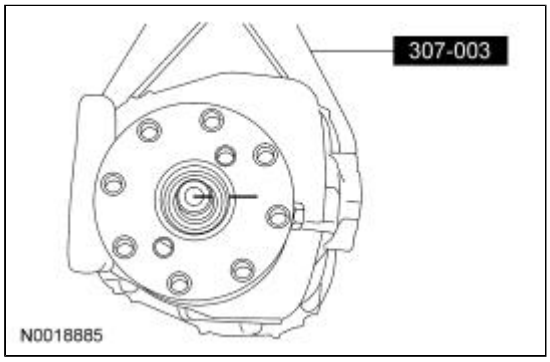
17. Position the drive pinion in the housing.



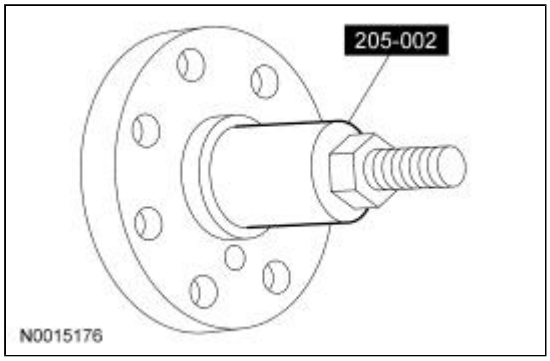
18. **CAUTION: Never install the drive pinion universal joint flange with a hammer or power tools.**

    NOTE: Disregard the scribe marks if installing a new flange.

    Align the index marks and position the universal joint flange on the drive pinion.



19. Using the special tool, install the drive pinion universal joint flange.

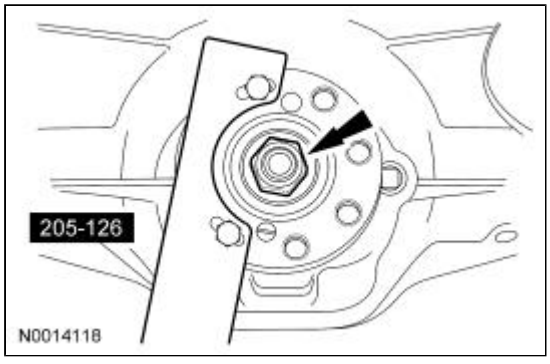


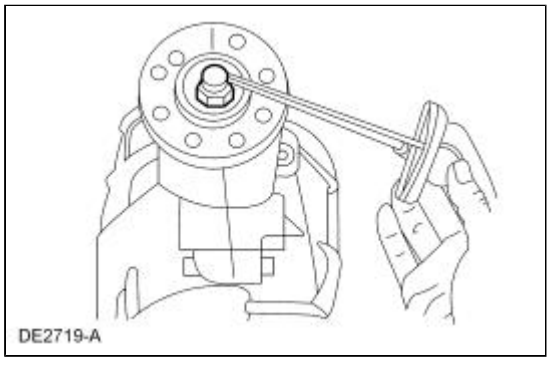
20. Apply a small amount of lubricant to the washer side of the new pinion nut, and install the nut.

21. **CAUTION: Do not loosen the pinion nut to reduce preload under any circumstance. If it is necessary to reduce preload, install a new drive pinion collapsible spacer and pinion nut.**

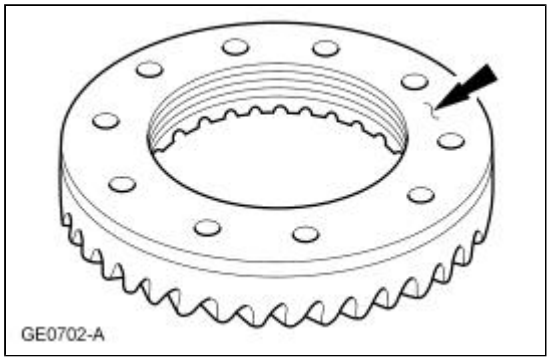
    Install the special tool, and tighten the pinion nut. Refer to the torque specifications in the Specifications portion of this section.

    - Rotate the pinion gear occasionally to make sure the pinion bearings are seating correctly. Take frequent pinion bearing torque preload readings by rotating the pinion gear with a Nm (inch-pound) torque wrench.

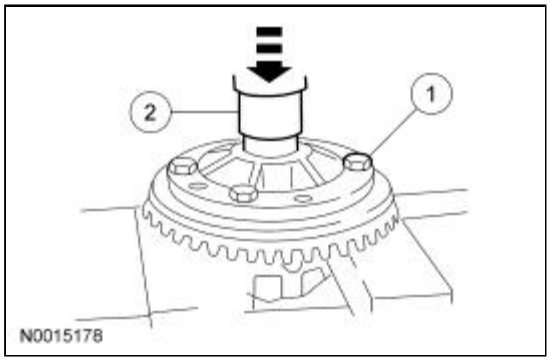




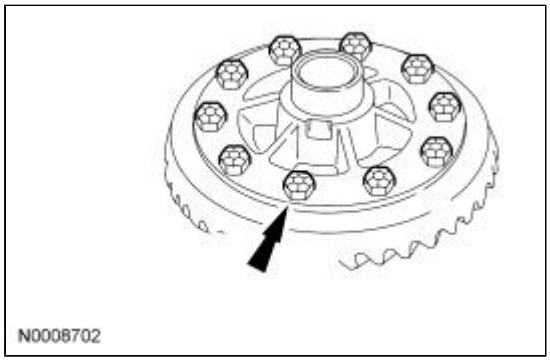
22. Use a fine flat file to remove any burrs or nicks from the ring gear mounting surface.



23. Install the ring gear.
    1. Position 3 bolts to align the holes in the ring gear and the differential case.
    2. Using a suitable press, install the ring gear.

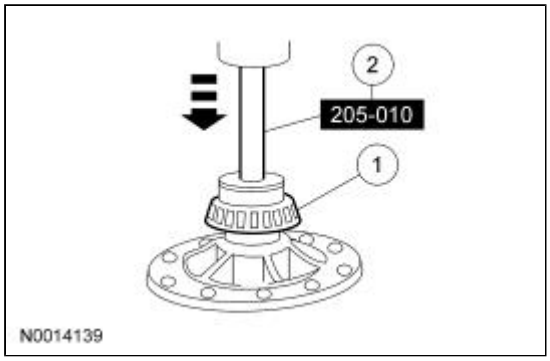


24. Install the remaining bolts.
    - Tighten to 105 Nm (77 lb-ft).

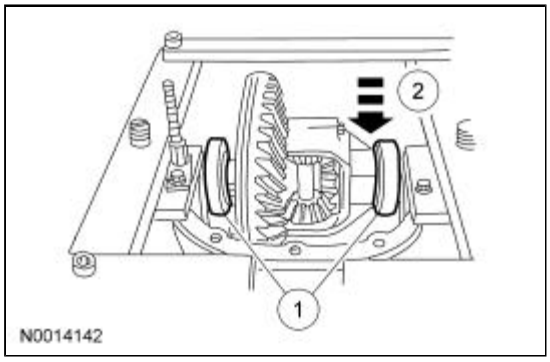


25. **CAUTION: Press against the bearing inner core only.**

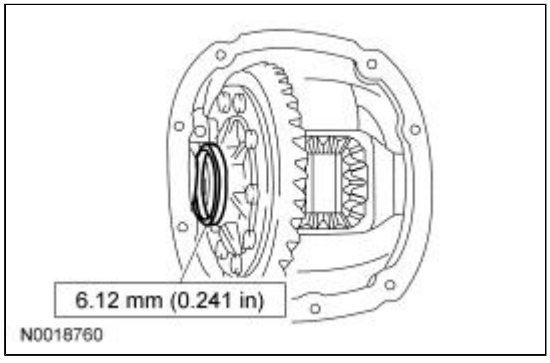
Using a suitable press and the special tool, install the differential bearings.
1. Position the appropriate differential bearing (RH or LH).
2. Using a suitable press and the special tool, install the differential bearing.
   - Repeat the procedure for the other differential bearing.



26. Install the differential carrier.
    1. Position the differential bearing cups on the differential bearings.
    2. Lower the differential carrier in place.

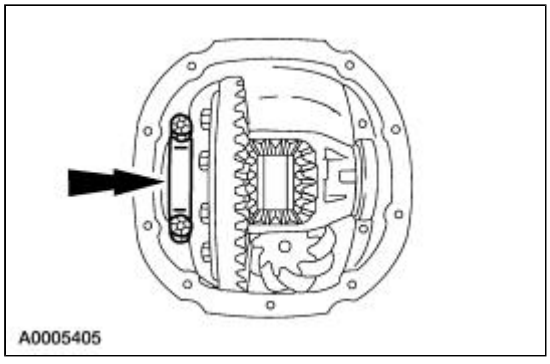


27. Install a differential bearing shim of the thickness shown on the LH side of the differential bearing.



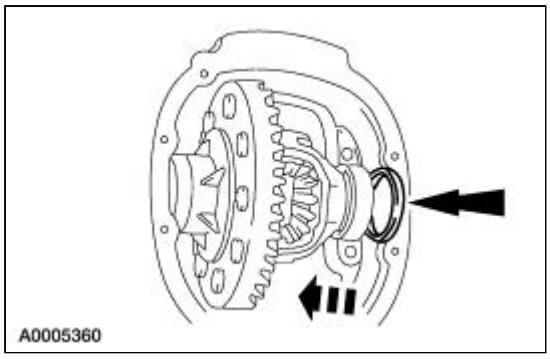
28. **NOTE:** Apply pressure to the left side to make sure the left bearing cup is seated.

    Install the left bearing cap and loosely install the bearing cap bolts.



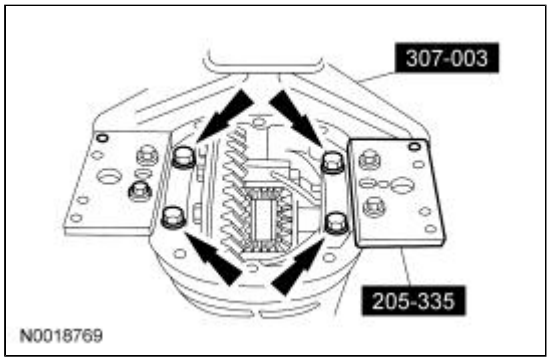
29. Install progressively thicker differential bearing shims on the right side until the thickest differential

bearing shim can be inserted by hand.

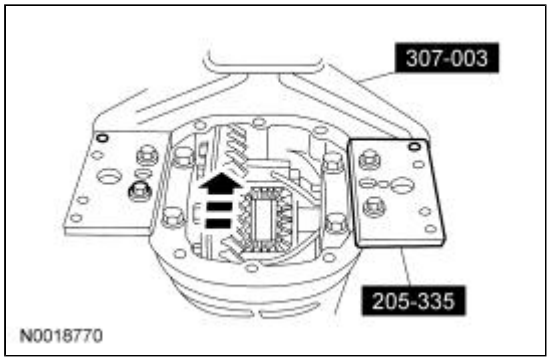


30. Install the right bearing cap and bolts.

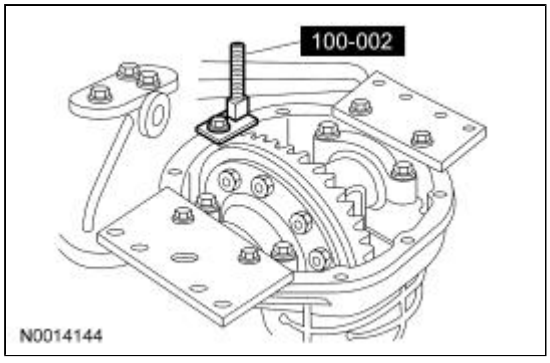
31. Tighten the 4 differential bearing cap bolts.
    - Tighten to 105 Nm (77 lb-ft).



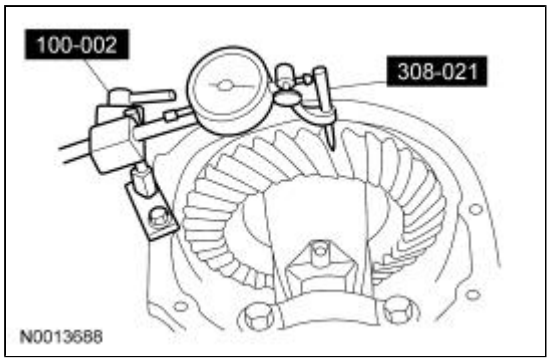
32. Rotate the differential carrier to make sure it turns freely.



33. Install the special tool.

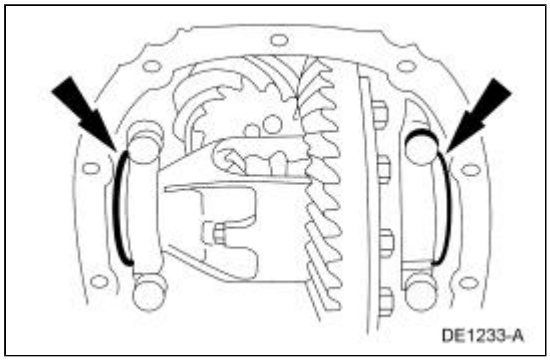


34. Measure the ring gear backlash at 4 places to obtain a consistent reading.

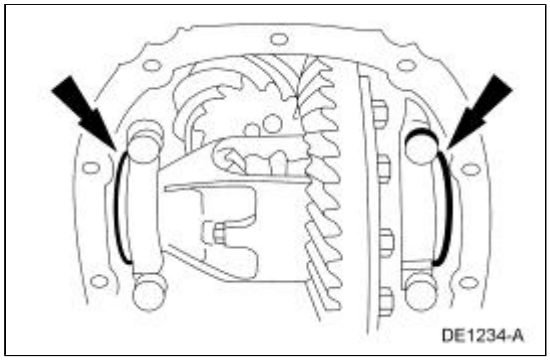


35. **NOTE:** If the backlash is not within the specifications, correct it by increasing the thickness of one differential bearing shim and decreasing the thickness on the other differential bearing shim by the same amount.

    To increase the backlash, install a thicker differential bearing shim and a thinner differential bearing shim as shown.



36. To decrease the backlash, install a thicker differential bearing shim and a thinner differential bearing shim as shown.



37. Select the appropriate shim by the thickness or the stripe color.

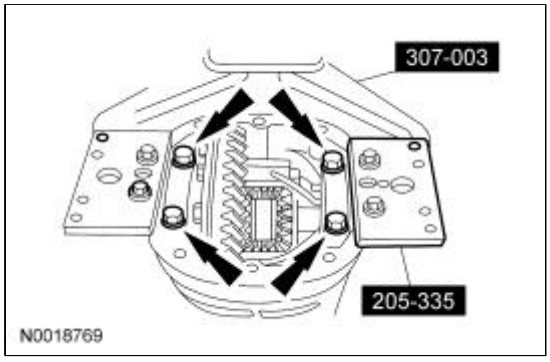
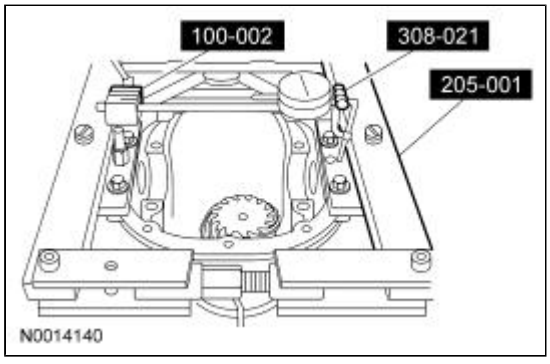
38. Remove the 4 differential bearing cap bolts.
    - Remove the differential carrier.



39. Measure the thickness of the selected right and left bearing shims.

40. To establish differential bearing preload, increase both the left and right differential bearing shim thickness by 0.203 mm (0.008 in).

41. Install the special tools.

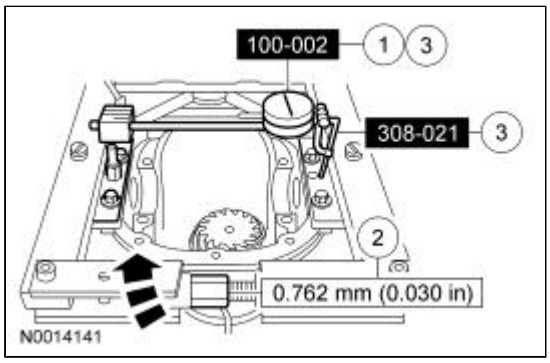


42. **CAUTION: Overspreading may damage the differential housing.**

    NOTE: Tighten and loosen the differential carrier spreader adapters to normalize the housing adapters prior to taking the final dial indicator reading.

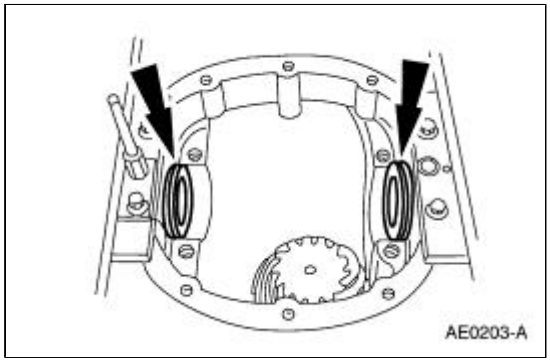
Spread the differential housing to the specification.

1. Adjust the special tool to zero.
2. Tighten the screw until spreading the differential housing to the specifications.
3. Remove the special tools.

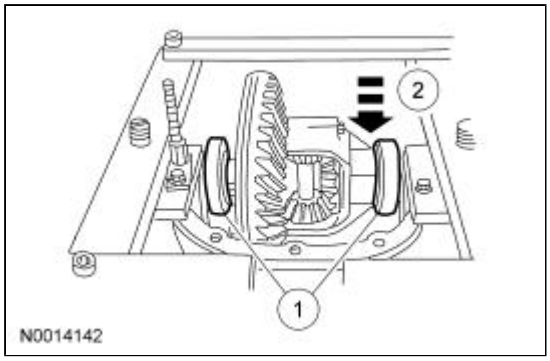


43. **CAUTION: To avoid galling the case, insert the shims with a light coating of grease before installing the differential carrier.**

    Place the differential bearing shims in the differential housing.

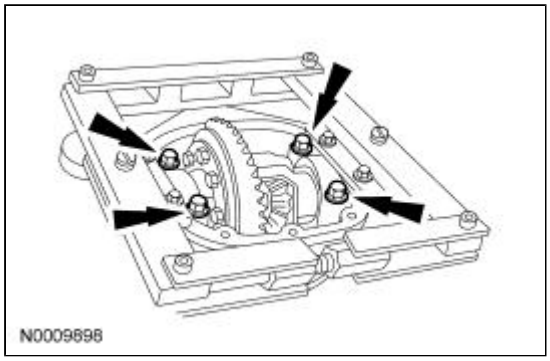


44. Install the differential carrier.
    1. Position the differential bearing cups on the differential bearings.
    2. Lower the differential carrier in place between the differential bearing shims.

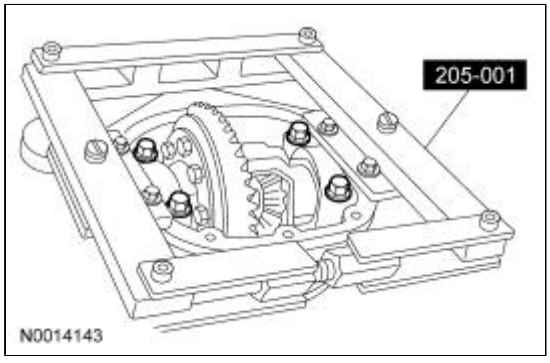


45. **NOTE:** Hand-tighten the differential bearing cap bolts prior to releasing the special tool.

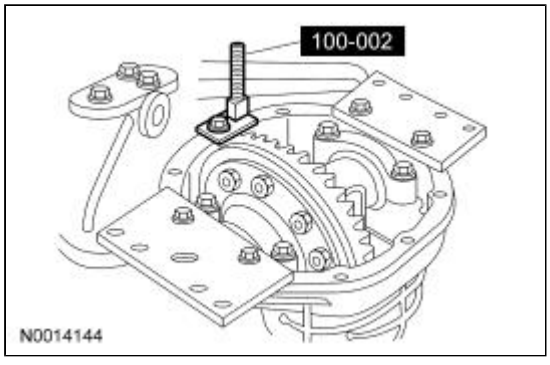
    Install the differential bearing caps and bolts in their original location.



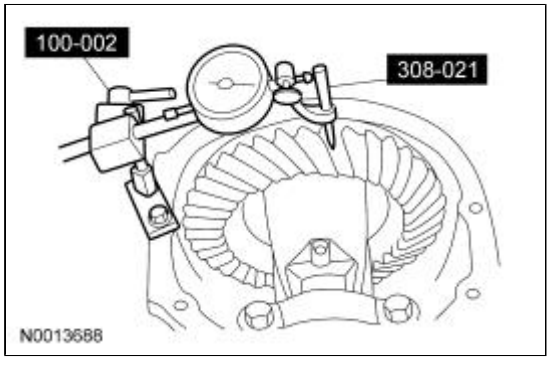
46. Loosen and remove the special tool.



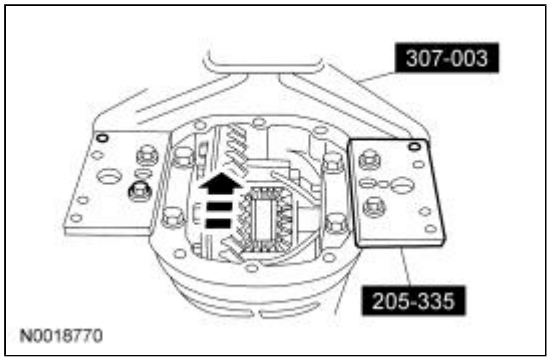
47. Install the special tool at the 12 o'clock position.



48. Using the special tools, recheck the ring gear backlash.



49. Apply marking compound and rotate the differential assembly 5 complete revolutions.



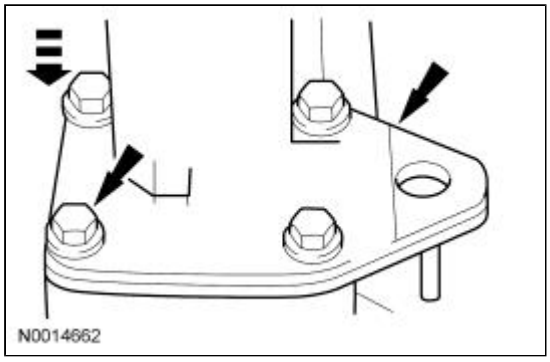
50. Verify an acceptable pattern check. For additional information, refer to Diagnosis and Testing in this section.

51. **CAUTION: Remove all of the old liquid gasket, and make sure the machined surfaces are free of oil before applying the new silicone rubber.**

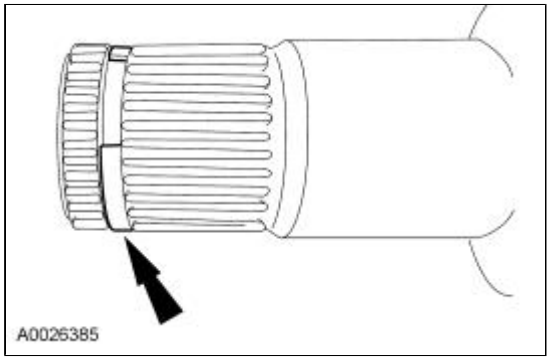
    CAUTION: Install the axle housing tube within 15 minutes of applying the silicone or it will be necessary to remove and reapply new sealant. If possible, allow one hour before filling with lubricant to make sure the silicone sealant has cured.

    CAUTION: Do not allow any silicone rubber to squeeze inside during assembly.

    Assemble the axle housing tube.
    - Align the bolt holes and position the axle tube.
    - Position the axle identification tag.
    - Install the bolts.
        - Tighten to 73 Nm (54 lb-ft).



52. Install a new O-ring and new circlips on the intermediate shaft ends.



53. Install a new stub shaft seal. For additional information, refer to Stub Shaft Pilot Bearing and Seal in this section.

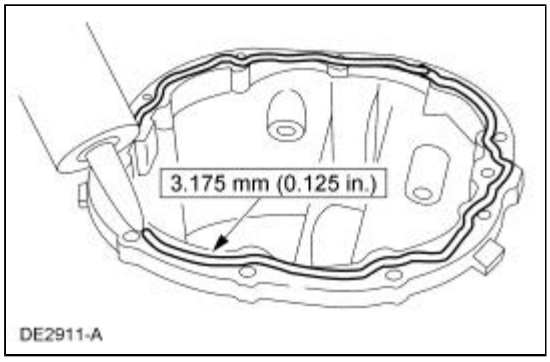
54. Insert the intermediate shaft and engage the circlip with the side gears.

55. Remove the axle assembly from the Holding Fixture and place it on the bench.

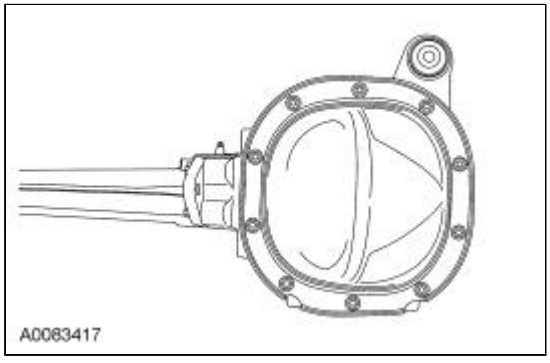
56. **CAUTION: Remove all of the old liquid gasket, and make sure the machined surfaces are free of oil before applying the new silicone rubber.**

    CAUTION: Install the differential housing cover within 15 minutes of applying the silicone, or it will be necessary to remove and reapply new sealant. If possible, allow one hour before filling with lubricant to make sure the silicone sealant has cured.

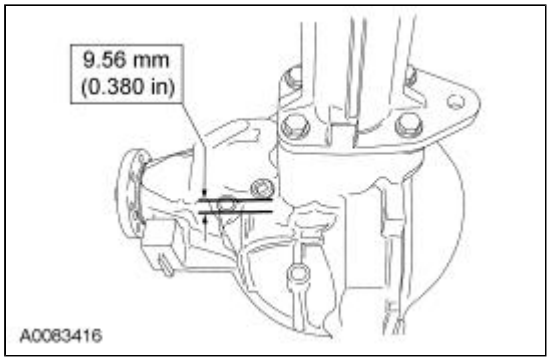
    Fill the sealing groove on the differential housing cover with silicone gasket and sealant.



57. Install the differential housing cover and the 10 cover bolts.
    - Tighten to 32 Nm (24 lb-ft).



58. Fill the differential carrier housing, and install the fill plug.
    - Use rear axle lubricant.



59. Install the front drive axle assembly. For additional information, refer to Axle Assembly in this section.

Differential Case

Printable View (382 KB)

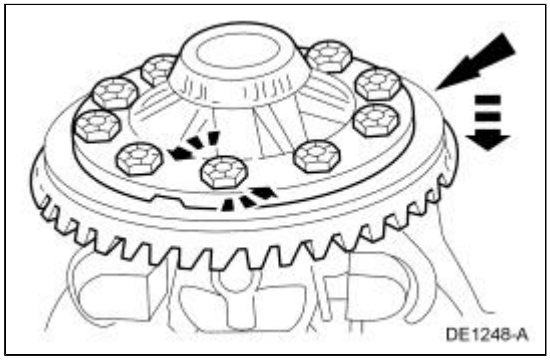
Material

Item	Specification
Motorcraft 80W-90 Premium Rear Axle Lubricant XY-80W90-QL (US); CXY-80W90-IL (Canada); (Model 60/70 axles)	WSP-M2C197-A
Threadlock and Sealer TA-25	WSK-M2G351-A5

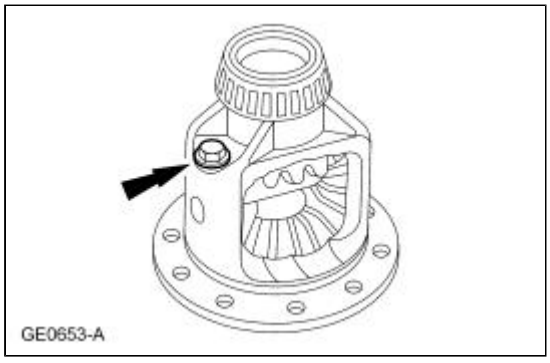
Disassembly

1. Remove the differential carrier. For additional information, refer to Differential Carrier in this section.

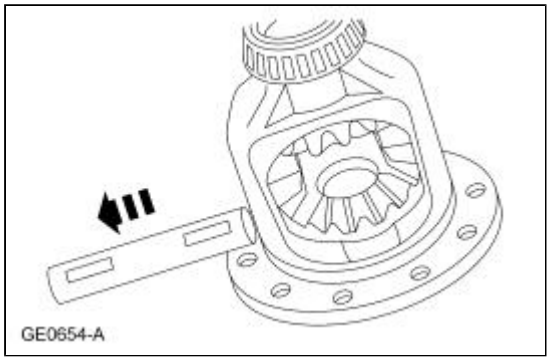
2. Remove the ring gear.
   - Remove the 10 bolts.
   - Use a drift punch to separate the ring gear from the differential case.



3. Remove the differential pinion shaft bolt.

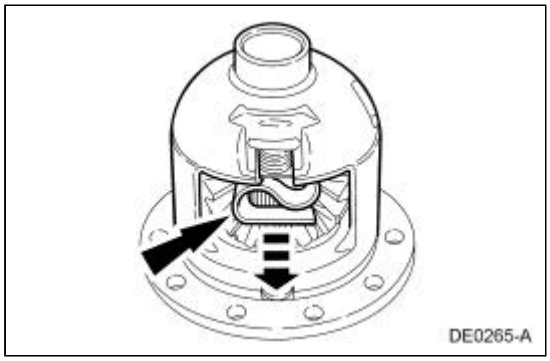


4. Remove the differential pinion shaft.

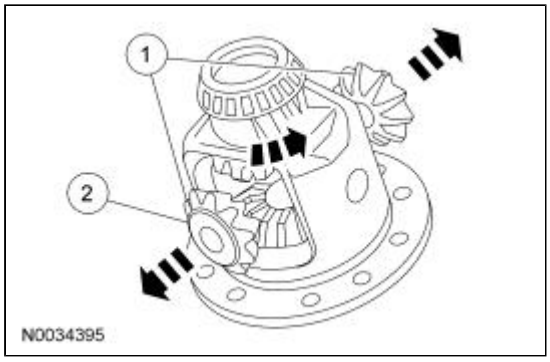


5. **WARNING: Due to the spring tension, use care when removing the differential clutch spring. Failure to follow these instructions may result in personal injury.**

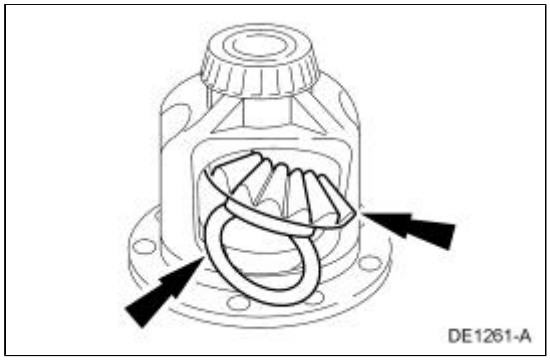
   Remove the differential clutch spring.



6. Remove the differential pinion thrust washers and the differential pinion gears.
   1. Rotate the differential pinion gears to the differential case window, and remove them.
   2. Separate the thrust washers from the gears.



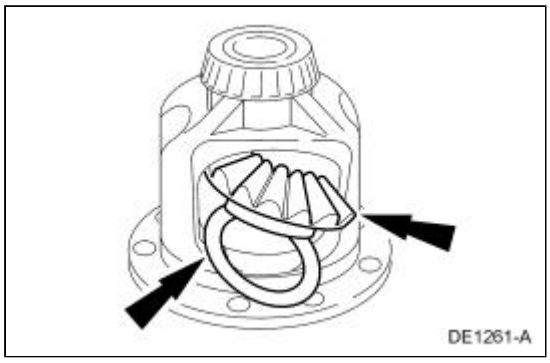
7. Remove the differential side gears and the differential side gear thrust washers.



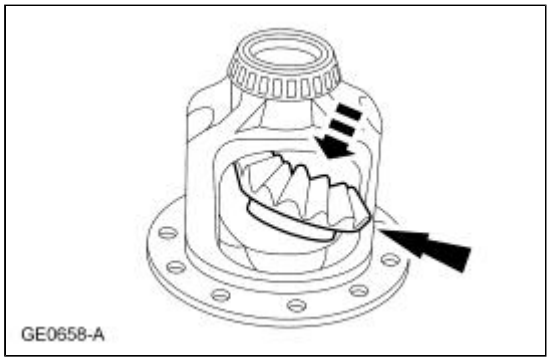
Assembly

1. Lubricate the differential side gear thrust washers and the differential side gear journals with axle lubricant.

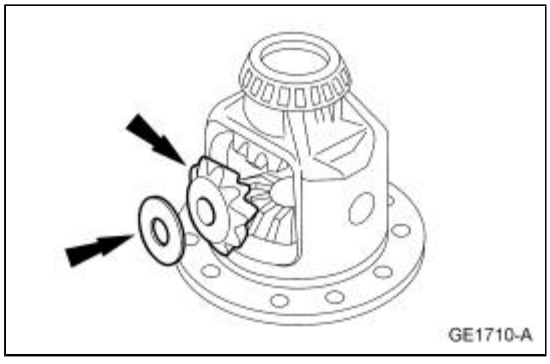
2. Position the differential side gear thrust washers on the differential side gears.



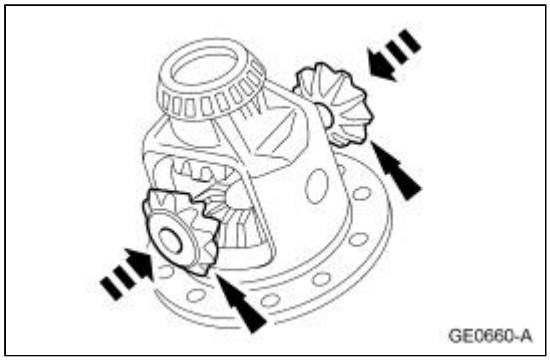
3. Position the differential side gears.



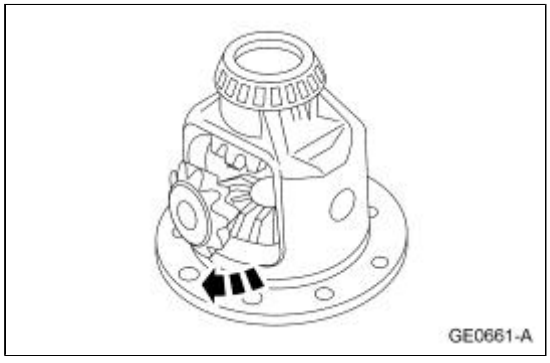
4. Lubricate the differential pinion thrust washers and the differential pinion gears with axle lubricant and assemble them.



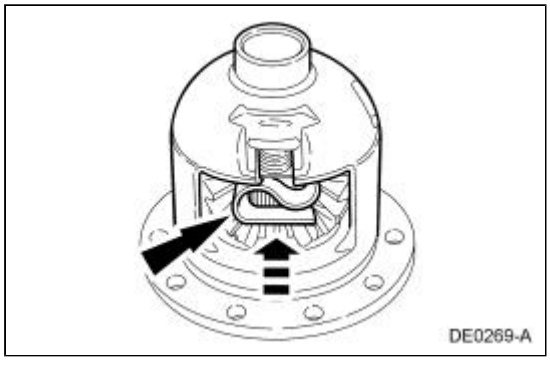
5. Engage the differential pinion gears opposite the differential side gears.



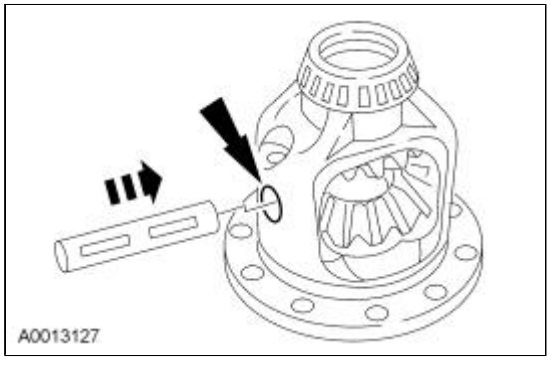
6. Rotate the differential pinion gears to align with the differential pinion shaft bore.



7. Using a soft-faced hammer, install the differential clutch spring.

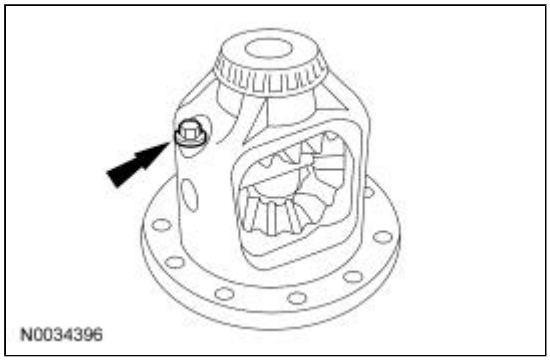


8. Insert the differential pinion shaft.



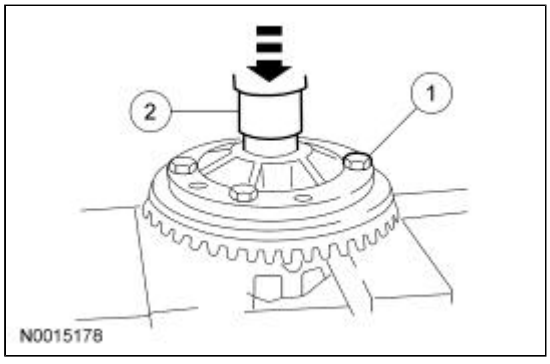
9. **NOTE:** If a new pinion shaft bolt is unavailable, coat the threads with sealer.

   Install a new differential pinion shaft bolt.
   - Tighten to 30 Nm (22 lb-ft).

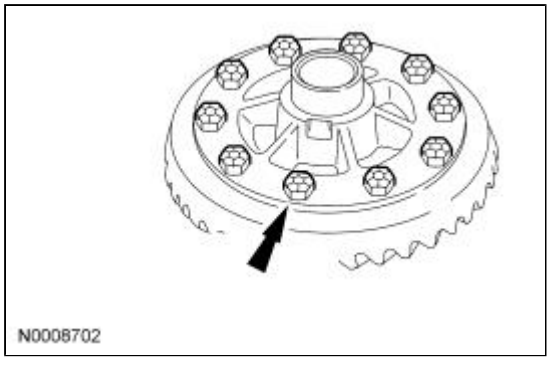


10. **CAUTION: Do not press on the bearing.**

    Install the ring gear.
    1. Position 3 bolts to align the holes in the ring gear and the differential case.
    2. Using a suitable press, install the ring gear.



11. Install the remaining bolts.
    - Tighten to 105 Nm (77 lb-ft).



12. Install the differential carrier. For additional information, refer to Differential Carrier in this section.

General Specifications

Item	Specification
Right halfshaft assembled length	411.85 mm (16.21 in)
Constant Velocity Joint Grease (High Temperature) XG-5	WSS-M1C258-A1
Left halfshaft assembled length	406.45 mm (16.00 in)

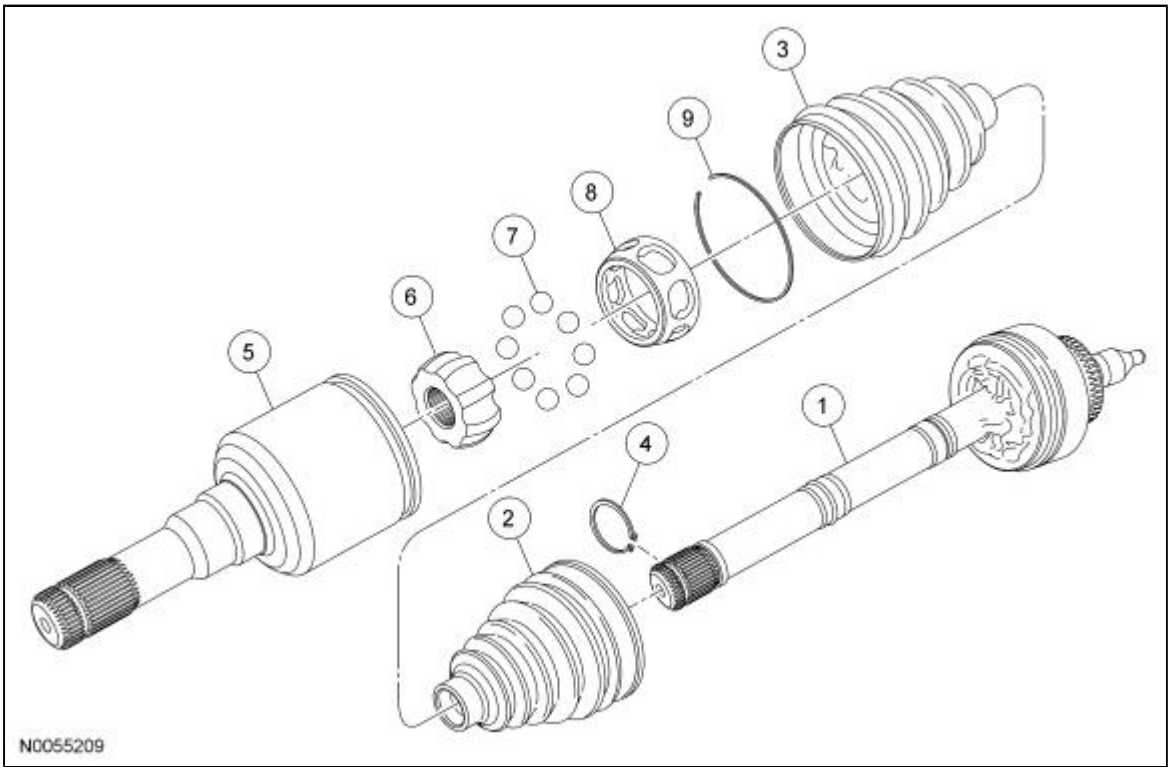
Torque Specifications

Description	Nm	lb-ft
Axle nut	27	20
Front disc brake caliper-to-anchor plate bolt	32	24
IWE disconnect-to-steering knuckle nut	12	9
Knuckle-to-upper control arm nut	150	111
Tie-rod end to knuckle nut	150	111

Front Drive Halfshafts

Printable View (157 KB)

Front Wheel Halfshaft and Joint, Disassembled View



Item	Description
1	Outboard constant velocity (CV) joint and interconnecting shaft assembly
2	Outboard boot
3	Inboard boot
4	Snap ring
5	Inboard CV joint housing
6	Inner race
7	Ball (8 required)
8	Ball cage
9	Retaining ring

New halfshaft components are available as follows:

- A repair kit includes the boots, clamps, snap ring, retaining ring and grease.
- A new inboard constant velocity (CV) joint (plunge-type).
- A new outboard CV joint and interconnecting shaft assembly includes the outboard front wheel halfshaft joint (fixed-type), boot and clamps.
- A new integrated wheel end disconnect assembly.

Front Drive Halfshafts

Printable View (62 KB)

Refer to Section 205-00 .

Halfshaft

Printable View (311 KB)

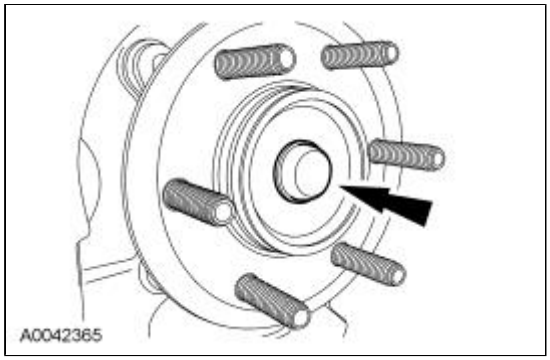
Special Tool(s)

ST1185-A	Slide Hammer 100-001 T50T-100-A
ST2934-A	Halfshaft Remover 205-832

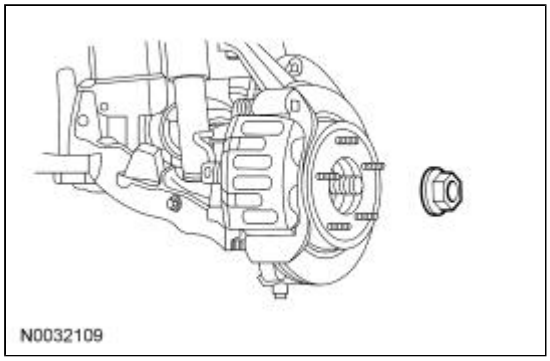
Removal and Installation

CAUTION: Whenever a halfshaft is removed, a new circlip and stub shaft pilot bearing seal must be installed.

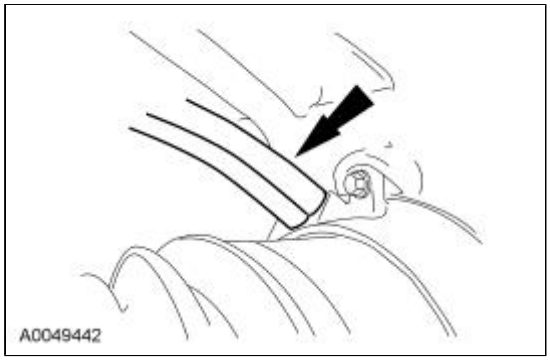
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disable the air suspension system. For additional information, refer to Section 204-05 .
3. Remove the dust cap.



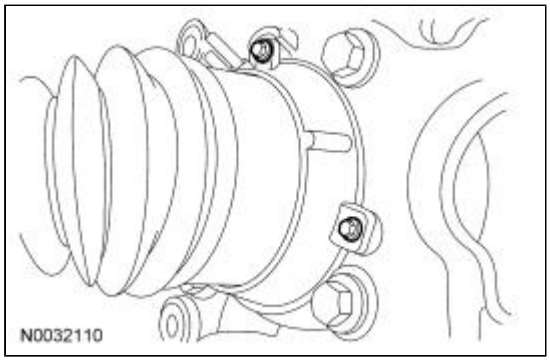
4. Remove and discard the axle nut.
   - To install, tighten to 27 Nm (20 lb-ft).



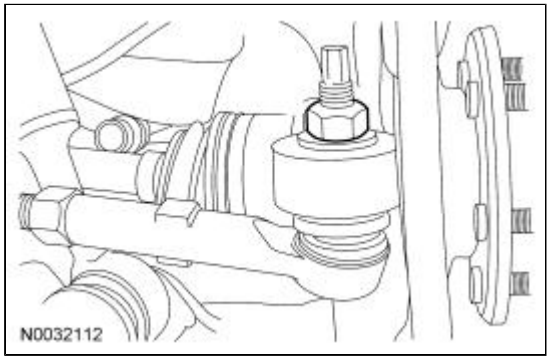
5. Remove the vacuum/vent line at the vacuum/vent port of the integrated wheel end (IWE) disconnect.



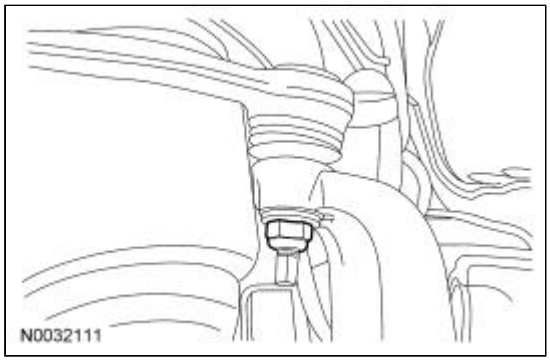
6. Remove the 3 IWE retaining bolts to the steering knuckle.
    - To install, tighten to 12 Nm (9 lb-ft).



7. Remove the tie-rod end nut.
    - Disconnect the tie-rod end from the steering knuckle.
    - Discard the tie-rod end nut.
    - To install, tighten to 150 Nm (111 lb-ft).



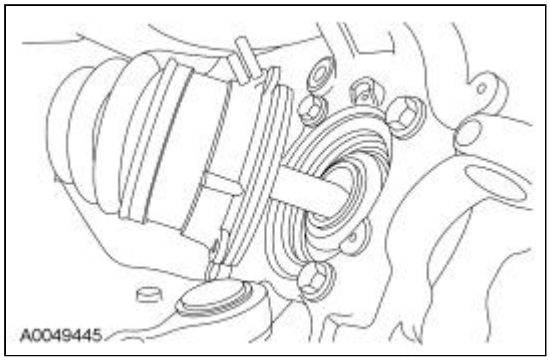
8. Remove the upper ball joint nut.
    - Disconnect the upper ball joint from the steering knuckle.
    - Discard the upper ball joint nut.
    - To install, tighten to 150 Nm (111 lb-ft).



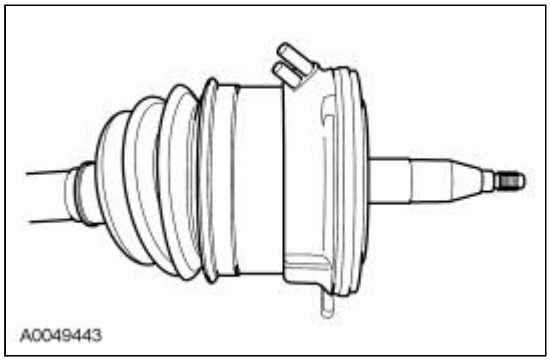
9. **CAUTION: Do not damage the hub seal.**

    NOTE: Allow the steering knuckle to swing outboard while keeping the constant velocity (CV) shaft pushed inboard.

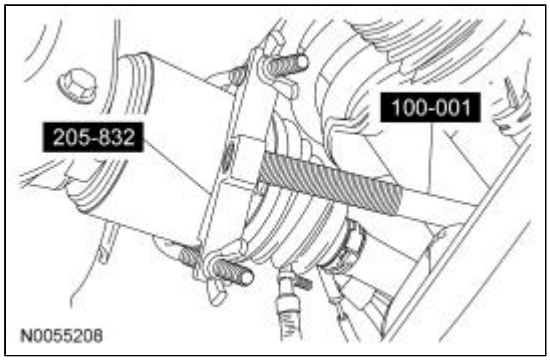
    Once clearance is available, remove the CV shaft joint outboard end and IWE disconnect from the steering knuckle hub bearing.



10. Remove the IWE disconnect from the outboard CV joint housing.



11. Using the special tools, remove the halfshaft from the differential and the intermediate shaft.



12. Remove and discard the circlip and the stub shaft seal. For additional information, refer to Section 205-03 .

13. **CAUTION: Verify the spline engagement by checking for spline lash before installing the halfshaft nut.**

    To install, reverse the removal procedure.
    - Install a new axle nut, tie-rod end nut and an upper ball joint nut.

Halfshaft

Printable View (497 KB)

Special Tool(s)

 ST1301-A	Installer, Constant Velocity Joint Boot Clamp 205-343 (T95P-3514-A)

Material

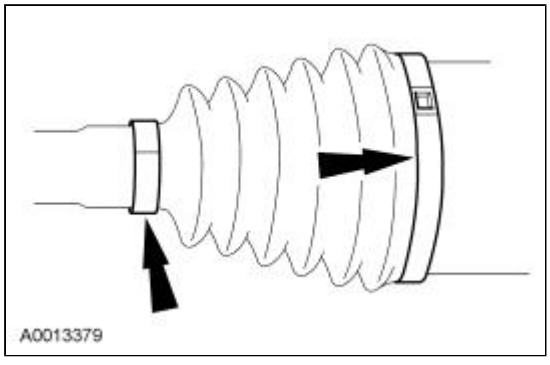
Item	Specification
Constant Velocity Joint Grease (High Temperature) XG-5	WSS-M1C258-A1

Disassembly

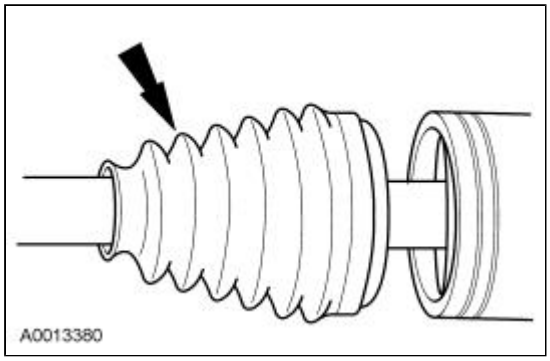
1. Remove the halfshaft from the vehicle. For additional information, refer to Halfshaft in the Removal and Installation portion of this section.

2. **CAUTION: Do not damage the boot.**

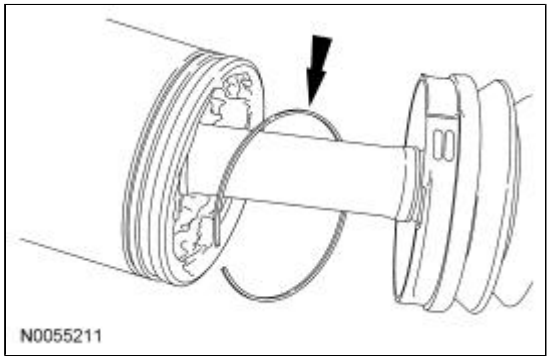
   Remove the boot clamps.



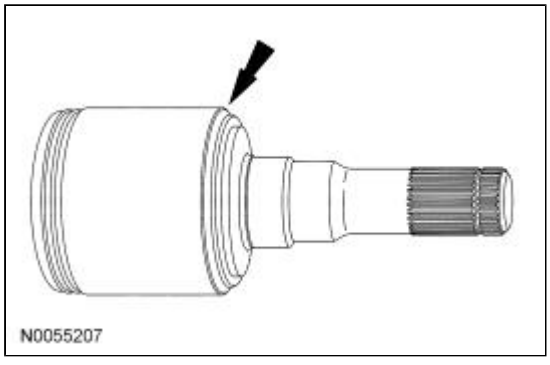
3. Separate the boot from the inboard constant velocity (CV) joint housing.



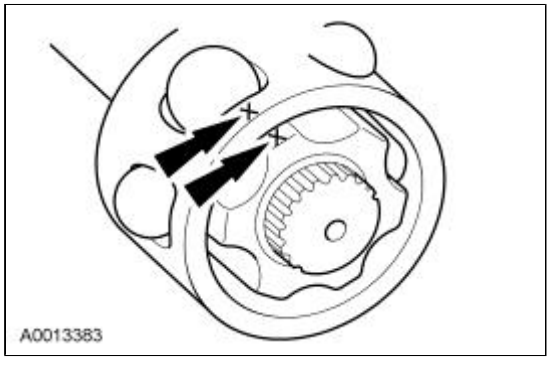
4. Remove the retaining ring.



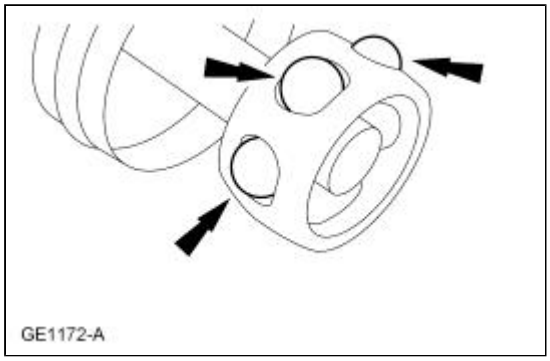
5. Remove the inboard CV joint housing.



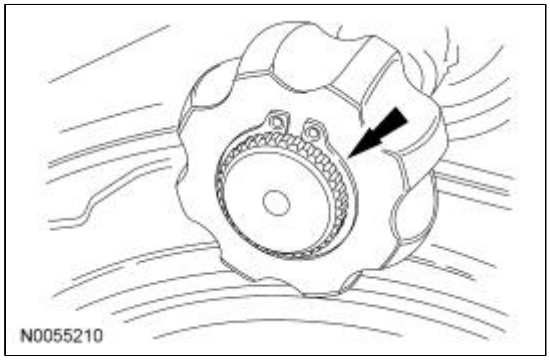
6. Index-mark the inner race and ball cage.



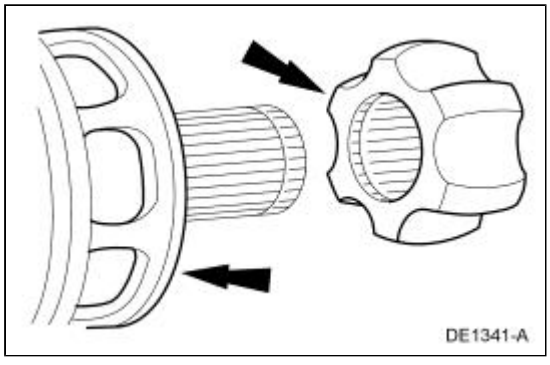
7. Remove the 6 balls.



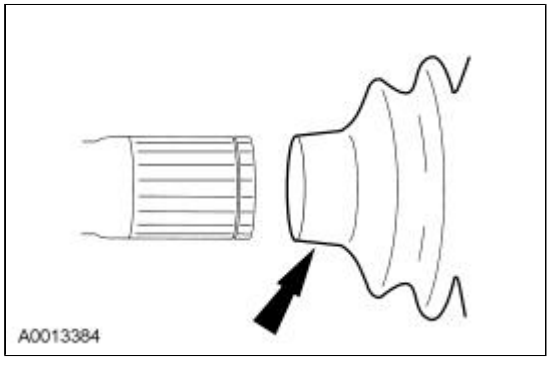
8. Remove the snap ring.



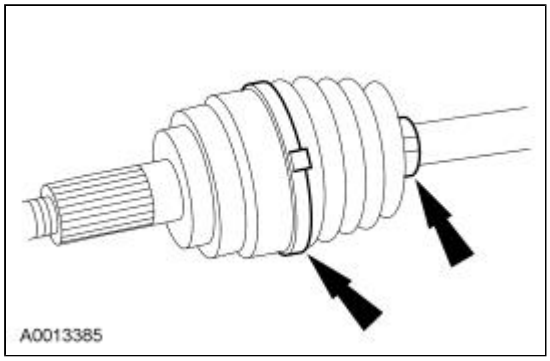
9. Remove the inner race and the ball cage.



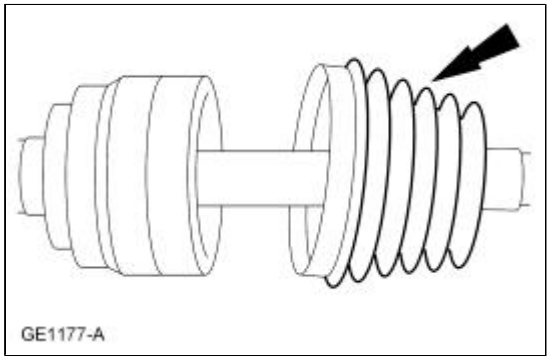
10. Remove the inboard boot.



11. Remove the boot clamps.



12. Remove the outboard boot.

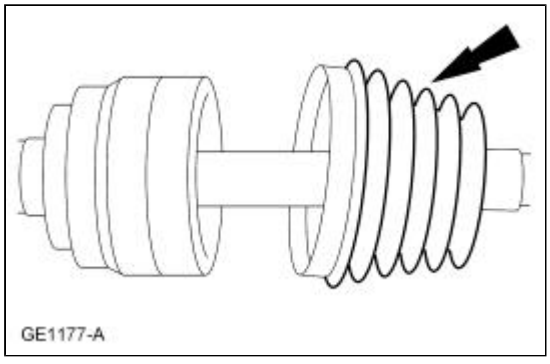


13. **NOTE:** If the grease is contaminated, clean and inspect the joint for wear. Install a new outboard CV joint and interconnecting shaft assembly if worn/damaged.

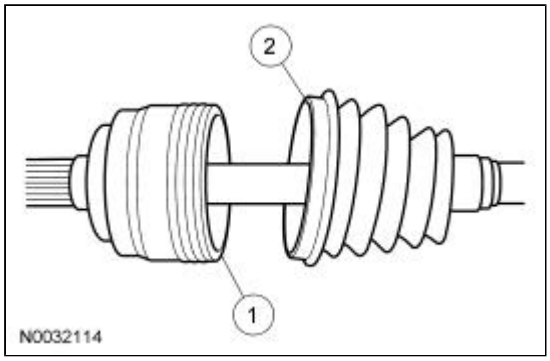
    Check the grease for contamination.

Assembly

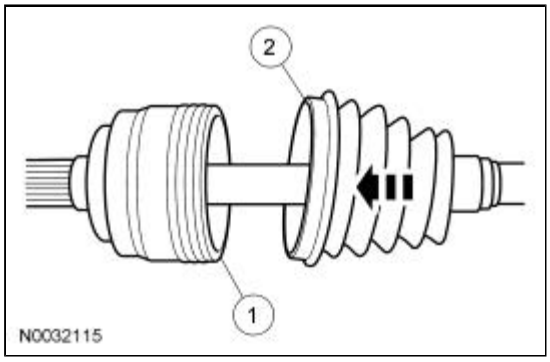
1. Position the outboard boot on the shaft.



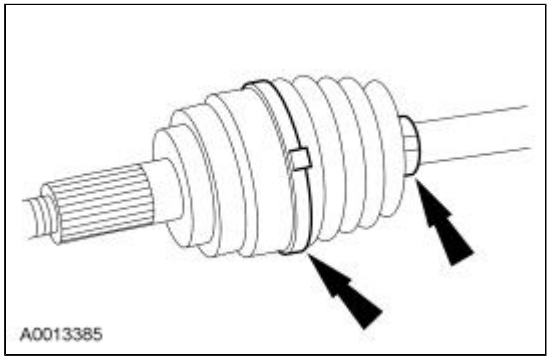
2. Pack the outboard CV joint with 165 grams (5.82 ounces) of grease.
    1. Use CV joint grease or equivalent provided in the boot kit.
    2. Spread any remaining grease from the kit evenly inside the boot.



3. Install the outboard boot.
    1. Clean the boot mounting surface.
    2. Seat the boot in the joint boot groove.

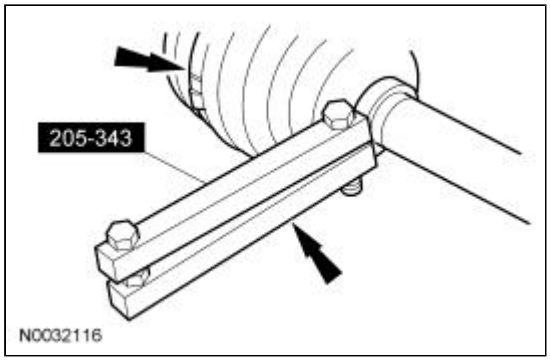


4. Position the boot clamps.

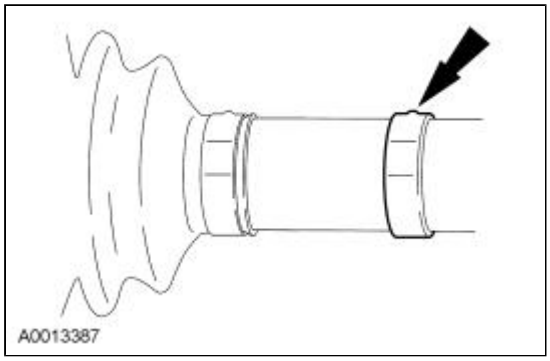


5. **NOTE:** Tighten the through-bolt until the tool is in the closed position.

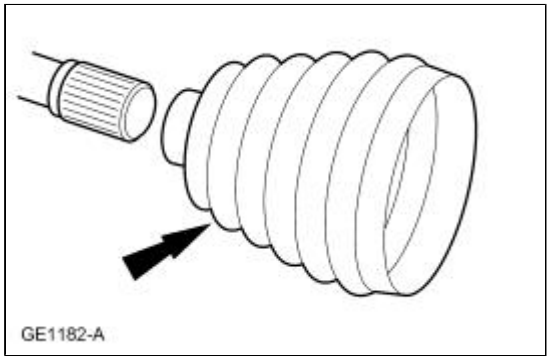
    Using the special tool, install the 2 boot clamps.



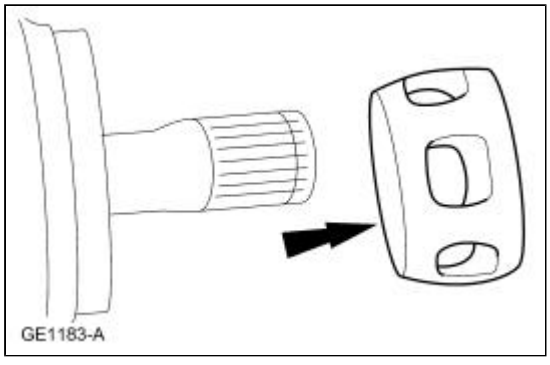
6. Position the boot clamp on the shaft.



7. Position the inboard boot on the shaft.

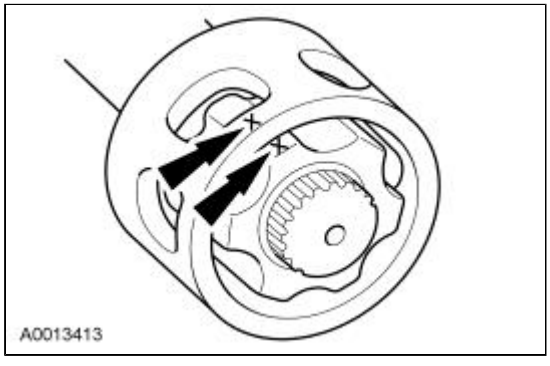


8. Position the ball cage on the shaft with the tapered end facing the boot.

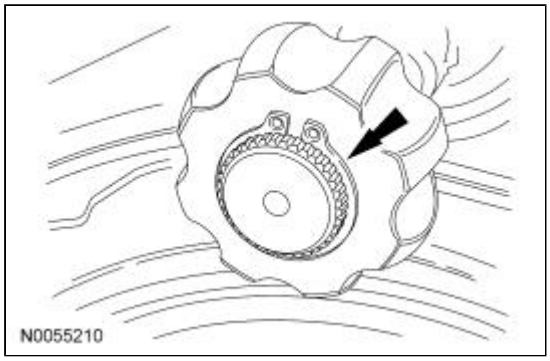


9. **NOTE:** Align the index marks.

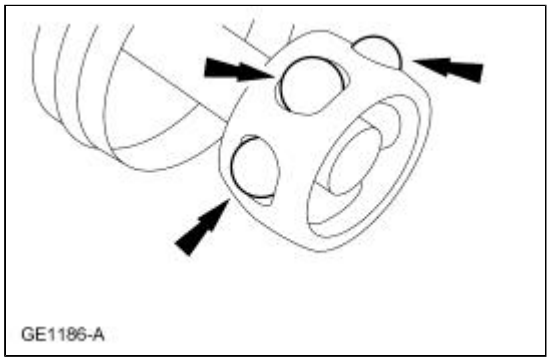
   Position the inner race on the shaft with the counterbored end facing the boot.



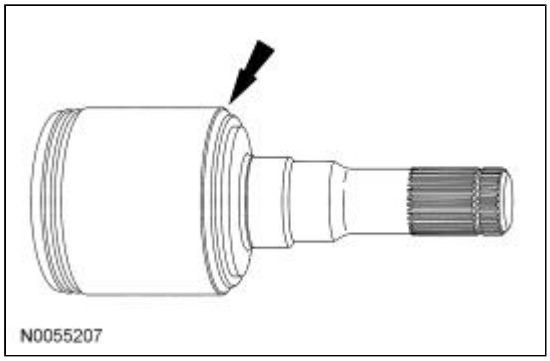
10. Install the snap ring.



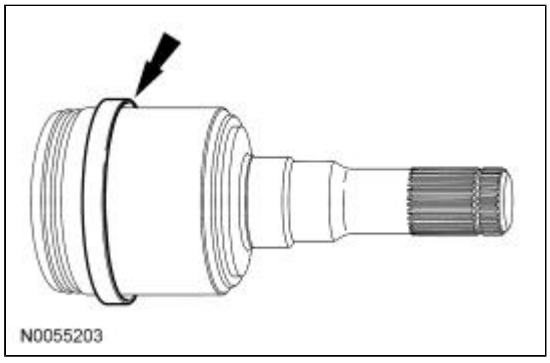
11. Lubricate and position the 6 balls.
    - Use CV joint grease or equivalent provided in the boot kit.



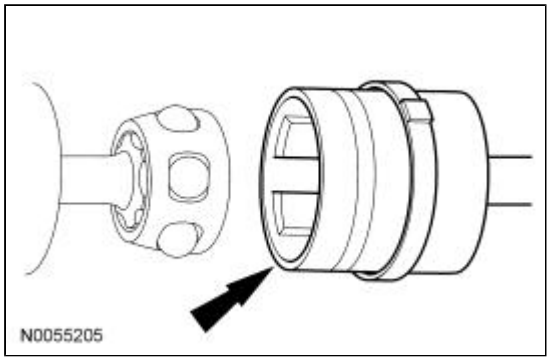
12. Fill the inboard CV joint housing with 235 grams (8.29 ounces) of grease.
    - Use CV joint grease or equivalent provided in the boot kit.



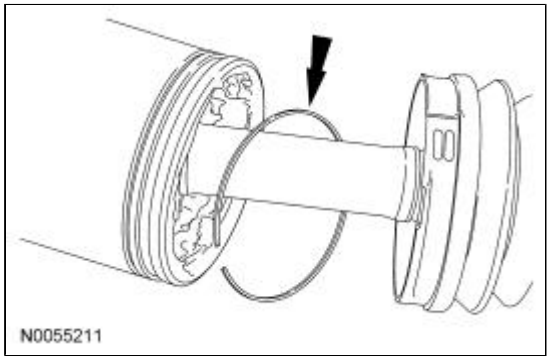
13. Position the boot clamp on the inboard CV joint housing.



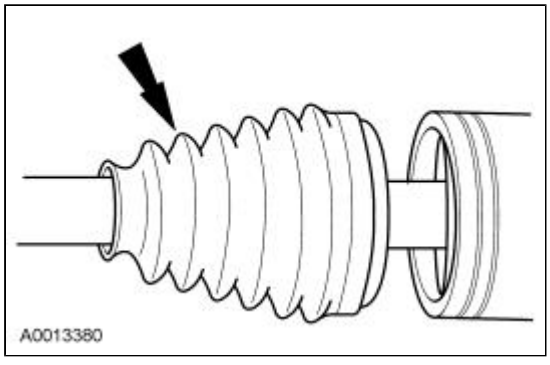
14. Position the inboard CV joint housing on the ball and race assembly.



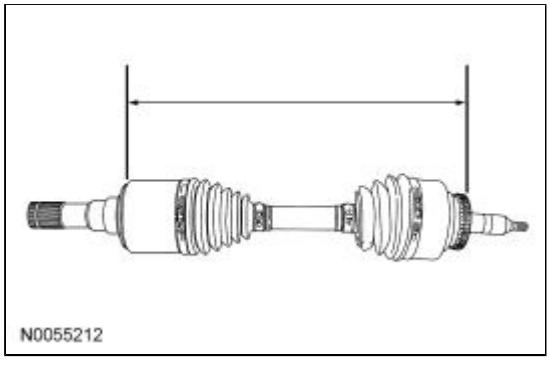
15. Install the retaining ring.



16. Remove any excess grease from the mating surface. Seat the boot in the joint boot groove.

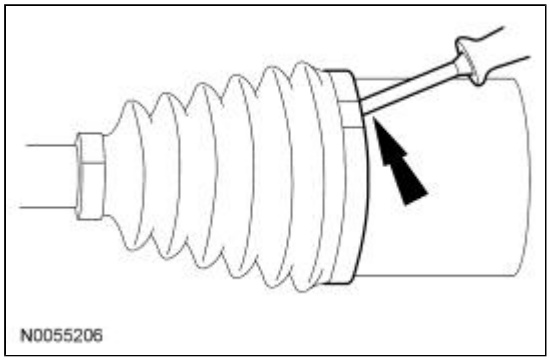


17. Set the halfshaft assembled length to specification. For additional information, refer to Specifications in this section.



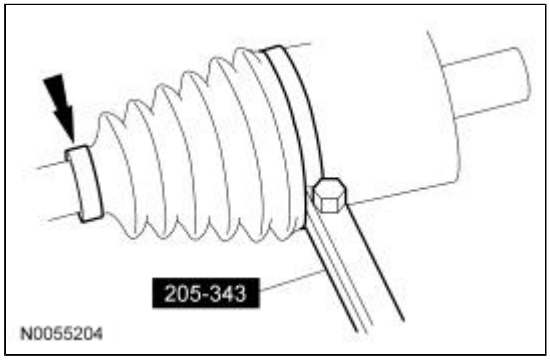
18. **CAUTION: Do not damage the boot.**

    Insert a dull screwdriver blade under the boot to release the pressure.



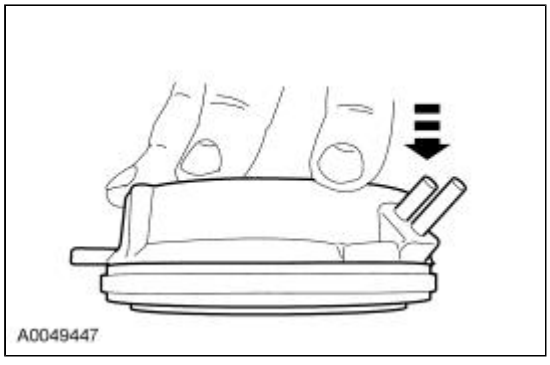
19. **NOTE:** Tighten the through-bolt until the tool is in the closed position.

    Using the special tool, install the 2 boot clamps.

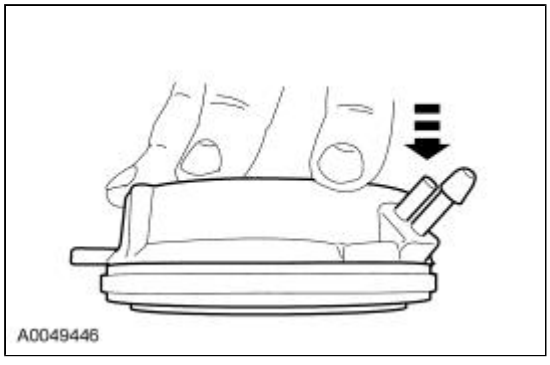


20. **NOTE:** Maintain a clean work surface.

    Compress the integrated wheel end (IWE) disconnect on the bench to collapse the vacuum chamber.

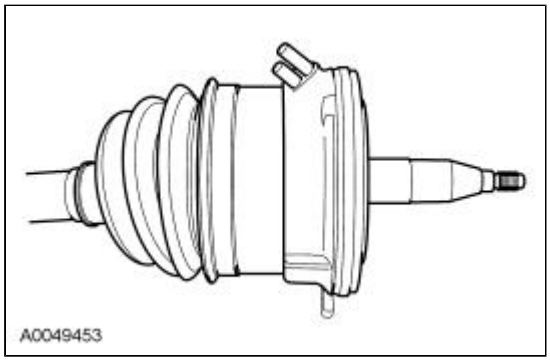


21. While the IWE disconnect is collapsed, install a vacuum cap on the vacuum port.



22. **CAUTION: Do not install the integrated wheel end disconnect in the knuckle. It must be installed on the outer constant velocity joint housing.**

    Install the IWE disconnect on the outer CV joint housing.



23. **CAUTION: Verify the spline engagement by checking for spline lash before installing the halfshaft nut.**

    Install the halfshaft in the vehicle. For additional information, refer to Halfshaft in the Removal and Installation portion of this section.

Printable View (63 KB)

General Specifications

Item	Specification
Halfshaft assembled length, LH	952.3 mm (37.49 in)
Halfshaft assembled length, RH	910.8 mm (35.86 in)

Torque Specifications

Description	Nm	lb-ft
Knuckle to lower control arm bolt	400	295
Rear axle wheel hub retainer	345	254
Toe-link nut	55	41

Materials

Item	Specification
Constant Velocity Joint Grease (High Temperature) XG-5	WSS-M1C258-A1

Rear Drive Halfshafts

Printable View (84 KB)

- The RH and LH halfshafts are different lengths, with the LH halfshaft being the longer of the 2.
- Inboard and outboard CV joints connect to a splined shaft.
- An axle circlip retains the splined inboard CV joint to the differential side gear. Install a new axle circlip every time the halfshaft is removed from the vehicle.
- A rear axle wheel hub retainer secures the side shaft assembly (interconnecting shaft and outboard CV joint) to the rear hub. Install a new rear axle wheel hub retainer every time you remove the halfshaft from the vehicle.

Halfshaft Handling

CAUTION: Never pick up or hold the halfshaft by the inboard or outboard CV joint only.

NOTE: Only the inner CV joints are removable for installation of new CV boots and clamps. The boots and clamps are the only serviced parts of the halfshaft assembly.

Handle all halfshaft components carefully during removal and installation procedures.

- The halfshaft assemblies are not repairable. Install new assemblies if worn/damaged.
- To separate the halfshaft from the rear hub, press the outboard CV joint from the rear hub.
- To separate the halfshaft from the differential, apply a load to the back face of the inboard CV joint assembly to overcome the axle circlip.
- Do not over-angle the CV joints.
- Install new differential stub shaft seals whenever the halfshafts are removed. For additional information, refer to Section 205-02 .
- Damage will occur to an assembled inboard CV joint if it is over-plunged outward from the joint housing.
- Never use a hammer to remove or install the halfshafts.
- Never use the halfshaft assembly as a lever to position other components. Always support the free end of the halfshaft.
- Do not allow the boots to contact sharp edges or hot exhaust components.
- Handle the halfshaft by the interconnecting shaft only to avoid pull-apart and potential damage to the CV joints.
- Do not drop assembled halfshafts. The impact can cut the boots from the inside without evidence of external damage.

Wheel and Tire Balancing, Rear

WARNING: Do not balance the rear wheels and tires while mounted on the vehicle. For additional information, refer to Section 204-04 .

Hoisting

CAUTION: Use a frame-contact hoist only. Vehicle or component damage can result if other types of hoists are used. For additional information, refer to Section 100-02 .

Never raise the vehicle using the halfshafts as lift points.

Undercoating and Rustproofing

During undercoating and rustproofing procedures, protect the boots from the coating materials. Foreign materials on the rubber boots will cause extreme advanced wear.

Rear Drive Halfshafts

Printable View (62 KB)

Refer to Section 205-00 .

Halfshaft

Printable View (266 KB)

Special Tool(s)

ST2666-A	Remover, Halfshaft 205-529
ST1326-A	Adapter for 303-224 (Handle) 205-153 (T80T-4000-W)

Removal and Installation

NOTE: This procedure applies to both rear halfshaft assemblies.

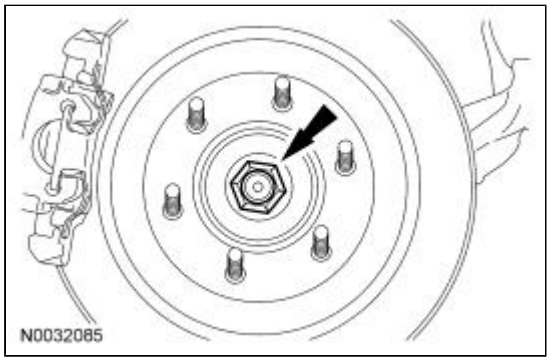
1. **CAUTION: Do not loosen the rear axle wheel hub retainer until after the wheel and tire assembly is removed from the vehicle. Wheel bearing damage will occur if the wheel bearing is unloaded with the weight of the vehicle applied.**

   With the vehicle in NEUTRAL, raise and support the vehicle. For additional information, refer to Section 100-02 .

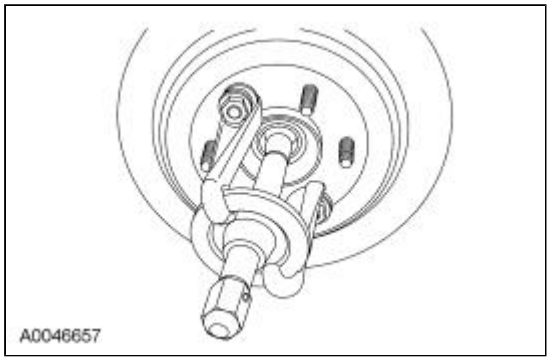
2. Remove the rear wheel and tire assembly. For additional information, refer to Section 204-04 .

3. **NOTE:** Have an assistant press the brake pedal to keep the axle from rotating.

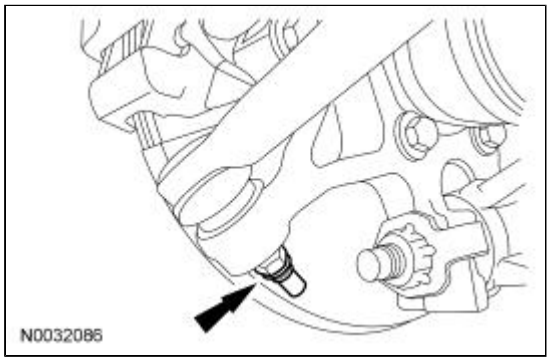
   Remove and discard the rear axle wheel hub retainer and the washer.
   - To install, tighten to 345 Nm (254 lb-ft).



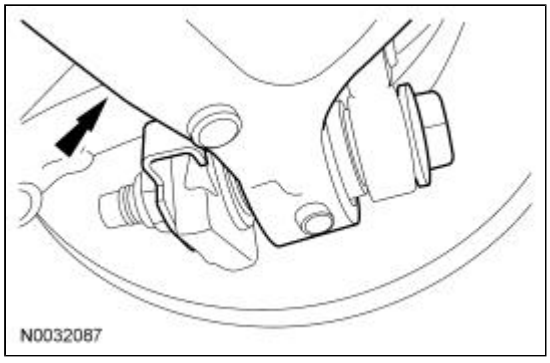
4. Using a suitable hub puller, separate the halfshaft from the knuckle.



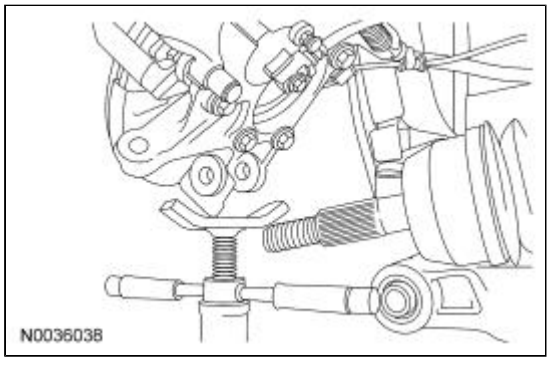
5. Disconnect the toe link from the rear knuckle.
    - To install, tighten to 55 Nm (41 lb-ft).



6. Remove the bolt retaining the knuckle to the lower control arm.
    - To install, tighten to 400 Nm (295 lb-ft).



7. Pivot the rear knuckle on the upper control arm bolts and support the knuckle in a raised position.

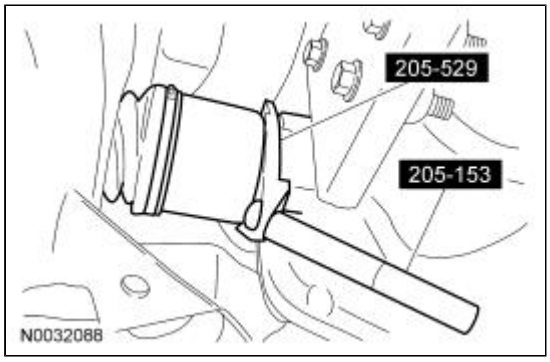


8. **CAUTION: Do not damage the axle shaft oil seal or the machined sealing surface on the inboard CV joint housing.**

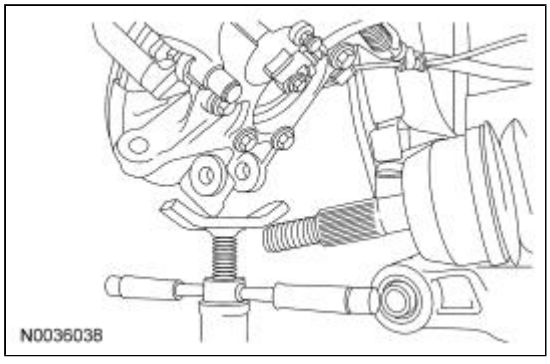
CAUTION: Do not allow the splines on inboard CV joint housing to touch the axle shaft oil seal.

NOTE: A circlip retains the inboard CV joint housing to the differential side gear in the axle.

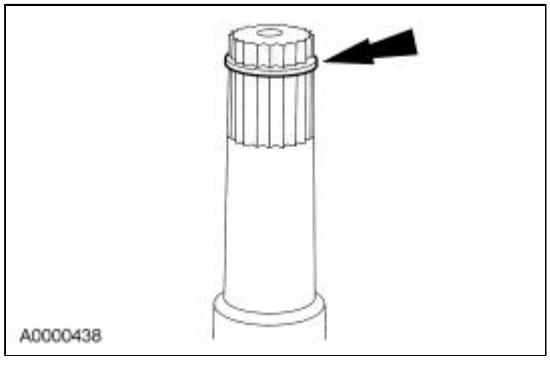
Using the special tool, disengage the inboard CV joint housing from the differential side gear.



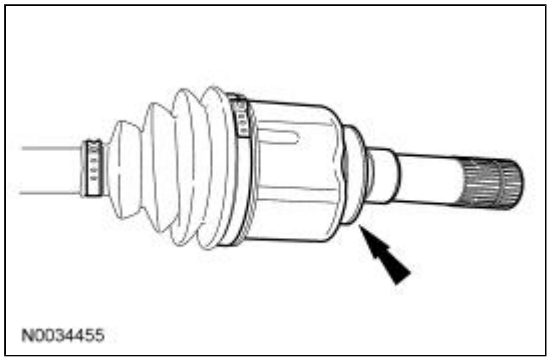
9. Remove the halfshaft assembly from the vehicle.



10. Remove and discard the halfshaft retainer circlip.



11. Remove and discard the halfshaft excluder seal, if equipped.
    - Do not install a new excluder seal.



12. **CAUTION: Always install a new differential stub shaft seal. For additional information, refer to Section 205-02 .**

    CAUTION: Always install the halfshaft with a new retainer circlip and a new rear axle wheel hub retainer.

    CAUTION: Never use power tools to tighten the rear axle wheel hub retainer.

    To install, reverse the removal procedure.

Halfshaft Joint

Printable View (278 KB)

Special Tool(s)

 ST1301-A	Installer, Constant Velocity Joint Boot Clamp 205-343 (T95P-3514-A)
ST1358-A	Installer, Drive Pinion Oil Seal 205-133 (T79P-4676-A)

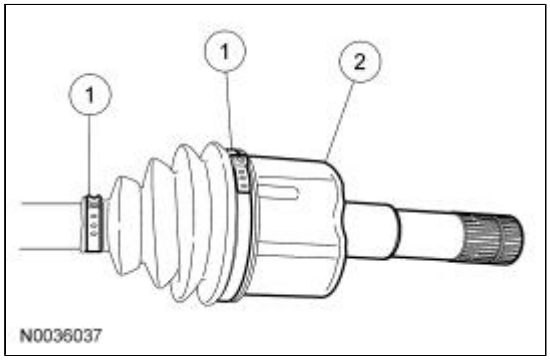
Material

Item	Specification
Constant Velocity Joint Grease (High Temperature) XG-5	WSS-M1C258-A1

Disassembly

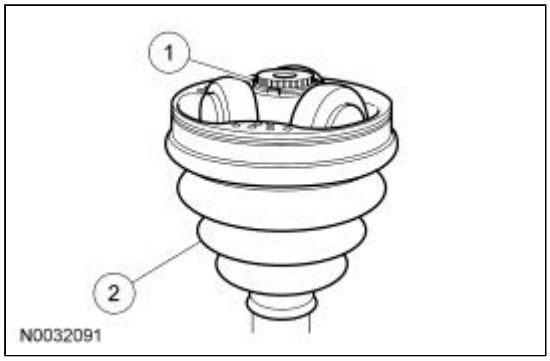
1. Remove the halfshaft assembly from the vehicle. For additional information, refer to Halfshaft in this section.

2. For the inboard CV joint, carry out the following:
   1. Remove and discard the boot clamps.
      - Use diagonal cutters to cut the clamp.
   2. Remove the inboard CV joint housing.

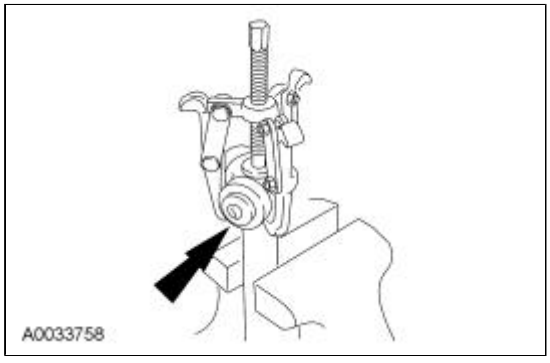


3. **NOTE:** Install the halfshaft in a soft-jaw vise.

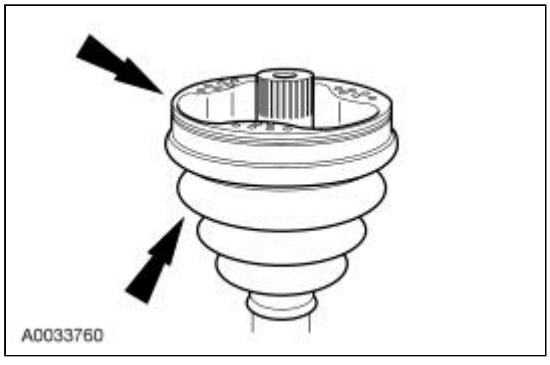
   For the inboard CV joint, carry out the following:
   1. Remove and discard the retainer circlip.
   2. Slide the boot away from the CV joint.



4. Using a suitable 3-jaw puller, remove the CV joint.

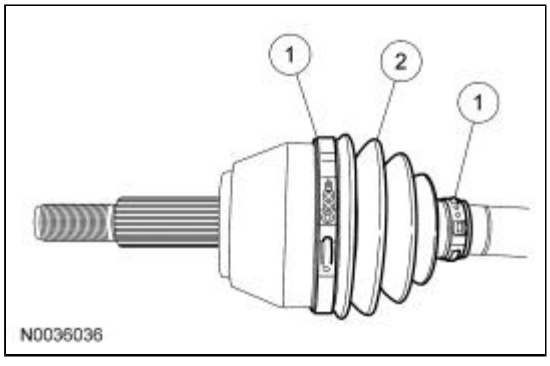


5. Remove and discard the tri-lobe insert and the boot.



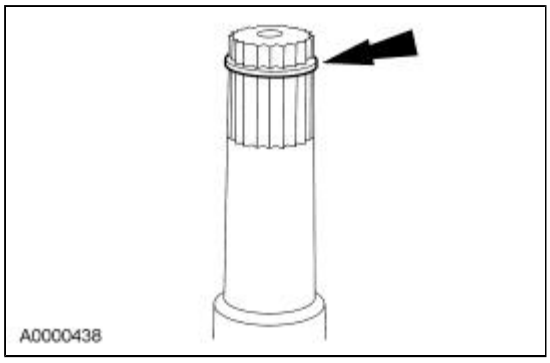
6. **NOTE:** The outboard CV joint is not removable from the halfshaft. The boot must be removed or installed from the inboard CV joint side of the shaft.

   For the outboard CV joint, carry out the following:
   1. Remove and discard the boot clamps.
   2. Remove and discard the boot.



7. Inspect the grease, packed in the inboard CV joint and the outboard CV joint, for contamination. Rub some of the grease from each joint between 2 fingers. Any gritty feeling indicates contamination. Wash all of the grease from the inboard CV joint, the inboard CV joint housing, the outboard CV joint and the interconnecting shaft. Thoroughly dry all of the components and inspect them for wear or damage. Discard the assembly, if necessary. Only proceed as follows if not discarding the assembly.

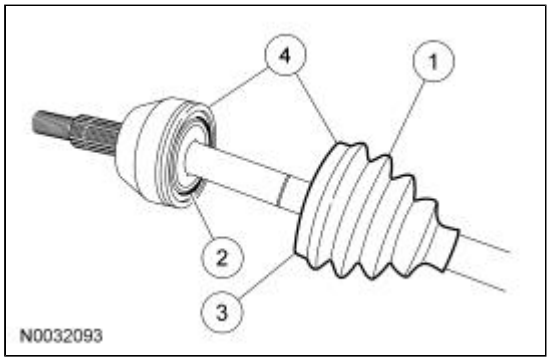
8. On the inboard end, remove and discard the retainer circlip.



Assembly

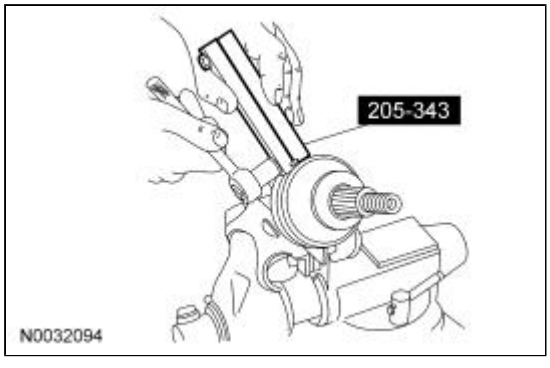
1. **NOTE:** Clean any excess grease from the boot mounting surfaces before installing the boot.

   For the outboard CV joint, carry out the following:
   1. Slide the boot on the interconnecting shaft.
   2. Pack the outboard CV joint with 275 grams (9.7 ounces) of grease.
   3. Spread any remaining grease evenly inside the boot.
   4. Install the boot by seating it in the groove in the CV joint housing.



2. **NOTE:** Tighten the through-bolt until the special tool is in the closed position.

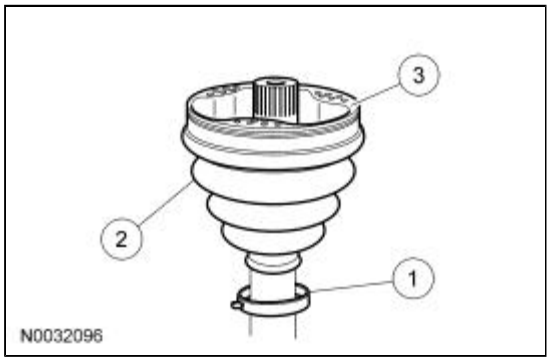
   Using the special tool, install both boot clamps.



3. **NOTE:** Install the halfshaft in a soft-jaw vise.

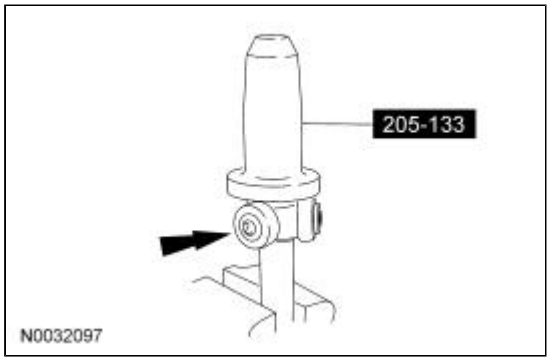
   NOTE: The lip on the end of the tri-lobe insert must seat against the end of the boot.

   For the inboard CV joint, carry out the following:
   1. Position the clamp on the interconnecting shaft.
   2. Position the boot on the interconnecting shaft.
   3. Install the tri-lobe insert.

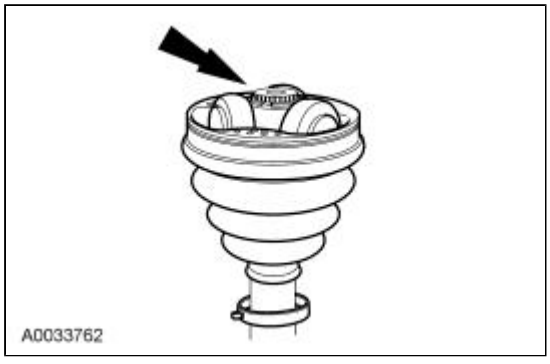


4. **NOTE:** One side of the inboard CV joint has a chamfer cut in the edge of joint at the inner diameter near the splines. Install the inboard CV joint so that the chamfer faces the outboard end of the halfshaft.

   Install the CV joint.

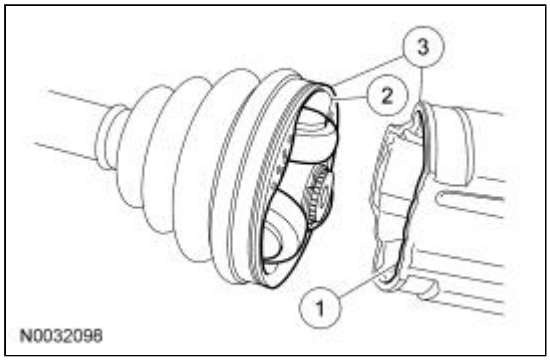


5. Install the retainer circlip.

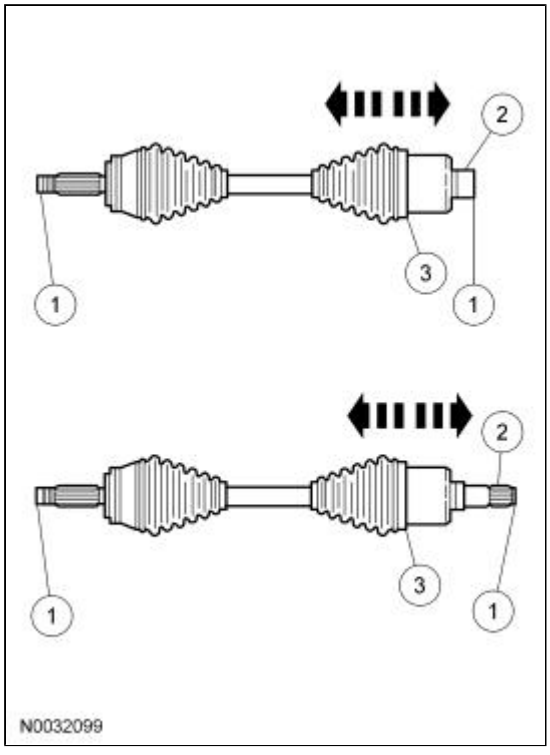


6. **NOTE:** Clean any excess grease from the boot mounting surfaces before installing the boot.

   For the inboard CV joint, carry out the following:
   1. Pack the inboard CV joint housing with 325 grams (11.5 ounces) of grease.
   2. Spread any remaining grease evenly inside the boot and on the CV joint.
   3. Install the inboard CV joint housing, seating the boot in the groove in the housing.

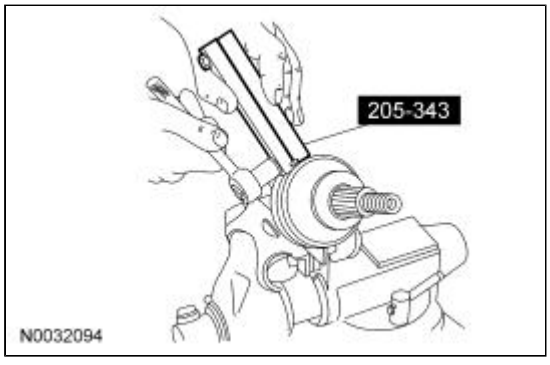


7. Set the halfshaft assembled length to specification. For additional information, refer to Specifications in this section.
    1. Measure the entire assembly length.
    2. Push in or pull out on the inner joint as necessary to adjust the halfshaft assembled length to specification.
    3. Hold the inner joint to prevent the assembled length from changing, and insert a small flat-blade screwdriver between the boot and the joint to equalize the pressure.



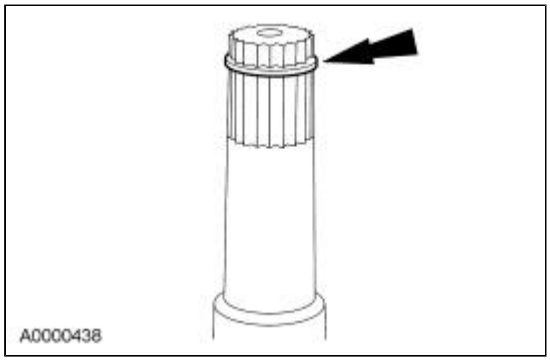
8. **NOTE:** Tighten the through-bolt until the special tool is in the closed position.

    Using the special tool, install both boot clamps.



9. **CAUTION: Do not overexpand or twist the circlip during installation.**

   Install a new retainer circlip.



10. Install the halfshaft assembly in the vehicle. For additional information, refer to Halfshaft in this section.

Brake System

Printable View (62 KB)

The brake system consists of:

- a vacuum-assisted power braking system.
- a front-to-rear split hydraulic system.
- front brakes utilize a dual piston brake caliper and disc brake system.
- rear brakes utilize a single piston brake caliper and disc brake system.
- parking brake system is a mechanical system that activates a shoe-and-drum system within the brake disc.
- four-wheel anti-lock brake system (4WABS) is standard equipment.

High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A
Metal Brake Parts Cleaner PM-4-A or PM-4-B (US); CPM-4 (Canada)	—

Principles of Operation

Hydraulic Brake System

Applying the brake pedal uses lever action to push a rod into the brake booster, which through the use of vacuum, boosts the force of the rod and then transmits this force into the master cylinder. This produces hydraulic pressure in the master cylinder. On vehicles not equipped with anti-lock brake systems (ABS), the hydraulic pressure is transmitted by brake fluid through the brake tubes to the individual brake calipers. On vehicles equipped with ABS, the hydraulic pressure is transmitted by brake fluid through the brake tubes to the ABS hydraulic control unit (HCU), which then distributes that pressure to the individual brake calipers. The brake calipers use hydraulic pressure to apply the pads. The application of the brake pads will cause the rotation of the wheels to slow or stop depending on how much brake pressure is applied. The parking brakes carry out the same function except that they are mechanically actuated by a cable that connects only to the rear brakes.

Programming Adjustable Pedal Positions

An adjustable pedal position can be stored at any time.

Programming adjustable pedal positions can be accomplished by doing the following:

- An adjustable pedal position can be stored at any time. To store the adjustable pedal position to memory, the driver must move the pedals to the preferred position using the adjustable pedal switch. The driver must then depress the memory SET switch. Within 5 seconds, the driver must select a memory position. Memory No. 1 is selected by depressing the 1 switch. Memory No. 2 is selected by depressing the 2 switch.
- If no memory switch input is received within the 5 second time limit, the operation is aborted. If one of the following inputs is received during the 5 second programming limit, the operation will also be aborted:
  - Adjustable pedal switch
  - Power driver seat switch
  - Power outside rearview mirrors switch
  - Memory SET switch

To program the remote keyless entry (RKE) transmitter, refer to Section 501-14 .

Recalling a Stored Adjustable Pedal Position

Once the driver has stored a preferred adjustable pedal position, the driver can recall the setting by depressing the corresponding memory switch or by using a programmed remote transmitter. Recalling a stored adjustable pedal position can be accomplished by doing the following:

- The driver can recall a preferred adjustable pedal position by depressing one or both of the memory recall switches. Pressing memory switch 1 will initiate a recall of the adjustable pedal position stored in memory No. 1. Pressing memory switch 2 will initiate a recall of the adjustable pedal position stored in memory No. 2. Pressing both memory No. 1 and memory No. 2, will initiate a recall of the adjustable pedal position stored in memory No. 3.
- A remote transmitter can be used to recall previously set memory positions. The remote transmitters are manufactured with an assigned personality number (1, 2 or 3) and are so designated on the back of the remote transmitter case. The remote transmitter assigned with personality 1 is capable of only recalling memory position 1. Similarly, the remote transmitters assigned with personalities 2 and 3, can only recall memory positions 2 and 3, respectively.
- Memory recall occurs when the unlock switch is pressed on the remote transmitters. A second press of the unlock switch, which unlocks the passenger doors, does not initiate a memory recall.
- A memory recall in progress does not prohibit the initiation of another memory recall; the most recently requested memory recall will be executed.

Inspection and Verification

WARNING: Use of any brake fluid other than the approved DOT 3 will cause permanent damage to brake components and will render the brakes inoperative. Failure to follow these instructions may result in personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled

onto a painted or plastic surface, immediately wash it with water.

NOTE: Always check the fluid level in the brake master cylinder reservoir before carrying out the test procedures. If the fluid level is not at the correct level, clean the reservoir cap before removing, then add clean, specified brake fluid.

NOTE: Prior to carrying out any diagnosis, make sure the red brake warning indicator is functional. Refer to Section 413-01 .

The first indication that something may be wrong in the brake system is a change in the feeling through the brake pedal. The brake warning indicator in the instrument cluster and the brake fluid level in the brake master cylinder reservoir are also indicators of system concerns.

If a wheel is locked and the vehicle must be moved, open a bleeder screw at the locked wheel to let out enough fluid to relieve the pressure. Close the bleeder screw. This bleeding operation may release the brakes but will not correct the cause of the trouble. If this does not relieve the locked wheel condition, repair the locked components before proceeding.

Inspect all hoses and connections. All unused vacuum connectors should be capped. Make sure hoses and their connections are correctly secured and in good condition with no holes, soft or collapsed areas.

Road Test

The technician should have a thorough knowledge of the brake system operation and accepted general braking guidelines in order to detect any problems.

Select a road that is reasonably smooth and level. Gravel or bumpy roads are not suitable because the surface does not allow the tires to grip the road equally. Avoid crowned roads.

A key factor in evaluating brake concerns is the deceleration rate. This varies from vehicle to vehicle and with changes in operating conditions. It is evident how well the brakes are working after just a few applications.

Brake Pads

NOTE: It is not required to install new brake pads if friction material properties are within guidelines. It is also not required to install new brake pads when the brake discs are machined.

- Remove the brake pads. Refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
- Inspect and measure the thickness of the brake pad friction material.
    - Install new brake pads if the thickness of the friction material is less than 2 mm (0.079 in). Refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
    - Compare all 4 front or rear pads for uneven wear. Install new brake pads if the thickness of the friction material varies from pad to pad by more than 2 mm (0.07 in). Refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
    - Install new brake pads if there are missing chunks or cracks in the lining through to the backing plate. Refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
    - If the friction material thickness varies by more than 3 mm (0.11 in) in any direction (taper wear), verify the caliper guide pins are functioning correctly. Refer to Brake Caliper Guide Pins in this section.

Brake Discs

CAUTION: Using an impact tool without a torque socket will lead to unevenly tightened lug nuts. This causes brake disc on-vehicle lateral runout and brake roughness.

NOTE: It is generally not required to install new brake discs to address noise issues.

- Remove the brake disc. Refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
- Inspect the brake discs and measure the brake disc thickness in a minimum of 4 places around the circumference of the brake disc. Record the measurements.
  - Install new brake discs if any thickness measurement is less than the minimum specification. Refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
  - Install new brake discs if cracked. Refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
  - Machine the brake discs if the diagnosis has revealed vibration in the steering wheel, seat or pedal while braking. Heavily scored brake discs, similar to that caused by pads worn down to the backing plate, should also be machined. In order to machine, discs must be above the minimum thickness to machine specification. Refer to Specifications and Brake Disc Machining in this section.

Brake Caliper

Inspect the brake calipers:

- for brake fluid leaks. Refer to Brake System Leak Check in this section.
- boots and seals for tears or cracks.
- caliper piston for binding and corrosion.
- guide pins for correct operation. Refer to Brake Caliper Guide Pins in this section.

Brake Caliper Guide Pins

CAUTION: Do not use power tools for caliper guide pin bore cleaning.

The guide pins should slide with a reasonable amount of hand force. If the brake pads show taper wear or the guide pins are difficult to move, then carry out the following steps.

NOTE: If a guide pin kit is not available, install a new caliper assembly.

- Disassemble the guide pins. Refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
- Use a wire brush, rolled-up sandpaper or emery cloth to remove all corrosion and foreign material from the caliper guide pin bores. Clean remaining foreign material from the bores with brake parts cleaner and compressed air.
- Install new brake pads if the lining is not within specifications. Refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
- Assemble the caliper guide pins using new caliper seals, boots and guide pins. Use an ample amount of grease to lubricate the bores and guide pins.

Brake Hoses and Tubes

CAUTION: Never use copper tubing. It is subject to fatigue, cracking and corrosion, which

could result in brake tube failure.

- Double-wall steel tubing is used throughout the brake hydraulic system. All brake tube fittings must be correctly double flared to provide strong, leakproof connections. When bending tubing to fit the underbody or rear axle contours, be careful not to kink or crack the tube.
- If a section of the brake tube is damaged, the entire section must be installed new with a tube of the same type, size, shape and length.
- When installing the hydraulic brake tubing, hoses or connectors, tighten all connections to specifications. After installation, bleed the brake system. Refer to Brake System Bleeding in this section.
- The wet appearance on the outer cover of rubber brake hoses is called "sweating". This is a normal condition for neoprene rayon braid hose and is not a sign of leakage or cause to install a new hose.

Install a new brake hose if the hose shows signs of softening, cracking or other damage.

When installing a new brake hose, position the hose to avoid contact with other vehicle components.

Non-Pressure Leaks

NOTE: The wet appearance on the outer cover of rubber brake hoses is called "sweating". This is a normal condition for neoprene rayon braid hose. The sweating condition is not evidence of a brake fluid leak and will not result in a loss of pressure in the system.

The only part of the brake system that could have a brake fluid loss that does not appear when the system is under pressure is the brake master cylinder reservoir under the following conditions:

- Missing or poorly-fitted brake master cylinder filler cap
- Punctured or otherwise damaged brake master cylinder reservoir
- Missing or damaged brake master cylinder filler cap gasket
- Missing, damaged or poorly-fitted sealing grommets between the brake master cylinder and the brake master cylinder reservoir

The brake master cylinder reservoir grommets are not repairable and must be installed new as part of a new brake master cylinder reservoir.

Brake Master Cylinder — Normal Conditions

The following conditions are considered normal and are not indications that the brake master cylinder is in need of service.

Condition 1: During normal operation of the brake master cylinder, the fluid level in the brake master cylinder reservoir will fall during brake application and rise during release. The net fluid level (such as after brake application and release) will remain unchanged.

Condition 2: A trace of brake fluid will exist on the booster shell below the master cylinder mounting flange. This results from the normal lubricating action of the master cylinder bore and seal.

Condition 3: Fluid level will decrease with pad wear.

Brake Master Cylinder — Abnormal Conditions

Changes in brake pedal feel or travel are indicators that something could be wrong in the brake system. GO to Symptom Chart for abnormal condition diagnosis.

Brake Booster

Inspect the brake booster for the following:

- Excessive corrosion or damage
- Vacuum connections for leakage
- Vacuum hoses for kinks or leakage
- Brake booster check valve for correct operation

Changes in the brake pedal feel or travel are indicators that something could be wrong in the brake system. GO to Symptom Chart for abnormal condition diagnosis.

Parking Brake

Check the operation of the parking brake system with the vehicle on a hoist and the parking brake control fully released. Check for any damaged cables and install new components as necessary. Check the rear brake adjustment or carry out the brake system diagnosis. Refer to Section 206-05 .

Visual Inspection Chart

Mechanical	Electrical
• Brake master cylinder • Brake caliper piston • Brake discs • Wheel bearings • Brake pads • Power brake booster • Brake pedal linkage • Booster vacuum hose • Tires • Foreign material	• Parking brake switch • Damaged or corroded wiring harness • Brake master cylinder fluid level switch

For low or spongy brake pedal concerns:

- check the system for leaks and repair as necessary.
- check and, if necessary, refill the brake master cylinder reservoir.
- bleed the brake system and retest the brake pedal feel.

For a slow or incomplete brake pedal return concern:

- inspect for binding, damage, correct installation or interference at the brake pedal.
- check the power brake booster for binding, damage and correct installation.

Adjustable Pedals Without Memory Feature

1. Verify the customer concern by operating the adjustable pedals.

2. Visually inspect for obvious signs of mechanical or electrical damage. Refer to the following chart:

Visual Inspection Chart

Mechanical	Electrical
• Adjustable pedals • Adjustable pedal cable • Adjustable pedal motor • Foreign material	• Electrical connectors • Wiring harnesses • Smart junction box (SJB) fuse 20 (15A) • Adjustable pedal switch

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, GO to Symptom Chart .

Adjustable Pedals With Memory Feature

1. Verify the customer concern by operating the adjustable pedals.

NOTE: If the adjustable pedals are not installed on the vehicle, when a self-test is carried out, the driver seat module (DSM) will set pedal codes.

2. Visually inspect for obvious signs of mechanical or electrical damage. Refer to the following chart:

Visual Inspection Chart

Mechanical	Electrical
• Adjustable pedals • Adjustable pedal cable • Adjustable pedal motor • Remote transmitter • Foreign material	• Electrical connectors • Wiring harnesses • Battery junction box (BJB) fuse 45 (30A) • Smart junction box (SJB) fuse 2 (15A) • Adjustable pedal switch • Memory SET switch • DSM

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the powertrain control module

(PCM).

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record continuous memory diagnostic trouble codes (DTCs).

8. Clear the continuous DTCs and carry out the self-test diagnostics for the DSM.

9. If the DTCs retrieved are related to the concern, go to the Driver Seat Module (DSM) Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Driver Seat Module (DSM) Diagnostic Trouble Code (DTC) Chart

Driver Seat Module (DSM) Diagnostic Trouble Code (DTC) Chart

DTC	Description	Source	Action
B1342	ECU is Defective	DSM	REFER to Section 419-10 .

B1990	Pedal Forward/Rearward Potentiometer Feedback Circuit Failure	DSM	Go To Pinpoint Test C .
B1991	Pedal Forward/Rearward Potentiometer Feedback Circuit Short to Battery	DSM	Go To Pinpoint Test C .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the driver seat module (DSM)	• Fuse • Circuitry • DSM	• REFER to Section 418-00 to diagnose the no communication problem.

• The red brake warning indicator is always on	• Brake fluid level	• INSPECT the system for leaks, REPAIR as necessary. FILL the brake fluid reservoir to the MAX line.
	• Parking brake switch/circuitry • Instrument cluster	• REFER to Section 413-01 .
	• Brake master cylinder	• CARRY OUT the Brake Master Cylinder Component Test in this section.
	• Parking brake component(s)	• REPAIR or INSTALL new component(s) as necessary. REFER to Section 206-05 .
• Red brake warning indicator inoperative	• Circuitry • Bulb	• REFER to Section 413-01 .
• The brakes pull or drift	• Tire air pressure	• CHECK the tires for uneven or excessive wear and correct inflation.
	• Brake pads • Brake components	• CHECK the brake pads for uneven taper or excessive wear. REPAIR as necessary. • CHECK the brake discs and the hubs for damage. REPAIR as necessary.
	• Suspension component • Wheel alignment	• CHECK wheel alignment. REFER to Section 204-00 .
• Brake pedal goes down fast	• Brake fluid level	• INSPECT the system for leaks, REPAIR as necessary. FILL the brake fluid reservoir to the MAX line. BLEED the system. REFER to Brake System Bleeding in this section.
	• Air in system	• INSPECT the system for leaks, REPAIR as necessary. BLEED the system. REFER to Brake System Bleeding in this section.
	• Brake master cylinder	• CARRY OUT the Brake Master Cylinder Component Test in this section.
• The brake pedal eases down slowly	• Air in system	• INSPECT the system for leaks, REPAIR as necessary. BLEED the system. REFER to Brake System Bleeding in this section.
	• Brake master cylinder	• CARRY OUT the Brake Master Cylinder Component Test in this

		section.
• Brake lockup under light brake pedal force	• Brake pads	• CHECK the brake pads for uneven taper or excessive wear. REPAIR as necessary.
	• Brake component	• CHECK the brake components for correct operation. REPAIR as necessary.
	• Parking brake component	• REPAIR or INSTALL new components as necessary. REFER to Section 206-05 .
	• Anti-lock brake control system	• CHECK the anti-lock brake control system. REFER to Section 206-09 .
• Excessive/erratic brake pedal travel	• Leak in hydraulic system • Air in system • Disc brake caliper	• INSPECT the system for leaks, REPAIR as necessary. BLEED the system. REFER to Brake System Bleeding in this section.
	• Brake master cylinder	• CARRY OUT the Brake Master Cylinder Component Test in this section.
	• Brake pads	• CHECK the brake pads for excessive wear.
	• Brake pedal	• CHECK the brake pedal for binding or obstructions. REPAIR as necessary.
• Brakes drag	• Parking brake component	• REPAIR or INSTALL new components as necessary. REFER to Section 206-05 .
	• Brake caliper guide pins	• REPAIR or INSTALL new caliper guide pins, seals and boots. REFER to Brake Caliper Guide Pins in this section.
	• Disc brake caliper	• REPAIR or INSTALL new brake calipers as necessary. REFER to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
	• Brake booster	• CARRY OUT the Brake Booster Component Test in this section.
	• Brake master cylinder	• CARRY OUT the Brake Master Cylinder Component Test in this section.
• Excessive brake pedal effort	• Brake booster	• CARRY OUT the Brake Booster Cylinder Component Test in this section.
	• Brake booster check valve	• CARRY OUT the Check Valve Component Test in

		this section.
	• Brake booster manifold vacuum hose	• REROUTE, REPAIR or INSTALL new components as necessary.
• Rattling noise	• Caliper mounting bolts loose	• CHECK the caliper bolts. TIGHTEN to specifications. REFER to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
	• Damaged or worn caliper guide pins or retainers	• CHECK the caliper guide pins and retainers for lubrication and correct operation. LUBRICATE or INSTALL new components as necessary. REFER to Brake Caliper Guide Pins in this section.
	• Missing or damaged anti-rattle clips or springs	• CHECK the brake pads for missing clips or broken springs. INSTALL new components as necessary. REFER to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
	• Loose brake disc shield	• TIGHTEN the brake disc shield bolts to specification. REFER to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
• Clicking noise — with brakes applied with anti-lock brake system (ABS)	• ABS hydraulic control unit	• Acceptable condition.
• Squealing noise — occurs on first (morning) brake application	• Brake pads	• Acceptable condition. Caused by humidity and low brake pad temperature.
• Squealing noise — a continuous squeal	• Brake pads or linings worn below minimum thickness	• INSPECT brake pads for excessive wear, taper wear or uneven wear. VERIFY brake pads are within minimum specifications. REFER to Brake Pads in this section.
• Squealing noise — an intermittent squeal brought on by cold, heat, water, mud or snow	• Brake pads	• Acceptable condition.
• Groaning noise — occurs at low speeds with brake lightly applied (creeping)	• Brake pads	• Acceptable condition.
• Grinding noise — continuous	• Brake pads or linings worn	• INSPECT the brake pads, brake discs and attaching

	below minimum thickness	hardware for damage. VERIFY brake pads are within minimum specifications. REFER to Brake Pads in this section.
• Moaning noise	• Brake linings contaminated with grease or oil	• INSPECT the brake pads for contamination. REPAIR or INSTALL new components as necessary. REFER to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
• Brake pedal application feels abnormal	• Power brake booster input shaft	• CHECK the orientation of the power brake booster input shaft; the offset (if present) must be downward. If incorrect, CORRECT as necessary.
• Adjustable brake pedal does not operate correctly — using the adjustable pedal switch (system without memory feature)	• Obstruction(s) • Adjustable pedal motor • Adjustable pedal cable • Adjustable pedal switch	• Go To Pinpoint Test A .
• Adjustable brake pedal does not operate correctly — using the adjustable pedal switch (system with memory feature)	• Fuse • Circuitry • Adjustable pedal switch • Adjustable pedal motor • DSM	• Go To Pinpoint Test B .
• Adjustable brake pedal does not operate correctly — using the memory SET switch	• Fuse • Circuitry • Memory set switch • Adjustable pedal motor • DSM	• If the seats and mirrors are also inoperative using the memory set switch, REFER to Section 501-10 . • If the only the adjustable pedals are inoperative using the memory set switch, Go To Pinpoint Test C .
• Adjustable brake pedal does not operate correctly — using the remote transmitter	• Fuse • Circuitry • Remote transmitter • Adjustable pedal motor • DSM	• If the seats and mirrors are also inoperative using the memory set switch, REFER to Section 501-10 . • If the only the adjustable pedals are inoperative using the memory set switch, Go To Pinpoint Test C .
• Vibration when the brakes are applied	• Uneven brake pad wear • Brake disc pad transfer • Brake disc • Suspension components	• COMPLETE the brake system inspection described in Inspection and Verification in this section. • Go To Pinpoint Test D .
• Brake vibration/shudder	• Brake caliper	• INSPECT the brake caliper

— occurs when the brake pedal is released	guide pins • Brake drag	guide pins for correct operation. REFER to Brake Caliper Guide Pins in this section. • INSPECT the brake pads for premature wear. REPAIR or INSTALL a new caliper as necessary. REFER to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.

Pinpoint Tests

Pinpoint Test A: Adjustable Brake Pedal Does Not Operate Correctly — Using the Adjustable Pedal Switch (System Without Memory Feature)

Refer to Wiring Diagrams Cell 127 , Adjustable Pedals for schematic and connector information.

Normal Operation

The adjustable pedal switch receives fused battery voltage from smart junction box (SJB) fuse 20 (15A) along circuit SBP20 (GN/RD).

When the adjustable pedal switch is pressed in the rearward position, the voltage is sent to the adjustable pedal motor along circuit CPP01 (WH/OG), the voltage returns to the switch along circuit CPP02 (BN) and is grounded through the switch along circuit GD138 (BK/WH).

When the adjustable pedal switch is pressed in the forward position, the voltage is sent to the adjustable pedal motor along circuit CPP02 (BN), the voltage returns to the switch along circuit CPP01 (WH/OG) and is grounded through the switch along circuit GD138 (BK/WH).

Possible Causes

- Fuse
- Circuit open
- Circuit shorted
- Foreign material
- Adjustable pedal cable
- Adjustable pedal switch
- Adjustable pedal motor
- Adjustable brake pedal assembly
- Adjustable accelerator pedal assembly

PINPOINT TEST A: ADJUSTABLE BRAKE PEDAL DOES NOT OPERATE CORRECTLY — SYSTEM WITHOUT MEMORY (SYSTEM WITHOUT MEMORY FEATURE)

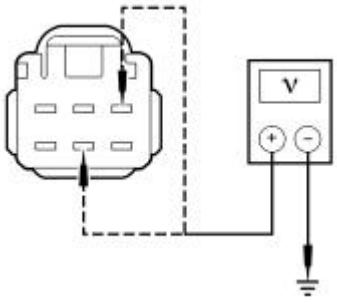
CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
A1 CHECK THE ADJUSTABLE PEDAL MOTOR INSTALLATION	

• Check adjustable pedal motor for correct installation. • **Is the motor installation OK?**	**Yes** GO to A2 . **No** CORRECT the adjustable pedal motor installation. TEST the system for normal operation.
A2 CHECK THE ADJUSTABLE ACCELERATOR PEDAL SYSTEM	
• Disconnect the adjustable brake pedal cable from the adjustable accelerator pedal motor. • Operate the adjustable pedal control switch. • **Does the adjustable brake pedal operate now?**	**Yes** REPAIR the adjustable accelerator pedal system. REFER to Section 310-02 . TEST the system for normal operation. **No** GO to A3 .
A3 INSPECT FOR FOREIGN MATERIAL	
• Inspect the adjustable brake pedal assembly for foreign material causing a binding condition. • **Was any foreign material found?**	**Yes** REMOVE the foreign material. TEST the system for normal operation. **No** GO to A4 .
A4 CHECK THE CABLE	
• Dismount the adjustable pedal motor. • Inspect the ends of the brake pedal motor cable for wear or damage. • **Are the cable ends OK?**	**Yes** GO to A5 . **No** INSTALL a new brake pedal motor cable. TEST the system for normal operation.
A5 TEST THE ADJUSTABLE PEDAL SWITCH	
• Key in OFF position. • Disconnect: Adjustable Pedal Switch C2089. • Carry out the adjustable pedal switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Does the adjustable pedal switch pass the component test?**	**Yes** GO to A6 . **No** INSTALL a new adjustable pedal switch. TEST the system for normal operation.
A6 CHECK CIRCUIT SBP20 (GN/RD) FOR VOLTAGE	
• Measure the voltage between adjustable pedal switch C2089-6, circuit SBP20 (GN/RD), harness side and ground.	**Yes** GO to A7 . **No** VERIFY SJB fuse 20 (15A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

 N0055804 • **Is the voltage greater than 10 volts?**	
A7 CHECK CIRCUIT GD133 (BK/WH) FOR AN OPEN	
• Measure the resistance between adjustable pedal switch C2089-2, circuit GD133 (BK/WH), harness side and ground.  N0055805 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR circuit GD133 (BK/WH). TEST the system for normal operation. **No** GO to A8 .
A8 CHECK CIRCUITS CPP01 (WH/OG) AND CPP02 (BN) FOR AN OPEN	
• Disconnect: Adjustable Pedal Motor C2003. • Measure the resistance between: ▪ adjustable pedal switch C2089-5, circuit CPP01 (WH/OG), harness side and adjustable pedal motor C2003-2, circuit CPP01 (WH/OG), harness side. ▪ adjustable pedal switch C2089-1, circuit CPP02 (BN), harness side and adjustable pedal motor C2003-1, CPP02 (BN), harness side. • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR the affected circuit (s) for an open. TEST the system for normal operation. **No** GO to A9 .
A9 CHECK CIRCUITS CPP01 (WH/OG) AND CPP02 (BN) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between ground and: ▪ adjustable pedal switch C2089-5, circuit CPP01 (WH/OG), harness side. ▪ adjustable pedal switch C2089-1, circuit CPP02 (BN), harness side.  N0055806	**Yes** REPAIR the affected circuit (s). TEST the system for normal operation. **No** GO to A10 .

• **Are the resistances less than 5 ohms?**	
A10 CHECK CIRCUITS CPP01 (WH/OG) AND CPP02 (BN) FOR A SHORT TO VOLTAGE	

• Key in ON position.
• Measure the voltage between ground and:
  ■ adjustable pedal switch C2089-5, circuit CPP01 (WH/OG), harness side.
  ■ adjustable pedal switch C2089-1, circuit CPP02 (BN), harness side.
  	


N0055807
• **Is voltage present?**
	Yes
	REPAIR the affected circuit (s) for a short to voltage. TEST the system for normal operation.
	
	No
	INSTALL a new brake pedal assembly. TEST the system for normal operation.

Pinpoint Test B: Adjustable Brake Pedal Does Not Operate Correctly — Using the Adjustable Pedal Switch (System With Memory Feature); DTCs B1987, B1988 and B1989 — Pedal Forward/Rearward Motor Stalled, Pedal Position Forward Switch Circuit Short to Battery and Pedal Position Rearward Switch Circuit Short to Battery

Refer to Wiring Diagrams Cell 127 , Adjustable Pedals for schematic and connector information.

Normal Operation

To move the pedal rearward, the adjustable pedal switch provides a ground path for the driver seat module (DSM) along circuit CPP10 (BN/BU), through the adjustable pedal switch and finally along circuit GD133 (BK). The DSM then provides voltage to the adjustable pedal motor along circuit CPP01 (WH/OG), through the adjustable pedal motor and back into the DSM along circuit CPP02 (BN).

To move the pedal forward, the adjustable pedal switch provides a ground path for the DSM along circuit CPP09 (VT/OG), through the adjustable pedal switch and finally along circuit GD133 (BK). The DSM then provides voltage to the adjustable pedal motor along circuit CPP02 (BN), through the adjustable pedal motor and back into the DSM along circuit CPP01 (WH/OG).

Possible Causes

- Circuit open
- Circuit shorted
- Adjustable pedal switch
- DSM

PINPOINT TEST B: ADJUSTABLE BRAKE PEDAL DOES NOT OPERATE CORRECTLY — USING THE ADJUSTABLE PEDAL SWITCH (SYSTEM WITH MEMORY FEATURE); DTCs B1987, B1988 AND B1989 — PEDAL FORWARD/REARWARD MOTOR STALLED, PEDAL POSITION FORWARD SWITCH CIRCUIT SHORT TO BATTERY AND PEDAL POSITION REARWARD SWITCH CIRCUIT SHORT TO BATTERY

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring

terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
B1 CHECK DSM FOR CORRECT ADJUSTABLE PEDAL SWITCH PID INPUTS	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Monitor the DSM adjustable pedal switch PID inputs while activating the adjustable pedal switch. • **Does the DSM adjustable pedal switch PID value agree with the adjustable pedal switch position within one second of releasing the switch?**	**Yes** Go To Pinpoint Test C . **No** GO to B2 .
B2 CHECK THE ADJUSTABLE PEDAL SWITCH	
• Key in OFF position. • Disconnect: Adjustable Pedal Switch C2089 . • Carry out the adjustable pedal switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Does the adjustable pedal switch pass the component test?**	**Yes** GO to B3 . **No** INSTALL a new adjustable pedal switch. CLEAR the DTCs. REPEAT the self-test.
B3 CHECK CIRCUIT GD133 (BK) FOR AN OPEN	
• Measure the resistance between adjustable pedal switch C2089-2, circuit GD133 (BK), harness side and ground.  N0055805 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR circuit GD133 (BK). CLEAR the DTCs. REPEAT the self-test. **No** GO to B4 .
B4 CHECK CIRCUITS CPP09 (VT/OG) AND CPP10 (BN/BU) FOR A SHORT TOGETHER	
• Disconnect: Driver Seat Module (DSM) C341c. • Measure the resistance between adjustable pedal switch C2089-1, circuit CPP09 (VT/OG), harness side and C2089-5, circuit CPP10 (BN/BU), harness side.  N0060854 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the affected circuit (s). CLEAR the DTCs. REPEAT the self-test. **No** GO to B5 .

B5 CHECK CIRCUITS CPP09 (VT/OG) AND CPP10 (BN/BU) FOR A SHORT TO GROUND	
• Measure the resistance between: ▪ adjustable pedal switch C2089-1, circuit CPP09 (VT/OG), harness side and ground. ▪ adjustable pedal switch C2089-5, circuit CPP10 (BN/BU), harness side and ground.  N0055806 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the affected circuit (s). CLEAR the DTCs. REPEAT the self-test. **No** GO to B6 .
B6 CHECK CIRCUITS CPP09 (VT/OG) AND CPP10 (BN/BU) FOR AN OPEN	
• Measure the resistance between: ▪ adjustable pedal switch C2089-1, circuit CPP09 (VT/OG), harness side and DSM C341c-5, circuit CPP09 (VT/OG), harness side. ▪ adjustable pedal switch C2089-5, circuit CPP10 (BN/BU), harness side and DSM C341c-6, circuit CPP10 (BN/BU), harness side. • **Are the resistances greater than 10,000 ohms?**	**Yes** REPAIR the affected circuit (s). CLEAR the DTCs. REPEAT the self-test. **No** GO to B7 .
B7 CHECK CIRCUITS CPP09 (VT/OG) AND CPP10 (BN/BU) FOR A SHORT TO VOLTAGE	
• Key in ON position. • Measure the voltage between ground and: ▪ adjustable pedal switch C2089-1, circuit CPP09 (VT/OG), harness side and ground. ▪ adjustable pedal switch C2089-5, circuit CPP10 (BN/BU), harness side and ground.  N0055807 • **Is voltage present?**	**Yes** REPAIR the affected circuit(s) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. **No** GO to B8 .
B8 CHECK THE DSM CONNECTORS	
• Key in OFF position. • Disconnect the DSM connectors. • Check for: ▪ corrosion. ▪ pushed-out pins. ▪ spread terminals.	**Yes** INSTALL a new DSM. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test.

• Connect the DSM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: Adjustable Brake Pedal Does Not Operate Correctly — Using the Memory Set Switch/Using the Remote Transmitter; DTCs B1990 and B1991 — Pedal Forward/Rearward Potentiometer Feedback Circuit Failure and Short to Battery

Refer to Wiring Diagrams Cell 127 , Adjustable Pedals for schematic and connector information.

Normal Operation

To move the pedals to position 1, the memory set switch provides a ground for the driver seat module (DSM) through circuit CPS15 (VT/WH), through the memory set switch internal resistor and finally through circuit GD133 (BK). The DSM then provides voltage to the adjustable pedal motor along circuit CPP01 (WH/OG), through the adjustable pedal motor and back into the DSM along circuit CPP02 (BN) depending on the current pedal position.

To move the pedals to position 2, the memory set switch provides a ground for the DSM through circuit CPS16 (YE), through the memory set switch internal resistor and finally through circuit GD133 (BK). The DSM then provides voltage to the adjustable pedal motor along circuit CPP02 (BN), through the adjustable pedal motor and back into the DSM along circuit CPP01 (WH/OG) depending on the current pedal position.

The DSM uses a potentiometer attached to the pedal assembly to identify the current pedal position. The DSM sends a reference voltage along circuit LPP06 (YE/BU), through the potentiometer and back to the DSM along the signal return circuit, RPP06 (GN), and the pedal sense circuit, VPP16 (BU/BN).

Possible Causes

- Circuit open
- Circuit shorted
- Memory set switch
- DSM
- Adjustable pedal motor

PINPOINT TEST C: ADJUSTABLE BRAKE PEDAL DOES NOT OPERATE CORRECTLY — USING THE MEMORY SET SWITCH/USING THE REMOTE TRANSMITTER; DTCs B1990 AND B1991 — PEDAL FORWARD/REARWARD POTENTIOMETER FEEDBACK CIRCUIT FAILURE AND SHORT TO BATTERY

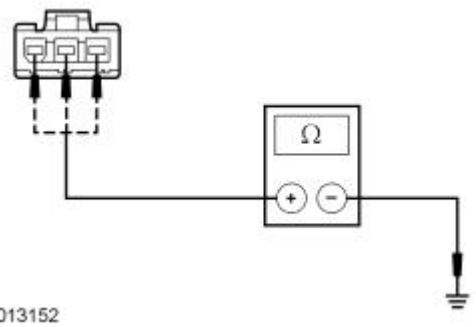
CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
C1 CHECK THE DSM ADJUSTABLE PEDAL OUTPUT ACTIVE COMMAND	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Select PARK.	**Yes** GO to C2 . **No**

• Trigger the DSM adjustable pedal forward active command ON and then OFF. • Trigger the DSM adjustable pedal rearward active command ON and then OFF. • **Do the adjustable pedals respond correctly to the corresponding active commands?**	GO to C6 .
C2 CHECK THE DSM ADJUSTABLE PEDAL POSITION PID	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Monitor the DSM adjustable pedal position PID while moving the adjustable pedal switch into the forward position, then into the rearward position. • **Does the PID value increase with forward movement, and decrease with rearward movement, throughout the pedal's entire travel?**	**Yes** GO to C10 . **No** GO to C3 .
C3 CHECK CIRCUITS LPP06 (YE/BU), RPP06 (GN) AND VPP16 (BU/BN) FOR AN OPEN	

• Key in OFF position.
• Disconnect: Driver Seat Module (DSM) C341c, C341d and C341e.
• Disconnect: Adjustable Pedal Motor Potentiometer C2090.
• Measure the resistance between:
  ▪ adjustable pedal motor potentiometer C2090-1, circuit LPP06 (YE/BU), harness side and DSM C341c-20, circuit LPP06 (YE/BU), harness side.
  ▪ adjustable pedal motor potentiometer C2090-2, circuit VPP16 (BU/BN), harness side and DSM C341d-18, circuit VPP16 (BU/BN), harness side.
  ▪ adjustable pedal motor potentiometer C2090-3, circuit RPP06 (GN), harness side and DSM C341e-14, circuit RPP06 (GN), harness side.
• **Is the resistance greater than 10,000 ohms?**
	Yes
	REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
	
	No
	GO to C4 .

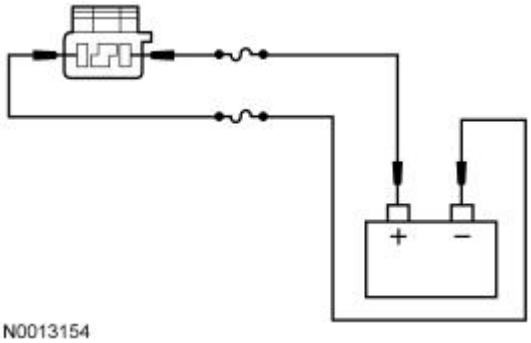
C4 CHECK CIRCUITS LPP06 (YE/BU), RPP06 (GN) AND VPP16 (BU/BN) FOR A SHORT TO GROUND	

• Measure the resistance between ground and:
  ▪ adjustable pedal motor potentiometer C2090-1, circuit LPP06 (YE/BU), harness side.
  ▪ adjustable pedal motor potentiometer C2090-2, circuit VPP16 (BU/BN), harness side.
  ▪ adjustable pedal motor potentiometer C2090-3, circuit RPP06 (GN), harness side.
  	


N0013152
• **Is the resistance less than 5 ohms?**
	Yes
	REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
	
	No
	GO to C5 .

C5 CHECK CIRCUITS LPP06 (YE/BU), RPP06 (GN) AND VPP16 (BU/BN) FOR A SHORT TO VOLTAGE	
• Key in ON position. • Measure the voltage between ground and:	**Yes** REPAIR the affected circuit(s).

■ adjustable pedal motor potentiometer C2090-1, circuit LPP06 (YE/BU), harness side. ■ adjustable pedal motor potentiometer C2090-2, circuit VPP16 (BU/BN), harness side. ■ adjustable pedal motor potentiometer C2090-3, circuit RPP06 (GN), harness side.  N0013151 • **Is any voltage present?**	CLEAR the DTCs. REPEAT the self-test. **No** GO to C10 .
C6 CHECK CIRCUITS CPP01 (WH/OG) AND CPP02 (BN) FOR AN OPEN	
• Key in OFF position. • Disconnect: Adjustable Pedal Motor C2003. • Disconnect: Driver Seat Module (DSM) C341b. • Measure the resistance between: ■ DSM C341b-13, circuit CPP01 (WH/OG), harness side and adjustable pedal motor C2003-2, circuit CPP01 (WH/OG), harness side. ■ DSM C341b-5, circuit CPP02 (BN), harness side and adjustable pedal motor C2003-1, circuit CPP02 (BN), harness side. • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self test. **No** GO to C7 .
C7 CHECK CIRCUITS CPP01 (WH/OG) AND CPP02 (BN) FOR A SHORT TO GROUND	
• Measure the resistance between ground and: ■ DSM C341a-13, circuit CPP01 (WH/OG), harness side. ■ DSM C341a-5, circuit CPP02 (BN), harness side. • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. **No** GO to C8 .
C8 CHECK CIRCUITS CPP01 (WH/OG) AND CPP02 (BN) FOR A SHORT TO VOLTAGE	
• Key in ON position. • Measure the voltage between ground and: ■ DSM C341a-13, circuit CPP01 (WH/OG), harness side. ■ DSM C341a-5, circuit CPP02 (BN), harness side. • **Is voltage present?**	**Yes** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. **No** GO to C9 .
C9 CHECK ADJUSTABLE PEDAL MOTOR OPERATION	
• Key in OFF position. • Connect a fused (10A) jumper between: ■ adjustable pedal motor C2003 pin-1, component side and the battery positive terminal. ■ adjustable pedal motor C2003 pin-2, component side and battery negative terminal.	**Yes** GO to C10 . **No** INSTALL a new adjustable pedal motor. CLEAR the DTCs. REPEAT the self-test. REFER to Section 501-10 .



N0013154
• Connect a fused (10A) jumper between:
  ▪ adjustable pedal motor C2003 pin-2, component side and battery positive terminal.
  ▪ adjustable pedal motor C2003 pin-1, component side and the battery negative terminal.
 N0013155
• **Does the adjustable pedal motor operate first in one direction and then in the opposite direction?**
	CLEAR the DTCs. REPEAT the self-test.

C10 CHECK THE DSM CONNECTORS	

• Key in OFF position.
• Disconnect the DSM connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect the DSM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new DSM. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: Vibration When Brakes are Applied

Normal Operation

During moderate to heavy braking, noise from the hydraulic control unit (HCU) and pulsation in the brake pedal can be observed. Pedal pulsation coupled with noise during heavy braking or on loose gravel, bumps, wet or snowy surfaces is acceptable and indicates correct functioning of the ABS. Pedal pulsation alone or steering wheel nibble when the brakes are applied (frequency is proportional to the vehicle speed) indicates a concern with a brake or suspension component.

Possible Causes

- Brake disc(s)
- Suspension component(s)
- Wheel(s) and tire(s)

PINPOINT TEST D: VIBRATION WHEN BRAKES ARE APPLIED

Test Step	Result / Action to Take
D1 CHECK OASIS AND TSBs FOR BRAKE CONCERNS	
• Check the On-Line Automotive Service Information System (OASIS) and Technical Service bulletins (TSBs) for applicable brake concerns. • **Is the applicable information available on OASIS or in a TSB?**	**Yes** REFER to OASIS or the TSB. CARRY OUT any necessary repairs that are indicated by OASIS or the TSB. If the concern is still present, GO to D2 . **No** GO to D2 .
D2 ROAD TEST THE VEHICLE — LIGHT BRAKING	
• Inspect the wheels and tires. Refer to Section 204-00 . • Road test the vehicle. Warm the brakes by slowing the vehicle from 80 to 32 km/h (50 to 20 mph) using light brake force. At highway speeds of 89-97 km/h (55-60 mph), apply the brake using light pedal force. • **Is there a vibration/shudder felt in the steering wheel, seat or brake pedal?**	**Yes** GO to D5 . **No** GO to D3 .
D3 ROAD TEST THE VEHICLE — MODERATE TO HEAVY BRAKING	
• Road test the vehicle. At highway speeds of 89-97 km/h (55-60 mph), apply the brake using a moderate to heavy pedal force. • **Is there a vibration/shudder?**	**Yes** GO to D4 . **No** The concern is not present at this time.
D4 NORMAL ACTUATION OF THE ABS SYSTEM DIAGNOSIS	
• During moderate to heavy braking, noise from the hydraulic control unit (HCU) and pulsation in the brake pedal can be observed. Pedal pulsation coupled with noise during heavy braking or on loose gravel, bumps, wet or snowy surfaces is acceptable and indicates correct functioning of the ABS. Pedal pulsation or steering wheel nibble (frequency is proportioned to the vehicle speed) indicates a concern with a brake or suspension component. • **Is the vibration/shudder vehicle speed sensitive?**	**Yes** GO to D6 . **No** The concern is not present at this time.
D5 CHECK THE FRONT SUSPENSION	
• Check the front suspension. Refer to Section 204-00 . • **Are all the suspension components in satisfactory condition?**	**Yes** GO to D6 . **No** REPAIR or INSTALL new components as necessary. TEST the system for normal operation.
D6 RESURFACE THE FRONT BRAKE DISCS	
• **CAUTION: Do not use a bench lathe to machine brake discs.** • **NOTE:** Follow the manufacturer's instructions to machine the	**Yes** GO to D7 . **No**

brake discs. After machining, make sure the brake disc meets the thickness specification. • Resurface the front brake discs. Refer to Brake Disc Machining in this section. • Road test the vehicle. • **Is the vibration/shudder present?**	The concern is not present at this time.
D7 CHECK THE REAR SUSPENSION	
• Check the rear suspension. Refer to Section 204-00 . • **Are all the suspension components in satisfactory condition?**	**Yes** GO to D8 . **No** REPAIR or INSTALL new components as necessary. TEST the system for normal operation.
D8 RESURFACE THE REAR BRAKE DISC	
• **CAUTION: Do not use a bench lathe to machine brake discs.** • **NOTE:** Follow the manufacturer's instructions to machine the brake discs. After machining, make sure the brake disc meets the thickness specification. • Resurface the rear brake discs. Refer to Brake Disc Machining in this section. • Road test the vehicle. • **Is the vibration/shudder present?**	**Yes** REFER to Section 100-04 to continue diagnosis of the vibration. **No** The concern is not present at this time.

Component Tests

Brake Booster

1. Check the hydraulic brake system for leaks or insufficient fluid.

2. With the transmission in NEUTRAL, stop the engine and apply the parking brake control. Apply the brake pedal several times to exhaust all vacuum in the system.

3. Apply the brake pedal and hold it in the applied position. Start the engine. If the vacuum system is operating, the brake pedal will tend to move downward under constant foot pressure. If no motion is felt, the power brake booster system is not functioning.

Brake Booster Operation

1. Remove the vacuum booster hose from the check valve connection. Manifold vacuum must be available at the check valve end of the vacuum booster hose with the engine at idle speed and the transmission in NEUTRAL. If the manifold vacuum is available to the power brake booster, connect the vacuum booster hose to the power brake booster check valve and repeat Steps 2 and 3 of the Brake Booster check. If no downward movement of the brake pedal is felt, install a new power brake booster.

2. Operate the engine a minimum of 10 seconds at fast idle. Stop the engine, and let the vehicle stand for 10 minutes. Then apply the brake pedal with approximately 89 N (20 lb) of force. The brake pedal feel should be the same as that noted with the engine operating. If the brake pedal feels hard (no power assist), install a new power brake booster check valve and retest. If the

brake pedal feels spongy, bleed the hydraulic system to remove air. Refer to Brake System Bleeding in this section.

Check Valve

The function of the power brake booster check valve is to allow manifold vacuum to enter the power brake booster and prevent the escape of vacuum in case manifold vacuum is lost during sustained full throttle operation.

To test the function of the power brake booster check valve:

- start and run the engine for at least 10 seconds.
- operate the brake pedal to check for power assist.
- disconnect the vacuum booster hose from the power brake booster. Do not remove the power brake booster check valve from the power brake booster.
- there should be enough vacuum retained in the power brake booster for at least one more power-assisted brake operation.

Brake Master Cylinder — Bypass Condition

1. Disconnect the brake tubes at the brake master cylinder.

2. Plug the outlet ports of the brake master cylinder.

3. Apply the brakes. If brake pedal height cannot be maintained, the brake master cylinder has an internal leak and a new one must be installed.

Brake Master Cylinder — Compensator Port

The purpose of the compensator ports in the brake master cylinder is to supply any additional brake fluid required by the system due to brake pad wear and to allow brake fluid returning from the brake tubes to the brake master cylinder to enter the brake master cylinder reservoir.

The returning brake fluid will cause a slight turbulence in the brake master cylinder reservoir. Turbulence seen in the brake master cylinder reservoir upon release of the brake pedal is normal and shows that the compensating ports are not plugged.

Brake Disc Machining

Printable View (83 KB)

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2 (US); CXG-2-B (Canada)	ESE-M12A4-A
Metal Brake Parts Cleaner PM-4-A or PM-4-B (US); CPM-4 (Canada)	—

CAUTION: Do not use a bench lathe to machine the brake discs.

NOTE: Read the entire operating manual and view the video shipped with the lathe before installing, operating or repairing the lathe.

NOTE: If the thickness of the brake disc is less than the minimum thickness to machine specification, install a new brake disc. This will make sure that the brake disc will be above minimum thickness after machining.

NOTE: Do not machine new brake discs.

NOTE: Lateral runout and disc thickness variation measurements are not required because correct adjustment of the on-vehicle brake lathe will make sure that these dimensions are within specifications.

1. **NOTE:** It is not necessary to disconnect the brake line from the brake caliper.

   Position the brake caliper and brake caliper anchor bracket aside. For additional information, refer to Section 206-03 for front brake discs or Section 206-04 for rear brake discs.

2. For vehicles with a 2-piece brake disc and hub assembly:
   1. Mark the brake disc and the wheel stud for correct indexing during re-assembly.
   2. Remove the brake disc from the hub.
   3. **CAUTION: Do not use an abrasive sanding disc since it will remove paint or other protective finishes from the wheel or metal from the mounting surfaces, adversely affecting corrosion protection and brake disc lateral runout.**

      Remove corrosion from the wheel mounting surface, both disc mounting surfaces and hub mounting surface.
   4. Align the match marks and install the brake disc on the hub.

3. Machine the brake disc using an on-vehicle brake lathe.
   1. Install the hub adapter and silencer belt if necessary.
   2. Install the cutting lathe.
   3. If the lathe is not self adjusting, adjust the lathe oscillation using a dial indicator. Total indicated reading (TIR) target is 0.000 mm (0.000 in), maximum is 0.08 mm (0.003 in).
   4. Center the cutting head, adjust the cutting bits and install the chip deflector.
   5. **NOTE:** The depth of cut should be between 0.10 and 0.20 mm (0.004 and 0.008 in). Lighter cuts will cause the bit to heat up and wear faster. Heavier cuts will cause poor brake disc surface finish.

Machine the brake disc.
6. Remove the lathe and, if installed, the silencer belt.
7. Remove the hub adapter.

4. Remove the metal shavings.

5. For vehicles with a 2-piece brake disc and hub assembly:
    1. Remove the brake disc from the hub.
    2. Remove metal shavings from the hub, the brake disc mounting surfaces and from the ABS sensors.
    3. Apply anti-seize lubricant to the hub mounting surface to prevent corrosion.
    4. Align the match marks and install the brake disc on the hub.

6. **NOTE:** It is not required to install new brake pads if friction material properties are within guidelines. For additional information, refer to Brake Pads in this section.

    Install the brake caliper and brake caliper anchor bracket. For additional information, refer to Section 206-03 for front brake discs or Section 206-04 for rear brake discs.

Brake System Bleeding

Printable View (212 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A

Master Cylinder, In Vehicle

WARNING: Use of any other than approved DOT 3 motor vehicle brake fluid will cause permanent damage to brake components and will render the brakes inoperative. Failure to follow these instructions may result in personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in personal injury.

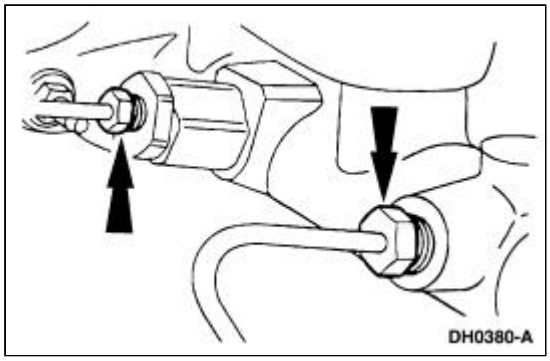
CAUTION: Do not allow the brake master cylinder reservoir to run dry during the bleeding operation. Keep the brake master cylinder reservoir filled with clean, specified brake fluid. Never reuse the brake fluid that has been drained from the hydraulic system.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: When any part of the hydraulic system has been disconnected for repair or new installation, air may get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it has been correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

1. **NOTE:** When a new brake master cylinder has been installed or the system has been emptied, or partially emptied, it should be primed to prevent air from getting into the system.

   Disconnect the brake master cylinder outlet tubes.



2. Install short brake tubes with ends submerged in the brake master cylinder reservoir and fill the brake master cylinder reservoir with clean, specified brake fluid.

3. Have an assistant pump the brake pedal until clear fluid flows from both brake tubes without air bubbles.

4. Remove the short brake tubes and install the brake outlet tubes.

5. Bleed each brake tube at the brake master cylinder as follows:
    1. Have an assistant pump the brake pedal and then hold firm pressure on the brake pedal.
    2. Loosen the rearmost brake tube fitting until a stream of brake fluid comes out. Have an assistant maintain pressure on the brake pedal while tightening the brake tube fitting.
    3. Repeat this operation until clear, bubble-free fluid comes out.
    4. Refill the brake master cylinder reservoir as necessary. Repeat the bleeding operation at the front brake tube.

6. While the assistant maintains pressure on the brake pedal, tighten the brake tube fittings.
    - Tighten to 25 Nm (18 lb-ft).

Anti-Lock Brake System (ABS)

WARNING: Use of any other than approved DOT 3 motor vehicle brake fluid will cause permanent damage to brake components and will render the brakes inoperative. Failure to follow these instructions may result in personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in personal injury.

CAUTION: Do not allow the brake master cylinder reservoir to run dry during the bleeding operation. Keep the brake master cylinder reservoir filled with clean, specified brake fluid. Never reuse the brake fluid that has been drained from the hydraulic system.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: When any part of the hydraulic system has been disconnected for repair or new installation, air may get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it has been correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

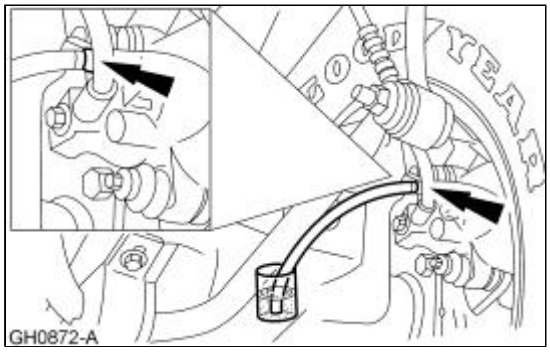
NOTE: This procedure must be performed if the anti-lock brake (ABS) hydraulic control unit (HCU) has been installed new.

NOTE: One conventional pressure bleed cycle consists of advancing the brake pedal to its depressed position, opening the disc brake caliper bleeder screw, allowing fluid to be released into the waste container, closing the disc brake caliper bleeder screw and releasing the brake pedal.

NOTE: Performing the diagnostic program routine drives entrapped air from the otherwise inaccessible lower section of the ABS valve into the upper sections (accessible by bleeding the brakes). Subsequent bleeding removes the air from the system.

NOTE: Add clean, specified brake fluid as necessary throughout the procedure.

1. Connect a clear hose to the RH rear disc brake caliper bleeder screw and the other end in a container partially filled with clean, specified brake fluid.



2. Have an assistant pump the brake pedal and then hold firm pressure on the brake pedal.

3. Loosen the RH rear disc brake caliper bleeder screw until a stream of brake fluid comes out. Have an assistant maintain pressure on the brake pedal while tightening the RH rear disc brake caliper bleeder screw.
    - Repeat until clear, bubble-free fluid comes out.
    - Refill the brake master cylinder reservoir as necessary.

4. Tighten the RH rear disc brake caliper bleeder screw.
    - Tighten to 16 Nm (12 lb-ft).

5. Repeat Steps 1 through 4 for the LH rear disc brake caliper bleeder screw, RH front disc brake caliper bleeder screw and the LH front disc brake caliper bleeder screw.
    - Tighten to 16 Nm (12 lb-ft).

6. **NOTE:** Go to the Help menu in the scan tool.

    Connect the scan tool to the vehicle data link connector (DLC) under the dash and follow the scan tool instructions.

7. Repeat the conventional bleed procedure as outlined in Steps 1 through 5.

8. If the brake pedal feels spongy, repeat the scan tool service bleed procedure.

Gravity

WARNING: Use of any other than approved DOT 3 motor vehicle brake fluid will cause permanent damage to brake components and will render the brakes inoperative. Failure to follow these instructions may result in personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in personal injury.

CAUTION: Do not allow the brake master cylinder reservoir to run dry during the bleeding operation. Keep the brake master cylinder reservoir filled with clean, specified brake fluid. Never reuse the brake fluid that has been drained from the hydraulic system.

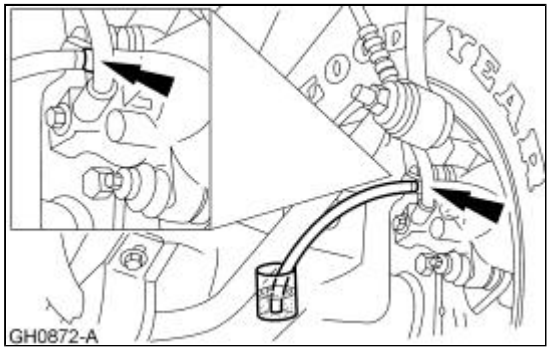
CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: When any part of the hydraulic system has been disconnected for repair or new installation, air may get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it has been correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

NOTE: When a new brake master cylinder has been installed or the system has been emptied, or partially emptied, it should be primed to prevent air from getting into the system.

1. Fill the brake master cylinder reservoir with clean, specified brake fluid.

2. Bleed the rear disc brake calipers.
    - Place a box-end wrench on the RH rear disc brake caliper bleeder screw.
    - Attach a rubber drain hose to the RH rear disc brake caliper bleeder screw and submerge the free end of the tube in a container partially filled with clean, specified brake fluid.
    - Open the bleeder screw and leave open until clear bubble-free brake fluid flows.
        - Repeat for LH rear disc brake caliper.



3. Tighten the rear disc brake caliper bleeder screws.
    - Tighten to 16 Nm (12 lb-ft).

4. Bleed the front disc brake calipers.
    - Place a box-end wrench on the RH front disc brake caliper bleeder screw.
    - Attach a rubber drain hose to the RH front disc brake caliper bleeder screw and submerge

the free end of the tube in a container partially filled with clean, specified brake fluid.
- Open the bleeder screw and leave open until clear bubble-free brake fluid flows.
  - Repeat for LH front disc brake caliper.

5. Tighten the front disc brake caliper bleeder screws.
   - Tighten to 16 Nm (12 lb-ft).

Manual

WARNING: Use of any other than approved DOT 3 motor vehicle brake fluid will cause permanent damage to brake components and will render the brakes inoperative. Failure to follow these instructions may result in personal injury.

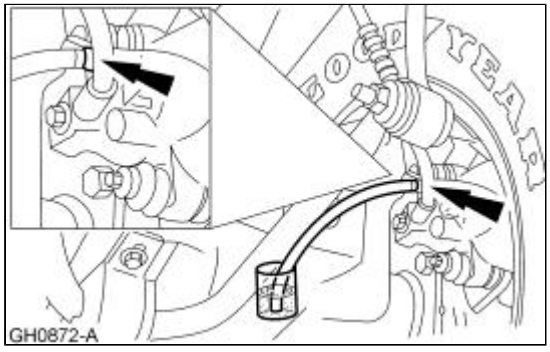
WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in personal injury.

CAUTION: Do not allow the brake master cylinder reservoir to run dry during the bleeding operation. Keep the brake master cylinder reservoir filled with the clean, specified brake fluid. Never reuse the brake fluid that has been drained from the hydraulic system.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: When any part of the hydraulic system has been disconnected for repair or new installation, air may get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it has been correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

1. Place a box-end wrench on the RH rear disc brake caliper bleeder screw. Attach a rubber drain hose to the RH rear disc brake caliper bleeder screw and submerge the free end of the tube in a container partially filled with clean, specified brake fluid.



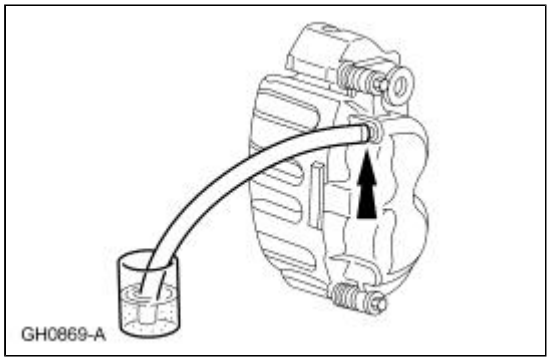
2. Have an assistant pump the brake pedal and then hold firm pressure on the brake pedal.

3. Loosen the RH rear disc brake caliper bleeder screw until a stream of brake fluid comes out. Have an assistant maintain pressure on the brake pedal while tightening the RH rear disc brake caliper bleeder screw.
   - Repeat until clear, bubble-free fluid comes out.
   - Refill the brake master cylinder reservoir as necessary.

4. Tighten the RH rear disc brake caliper bleeder screw.
   - Tighten to 16 Nm (12 lb-ft).

5. Repeat Steps 1 through 4 for the LH rear disc brake caliper.

6. Place a box-end wrench on the RH front disc brake caliper bleeder screw. Attach a rubber drain hose to the RH front disc brake caliper bleeder screw and submerge the free end of the tube in a container partially filled with clean, specified brake fluid.



7. Have an assistant pump the brake pedal and then hold firm pressure on the brake pedal.

8. Loosen the RH front disc brake caliper bleeder screw until a stream of brake fluid comes out. Have an assistant maintain pressure on the brake pedal while tightening the RH front disc brake caliper bleeder screw.
    - Repeat until clear, bubble-free fluid comes out.
    - Refill the brake master cylinder reservoir as necessary.

9. Tighten the RH front disc brake caliper bleeder screw.
    - Tighten to 16 Nm (12 lb-ft).

10. Repeat Steps 6 through 9 for the LH front disc brake caliper bleeder screw.

11. If necessary, bleed the brake master cylinder. For additional information, refer to Brake System Bleeding in this section.

Pressure

WARNING: Use of any other than approved DOT 3 motor vehicle brake fluid will cause permanent damage to brake components and will render the brakes inoperative. Failure to follow these instructions may result in personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in personal injury.

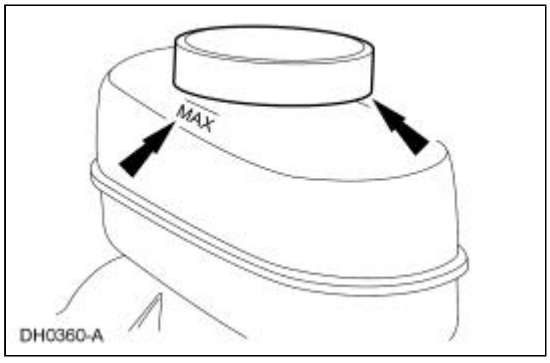
CAUTION: Do not allow the brake master cylinder reservoir to run dry during the bleeding operation. Keep the brake master cylinder reservoir filled with clean, specified brake fluid. Never reuse the brake fluid that has been drained from the hydraulic system.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: When any part of the hydraulic system has been disconnected for repair or new installation, air may get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it has been correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

NOTE: Bleed the longest line first. Be sure the bleeder tank contains enough clean, specified brake fluid to complete the bleeding operation.

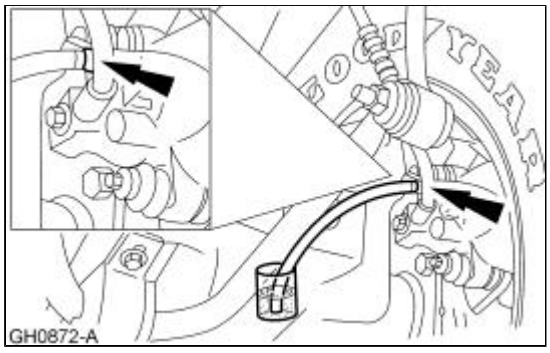
1. Clean all dirt from and remove the brake master cylinder filler cap and fill the brake master cylinder reservoir with clean, specified brake fluid.



2. **NOTE:** Master cylinder pressure bleeder adapter tools are available from various manufacturers of pressure bleeding equipment. Follow the instructions of the manufacturer when installing the adapter.

   Install the bleeder adapter to the brake master cylinder reservoir and attach the bleeder tank hose to the fitting on the adapter.

3. Place a box-end wrench on the RH rear disc brake caliper bleeder screw. Attach a rubber drain hose to the RH rear disc brake caliper bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.



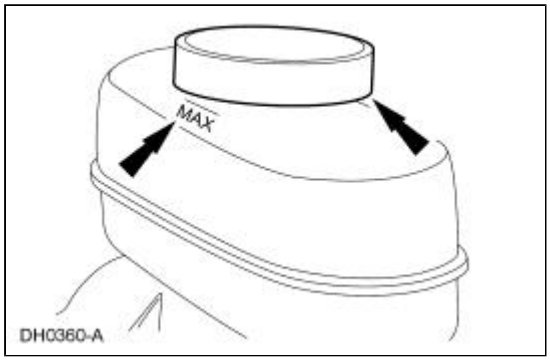
4. Open the valve on the bleeder tank.

5. Loosen the rear disc brake caliper bleeder screw. Leave open until clear, bubble-free brake fluid flows, then tighten rear disc brake caliper bleeder screw and remove the rubber hose.
   - Tighten to 16 Nm (12 lb-ft).

6. Continue bleeding the rest of the system, going in order from the LH rear disc brake caliper to the RH front disc brake caliper, ending with the LH front disc brake caliper.

7. Close the bleeder tank valve and remove the tank hose from the adapter and remove the adapter.

8. Fill the brake master cylinder reservoir with clean, specified brake fluid and install the brake master cylinder filler cap.



Master Cylinder, Bench

WARNING: Use of any other than approved DOT 3 motor vehicle brake fluid will cause permanent damage to brake components and will render the brakes inoperative. Failure to follow these instructions may result in personal injury.

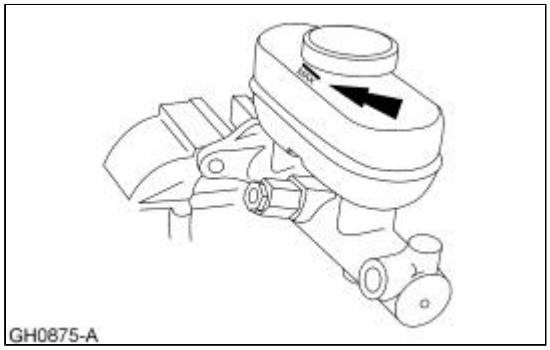
WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in personal injury.

CAUTION: Do not allow the brake master cylinder reservoir to run dry during the bleeding operation. Keep the brake master cylinder reservoir filled with clean, specified brake fluid. Never reuse the brake fluid that has been drained from the hydraulic system.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: When any part of the hydraulic system has been disconnected for repair or new installation, air may get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it has been correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

1. Support the brake master cylinder body in a vise and fill the brake master cylinder reservoir with clean, specified brake fluid.



2. Install short brake tubes with the ends submerged in the brake master cylinder reservoir.

3. Slowly depress the primary piston until clear fluid flows from both brake tubes, without air bubbles.

4. Remove the short brake tubes.

Brake System Leak Check

Printable View (78 KB)

1. **NOTE:** Brake fluid is water soluble and therefore evidence of leakage can be washed away if the vehicle is operated in rain or snow.

   Fill the brake master cylinder reservoir.

2. Apply and hold the brakes several times.

3. Check the brake master cylinder reservoir to verify fluid loss.

4. Inspect the brake system for signs of fresh brake fluid leakage.

5. Locate and correct the source of the external leak.

Brake caliper guide pins	55	41
Brake disc shield screws	17	13
Brake hose flow bolt	35	26

Front Disc Brake

Printable View (63 KB)

On front brake disc systems:

- the brake caliper bolts to the brake caliper anchor plate.
- the brake caliper anchor plate bolts to the wheel knuckle.
- a separate brake disc attaches to the wheel hub.

The brake caliper:

- is a guide pin, dual-piston type.
- housing has a fluid inlet at the center of the bore. A square section seal fitted into an annular groove in the caliper cylinder bore seals against hydraulic pressure, while rubber boots seal the caliper pistons and caliper bore from contamination.

The brake disc shield:

- bolts to the wheel knuckle.
- protects the inboard surface of the brake disc.

The pads are:

- contained within the brake caliper anchor plate.
- held to the brake caliper anchor plate abutments by disc brake anti-rattle clips.

Removal

WARNING: Use of any other than approved DOT 3 motor vehicle brake fluid will cause permanent damage to brake components and will render the brakes inoperative. Failure to follow these instructions may result in personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in personal injury.

CAUTION: Brake fluid is harmful to painted or plastic surfaces. Do not spill brake fluid onto painted or plastic surfaces. If spilled, wipe up immediately.

1. If necessary, using a suitable suction device, remove the brake fluid from the master cylinder reservoir until it is half filled.

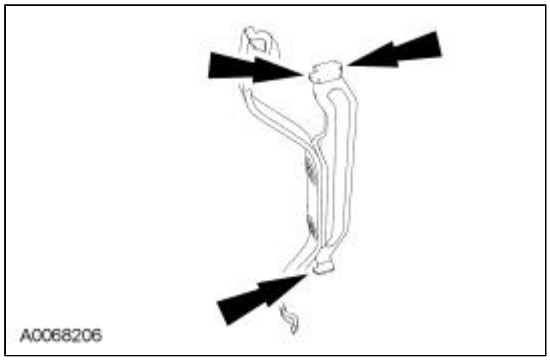
2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

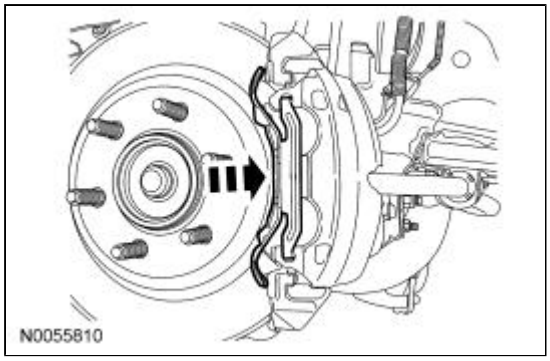
3. **CAUTION: If the anchor housing spring is to be removed, do not force the spring off the brake caliper or damage to the spring can occur.**

   CAUTION: Do not use any tools to remove the spring, use hand force only. Do not use excessive force or damage to the spring can occur.

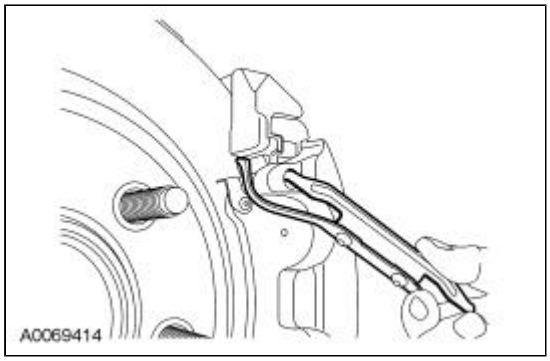
   NOTE: The LH side anchor housing spring must be installed with the 2-tabbed end in the upper brake caliper cavity.

   For the LH brake caliper, release the lower portion of the anchor housing spring.
   - Apply force to the center of the spring and pull outward at the bottom of the spring to remove it from the lower brake caliper cavity.





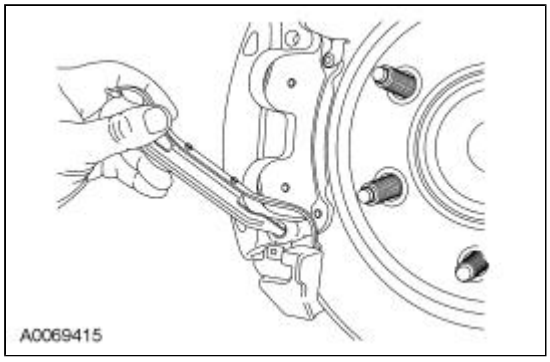
4. Rotate the spring upward and remove it from the brake caliper.



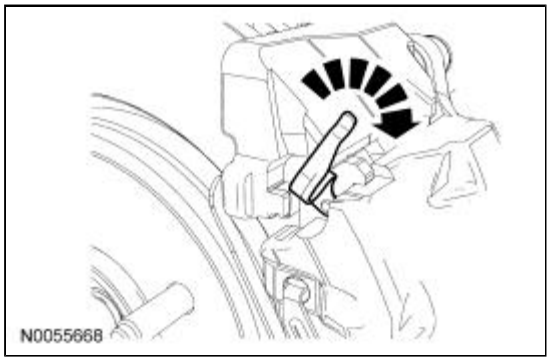
5. **NOTE:** The RH side anchor housing spring must be installed with the 2-tabbed end in the lower brake caliper cavity.

   For the RH brake caliper, release the upper portion of the anchor housing spring.
   - Apply force to the center of the spring and pull outward at the top of the spring to remove it from the upper brake caliper cavity.

6. Rotate the spring downward and remove it from the brake caliper.



7. Rotate the outer brake pad upper and lower retaining springs to disengage them from the brake caliper anchor plate.



8. **CAUTION: Do not allow the caliper to hang from the brake hose or damage to the hose can occur.**

   Remove the 2 guide pin busing caps, remove and discard the 2 brake caliper guide pin bolts and position the caliper aside.
   - Support the caliper using mechanic's wire.
   - Remove and discard the 2 brake caliper guide pin bushings.

9. Remove the 2 brake pads from the caliper.

10. Inspect the brake pads for wear and contamination, install new pads as necessary. For additional information, refer to the Diagnosis and Testing portion of Section 206-00 .

11. **NOTE:** Use a wood block or a used brake pad to protect the brake caliper piston boots.

    Compress the brake caliper piston.

12. Inspect the brake disc and resurface or install new as necessary. For additional information, refer to the Diagnosis and Testing portion of Section 206-00 .

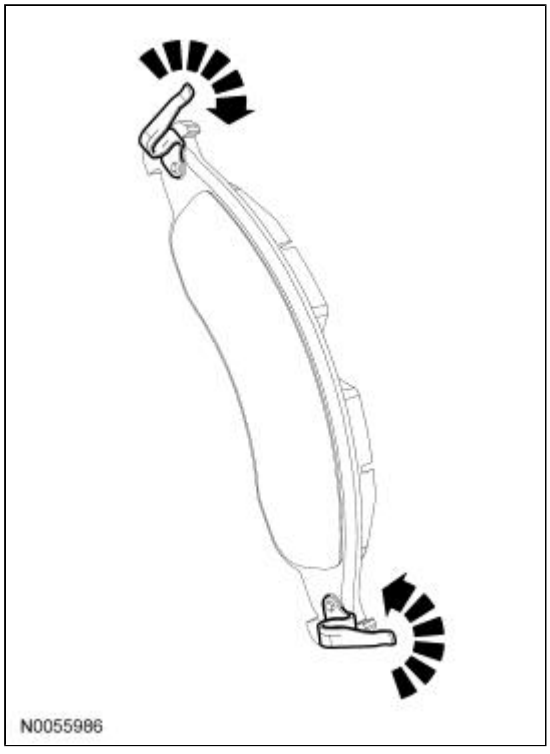
Installation

1. Clean the brake pad contact areas of the brake caliper.

2. Install new brake hardware as follows:
   1. Install the guide pin bushings into the caliper bores.
   2. Apply grease to the inside of the guide pin bushings. Do not apply grease to the guide pin threads.
   3. Push the guide pins into the bushings.

3. Install the inboard brake pad onto the caliper.

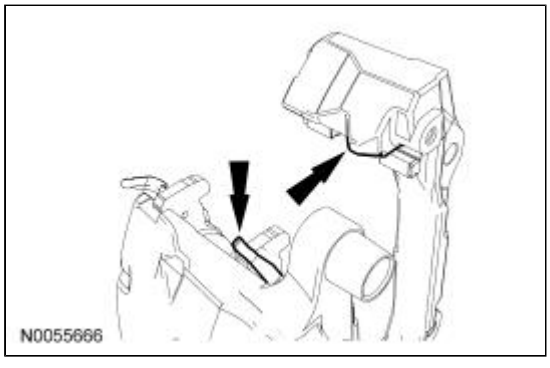
4. Rotate the outer brake pad upper and lower retaining springs 90 degrees.



5. Remove the protective paper from the outboard brake pad and install it onto the brake caliper.

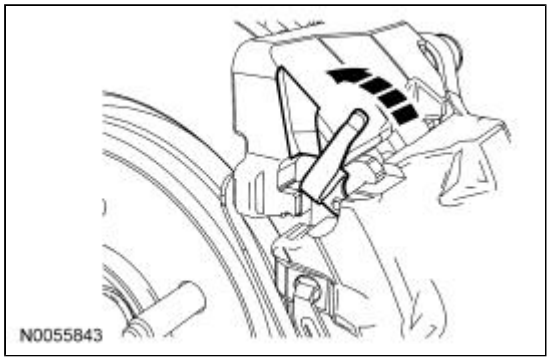
6. **NOTE:** Make sure that the inner brake pad retaining springs are correctly seated onto the brake caliper anchor plate.

   Position the brake caliper assembly onto the anchor plate.



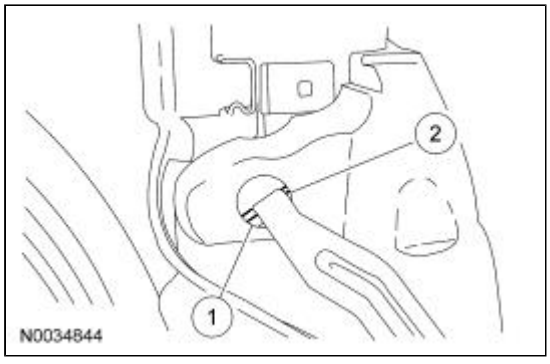
7. Install the 2 brake caliper guide pin bolts and the 2 bushing caps.
   - Tighten the bolts to 55 Nm (41 lb-ft).

8. Rotate the outer brake pad upper and lower retaining springs until they are correctly seated on the anchor plate.



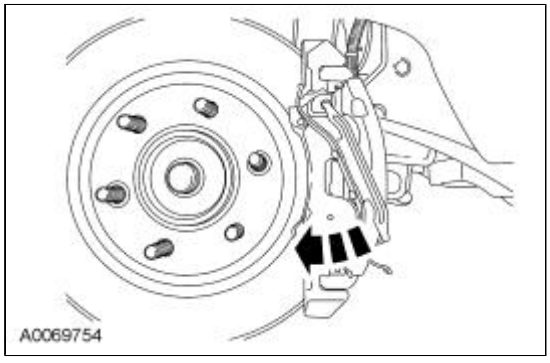
9. **NOTE:** If present, the 2-tabbed end of the anchor housing spring must be installed first.

   Install the anchor housing spring using the following procedure:
   1. Insert the tab of the spring into the brake caliper cavity.
   2. Twist the tab into the cavity (LH side in the upper brake caliper cavity, RH side in the lower brake caliper cavity).



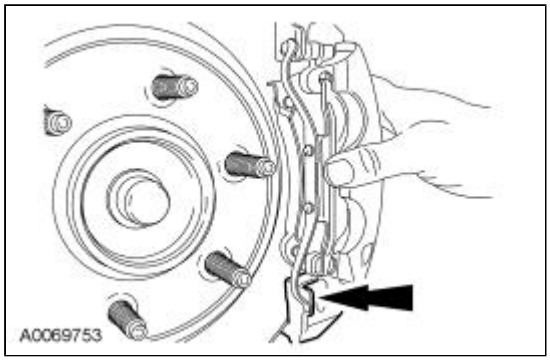
10. **NOTE:** LH anchor housing spring shown.

    Rotate the anchor housing spring and position the upper portion onto the anchor plate.



11. **NOTE:** LH anchor housing spring shown.

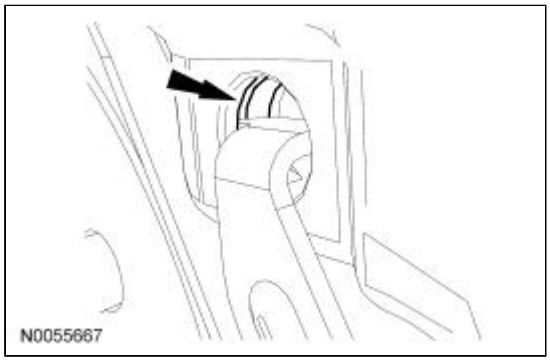
    Position the other anchor housing spring portion onto the anchor plate.



12. Push down and inward until the upper and lower ends of the anchor housing spring are latched and seated in the brake caliper cavities.

13. **NOTE:** The latch **MUST** be positioned as shown.

    Verify that the anchor housing spring is correctly latched by pulling on the spring.



14. Apply the brake several times to verify correct brake operation.

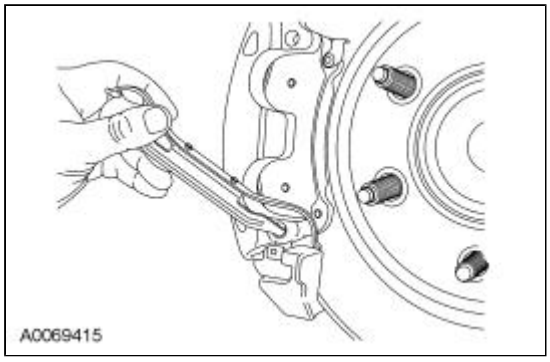
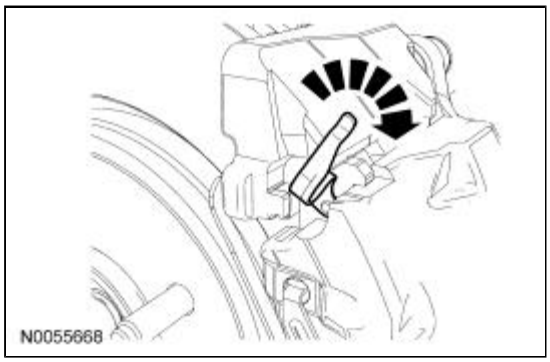
5. **NOTE:** The RH side anchor housing spring must be installed with the 2-tabbed end in the lower brake caliper cavity.

   For the RH brake caliper, release the upper portion of the anchor housing spring.
   - Apply force to the center of the spring and pull outward at the top of the spring to remove it from the upper brake caliper cavity.

6. Rotate the spring downward and remove it from the brake caliper.



7. Rotate the outer brake pad upper and lower retaining springs to disengage them from the brake caliper anchor plate.



8. **CAUTION: Do not allow the caliper to hang from the brake hose or damage to the hose can occur.**

   Remove the 2 guide pin bushing caps, remove and discard the 2 brake caliper guide pin bolts and position the caliper aside.
   - Support the caliper using mechanic's wire.
   - Remove and discard the 2 brake caliper guide pin bushings.

9. Remove the 2 brake caliper anchor plate bolts and the anchor plate.

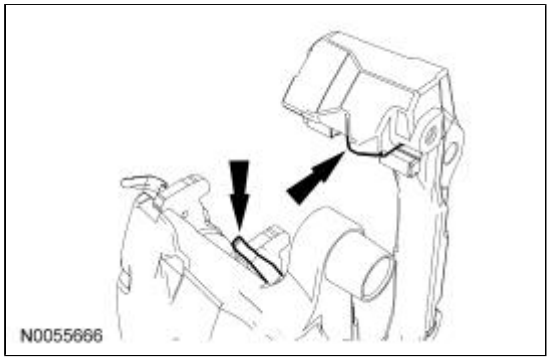
Installation

1. Position the brake caliper anchor plate and install the 2 anchor plate bolts.
   - Tighten to 200 Nm (148 lb-ft).

2. Install new brake hardware as follows:
   1. Install the guide pin bushings into the caliper bores.
   2. Apply grease to the inside of the guide pin bushings. Do not apply grease to the guide pin threads.
   3. Push the guide pins into the bushings.

3. **NOTE:** Make sure that the inner brake pad retaining springs are correctly seated onto the brake caliper anchor plate.

   Position the brake caliper assembly onto the anchor plate.



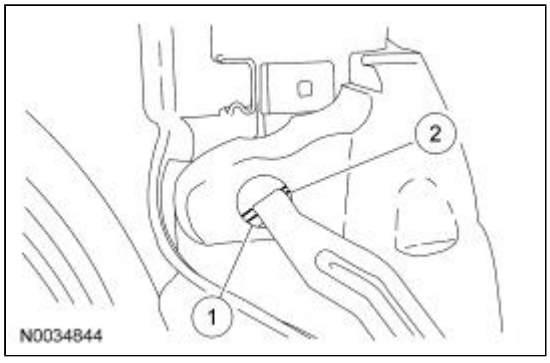
4. Install the 2 brake caliper guide pin bolts and the 2 bushing caps.
   - Tighten the bolts to 55 Nm (41 lb-ft).

5. Rotate the outer brake pad upper and lower retaining springs until they are correctly seated on

the anchor plate.

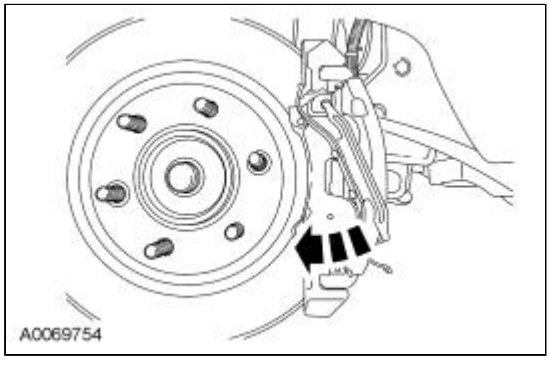
6. **NOTE:** If present, the 2-tabbed end of the anchor housing spring must be installed first.

   Install the anchor housing spring using the following procedure:
   1. Insert the tab of the spring into the brake caliper cavity.
   2. Twist the tab into the cavity (LH side in the upper brake caliper cavity, RH side in the lower brake caliper cavity).



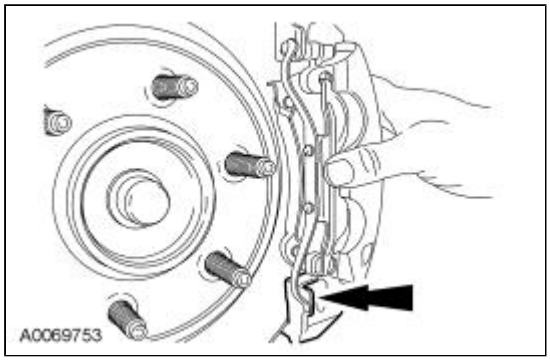
7. **NOTE:** LH anchor housing spring shown.

   Rotate the anchor housing spring and position the upper portion onto the anchor plate.



8. **NOTE:** LH anchor housing spring shown.

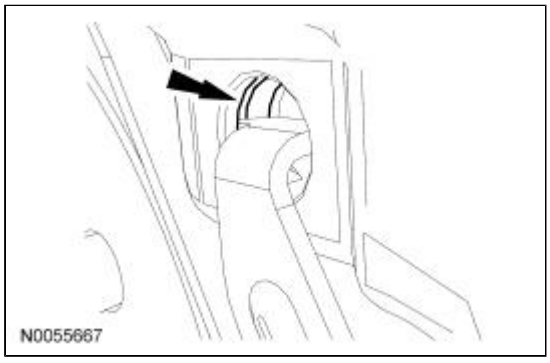
   Position the other anchor housing spring portion onto the anchor plate.



9. Push down and inward until the upper and lower ends of the anchor housing spring are latched and seated in the brake caliper cavities.

10. **NOTE:** Latch **MUST** be positioned as shown.

    Verify that the anchor housing spring is correctly latched by pulling on the spring.



11. Apply the brake several times to verify correct brake operation.

Rear Disc Brake

Printable View (78 KB)

NOTE: The inboard and outboard brake pads are not interchangeable.

The rear brake system consists of the following:

- The brake disc is a vented, full-cast, drum-in-hat type.
- The disc brake caliper is a single-piston type.
- Each brake pad is equipped with a riveted spring clip that secures it to either the rear disc brake caliper piston or the rear disc brake caliper housing.

Removal

WARNING: Use of any other than approved DOT 3 motor vehicle brake fluid will cause permanent damage to brake components and will render the brakes inoperative. Failure to follow these instructions may result in personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Using a suitable suction device, remove brake fluid in the master cylinder reservoir until the reservoir is half full.

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. **CAUTION: Do not allow the brake caliper to hang by the flexible brake hose or damage to the hose can occur.**

   Remove the 2 brake caliper guide pin caps and bolts and position the caliper aside.
   - Support the caliper using mechanic's wire.
   - Inspect the guide pin threads for damage and inspect the guide pin bushings for damage/wear. Install a new guide pin(s) and bushing(s) as necessary.

4. Remove the brake pads from the caliper.

5. **CAUTION: Install new pads if the lining(s) are worn to or past the specified thickness above the metal backing plate. Install new pads in complete axle sets.**

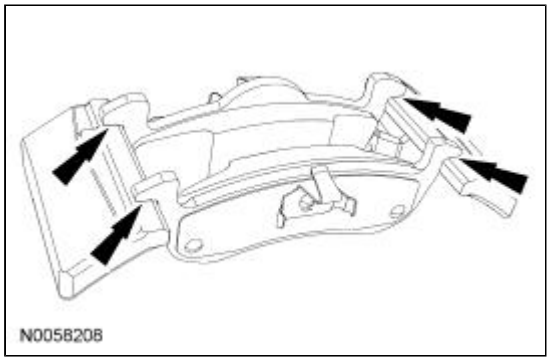
Inspect the brake pads for wear or contamination and install new pads as necessary. For additional information, refer to the Diagnosis and Testing portion of Section 206-00 .

6. Using a suitable clamp, press the piston into the caliper.

7. Inspect the brake disc and resurface or install a new brake disc as necessary. For additional information, refer to the Diagnosis and Testing portion of Section 206-00 .

Installation

1. Clean, dry and inspect the brake caliper anchor plate. Apply a light coat of lubricant to the 4 brake pad contact points on the anchor plate as indicated.



2. Install the brake pads to the caliper.

3. Position the caliper onto the anchor plate and install the 2 brake caliper guide pin bolts.
   - To install, tighten to 35 Nm (26 lb-ft).

4. Apply the brake several times to verify correct brake operation.

Parking Brake

Printable View (62 KB)

The park brake system consists of the following:

- Foot-actuated park brake control
- Park brake release handle
- Front park brake cable
- Parking brake equalizer
- LH rear park brake cable
- RH rear park brake cable
- Park brake shoes and a drum-in-hat style brake disc

Parking Brake

Printable View (162 KB)

Principles of Operation—Automatic Parking Brake Release (Navigator)

The automatic parking brake release consists of the following components:

- Release actuator
- Electromechanical solenoid
- Gearshift lever position switch
- Parking brake warning indicator switch
- Wiring harnesses connecting the various components

When the parking brake is set and the gearshift lever is moved to R or D, the gearshift lever position switch closes. The anti-lock brake system (ABS) module energizes the electronic parking brake release relay. Once the parking brake is released, the parking brake warning indicator switch opens, and the ABS module energizes the electronic parking brake retract relay. The solenoid is energized only when both the parking brake warning indicator switch and the gearshift lever position switch are closed with the brake pedal applied.

Inspection and Verification

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the RH kick panel area. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations. Failure to follow these instructions may result in personal injury.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Release actuator
• Electromechanical solenoid
• Shift lever assembly
• Brake on/off switch
	• Smart junction box (SJB) fuses:
	  ▪ 16 (15A)
	  ▪ 33 (10A)
	• Wiring harness
	• Connectors
	• Circuitry

3. Check the operation of the parking brake with the vehicle on a hoist and the parking brake control fully released. Check for any cable damage and install a new cable as necessary.
4. Check the parking brake by depressing the parking brake control pedal. The parking brake must fully set upon full apply.
5. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

6. If the cause is not visually evident, verify the symptom and GO to Symptom Chart .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Parking brake will not apply	• Clearance	• CHECK the brake cable for slack or breaks. APPLY the park brake pedal to cycle the park brake system as necessary.
	• Grease-soaked parking brake shoe linings	• REPAIR the source of the leak and INSTALL a new parking brake shoe and lining.
	• Binding linkage	• CHECK for linkage binding and misalignment. LUBRICATE all friction points.
	• Parking brake shoe and lining	• INSTALL a new parking brake shoe and lining. CHECK the drum-in-hat surface for scoring and INSTALL new as necessary. REFER to Section 206-04 .
	• Worn or damaged parking brake components	• INSTALL new components as necessary.
• Parking brake will not release	• Parking brake control • Park brake handle binding • Parking brake cables binding • Binding parking brake components	• INSPECT and REPAIR as necessary.
• Automatic parking brake release does not operate	• Smart junction box (SJB) fuse (s) • Gearshift lever position switch • Wiring • Release actuator • Release relay • Reset relay	• RETRIEVE and RECORD any anti-lock brake system (ABS) diagnostic trouble codes (DTCs). If any ABS module DTCs are present, REPAIR them first. REFER to Section 206-09 . If no ABS module DTCs are present, Go To Pinpoint Test A .
• Excessive lining wear	• Brake drag	• CHECK the parking brake cables for a binding condition. INSPECT for broken or missing springs.
	• Rough brake disc drum surface	• INSTALL a new brake disc if drum section is badly scored. REFER to Section 206-04 .

Pinpoint Tests

Pinpoint Test A: Automatic Parking Brake Release Does Not Operate

Refer to Wiring Diagrams Cell 129 , Electronic Parking Brake for schematic and connector information.

Normal Operation

The parking brake uses an electrically operated solenoid to release the parking brake. With the brake pedal depressed and the gear shift lever moved from the PARK position, the solenoid retracts to release the parking brake. The solenoid is controlled by the release and retract relays which are controlled by the anti-lock brake system (ABS) module. The ABS module provides grounds for the release and reset relays, fused battery voltage is provided to the relays from battery junction box (BJB) fuse 16 (15A) along circuit SBP16 (VT/RD) for actuating the parking brake release solenoid. Fused ignition voltage is provided to the relays from BJB fuse 33 (10A) along circuit CBP33 (WH/BN) for activating the relays. The relays alternately provide power or ground to the park brake solenoid. Actuation of the relays depends on input signals from the brake pedal on/off (BOO) switch and the transmission microprocessor which sends the information along the high speed-communication area network (HS-CAN).

To release the parking brake release solenoid, the ABS module provides a ground path for the release relay along circuit CCB21 (GN/VT). This engages the release relay. The release relay is supplied fused battery voltage from BJB fuse 16 (15A) along circuit SBP16 (VT/RD). When the release relay is engaged, this voltage is supplied to the solenoid along circuit CCB17 (BU/GN), the solenoid is grounded along circuit CCB16 (WH/VT), through the reset relay and finally along circuit GD138 (BK/WH).

To reset the parking brake release solenoid, the ABS module provides a ground path for the reset relay along circuit CCB20 (BU/WH). This engages the relay. The reset relay is supplied fused battery voltage from BJB fuse 16 (15A) along circuit SBP16 (VT/RD). When the reset relay is engaged, this voltage is supplied to the solenoid along circuit CCB16 (WH/VT), the solenoid is grounded along circuit CCB17 (BU/GN), through the release relay and finally along circuit GD138 (BK/WH).

Possible Causes

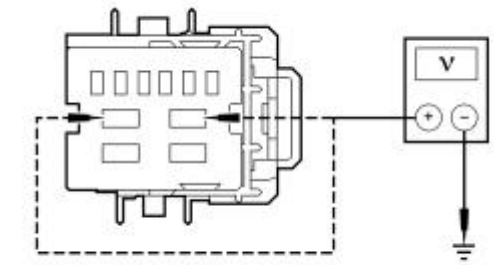
- Fuse(s)
- Circuit open
- Circuit shorted
- Park brake release relay
- Park brake reset relay
- Park brake release solenoid
- ABS module

PINPOINT TEST A: AUTOMATIC PARKING BRAKE RELEASE DOES NOT OPERATE

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
A1 CHECK FOR BATTERY VOLTAGE AT THE RELAYS	

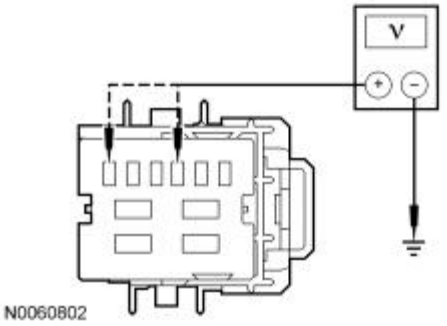
• Key in OFF position.
• Disconnect: Parking Brake Reset Relay.
• Disconnect: Parking Brake Release Relay.
• Measure the voltage between ground and:
  ▪ reset relay socket pin-5, circuit SBP16 (VT/RD), harness side.
  ▪ release relay socket pin-5, circuit SBP16 (VT/RD), harness side.
	Yes
	GO to A2 .
	
	No
	VERIFY BJB fuse 16 (15A) is OK. If OK, REPAIR circuit CBP33 (WH/BN). TEST the system for normal operation.



N0056029

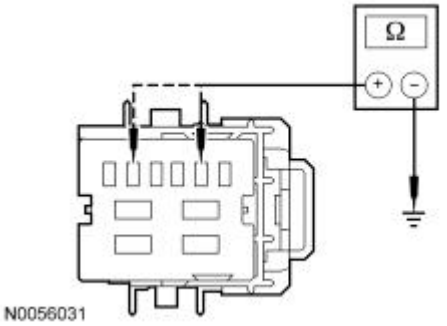
- **Is the voltage greater than 10 volts?**

A2 CHECK FOR IGNITION VOLTAGE AT THE RELAYS	

• Key in ON position.
• Measure the voltage between ground and:
  ▪ reset relay socket pin-2, circuit CBP33 (WH/BN), harness side.
  ▪ release relay socket pin-2, circuit CBP33 (WH/BN), harness side.
  	


N0060802
• **Is the voltage greater than 10 volts?**
	Yes
	GO to A3 .
	
	No
	VERIFY BJB fuse 33 (10A) is OK. If OK, REPAIR circuit CBP33 (WH/BN). TEST the system for normal operation.

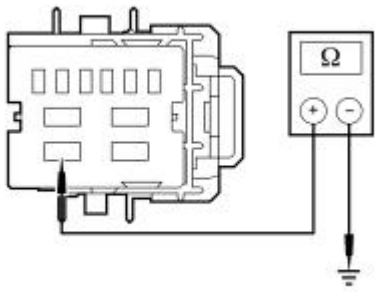
A3 CHECK CIRCUIT GD138 (BK/WH) FOR AN OPEN	

• Key in OFF position.
• Measure the resistance between ground and:
  ▪ reset relay socket pin-4, circuit GD138 (BK/WH), harness side.
  ▪ release relay socket pin-4, circuit GD138 (BK/WH), harness side.
  	


N0056031
• **Is the resistance greater than 10,000 ohms?**
	Yes
	REPAIR circuit GD138 (BK/WH). TEST the system for normal operation.
	
	No
	GO to A4 .

A4 CHECK CIRCUIT CCB17 (BU/GN) FOR AN OPEN	
• Disconnect: Park Brake Release Solenoid C2132. • Measure the resistance between release relay pin-3, circuit CCB17 (BU/GN), harness side and park brake release solenoid C2132-2, circuit CCB17 (BU/GN), harness side.	**Yes** REPAIR circuit CCB17 (BU/GN). TEST the system for normal operation.

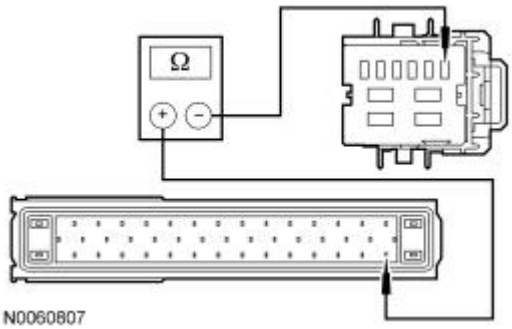
 N0060803 • **Is the resistance greater than 10,000 ohms?**	**No** GO to A5 .
A5 CHECK CIRCUIT CCB17 (BU/GN) FOR A SHORT TO GROUND	
• Measure the resistance between release relay pin-3, circuit CCB17 (BU/GN), harness side and ground.  N0056035 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR circuit CCB17 (BU/GN). TEST the system for normal operation. **No** GO to A6 .
A6 CHECK CIRCUIT CCB16 (WH/VT) FOR AN OPEN	
• Measure the resistance between reset relay pin-3, circuit CCB16 (WH/VT), harness side and park brake release solenoid C2132-1, circuit CCB16 (WH/VT), harness side.  N0060804 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR circuit CCB16 (WH/VT). TEST the system for normal operation. **No** GO to A7 .
A7 CHECK CIRCUIT CCB16 (WH/VT) FOR A SHORT TO GROUND	
• Measure the resistance between reset relay pin-3, circuit CCB16 (WH/VT), harness side and ground.	**Yes** REPAIR circuit CCB16 (WH/VT). TEST the system for normal operation. **No** GO to A8 .



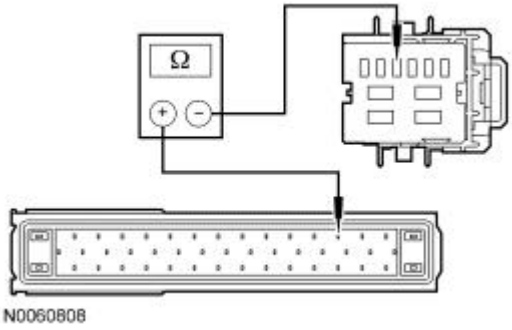
N0056033

- **Is the resistance less than 5 ohms?**

A8 CHECK THE RELEASE RELAY ABS MODULE GROUND • Connect the diagnostic tool. • Key in ON position. • Measure the resistance between release relay pin-1, circuit CCB21 (GN/VT), harness side and ground.  N0060806 • Trigger the electric park brake release relay active command to ENERGIZE. • **Is the resistance greater than 10,000 ohms when the active command is triggered ON?**	**Yes** TRIGGER the electric park brake release relay active command to DE-ENERGIZE. REPAIR circuit CCB21 (GN/VT). TEST the system for normal operation. **No** TRIGGER the electric park brake release relay active command to DE-ENERGIZE. GO to A9 .
A9 CHECK THE RETRACT RELAY ABS MODULE GROUND • Measure the resistance between reset relay pin-1, circuit CCB20 (BU/WH), harness side and ground.  N0060805 • Trigger the electric park brake reset relay active command to ENERGIZE. • **Is the resistance less than 5 ohms?**	**Yes** TRIGGER the electric park brake reset relay active command to DE-ENERGIZE. REPAIR circuit CCB20 (BU/WH). TEST the system for normal operation. **No** TRIGGER the electric park brake reset relay active command to DE-ENERGIZE. GO to A10 .
A10 CHECK CIRCUITS CCB20 (BU/WH) AND CCB21 (GN/VT) FOR AN OPEN • Key in OFF position. • Disconnect: ABS Module C135. • Measure the resistance between reset release relay pin-1, circuit CCB21 (GN/VT), harness side and ABS module C135-15, circuit CCB21 (GN/VT), harness side.	**Yes** REPAIR the affected circuit (s). TEST the system for normal operation. **No** GO to A11 .



- Measure the resistance between reset relay pin-1, circuit CCB20 (BU/WH), harness side and ABS module C135-44, circuit CCB20 (BU/WH), harness side.



- **Is the resistance greater than 10,000 ohms?**

A11 CHECK THE RELEASE SOLENOID OPERATION	
• Connect: Parking Brake Reset Relay. • Connect: Parking Brake Release Relay. • Connect: Park Brake Release Solenoid C2132. • Connect: ABS Module C135. • Key in ON position. • Trigger the electric park brake release relay active command to ENERGIZE. • Trigger the electric park brake release relay active command to DE-ENERGIZE. • Trigger the electric park brake reset relay active command to ENERGIZE. • Trigger the electric park brake reset relay active command to DE-ENERGIZE. • **Did the park brake release solenoid operation match the active commands?**	**Yes** GO to A12 . **No** INSTALL a new parking brake release solenoid. REFER to Parking Brake Release Solenoid in this section. TEST the system for normal operation.
A12 CHECK THE ABS MODULE CONNECTOR	

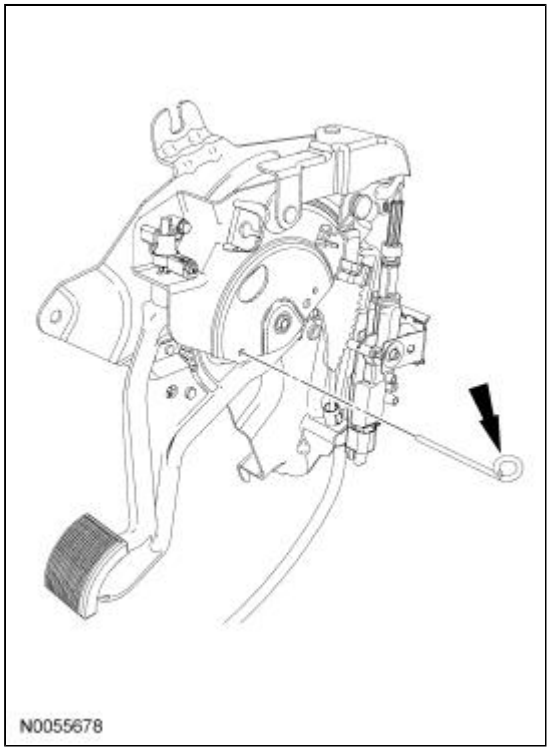
• Key in OFF position.
• Disconnect: ABS Module C135.
• Check the ABS module for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect: ABS Module C135.
• Make sure the connector is seated correctly and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ABS module. REFER to Section 206-09 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Parking Brake Cable Tension Release

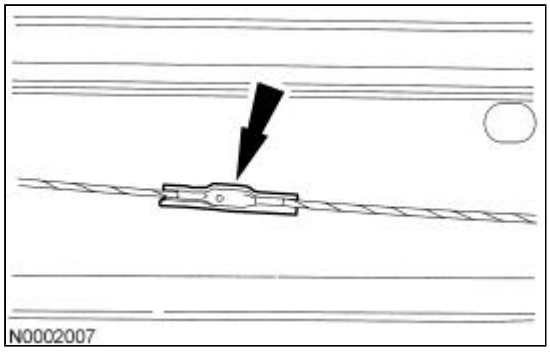
Printable View (119 KB)

1. Remove the LH cowl side trim panel. For additional information, refer to Section 501-05 .

2. With the help of an assistant, release the parking brake cable tension by pulling down on the intermediate cable at the cable-to-cable connector clip until the parking brake control sector rotates to its stop and a 4 mm (0.15 in) x 150 mm (5.9 in) retainer pin can be inserted.



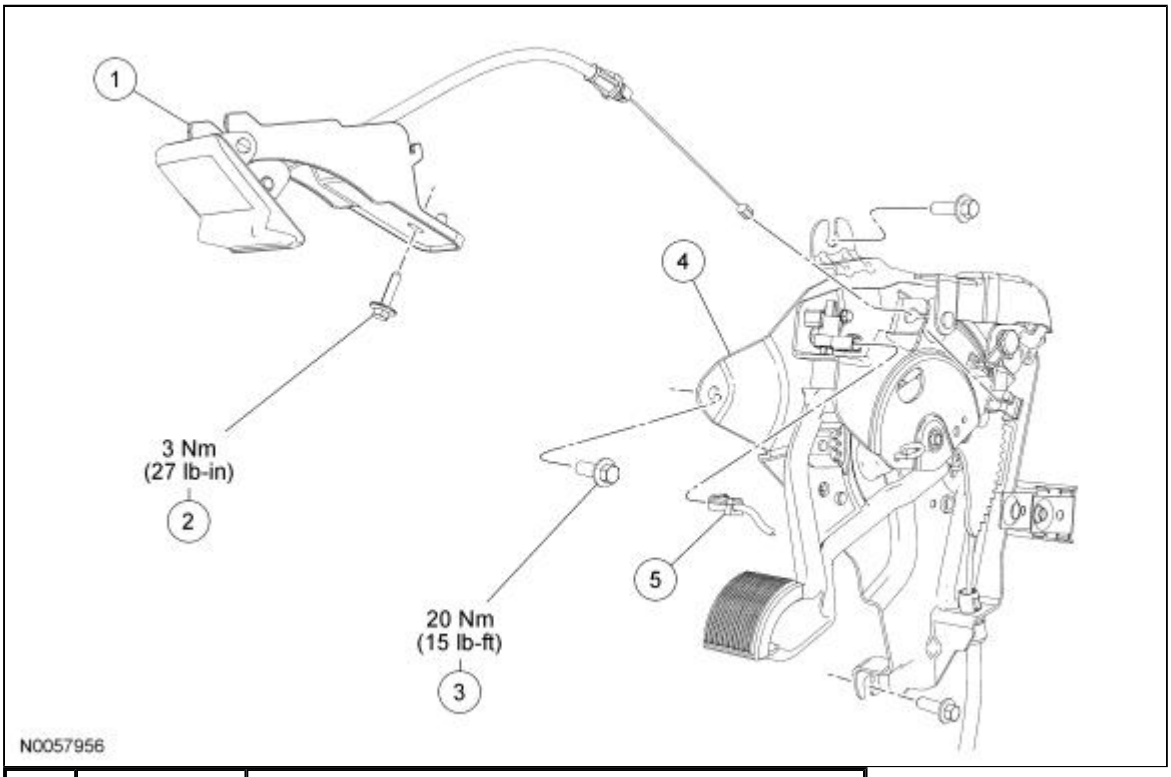
3. Disconnect the cable-to-cable connector clip.



4. To reload the tension on the parking brake cable, follow the release procedure in reverse.
   - Make sure the cable-to-cable connector clip is connected to the front and rear cable before removing the brake control retaining pin, and the cable tension is reloaded slowly.

Parking Brake Control

Printable View (225 KB)



Item	Part Number	Description
1	2783	Parking brake release handle
2	W707628	Parking brake release handle bolt
3	W704522	Parking brake control assembly bolt (3 required)
4	2780	Parking brake control
5	—	Parking brake switch electrical connector (part of 14489)

Removal and Installation

1. Relieve tension on the parking brake cable system. For additional information, refer to Parking Brake Cable Tension Release in this section.

2. If equipped, remove the parking brake release solenoid. For additional information, refer to Parking Brake Release Solenoid in this section.

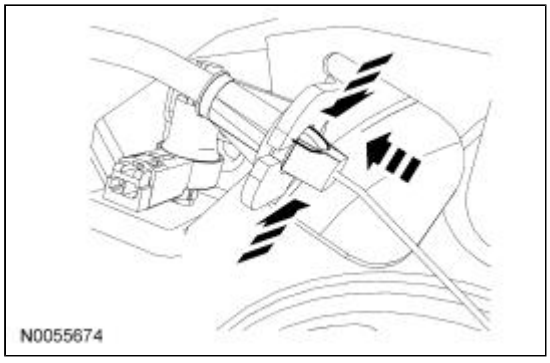
3. Remove the door scuff plate.

4. Remove the 2 screws and the instrument panel steering column cover.
   - Pull the weatherstrip back to release the edge of the panel.

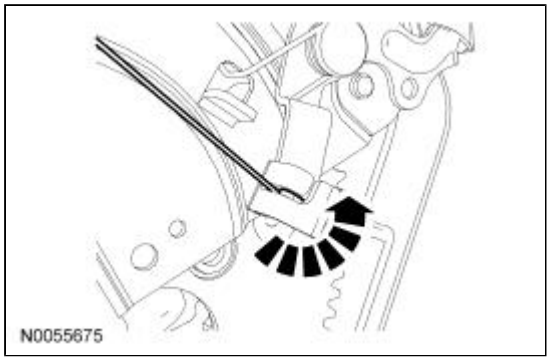
5. Remove the parking brake release handle bolt.
   - To install, tighten to 3 Nm (27 lb-in).

6. Remove the retainer and the cowl trim panel.

7. Compress the 2 tabs and disconnect the parking brake release cable from the parking brake control assembly.



8. Disconnect the parking brake release cable from the release lever and remove the parking brake release handle.

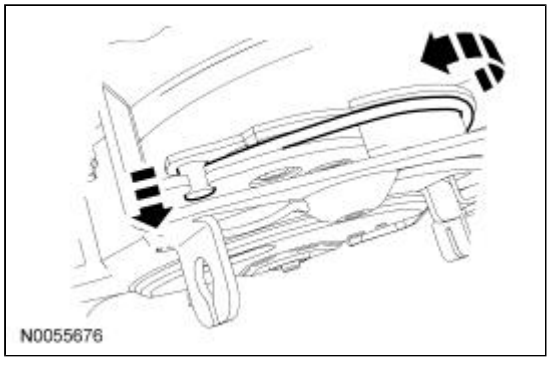


9. Disconnect the parking brake switch electrical connector.

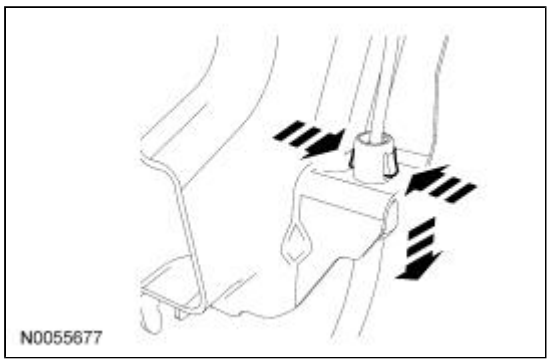
10. Remove the 3 parking brake control assembly bolts.
    - To install, tighten to 20 Nm (15 lb-ft).

11. Position the parking brake control assembly onto the floor.

12. Disconnect the parking brake cable from the take-up spool.



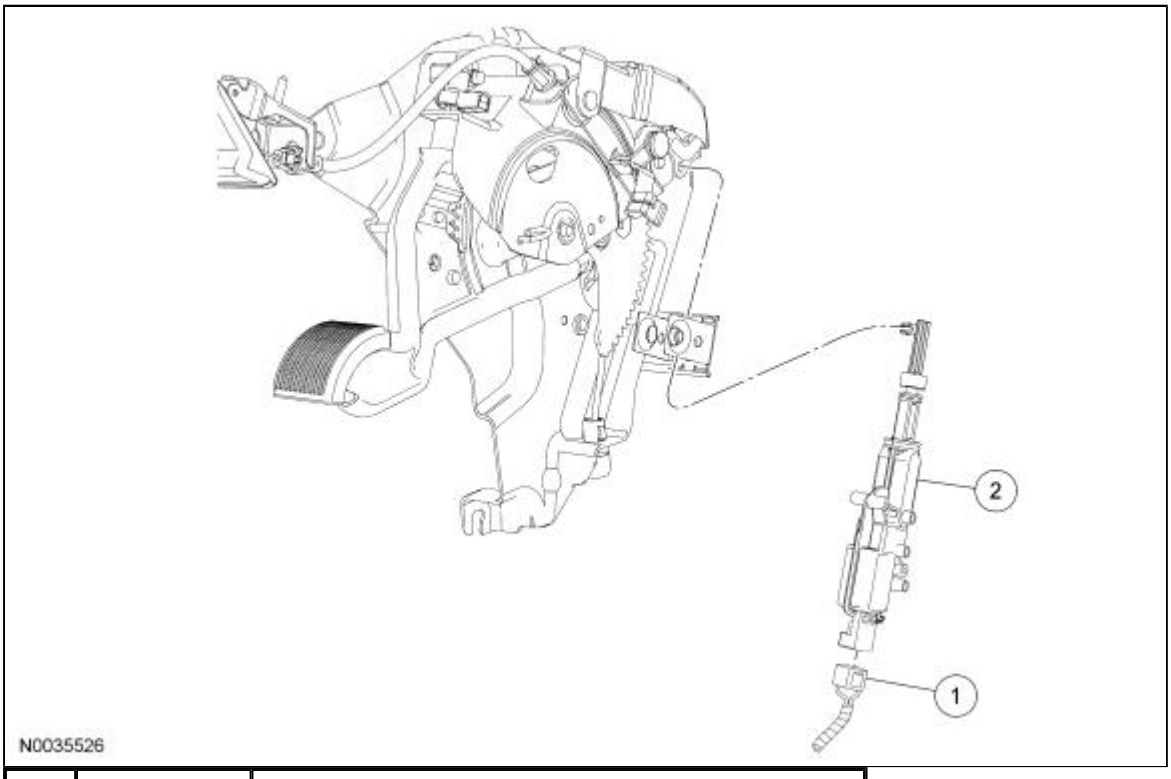
13. Compress the 2 tabs, disconnect the parking brake cable from the control assembly and remove the control assembly.



14. To install, reverse the removal procedure.

Parking Brake Release Solenoid

Printable View (131 KB)



Item	Part Number	Description
1	—	Parking brake release solenoid electrical connector
2	15A851	Parking brake release solenoid

Removal and Installation

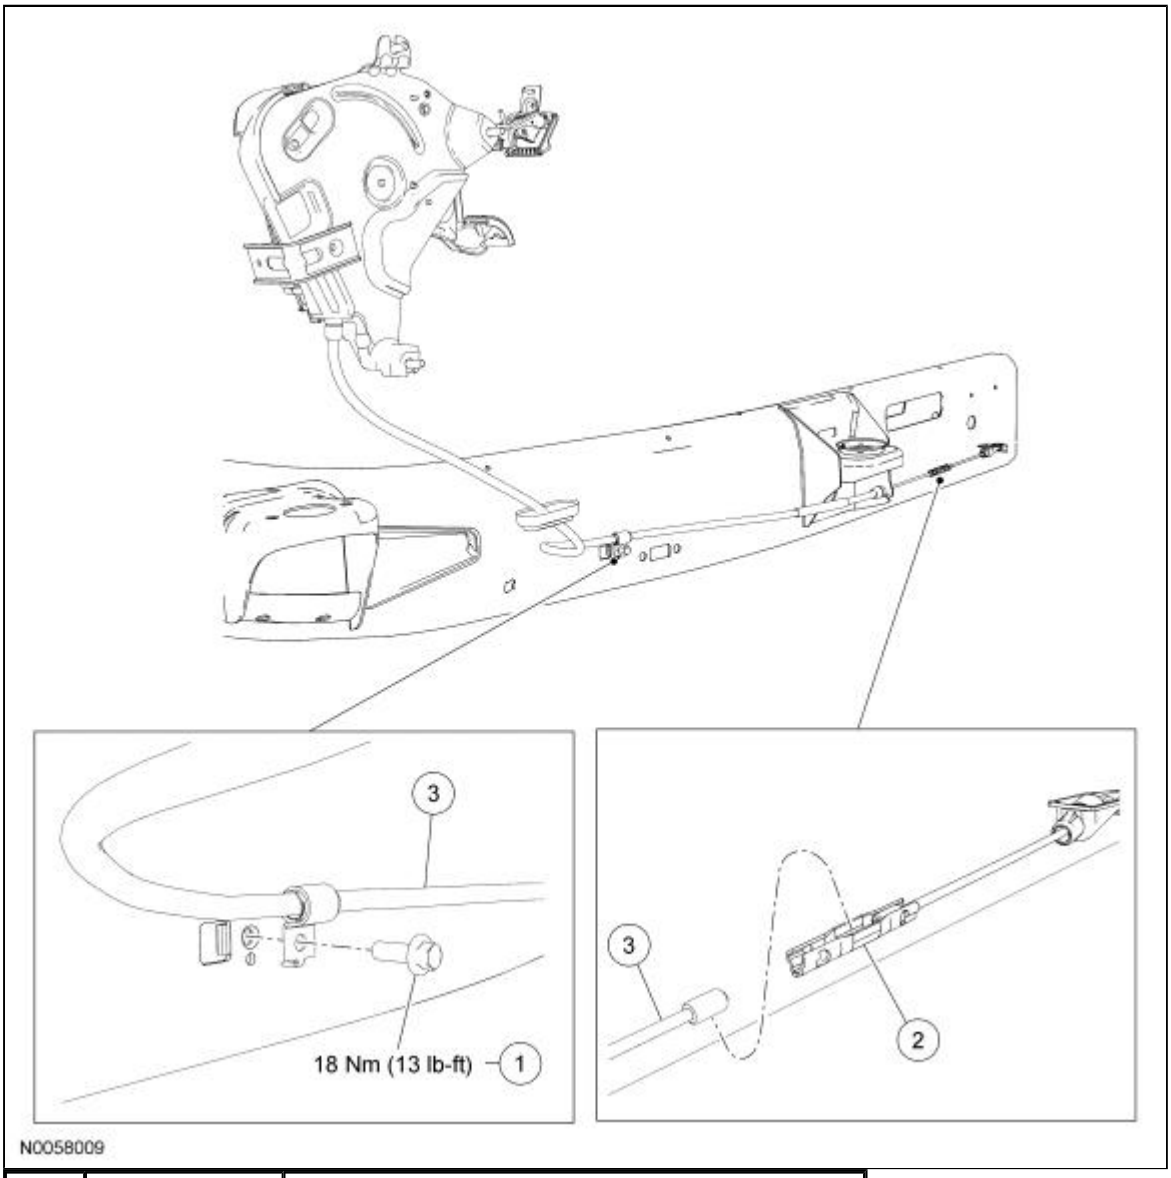
1. Disconnect the parking brake release solenoid electrical connector.

2. Remove the parking brake release solenoid.
   - Pry the mounting bracket apart slightly to release the solenoid.
   - Disengage the solenoid from the release lever.

3. To install, reverse the removal procedure.

Parking Brake Cable — Front

Printable View (139 KB)



Item	Part Number	Description
1	W506423	Front park brake cable P-clip-to-frame bolt
2	—	Park brake cable union
3	2853	Front park brake cable

Removal and Installation

1. Remove the parking brake control. For additional information, refer to Parking Brake Control in this section.
2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
3. Remove the front park brake cable P-clip-to-frame bolt.

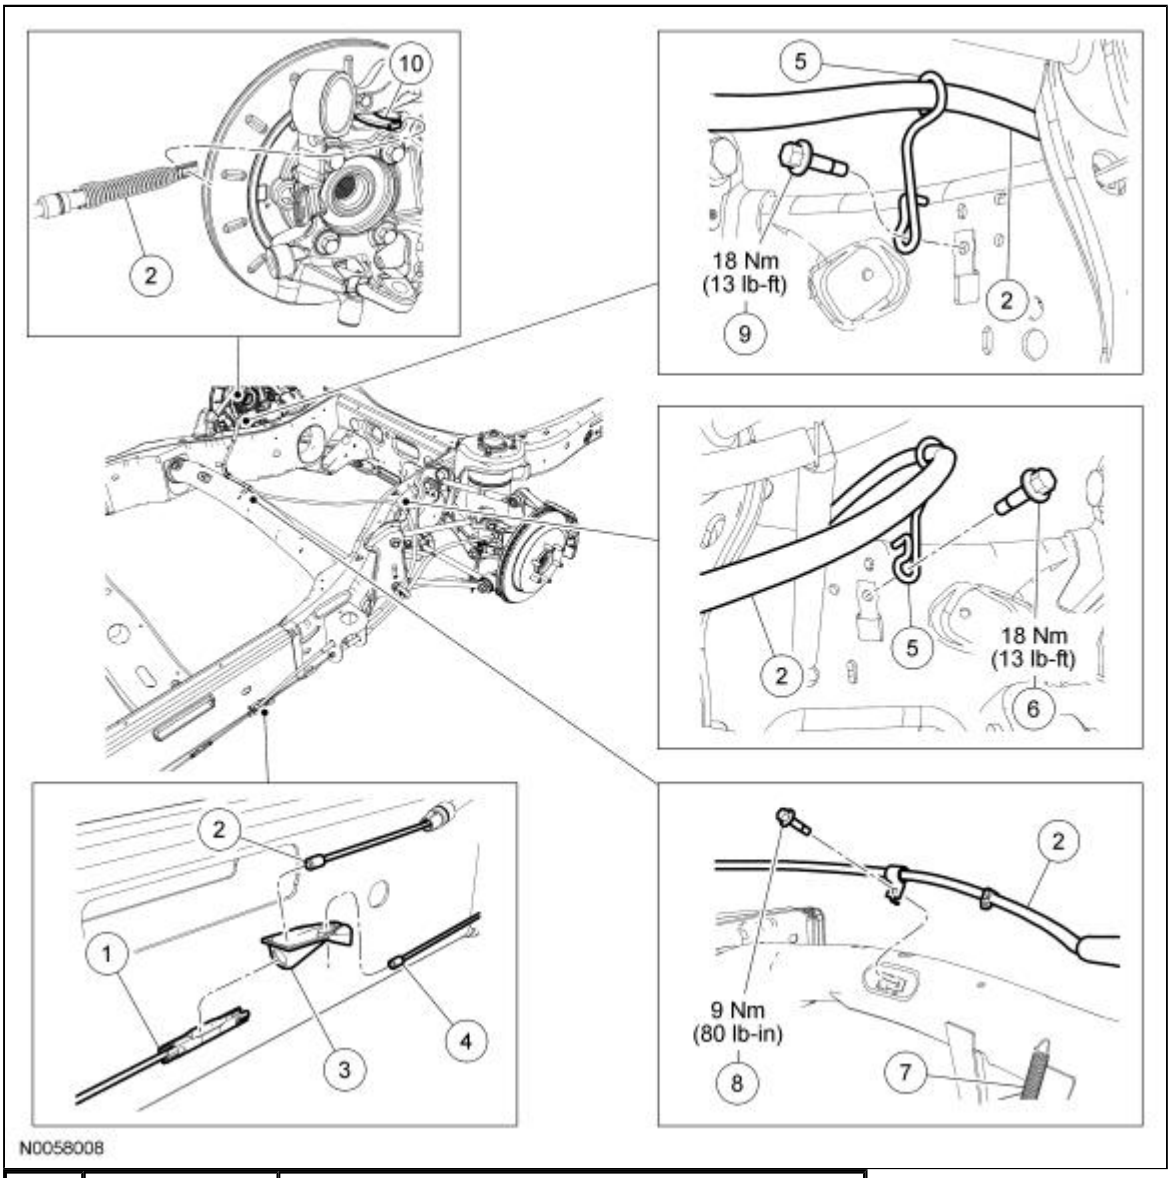
- To install, tighten to 18 Nm (13 lb-ft).

4. Remove the front parking brake cable and conduit.
    - Pry the rubber seal from the front floor pan.
    - Compress the retainer and release the conduit from the bracket.
    - Remove the front cable and conduit from the cable union.

5. To install, reverse the removal procedure.

Parking Brake Cable — Rear, RH

Printable View (234 KB)



Item	Part Number	Description
1	—	Parking brake cable union
2	2A635	RH parking brake cable
3	2A602	Parking brake cable equalizer
4	2A809	LH parking brake cable
5	—	Wire form bracket (part of 2A635)
6	W506423	Wire form bracket bolt
7	2A709	Parking brake cable retaining spring
8	W506014	Rear park brake cable-to-crossmember bolt
9	W506423	Wire form bracket bolt
10	2A637	RH parking brake shoe lever

Removal and Installation

1. Relieve the tension on the parking brake cable system. For additional information, refer to Parking Brake Cable Tension Release in this section.

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. Disconnect the RH rear cable from the cable union.

4. Compress the 2 tabs and release the conduit from the equalizer.

5. Remove the RH rear cable from the retaining clip.

6. Remove the bolt and the wire form bracket from the LH side of the vehicle.
    - To install, tighten to 18 Nm (13 lb-ft).

7. Remove the rear park brake cable-to-crossmember bolt.
    - To install, tighten to 9 Nm (80 lb-in).

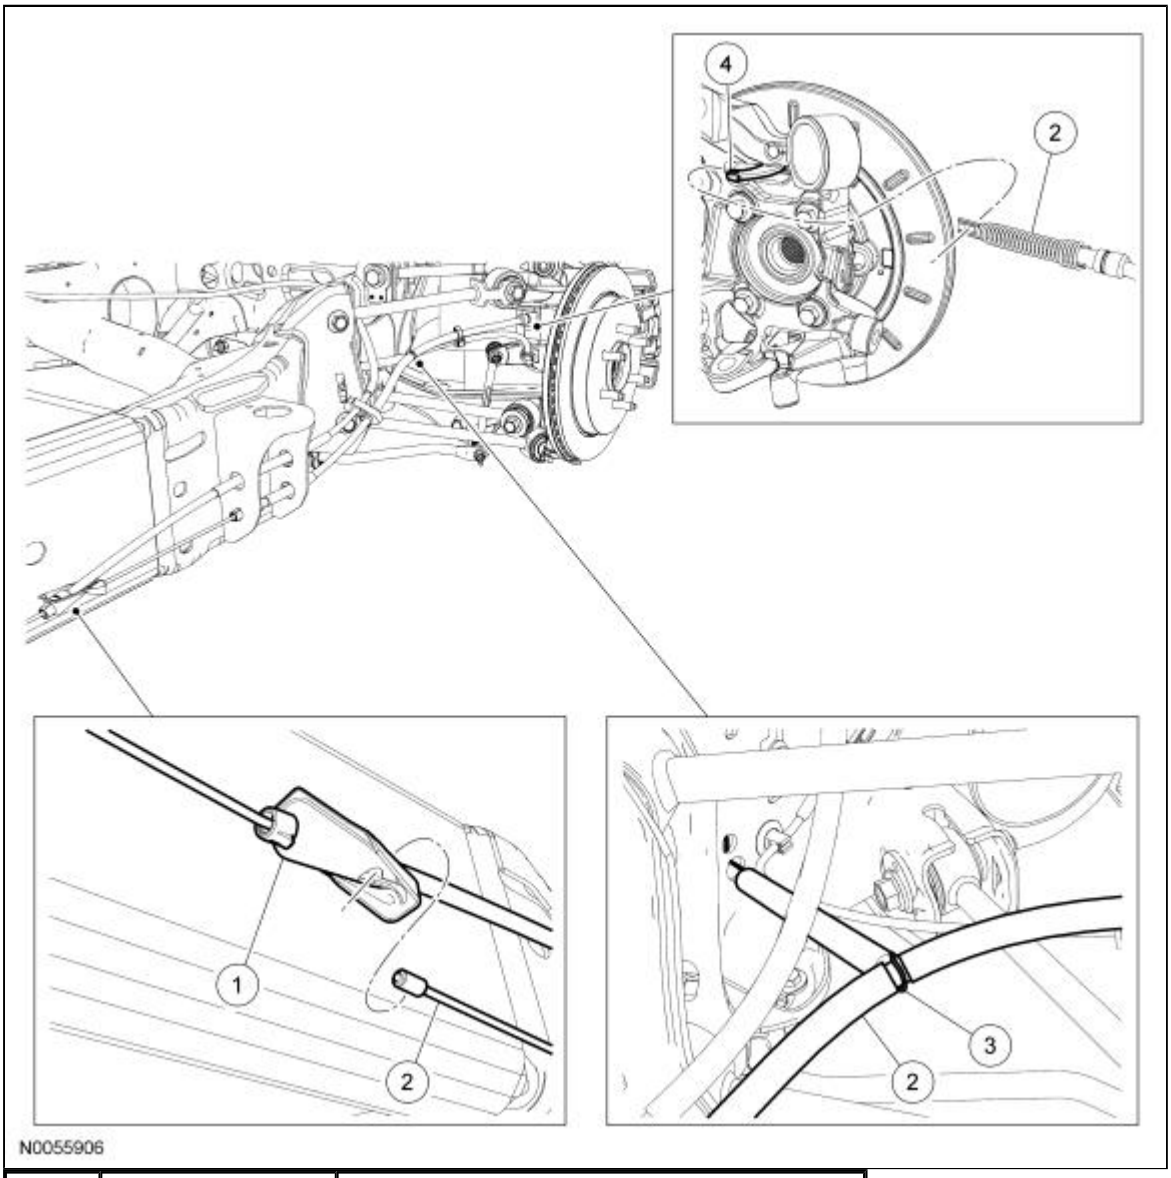
8. Remove the bolt and the wire form bracket from the RH side of the vehicle.
    - To install, tighten to 18 Nm (13 lb-ft).

9. Compress the 2 tabs and release the conduit, then unclip the cable end fitting from the parking brake shoe lever.

10. To install, reverse the removal procedure.

Parking Brake Cable — Rear, LH

Printable View (255 KB)



Item	Part Number	Description
1	2A602	Equalizer
2	2A809	LH rear park brake cable
3	2A709	Park brake cable retainer spring
4	2A637	Park brake shoe lever

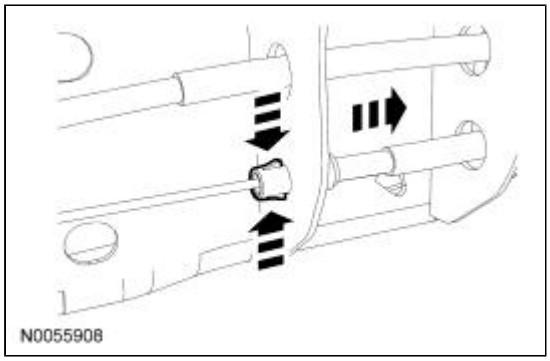
Removal and Installation

1. Relieve the tension on the parking brake cable system. For additional information, refer to Parking Brake Cable Tension Release in this section.

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. Separate the LH rear cable from the equalizer.

4. Remove the conduit from the bracket.
    1. Compress the 2 tabs.
    2. Remove the conduit from the bracket.



5. **NOTE:** Be sure to correctly install the park brake cable retainer spring and route cables between suspension links.

    Remove the LH rear cable.
    1. Remove the LH rear cable from the retaining clip.
    2. Disconnect the park brake cable retainer spring.
    3. If equipped, disconnect the anti-lock brake system (ABS) sensor wire from the retaining clip.

6. Remove the wireform bracket retaining bolt and the bracket.
    - To install, tighten to 17 Nm (13 lb-ft).

7. Compress the retainer and release the conduit, then unclip the cable end fitting from the parking brake shoe lever.

8. To install, reverse the removal procedure.

Parking Brake Shoes

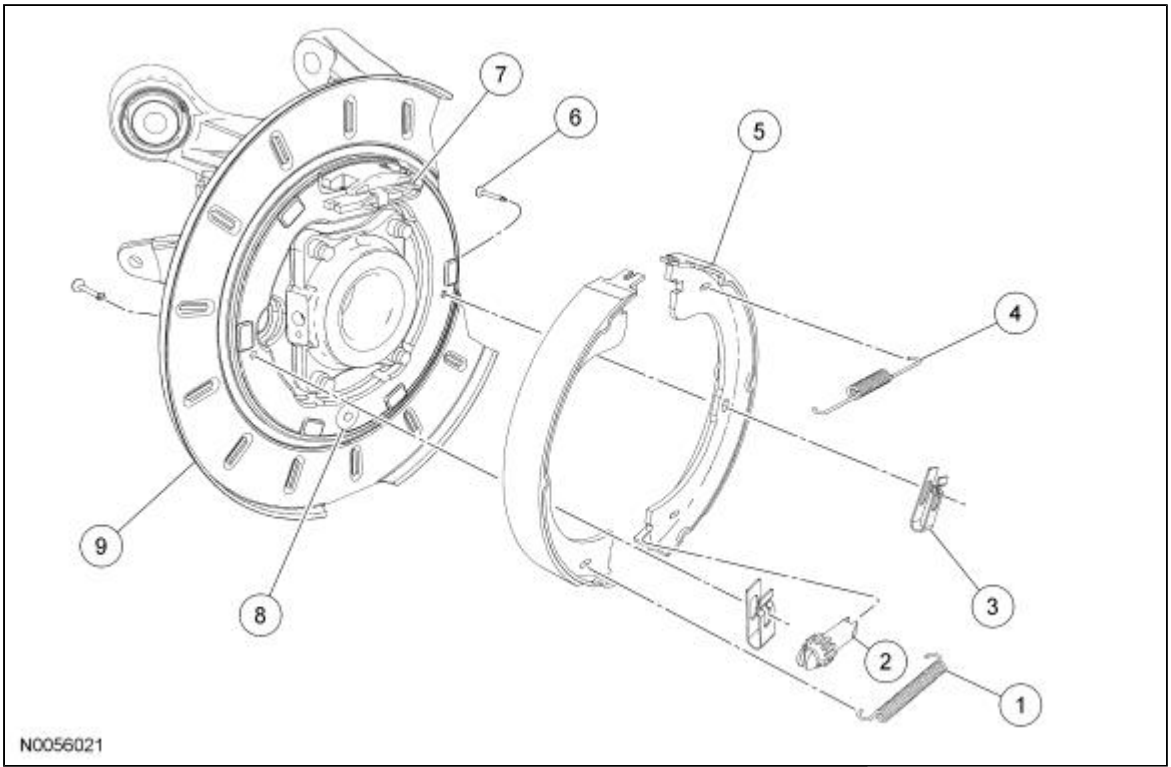
Printable View (250 KB)

Special Tool(s)

ST1468-A	Gauge, Brake Adjusting 206-D002 (D81L-1103-A) or equivalent

Material

Item	Specification
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A



Item	Part Number	Description
1	—	Parking brake shoe adjuster spring (part of 2648)
2	2041	Parking brake shoe adjuster
3	—	Parking brake shoe retaining clip (2 required) (part of 2648)
4	—	Parking brake shoe return spring (part of 2648)

5	2A753	Parking brake shoe (part of 2648)
6	—	Parking brake shoe retaining pin (2 required) (part of 2648)
7	2404	Parking brake shoe lever boot (Navigator/Expedition)
8	2092	Adjuster hole plug
9	2C029 LH/ 2C028 RH	Brake disc shield

Removal

1. Relieve the tension on the parking brake cable system. For additional information, refer to Parking Brake Cable Tension Release in this section.

2. Remove the brake disc. For additional information, refer to Section 206-04 .

3. Remove the front parking brake shoe retaining clip and pin.

4. Remove the parking brake shoe adjuster.
   - Using a suitable tool, spread the bottom of the parking brake shoes apart.
   - Remove the parking brake shoe adjuster.

5. Remove the parking brake shoe adjuster spring.

6. Slide the front parking brake shoe up and out of the guide flange.

7. Remove the front parking brake shoe.
   - Rotate the front parking brake shoe outward.
   - Remove the parking brake shoe return spring.

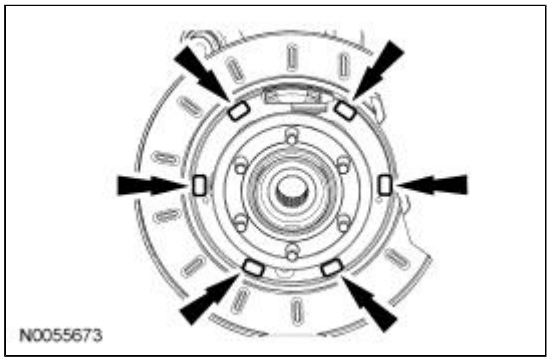
8. Remove the rear parking brake shoe.
   - Remove the retaining clip and pin.
   - Remove the rear parking brake shoe.

9. Inspect the components for excessive wear or damage and install new parts as required.

Installation

1. **CAUTION: Apply the grease only where indicated, do not apply the grease to the parking brake shoes. The grease will contaminate the brake shoe linings and damage to the linings will result.**

   Apply a light coat of grease to the 6 parking brake shoe contact points on the disc brake shield.



2. Install the rear parking brake shoe.
    - Hold the rear parking brake shoe in position.
    - Install the retaining pin and clip.

3. Install the front parking brake shoe.
    - Install the parking brake shoe return spring to the rear parking brake shoe and to the front parking brake shoe.
    - Rotate the front parking brake shoe into the guide flange.

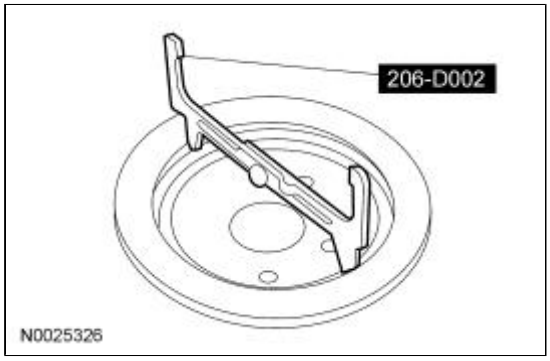
4. Slide the front parking brake shoe down into position on the flange.

5. Install the front parking brake shoe retaining pin and clip.

6. Install the parking brake shoe adjuster spring.

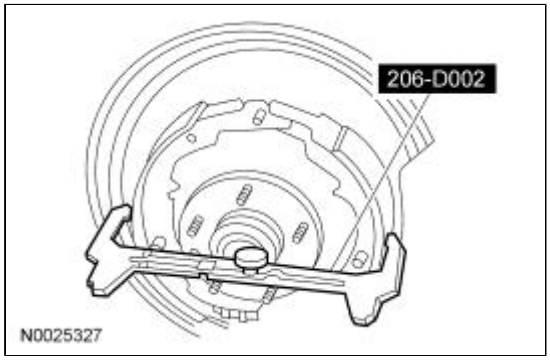
7. Install the parking brake shoe adjuster.
    - Using a suitable tool, spread the bottom of the parking brake shoes apart.
    - Install the parking brake shoe adjuster.

8. Using the special tool, measure the inside diameter of the drum portion of the rear brake disc.
    - Record the measurement.



9. **NOTE:** Make sure that the parking brake shoes are correctly centered. Take the measurement at the widest point across the center of the parking brake shoes.

    Using the special tool, measure the parking brake shoe diameter.
    - Rotate the adjuster to set the parking brake shoe diameter to 0.45 mm (0.02 in) less than the recorded inside diameter of the drum portion of the rear brake disc.



10. Install the brake disc. For additional information, refer to Section 206-04 .

11. **NOTE:** This step will require the aid of an assistant.

Enable the parking brake cable system.

- Pull down on the front parking brake cable at the coupler.
- Remove the retaining pin from the parking brake lever.

12. Check the parking brake for correct operation.

Printable View (63 KB)

General Specifications

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A

Torque Specifications

Description	Nm	lb-ft
Brake master cylinder nuts	25	18
Brake pedal bracket nuts and bolts	27	20
Brake pressure switch	18	13
Brake tube fittings	18	13

Hydraulic Brake Actuation

Printable View (81 KB)

The brake pedal is connected to the power brake booster, which is connected to the brake master cylinder. The brake pedal is either fixed or adjustable; non-memory or memory is available. When the brake pedal is depressed, brake fluid is pushed from the master cylinder through the metal tubing and flexible hoses to the front disc brake calipers and the rear disc brake calipers. The front disc brake caliper pistons are forced outward against the brake pads and contact the braking surface of the brake discs. The brake fluid enters the rear disc brake calipers, forcing the rear disc brake caliper pistons outward against the brake pads. The brake pads press against the braking surface on the brake discs. When the brake pedal is released, the pressure is relieved, returning the brake caliper pistons and the brake pads to the released position.

The dual brake system is split front and rear with the front wheel brakes comprising one circuit and the rear wheel brakes, the other circuit.

The ability of a brake system to stop the vehicle is dependent on the available traction.

Brake Master Cylinder

The brake master cylinder is a dual-piston type.

The brake master cylinder is assisted by a power brake booster. Refer to Section 206-07 .

The following conditions are considered normal and are not indications that the brake master cylinder is in need of repair or replacement.

- Low brake fluid level detected without signs of leakage. This condition is caused by displacement of brake fluid from the brake master cylinder reservoir into the disc brake calipers to compensate for normal brake wear. Add brake fluid as needed.
- A momentary or slight ripple of brake fluid inside the brake master cylinder reservoir upon application or release of the brake pedal.
- A trace of brake fluid found on the outside of the power brake booster below the brake master cylinder mounting flange. This condition results from the lubricating action of the brake master cylinder wiping seal.

Brake Fluid Level Warning Switch

The brake fluid level warning switch is an integral part of the brake master cylinder reservoir. It consists of a float containing a magnet and a reed switch mounted in the bottom of the brake master cylinder reservoir.

When the brake fluid in the brake master cylinder reservoir gets to a predetermined level, the floating magnet actuates the reed switch, causing the red brake warning indicator to illuminate. Loss of brake fluid from either the primary (front) or secondary (rear) system will cause this system to activate. If the brake fluid level warning switch is inoperative, a new brake master cylinder reservoir must be installed.

Tubes and Hoses

CAUTION: Only authorized inlet hydraulic brake tubes should be used. These tubes are of a specific design and new authorized parts only should be installed.

Steel tubing with flex hoses are used in the hydraulic tubes between the brake master cylinder and the hydraulic control unit (HCU). Steel tubing is used between the HCU and the front and rear hoses.

Double flared brake tubing provides good leakproof connections.

When replacing hydraulic brake tubing, hoses or connectors, tighten all connections securely. After replacement, bleed the brake system. Refer to Section 206-00 .

Hydraulic Brake Actuation

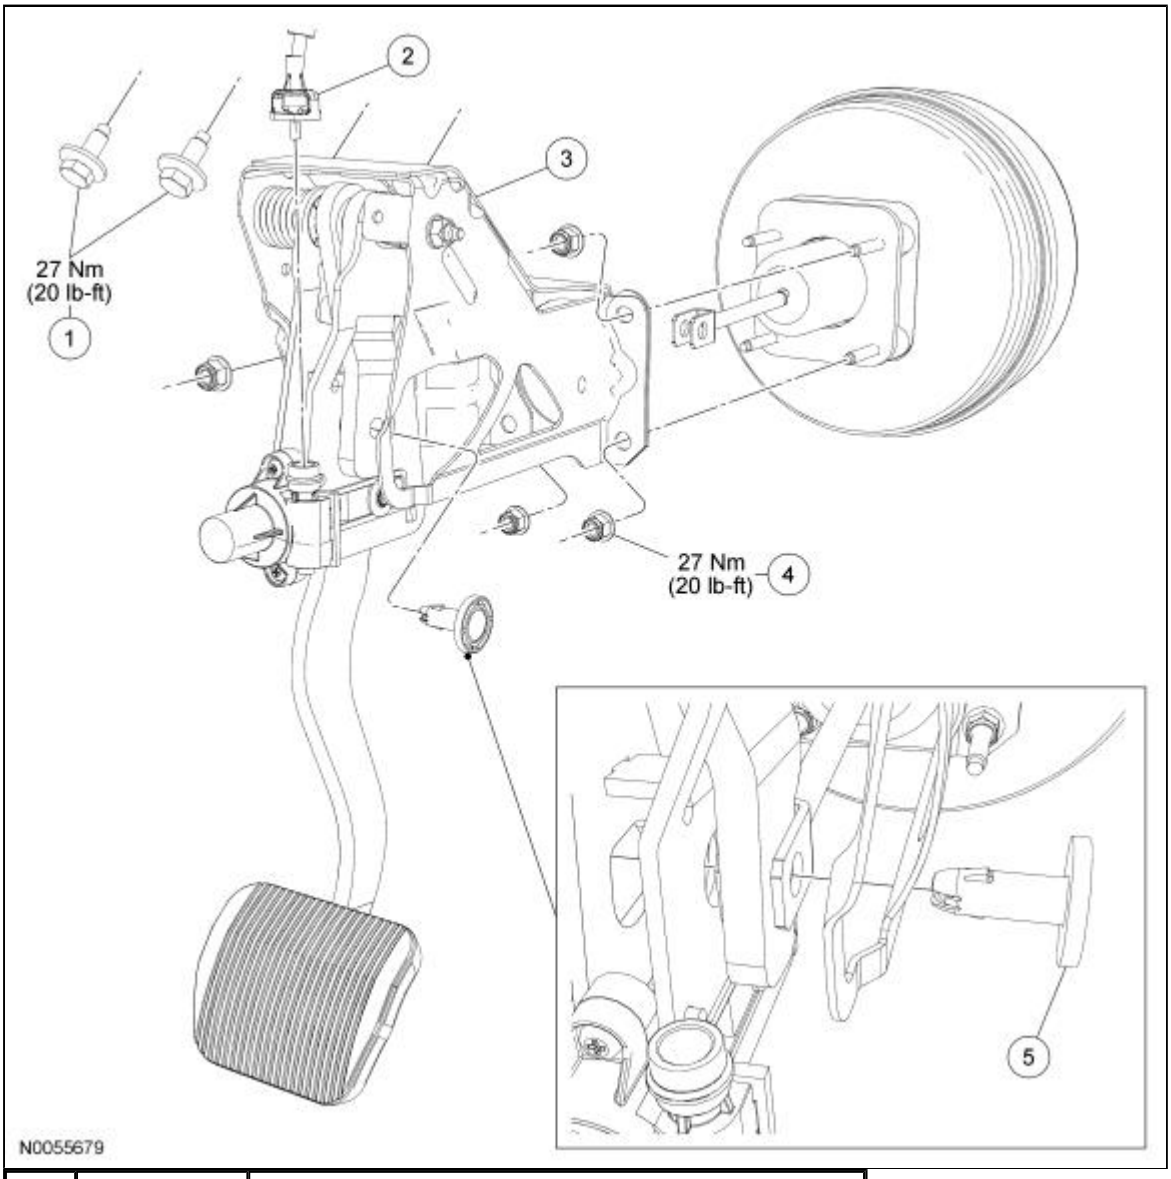
Printable View (62 KB)

Refer to Section 206-00 .

Brake Pedal and Bracket

Printable View (236 KB)

NOTE: Adjustable brake pedal and bracket shown, fixed brake pedal and bracket similar.



Item	Part Number	Description
1	W702368	Brake pedal bracket bolts (2 required)
2	—	Accelerator pedal-to-brake pedal cable (part of 9F836)
3	2450	Brake pedal and bracket
4	W520212	Brake pedal bracket nut (4 required)
5	2L523	Brake pedal pin

Removal and Installation

Adjustable pedal vehicles

1. **CAUTION: The brake pedal and the accelerator pedal must be in the same position when installing a new cable or a new pedal. The pedals must be all the way forward or all the way rearward.**

   Disconnect the battery negative cable. For additional information, refer to Section 414-01 .

2. If equipped, disconnect the accelerator pedal-to-brake pedal cable from the adjustable brake pedal motor.

All vehicles

3. **CAUTION: Always remove the stoplamp switch with the brake pedal secured to the brake booster push rod and with the brake pedal in the at-rest position. Do not press or pull on the brake pedal when removing the switch or damage to the switch can occur.**

   CAUTION: The stoplamp switch must be removed prior to removing the brake pedal and bracket, brake booster and associated mounting fasteners or damage to the switch can occur.

   Disconnect the electrical connector and turn the stoplamp switch clockwise to detach it from the brake pedal bracket.

4. **NOTE:** An 11 mm, 12-point socket or wrench can be used to compress the 2 tabs on the brake pedal arm pin.

   Remove the brake pedal arm pin and disconnect the brake booster push rod from the brake pedal arm.

5. Remove the bulkhead sound insulator.

6. Remove the 4 brake pedal bracket nuts.
   - To install, tighten to 27 Nm (20 lb-ft).

7. Remove the 2 brake pedal bracket bolts and remove the brake pedal and bracket.
   - To install, tighten to 27 Nm (20 lb-ft).

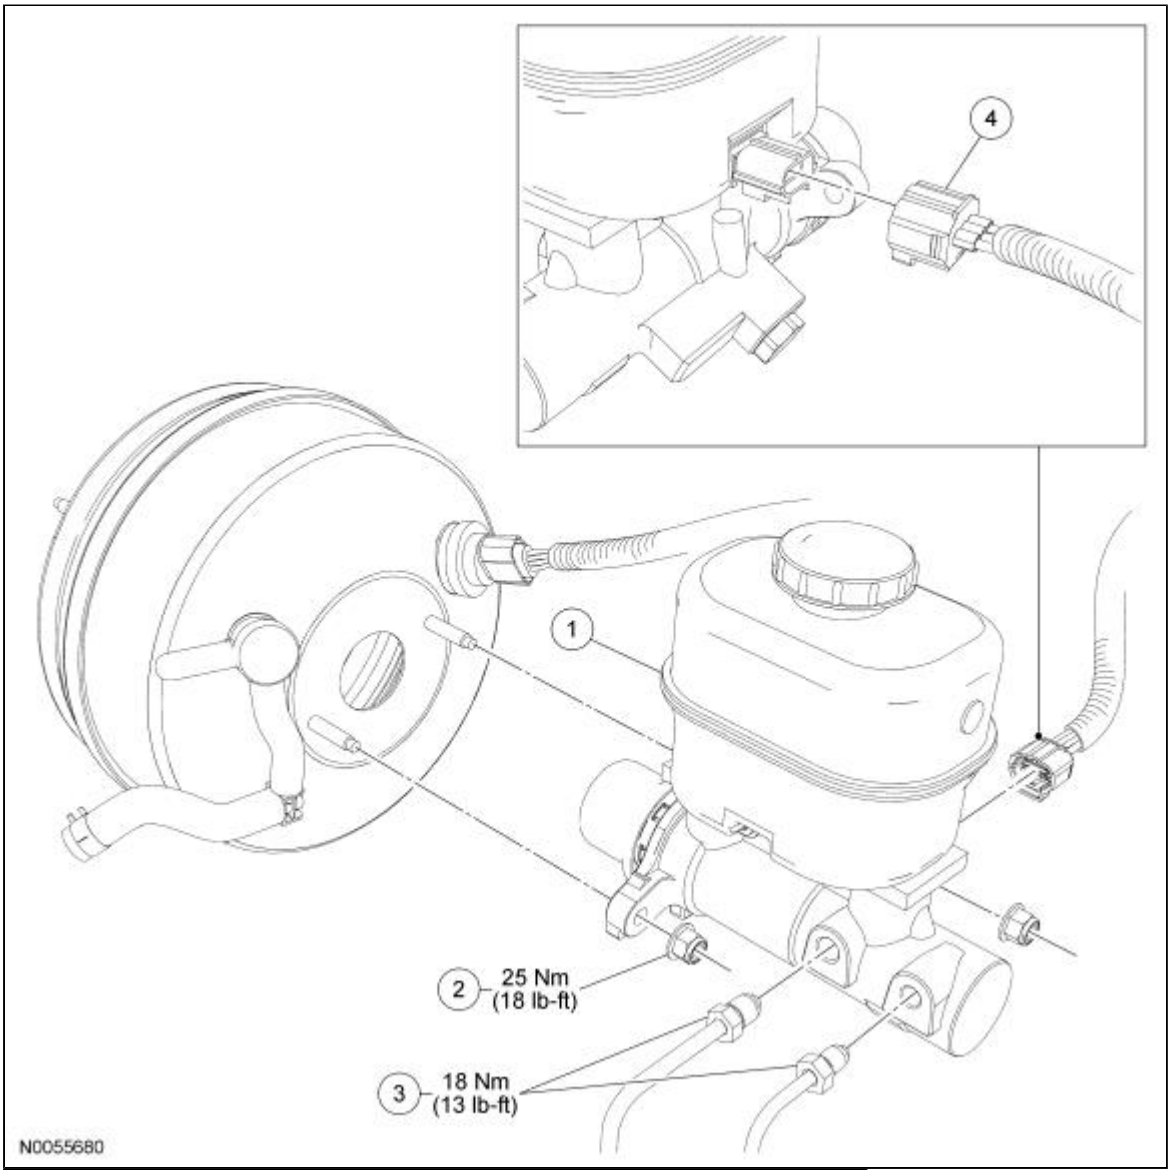
8. To install, reverse the removal procedure.

Brake Master Cylinder

Printable View (197 KB)

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1 (Canada)	WSS-M6C62-A



Item	Part Number	Description
1	2C156	Brake master cylinder and reservoir assembly
2	W520212	Brake master cylinder nut (2 required)
3	—	Brake tube fittings (front part of 2B253, rear part of 2A040)

4	—	Brake pressure switch electrical connector

Removal and Installation

WARNING: Use of any other than approved DOT 3 motor vehicle brake fluid will cause permanent damage to brake components and will render the brakes inoperative. Failure to follow these instructions may result in personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Disconnect the brake fluid level switch.
3. Loosen the brake tube fittings and disconnect the brake tubes.
   - Plug the master cylinder ports.
   - To install, tighten to 18 Nm (13 lb-ft).
4. Remove the 2 brake master cylinder nuts and the brake master cylinder.
   - To install, tighten to 25 Nm (18 lb-ft).
5. To install, reverse the removal procedure.
   - Bleed the brake system. For additional information, refer to Section 206-00 .

Printable View (63 KB)

Torque Specifications

Description	Nm	lb-ft	lb-in
Brake booster-to-pedal bracket nuts	27	20	—
Brake master cylinder nuts	25	18	—
Degas bottle bolts	9	—	80
Power steering fluid reservoir screws	11	8	—

Brake Booster

Printable View (63 KB)

The power brake booster:

- is a dual diaphragm, vacuum-assisted power brake booster.
- reduces brake pedal pressure and travel distance.
- is divided into separate vacuum and atmospheric pressure chambers by a diaphragm.

If the power assist fails, the brake system will continue to operate with increased brake pedal effort.

Hose and Check Valve

The power brake booster check valve:

- closes when the engine is turned off.
- in the closed position, traps engine vacuum in the power brake booster.
- retains vacuum to provide several power-assisted brake applications with the engine off.

Power Brake System

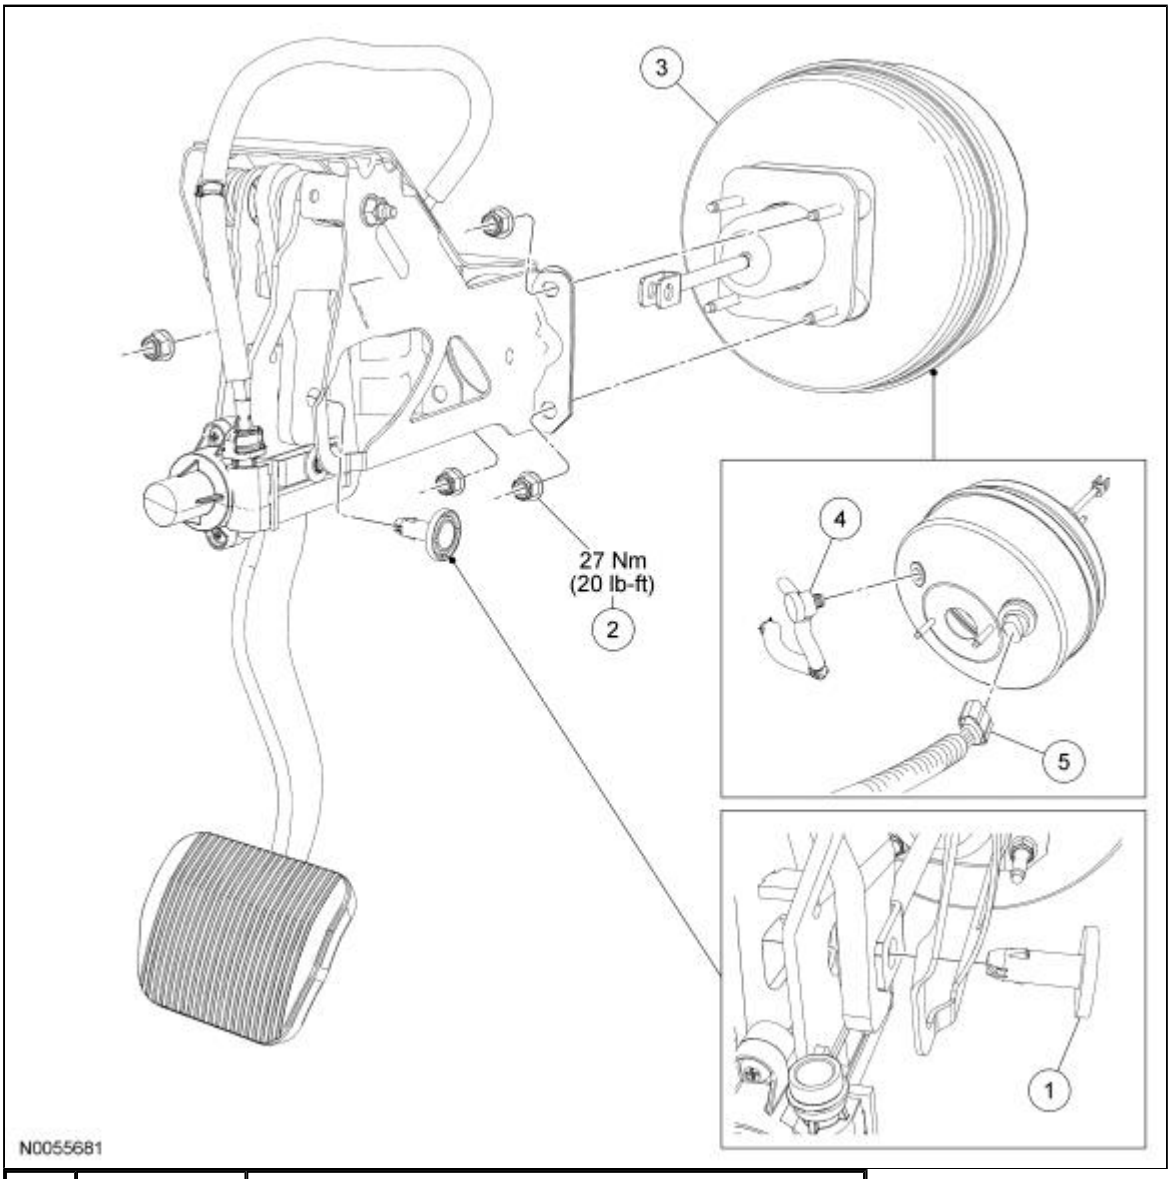
Printable View (62 KB)

Refer to Section 206-00 .

Brake Booster

Printable View (246 KB)

NOTE: Non-roll stability control equipped shown, roll stability control equipped similar.



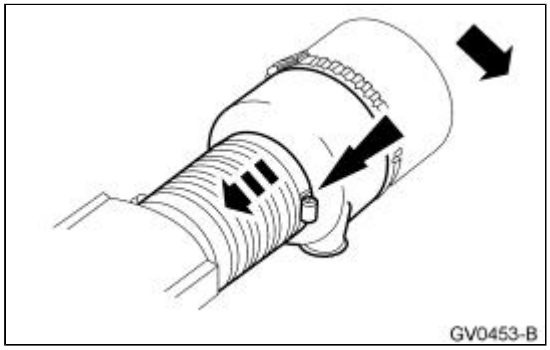
Item	Part Number	Description
1	2L523	Brake pedal pin
2	W702368	Brake booster-to-pedal bracket nut (4 required)
3	2005	Brake booster
4	9C490	Manifold vacuum outlet assembly
5	—	Pedal travel sensor electrical connector (part of 14A464)

Removal and Installation

All vehicles

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

2. Loosen the clamp and separate the air cleaner outlet tube and resonator from the air cleaner.



3. Disconnect the mass air flow (MAF) sensor electrical connector.

4. Lift the air cleaner assembly from the air cleaner tray.

5. Remove the 3 power steering fluid reservoir screws and position the reservoir aside.
   - To install, tighten to 11 Nm (8 lb-ft).

6. Depress the brake pedal at least 3 times to deplete the vacuum in the booster.

7. Disconnect the brake fluid level switch.

8. **NOTE:** Support the master cylinder with mechanic's wire.

   Remove and discard the 2 brake master cylinder nuts and position the master cylinder aside.
   - To install, tighten to 25 Nm (18 lb-ft).

9. Remove the 2 degas bottle bolts and position the degas bottle aside.
   - To install, tighten to 9 Nm (80 lb-in).

Vehicles equipped with roll stability control

10. Disconnect the brake pedal travel solenoid electrical connector.

All vehicles

11. Disconnect the brake pedal travel sensor electrical connector.

12. Disconnect the manifold vacuum outlet assembly from the brake booster.

13. **CAUTION: Always remove the stoplamp switch with the brake pedal secured to the brake booster push rod and with the brake pedal in the at-rest position. Do not press or pull on the brake pedal when removing the switch or damage to switch can occur.**

    CAUTION: The stoplamp switch must be removed prior to removing the brake pedal and bracket, brake booster and associated mounting fasteners or damage to the switch can occur.

    Disconnect the electrical connector and turn the stoplamp switch clockwise to detach it from the

brake pedal bracket.

14. Remove the brake pedal arm pin and disconnect the booster push rod from the brake pedal arm.

15. Remove the 4 brake booster-to-pedal bracket nuts and remove the brake booster.
    - To access the retaining nuts, fold back the sound insulation.
    - To install, tighten to 27 Nm (20 lb-ft).

16. To install, reverse the removal procedure.

Anti-Lock Control

Printable View (65 KB)

Anti-Lock Brake System (ABS)

The 4-wheel, 4-channel anti-lock brake system (ABS) consists of the following components:

- ABS module
- Front wheel speed sensor
- Front wheel speed sensor ring (integral to the front wheel bearing)
- Hydraulic control unit (HCU)
- Rear wheel speed sensor
- Rear wheel speed sensor ring (integral to the rear halfshaft)
- Yellow ABS warning indicator

The front wheel speed sensor rings are integral to the front hub and bearing assemblies. Refer to Section 204-01A or Section 204-01B .

The rear wheel speed sensor rings are integral to the rear halfshaft. Refer to Section 205-05 .

Anti-Lock Brake System (ABS) With Traction Control and Stability Assist

The anti-lock brake system (ABS) with stability assist consists of the following components:

- Active brake booster with integral solenoid
- Brake booster release switch
- Stability assist event indicator
- Steering position sensor
- Brake pressure sensor (part of HCU)
- Stability assist switch
- Lateral accelerometer (part of stability control sensor cluster)
- Longitudinal accelerometer (part of stability control sensor cluster)
- Roll rate sensor (part of stability control sensor cluster)
- Yaw rate sensor (part of stability control sensor cluster)

For removal and installation of the brake booster release switch, refer to Section 206-07 .

For removal and installation of the front wheel speed sensor indicators, refer to Section 204-01A for rear wheel drive (RWD) vehicles or Section 204-01B for four wheel drive (4WD) vehicles.

For removal and installation of the rear wheel speed sensor indicator, refer to Section 205-05 .

For removal and installation of the steering wheel position sensor, refer to Section 211-04 .

Anti-Lock Control

ST2574-A	Flex Probe Kit 105-R025B or equivalent

Principles of Operation

Anti-Lock Brake System (ABS)

The anti-lock brake system (ABS) module manages anti-lock braking, traction control and engine control systems to maintain vehicle control during deceleration and acceleration.

When the ignition switch is in the RUN position, the ABS module does a preliminary electrical check and, at approximately 20 km/h (12 mph), the hydraulic pump motor is turned on for approximately 1/2 second. During this time a buzzing or humming noise may be heard and a vibration maybe felt in the brake pedal. This is a normal condition. Any malfunction of the ABS disables the stability assist and the ABS warning indicator illuminates. However, the power-assist braking system functions normally.

The ABS module must be configured when a new ABS module is installed.

Electronic Brake Distribution (EBD)

The electronic brake distribution (EBD) controls the rear brake pressure and acts as an electronic proportioning valve. It is controlled by the ABS module. When EBD is disabled, the ABS warning indicator illuminates.

Stability Assist

With the ignition switch in the START or RUN positions, the ABS module with stability assist functions similarly to a conventional ABS module by monitoring and comparing the rotational speed of each wheel. Wheel speeds are measured by the wheel speed sensor, which electrically senses each tooth of the sensor ring as it passes through the magnetic field of the sensor. When the ABS module detects an

impending wheel lock, wheel spin or vehicle motion that is inconsistent with the driver commands, brake pressure is modulated to the appropriate brake caliper(s). The ABS module triggers the hydraulic control unit (HCU) to open and close the appropriate solenoid valves. Once the affected wheel(s) return to the desired speed, the ABS module returns the solenoid valves to their normal position and normal base brake operation is restored.

The ABS module communicates with the powertrain control module (PCM) to assist with traction control. When the drive wheels lose traction and begin to spin, with vehicle speed under 100 km/h (62 mph), the ABS module requests the PCM to reduce engine torque while simultaneously applying and releasing the appropriate brake caliper(s) to maintain traction. The PCM accomplishes this by minor incremental timing changes and fewer fuel injector pulses until the ABS module ends the request. The request ends when the driven wheel speed returns to the desired speed. After the vehicle speed exceeds 100 km/h (62 mph), the traction control is accomplished only through the PCM torque control.

The stability assist system constantly monitors the vehicle motion relative to the driver's intended course. This is done by using sensors to compare the driver's steering input and brake application with that of the actual vehicle motion. The system does not activate when the vehicle is traveling in reverse; however, the ABS and stability assist continue to function as usual.

The stability assist control switch allows the driver to control use of the stability assist system. This is independent of the ABS function, which cannot be switched off by the driver. The stability assist system status is indicated by a stability assist warning lamp in the message center. When the stability assist system is switched off, this indicator will illuminate. The anti-lock brake function continues to work as designed unless the yellow ABS warning indicator is also illuminated. Normal braking function always occurs, unless the red brake warning indicator is illuminated.

When stability assist activates, any of the following can occur:

- A rumble or grinding sound much like ABS or traction control
- A small deceleration or a reduction in the acceleration of the vehicle
- The stability assist indicator flashes
- If the driver's foot is on the brake pedal, a vibration will be felt in the pedal much like ABS
- If the event is severe and the driver's foot is not on the brake, the brake pedal will move to apply higher brake forces. A whooshing sound can also be heard from under the instrument panel in an event this severe

Some drivers may notice a slight movement of the brake pedal when the system checks itself. The brake pedal moves when an active test of the brake booster is run. During this test a small amount of pressure is generated at the master cylinder, but no pressure is generated in the brake calipers.

Roll Stability Control (RSC)

The roll stability control (RSC) system monitors the roll-rate sensor and existing stability assist sensors and calculates if the vehicle may be approaching a situation where rollover is probable. If such a situation exists, the RSC system applies preemptive action. When activated, the RSC system adjusts the brake torque at specific wheels in response to direct measurement of the vehicle roll motion. By adjusting brake torque, the system can reduce the cornering forces and, therefore, the total roll moment acting on the vehicle. Systems with RSC have an additional roll-rate sensor located within the sensor cluster and additional programming within the ABS module to help control the vehicle during sudden maneuvers.

Information from the roll-rate sensor is fed into the ABS module. The computer uses information from the ABS wheel speed sensors, the throttle position sensor, the steering wheel angle, the steering wheel rate of change and a yaw rate sensor that measures the change in vehicle direction. If the computer determines from all these inputs that conditions exist for a potential roll over, the system applies one or more brakes and reduces engine torque to make the vehicle more stable.

Stability Control Sensor Cluster

The sensor cluster (also called the accelerometer) consists of the yaw rate sensor, roll rate sensor,

lateral accelerometer and longitudinal accelerometer. The lateral accelerometer measures the acceleration that corresponds to the force involved when the vehicle slides sideways. This acceleration has 2 forms. The first is the centrifugal acceleration that is generated when the vehicle travels around in a circle. The second is the acceleration due to gravity. On level ground there is no contribution from this acceleration. However, if the vehicle is parked sideways on a bank or incline, the sensor measures some lateral acceleration due to gravity, even though the vehicle is not moving.

The longitudinal accelerometer measures the acceleration corresponding to the force involved when the vehicle moves forward and rearward in the horizontal plane, along the centerline of the vehicle's front and rear wheels.

The yaw rate sensor measures the relative vehicle motion about the vertical axis through its center of gravity.

The roll rate sensor measures the rate of rotation along the front to rear horizontal axis.

Steering Position Sensor

The steering position sensor measures the rate of rotation of the steering wheel by monitoring the steering wheel rotation ring as it passes through the sensor gap. The steering position sensor uses 2 signal lines to transmit information to the ABS module about whether the steering wheel is being turned left or right and how far it is being turned. The steering position sensor does not indicate the position of the steering wheel relative to straight-ahead. The stability assist system learns this position by comparing the steering wheel position with other signals and storing the position it has learned. The stability assist system confirms this position and modifies it as necessary during every new driving cycle.

Active Brake Booster

The active brake booster functions like a conventional brake booster with the added feature that it can be actuated electrically by the ABS module. The electrical brake booster actuation is necessary in severe stability assist events and makes sure that the HCU can generate enough brake pressure to maintain vehicle stability. The brake assist from the brake booster is especially useful in cold weather when the HCU cannot draw the brake fluid from the reservoir quickly at cold temperatures.

A solenoid within the active brake booster has a release switch to indicate when the driver is stepping on the brake pedal. The solenoid provides electrical actuation of the brake booster. Without the force of the input rod, the air valve is directly opened due to the movement of the energized solenoid. With increasing current applied to the solenoid, the air valve opens and output force is created. With decreasing current applied to the solenoid, the air valve is closed and the vacuum valve opens, reducing output force. The release switch indicates when the brake pedal has been applied. It is integrated into the booster key that normally sits against the rear shell of the boot in its rest position, and it adjoins the valve body when in its balance position. The switch itself provides indication from 2 positions. In its rest position it supplies 2 signals, normally open and normally closed. Upon application of sufficient force to initiate movement of the key away from the valve body, the brake booster switch changes state, signifying a driver application.

When the ABS module is activating the brake booster, the brake pedal is pulled forward as the valve body moves. The release switch is held in position by the input rod spring and remains against the valve body. Although the stoplamp switch changes state when the brake pedal drops, the release switch remains inactive until it encounters an external force from the driver or a stability assist event controlled by the ABS module.

The brake pedal force switch sends a brake application input to the ABS module. This signal is called driver brake application. This signal only changes state when the driver has applied the brake. If the ignition switch is in the RUN position, the brake booster is not electrically actuated, and no failure has been detected, the driver brake application signal indicates a brake application when either the brake on/off position (BOO) switch or the release switch (built into the brake booster) indicates that the driver has applied the brake pedal. If the ignition switch is in the OFF position, the driver brake application signal indicates a brake apply only when the BOO switch indicates that the driver is applying the brake pedal.

When the ignition switch is in the OFF position, failures cannot be detected. If there are failures, several layers of redundancy attempt to keep the driver brake application signal accurate. Control of the stoplamp operation is also required because the BOO switch can change states during a stability assist event when the driver is not applying the brake pedal. The switch can also change states during the system check of the brake booster. Only the stability assist system can interpret these changed states and determine which are actually due to driver brake application. Similarly, the stability assist system can take advantage of its other sensors to detect BOO switch failures.

ABS Module Configuration

The ABS module must be configured when a new module is installed. Refer to Section 418-01 . If installing a new ABS module with stability assist, the calibration procedure, as well as the configuration procedure, must be carried out.

ABS Module Calibration

If a new ABS module is installed, it must be configured. The ABS module also needs to be calibrated whenever a component specific to the stability assist system is disconnected or a new component is installed. For information regarding the DTCs that require the recalibration procedure, refer to the ABS Calibration List in this section. If a DTC is logged for any component of the stability assist system, the DTC must be cleared before carrying out the recalibration procedure. The need to recalibrate the ABS module is also indicated by the active/fail lamp flashing. The lamp will flash after clearing the DTCs that are indicated on the ABS Calibration List. If a DTC is retrieved after recalibration, refer to the Anti-Lock Brake System (ABS) Module Diagnostic Trouble Code (DTC) Chart. If installing a new ABS module, the calibration procedures, as well as the configuration procedure, must be carried out. For information regarding the module configuration and calibration, follow the scan tool directions for the calibration procedure.

When carrying out the lateral or longitudinal accelerometer yaw or roll rate calibration using the scan tool, the vehicle must be on a level surface, must not be moving, and the ignition switch must be in the RUN position.

Inspection and Verification

NOTE: If a new ABS module is installed, it must be configured. Refer to Section 418-01 . If equipped with stability assist, the ABS module must also be calibrated. Follow the scan tool directions.

1. Verify the customer concern.
2. Verify the stoplamps operate correctly by applying and releasing the brake pedal with the ignition switch in the OFF position. If the stoplamps do not operate correctly, refer to Section 417-01 . If the stoplamps operate correctly, proceed to the next step.
3. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Base brake system
• Tire pressure
• Tire size or mismatched tires
• Hydraulic control unit (HCU)
• Wheel speed sensor ring
• Brake booster vacuum hose
• Suspension components
• Steering components
	• Battery junction box (BJB) fuse(s):
	  ▪ 6 (60A)
	  ▪ 9 (60A)
	  ▪ 77 (10A)
	• Circuitry
	• Brake on/off (BOO) switch
	• Steering position sensor
	• Brake booster solenoid

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

5. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

6. **NOTE:** The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

7. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

8. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record continuous memory diagnostic trouble codes (DTCs).

9. Clear the continuous DTCs and carry out the self-test diagnostics for the ABS module.

10. If the DTCs retrieved are related to the concern, go to the Anti-Lock Brake System (ABS) Module Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

11. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

NOTE: The need to recalibrate the module is indicated by the active/fail lamp flashing. There are other service actions that can require recalibration when there is no flashing lamp. The lamp will flash after clearing the DTCs that are indicated in the ABS Module Calibration List.

Anti-Lock Brake System (ABS) Module Diagnostic Trouble Code (DTC) Chart

DTC	Description	Source	Action
B1342	ECU is Faulted	Anti-Lock Brake System (ABS) Module	**NOTE:** If other DTCs are present, REPAIR them before installing a new component. CLEAR the DTCs. RETRIEVE the DTCs. If DTC B1342 is retrieved, INSTALL a new module. REFER to Anti-Lock Brake System (ABS) Module in this

			section. REPEAT the self-test.
B1483	Brake Pedal Input Circuit Failure	ABS Module	Go To Pinpoint Test A .
B1676	Battery Pack Voltage Out of Range	ABS Module	Go To Pinpoint Test B .
B2477	Module Configuration Failure	ABS Module	CONFIGURE the ABS module. REFER to Section 418-01 . CLEAR the DTCs. REPEAT the self-test. If DTC B2477 is retrieved again, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module . REPEAT the self-test.
B2741	Sensor Cluster Defective	ABS Module	FOLLOW the scan tool directions for the calibration procedure.
B2900	VIN Mismatch	ABS Module	VERIFY that the module has the correct as-built data. CHECK for correct powertrain control module (PCM) and ABS module configurations using the scan tool. RECONFIGURE the component as necessary. FOLLOW the scan tool directions for the ABS module configuration or REFER to Section 418-01 for the PCM. CLEAR the DTC. REPEAT the self-test.
C1095	ABS Hydraulic Pump Motor Circuit Failure	ABS Module	Go To Pinpoint Test C .

C1277	Steering Wheel Angle 1 and 2 Circuit Failure	ABS Module	Go To Pinpoint Test F .
C1278	Steering Wheel Angle 1 and 2 Signal Faulted	ABS Module	Go To Pinpoint Test F .
C1279	Yaw Rate Sensor Circuit Failure	ABS Module	**NOTE:** When correctly installed, the electrical connector will be on the LH side of the vehicle. VERIFY that the stability control sensor cluster (accelerometer) is correctly installed. If the sensor is not correctly installed, REINSTALL the sensor. If the sensor is correctly installed, Go To Pinpoint Test G .

C1280	Yaw Rate Sensor Signal Fault	ABS Module	**NOTE:** When correctly installed, the electrical connector will be on the LH side of the vehicle. VERIFY that the stability control sensor cluster (accelerometer) is correctly installed. If the sensor is not correctly installed, REINSTALL the sensor. If the sensor is correctly installed, Go To Pinpoint Test G .
C1281	Lateral Accelerometer Circuit Failure	ABS Module	**NOTE:** When correctly installed, the electrical connector will be on the LH side of the vehicle. VERIFY that the stability control sensor cluster (accelerometer) is correctly installed. If the sensor is not correctly installed, REINSTALL the sensor. If the sensor is correctly installed, Go To Pinpoint Test G .
C1282	Lateral Accelerometer Signal Fault	ABS Module	**NOTE:** When correctly installed, the electrical connector will be on the LH side of the vehicle. VERIFY that the stability control sensor cluster (accelerometer) is correctly installed. If the sensor is not correctly installed, REINSTALL the sensor. If the sensor is correctly installed, Go To Pinpoint Test G .
C1285	Booster Solenoid Circuit Failure	ABS Module	Go To Pinpoint Test H .
C1287	Booster Pedal Force Switch Circuit Failure	ABS Module	Go To Pinpoint Test I .
C1288	Pressure Sensor Main/Primary Input Circuit Failure	ABS Module	CLEAR the DTCs. REPEAT the self-test. If DTC C1287 is present, make sure all HCU and ABS module fasteners are tightened to their correct torque specification. If all fasteners are tightened to their correct torque specification, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section.
C1440	Pressure Sensor Main/Primary Signal Faulted	ABS Module	CLEAR the DTCs. REPEAT the self-test. If DTC C1287 is present, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section.
C1470	TCS Function Disabled (brake fluid temperature is above a pre-set limit)	ABS Module	ALLOW the brake fluid time to cool. CLEAR the DTC. TEST DRIVE the vehicle and verify ABS operation.
C1516	Roll Rate Sensor Signal Fault	ABS Module	**NOTE:** When correctly installed, the electrical connector will be on the LH side of the vehicle. VERIFY that the stability control sensor cluster (accelerometer) is correctly installed. If the sensor is not correctly installed, REINSTALL the sensor. If the sensor is correctly installed, Go To Pinpoint Test G .
C1517	Roll Rate Sensor Circuit Failure	ABS Module	**NOTE:** When correctly installed, the electrical connector will be on the LH side of the vehicle. VERIFY that the stability control sensor cluster (accelerometer) is correctly installed. If the sensor is not correctly installed, REINSTALL the sensor. If the sensor is correctly installed, Go To Pinpoint Test G .
C1805	Mismatched PCM and/or ABS-TC Module	ABS Module	CHECK for correct PCM and ABS module configuration using the scan tool. RECONFIGURE the component as necessary. FOLLOW the scan tool

			directions for the ABS module configuration or REFER to Section 303-01 for the PCM. CLEAR the DTC. REPEAT the self-test.
C1963	Stability Control Inhibit Warning	ABS Module	This DTC is for information only. GO to the Principles of Operation. CLEAR the DTC. REPEAT the self-test.
C1991	Module Calibration Failure	ABS Module	Follow the scan tool directions for the calibration procedure.
C1996	Active Yaw and/or Roll Control Disabled	ABS Module	This DTC can be set if the ABS module system is activated for 15 seconds of continuous operation. CHECK for any major chassis modifications, gross suspension misalignment or other items that can alter the vehicle tracking dynamics. CLEAR the DTC. REPEAT the self-test.
C2769 (ABS with stability assist)	Longitudinal Acceleration Sensor Electrical Failure (sensor cluster fault)	ABS Module	**NOTE:** When correctly installed, the electrical connector will be on the LH side of the vehicle. VERIFY that the stability control sensor cluster (accelerometer) is correctly installed. If the sensor is not correctly installed, REINSTALL the sensor. If the sensor is correctly installed, Go To Pinpoint Test G .
C2769 (standard ABS)	Longitudinal Acceleration Sensor Electrical Fault	ABS Module	INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTCs. REPEAT the self-test.
C2770 (ABS with stability assist)	Longitudinal Acceleration Sensor Plausibility Failure (sensor cluster fault)	ABS Module	**NOTE:** When correctly installed, the electrical connector will be on the LH side of the vehicle. VERIFY that the stability control sensor cluster (accelerometer) is correctly installed. If the sensor is not correctly installed, REINSTALL the sensor. If the sensor is correctly installed, Go To Pinpoint Test G .
C2770 (standard ABS)	Longitudinal Acceleration Sensor Plausibility Failure	ABS Module	INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTCs. REPEAT the self-test.
C2777	Sensor Cluster Bus Failure	ABS Module	Go To Pinpoint Test G .
C2778	Sensor Cluster Power Supply Failure	ABS Module	Go To Pinpoint Test G .
U0001	High Speed CAN Communication Bus	ABS Module	REFER to Section 418-00 to diagnose the high speed communication area network (HS-CAN) bus.
U0100	Lost Communication With ECM/PCM	ABS Module	REPAIR all other DTCs first. If DTC U0100 is still present REFER to Section 418-00 to diagnose the high speed communication area network (HS-CAN) bus.
U0101	Lost Communication with TCM	ABS Module	REPAIR all other DTCs first. If DTC U0101 is still present REFER to Section 418-00 to diagnose the HS-CAN bus.
U0114	Lost Communication With Four-Wheel Drive Clutch Control Module	ABS Module	REPAIR all other DTCs first. If DTC U0114 is still present REFER to Section 418-00 to diagnose the HS-CAN bus.
U0140	Lost Communication with Body Control Module	ABS Module	REPAIR all other DTCs first. If DTC U0140 is still present, REFER to Section 418-00 to diagnose the high speed communication area network (HS-CAN) bus.

U0155	Lost Communication With Instrument Cluster	ABS Module	REPAIR all other DTCs first. If DTC U0155 is still present REFER to Section 418-00 to diagnose the HS-CAN bus.
U0401	Invalid Data Received From ECM/PCM	ABS Module	If other DTCs are present along with U0401, REPAIR those DTCs first. If U0401 is the only DTC present, CARRY OUT the PCM self-test, RETRIEVE and RECORD any DTCs. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to diagnose the PCM.
U0402	Invalid Data Received From Transmission Control Module	ABS Module	If other DTCs are present along with U0402, REPAIR those DTCs first. If U0402 is the only DTC present, CARRY OUT the transmission control module self-test, RETRIEVE and RECORD any DTCs. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to diagnose the transmission control module.
U0414	Invalid Data Received From Four-Wheel Drive Clutch Control Module	ABS Module	If other DTCs are present along with U0414, REPAIR those DTCs first. If U0414 is the only DTC present, CARRY OUT the four-wheel drive clutch control module self-test, RETRIEVE and RECORD any DTCs. REFER to Section 308-07A to diagnose the four-wheel drive clutch control module.
U1901	CAN Network #2 Communication Bus Fault	ABS Module	Go To Pinpoint Test G .
U2050	No Application Present	ABS Module	CONFIGURE the ABS module. REFER to Section 418-01 . CLEAR the DTCs. RETRIEVE the DTCs and VERIFY successful module configuration. If DTC U2050 is retrieved again, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTC. REPEAT the self-test.
U2051	One or More Calibration Files Missing or Corrupt	ABS Module	CALIBRATE the ABS module, follow the directions on the scan tool. CLEAR the DTCs. CARRY OUT the ABS module self-test. RETRIEVE and RECORD any DTCs. If DTC U2051 is retrieved again, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTC. REPEAT the self-test.

Anti-Lock Brake System (ABS) Calibration List

NOTE: The need to calibrate the ABS module is indicated by the stability assist active/fail lamp flashing. The lamp flashes after the DTCs on the calibration list are cleared.

DTC	Description	Calibration
C1277	Steering Wheel Angle 1 and 2 Circuit Failure	YES
C1278	Steering Wheel Angle 1 and 2 Signal Fault	YES
C1279	Yaw Rate Sensor Circuit Failure	YES
C1280	Yaw Rate Sensor Signal Fault	YES
C1281	Lateral Accelerometer Circuit Failure	YES
C1282	Lateral Accelerometer Signal Fault	YES
C1285	Booster Solenoid Circuit Failure	YES

C1287	Booster Pedal Force Switch Circuit Failure	YES
C1288	Pressure Sensor Main/Primary Input Circuit Failure	YES
C1440	Pressure Sensor Main/Primary Signal Faulted	YES
C1516	Roll Rate Sensor Signal Fault	YES
C1517	Roll Rate Sensor Circuit Fault	YES
C1963	Stability Control Inhibit Warning	NO
C1991	Module Calibration Failure	YES
C1996	Active Yaw and/or Roll Control Disabled	YES
C2769	Longitudinal Acceleration Sensor Electrical Failure	YES
C2770	Longitudinal Acceleration Sensor Plausibility Fault	YES
C2777	Sensor Cluster Bus Failure	YES
C2778	Sensor Cluster Power Supply Failure	YES

Pinpoint Tests

Pinpoint Test A: DTC B1483 — Brake Pedal Input Circuit Failure

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

When the brake pedal is pressed, the stoplamp switch routes voltage through circuit CLS17 (YE/GN) to

the anti-lock brake system (ABS) module.

Possible Causes

- Circuit open
- ABS module

PINPOINT TEST A: DTC B1483 — BRAKE PEDAL INPUT CIRCUIT FAILURE

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
A1 CHECK THE STOPLAMP OPERATION	
• Press the brake pedal. • **Do the stoplamps operate correctly?**	**Yes** GO to A2 . **No** REFER to Section 417-01 .
A2 CHECK CIRCUIT CLS17 (YE/GN) FOR AN OPEN	
• Key in OFF position. • Disconnect: ABS Module C135. • Measure the voltage between ABS module C135-6, circuit CLS17 (YE/GN), harness side and ground, while pressing the brake pedal.  • **Is the voltage greater than 10 volts?**	**Yes** GO to A3 . **No** REPAIR circuit CLS17 (YE/GN). CLEAR the DTC. REPEAT the self-test.
A3 CHECK THE ABS MODULE CONNECTORS	

• Key in OFF position.
• Disconnect all the ABS connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect all the ABS connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test B: DTC B1676 — Battery Pack Voltage Out of Range

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The operating voltage required to operate the anti-lock brake system (ABS) module, hydraulic pump and isolation valves is in a range between 10 and 16 volts.

Fused battery voltage is supplied by battery junction box (BJB) fuse 6 (60A) along circuit SBB06 (BN/RD) and by BJB fuse 9 (60A) along circuit SBB09 (RD). Fused ignition voltage is supplied by BJB fuse 77 (10A) along circuit CBB77 (WH). Ground is provided along circuit GD120 (BK/GN).

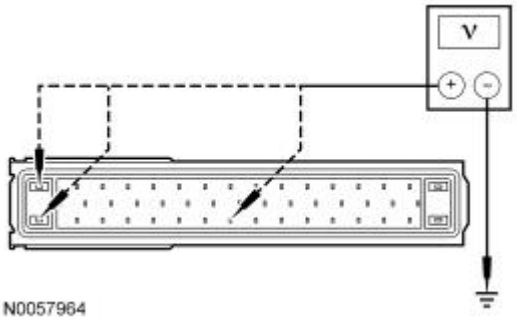
Possible Causes

- Fuse(s)
- Circuit open
- Charging system
- ABS module

PINPOINT TEST B: DTC B1676 — BATTERY PACK VOLTAGE OUT OF RANGE

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
B1 CHECK THE BATTERY VOLTAGE • Key in OFF position. • Measure the battery voltage between the positive and negative battery posts with the key ON engine OFF (KOEO), and with the engine running. • **Is the battery voltage between 10 and 13 volts with KOEO, and between 11 and 17 volts with the engine running?**	**Yes** GO to B2 . **No** REFER to Section 414-00 .

B2 CHECK THE VOLTAGE TO THE ABS MODULE
• Key in OFF position.
• Disconnect: ABS Module C135.
• Key in ON position.
• Measure the voltage between ground and:
  ▪ ABS module C135-1, circuit SBB09 (RD), harness side.
  ▪ ABS module C135-8, circuit CBB77 (WH), harness side.
  ▪ ABS module C135-32, circuit SBB06 (BN/RD), harness side.
  	


• **Is the voltage greater than 10 volts?**
	Yes
	GO to B3 .
	
	No
	VERIFY BJB fuses 6 (60A), 9 (60A) and 77 (10A) are OK. If OK, REPAIR the affected circuit(s). CLEAR the DTC. REPEAT the self-test.

B3 CHECK CIRCUIT A_GD120 (BK/GN) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between ABS module C135-16, circuit GD120 (BK/GN), harness side and ground.  N0057965 • **Is the resistances less than 5 ohms?**	**Yes** GO to B4 . **No** REPAIR circuit GD120 (BK/GN). CLEAR the DTC. REPEAT the self-test.
B4 CHECK THE ABS MODULE CONNECTORS	

• Disconnect all the ABS connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect all the ABS connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: DTC C1095 — ABS Hydraulic Pump Motor Circuit Failure

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The operating voltage required to operate the hydraulic pump is in a range between 10 and 16 volts.

Fused battery voltage is supplied by battery junction box (BJB) fuse 9 (60A) along circuit SBB09 (RD). Ground is provided along circuit GD120 (BK/GN).

Possible Causes

- Fuse
- Circuit open
- Hydraulic pump motor
- Anti-lock brake system (ABS) module

PINPOINT TEST C: DTC C1095 — ABS HYDRAULIC PUMP MOTOR CIRCUIT FAILURE

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
C1 CHECK THE ANTI-LOCK BRAKE SYSTEM (ABS) PUMP MOTOR	
• Key in ON position. • **Is the ABS pump motor running all the time?**	**Yes** GO to C5 . **No** GO to C2 .
C2 CHECK THE PUMP MOTOR OPERATION	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Using the scan tool, trigger the ABS module pump motor ON active command. • **Does the ABS pump motor run for approximately 2 seconds?**	**Yes** TRIGGER the ABS module pump motor OFF active command. CLEAR the DTCs. CHECK the yellow ABS warning indicator while driving the vehicle (the brakes must not be applied) above 20 km/h (12 mph). If the yellow ABS warning indicator illuminates, RETRIEVE the DTCs. If DTC C1095 is retrieved, GO to C5 . For all other DTCs, GO to the Anti-Lock Brake System (ABS) Module Diagnostic Trouble Code (DTC) Chart. **No** TRIGGER the ABS module pump motor OFF active command. GO to C3 .
C3 CHECK CIRCUIT SBB09 (RD) FOR AN OPEN	
• Key in OFF position. • Disconnect: ABS Module C135. • Measure the voltage between ABS module C135-1, circuit SBB09 (RD), harness side and ground.  N0057966 • **Is the voltage greater than 10 volts?**	**Yes** GO to C4 . **No** VERIFY the BJB fuse 9 (60A) is OK. If OK, REPAIR circuit SBB09 (RD). CLEAR the DTC. REPEAT the self-test.
C4 CHECK CIRCUIT GD120 (BK/GN) FOR AN OPEN	
• Measure the resistance between ABS module C135-16, circuit GD120 (BK/GN), harness side and ground.  N0057965	**Yes** GO to C5 . **No** REPAIR circuit GD120 (BK/GN). CLEAR the DTC. REPEAT the self-test.

• **Is the resistances less than 5 ohms?**	
C5 CHECK THE ABS MODULE CONNECTORS	

• Key in OFF position.
• Disconnect all the ABS connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect all the ABS connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: DTC C1145 (RF), DTC C1155 (LF), DTC C1165 (RR), DTC C1175 (LR) — Speed Wheel Sensor Input Circuit Failure

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The active wheel speed sensor generates a signal that is sent to the anti-lock brake system (ABS) module. The wheel speed sensor circuitry connects to the ABS module connector C135 through 2 wires and a connector at each wheel speed sensor. When the ignition switch is turned to the RUN position, the ABS module carries out a self-test by sending a reference voltage through the right front wheel speed sensor and the related circuitry to determine if it is functional.

Voltage is supplied to the active wheel speed sensors from the ABS module, ground is also supplied by the ABS module.

Possible Causes

- Wheel speed sensor(s)
- Circuit open
- Circuit shorted
- ABS module

PINPOINT TEST D: DTC C1145 (RF), DTC C1155 (LF), DTC C1165 (RR), DTC C1175 (LR) — SPEED WHEEL SENSOR INPUT CIRCUIT FAILURE

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

CAUTION: No measurements should be taken with the wheel speed sensor connected. Damage to the wheel speed sensor will result.

NOTE: Any time a wheel speed sensor is removed, thoroughly clean the mounting surfaces and apply a thin coating of grease.

Test Step	Result / Action to Take
D1 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR A SHORT TO VOLTAGE	

• Key in OFF position.
• Disconnect: ABS Module C135.
• Disconnect: Suspect Wheel Speed Sensor.
• Key in ON position.
• **For DTC C1145** , measure the voltage between:
  ▪ ABS module C135-34, circuit VCA05 (GY/VT), harness side and ground.
  ▪ ABS module C135-33, circuit RCA19 (VT), harness side and ground.
• **For DTC C1155** , measure the voltage between:
  ▪ ABS module C135-45, circuit VCA03 (VT/WH), harness side and ground.
  ▪ ABS module C135-46, circuit RCA17 (YE), harness side and ground.
• **For DTC C1165** , measure the voltage between:
  ▪ ABS module C135-43, circuit VCA06 (WH/OG), harness side and ground.
  ▪ ABS module C135-42, circuit RCA20 (BN), harness side and ground.
• **For DTC C1175** , measure the voltage between:
  ▪ ABS module C135-36, circuit VCA04 (BU/OG), harness side and ground.
  ▪ ABS module C135-37, circuit RCA18 (BN/GN), harness side and ground.
• **Is voltage present?**
	Yes
	REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
	
	No
	GO to D2 .

D2 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR A SHORT TO GROUND	

• Key in OFF position.
• **For DTC C1145** , measure the resistance between:
  ▪ ABS module C135-34, circuit VCA05 (GY/VT), harness side and ground.
  ▪ ABS module C135-33, circuit RCA19 (VT), harness side and ground.
• **For DTC C1155** , measure the resistance between:
  ▪ ABS module C135-45, circuit VCA03 (VT/WH), harness side and ground.
  ▪ ABS module C135-46, circuit RCA17 (YE), harness side and ground.
• **For DTC C1165** , measure the resistance between:
  ▪ ABS module C135-43, circuit VCA06 (WH/OG), harness side and ground.
  ▪ ABS module C135-42, circuit RCA20 (BN), harness side and ground.
• **For DTC C1175** , measure the resistance between:
  ▪ ABS module C135-36, circuit VCA04 (BU/OG), harness side and ground.
  ▪ ABS module C135-37, circuit RCA18 (BN/GN), harness side and ground.
• **Is the resistance greater than 10,000 ohms?**
	Yes
	GO to D3 .
	
	No
	REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

D3 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR AN OPEN	

• **For DTC C1145** , measure the resistance between:
  ▪ ABS module C135-34, circuit VCA05 (GY/VT), harness side and RF wheel speed sensor C160-2, circuit VCA05 (GY/VT), harness side.
  ▪ ABS module C135-33, circuit RCA19 (VT), harness side and RF wheel speed sensor C160-1, circuit RCA19 (VT), harness side.
• **For DTC C1155** , measure the resistance between:
  ▪ ABS module C135-45, circuit VCA03 (VT/WH), harness side and LF wheel speed sensor C150-2,
	Yes
	GO to D4 .
	
	No
	REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

circuit VCA03 (VT/WH), harness side. ▪ ABS module C135-46, circuit RCA17 (YE), harness side and LF wheel speed sensor C150-1, circuit RCA17 (YE), harness side. • **For DTC C1165** , measure the resistance between: ▪ ABS module C135-43, circuit VCA06 (WH/OG), harness side and RR wheel speed sensor C426-2, circuit VCA06 (WH/OG), harness side. ▪ ABS module C135-42, circuit RCA20 (BN), harness side and RR wheel speed sensor C426-1, circuit RCA20 (BN), harness side. • **For DTC C1175** , measure the resistance between: ▪ ABS module C135-36, circuit VCA04 (BU/OG), harness side and LR wheel speed sensor C440-2, circuit VCA04 (BU/OG), harness side. ▪ ABS module C135-37, circuit RCA18 (BN/GN), harness side and LR wheel speed sensor C440-1, circuit RCA18 (BN/GN), harness side. • **Is the resistance less than 5 ohms?**	
D4 CHECK FOR WHEEL SPEED SENSOR CIRCUITS SHORTED TOGETHER	
• **For DTC C1145** , measure the resistance between RF wheel speed sensor C160-2, circuit VCA05 (GY/VT), harness side and RF wheel speed sensor C160-1, circuit RCA19 (VT), harness side. • **For DTC C1155** , measure the resistance between LF wheel speed sensor C150-2, circuit VCA03 (VT/WH), harness side and LF wheel speed sensor C150-1, circuit RCA17 (YE), harness side. • **For DTC C1165** , measure the resistance between RR wheel speed sensor C426-2, circuit VCA06 (WH/OG), harness side and RR wheel speed sensor C426-1, circuit RCA20 (BN), harness side. • **For DTC C1175** , measure the resistance between LR wheel speed sensor C440-2, circuit VCA04 (BU/OG), harness side LR wheel speed sensor C440-1, circuit RCA18 (BN/GN), harness side. • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D5 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
D5 CHECK THE ABS MODULE OUTPUT	
NOTE: If the 2 wheel speed sensor circuits are shorted together, the anti-lock brake system (ABS) module will shut down those circuits and no voltage will be present at the connectors. If this happens, cycle the ignition key and take the measurement again, being careful not to short the 2 wheel speed sensor circuits together. • Connect: ABS Module C135. • Key in ON position. • **For DTC C1145** , measure the voltage between RF wheel speed sensor C160-2, circuit VCA05 (GY/VT), harness side and RF wheel speed sensor C160-1, circuit RCA19 (VT), harness side. • **For DTC C1155** , measure the voltage between LF wheel speed sensor C150-2, circuit VCA03 (VT/WH), harness side and LF wheel speed sensor C150-1, circuit RCA17 (YE), harness side. • **For DTC C1165** , measure the voltage between RR wheel speed sensor C426-2, circuit VCA06 (WH/OG), harness side and RR wheel speed sensor C426-1, circuit RCA20 (BN), harness side. • **For DTC C1175** , measure the voltage between LR wheel speed sensor C440-2, circuit VCA04 (BU/OG), harness	**Yes** INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor — Front or Wheel Speed Sensor — Rear in this section. CLEAR the DTC. REPEAT the self-test. **No** GO to D6 .

side LR wheel speed sensor C440-1, circuit RCA18 (BN/GN), harness side. • **Is the voltage greater than 10 volts?**	
D6 CHECK THE ABS MODULE CONNECTORS	

• Key in OFF position.
• Disconnect all the ABS connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect all the ABS connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: DTC C1233 (LF), DTC C1234 (RF), DTC C1235 (RR), DTC C1236 (LR) — Speed Wheel Input Signal Missing

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The wheel speed sensor and sensor ring generate a signal to the anti-lock brake system (ABS) module that is proportional to the wheel speed. The ABS module compares the wheel speed inputs from all wheel speed sensors to determine an impending wheel lockup.

Possible Causes

- Mismatched tire sizes
- Wheel speed sensor ring
- Wheel speed sensor
- ABS module

PINPOINT TEST E: DTC C1233 (LF), DTC C1234 (RF), DTC C1235 (RR), DTC C1236 (LR) — SPEED WHEEL INPUT SIGNAL MISSING

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

CAUTION: No measurements should be taken with the wheel speed sensor connected. Damage to the wheel speed sensor will result.

NOTE: Any time a wheel speed sensor is removed, thoroughly clean the mounting surfaces and apply a thin coating of grease.

Test Step	Result / Action to Take
E1 CHECK FOR ABS MODULE DIAGNOSTIC TROUBLE CODES (DTCs)	
• Key in ON position.	**Yes**

• Connect the diagnostic tool. • Enter the following diagnostic mode on the diagnostic tool: ABS Module Self-test. • Retrieve the ABS module DTCs. • **Is DTC C1145, C1155, C1165 or C1175 present?**	Go To Pinpoint Test D . **No** GO to E2 .
E2 MONITOR THE WHEEL SPEED SENSOR PIDS	
• Enter the following diagnostic mode on the diagnostic tool: ABS Module PIDs. • Monitor the wheel speed PIDs while driving the vehicle at a constant speed. • **Are the wheel speed PIDs consistent with the vehicle speed and each other?**	**Yes** CLEAR the DTCs. DRIVE the vehicle. RETRIEVE the DTCs. If DTC C1233, C1234, C1235 or C1236 is present, GO to E9 . For all other DTCs, GO to the Anti-Lock Brake System (ABS) Diagnostic Trouble Code (DTC) Chart. **No** GO to E3 .
E3 CHECK THE WHEEL SPEED SENSOR AND MOUNTING	
• With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • **CAUTION: Examine the wheel speed sensor wire carefully, using a good light source. Failure to verify damage in the wheel speed sensor wire can lead to unnecessary installation of a new component.** • Inspect the wheel speed sensor for looseness. • **Is the wheel speed sensor and mounting OK?**	**Yes** TIGHTEN the wheel speed sensor to specification, REFER to Specifications in this section. CLEAR the DTCs. GO to E4 . **No** GO to E5 .
E4 RECHECK THE WHEEL SPEED SENSOR PIDS	
• Enter the following diagnostic mode on the diagnostic tool: ABS Module PIDs. • Use the scan tool to monitor the ABS module wheel speed sensor PIDs while driving the vehicle at a constant speed. • **Are all the wheel speed sensor PID values similar?**	**Yes** The vehicle is OK. The concern may have been caused by a loose wheel speed sensor. **No** GO to E5 .
E5 CHECK THE WHEEL SPEED SENSOR FOR DAMAGE	
• Key in OFF position. • With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • **CAUTION: Examine the wheel speed sensor wire carefully with a good light source. Failure to verify damage in the wheel speed sensor wire can lead to unnecessary installation of a new component.** • Inspect the wheel speed sensor and attached wire harness for general damage. • **Is the wheel speed sensor and harness OK?**	**Yes** GO to E6 . **No** INSTALL a new wheel speed sensor. For the front wheel speed sensor, REFER to Wheel Speed Sensor — Front or Wheel Speed Sensor — Rear in this section. CLEAR the DTC. REPEAT the self-test.
E6 CHECK FOR WHEEL SPEED SENSOR RING DAMAGE	
• Remove the wheel speed sensor. Refer to Wheel Speed Sensor — Front or Wheel Speed Sensor — Rear in this section. • Inspect the wheel speed sensor ring for damaged or missing teeth. Rotate the wheel to verify that no	**Yes** GO to E7 . **No** INSTALL a new wheel hub and

teeth are missing. • **Is the wheel speed sensor ring OK?**	bearing assembly. Refer to the appropriate section in Group 204 for the procedure. CLEAR the DTCs. REPEAT the self-test.
E7 CHECK FOR WHEEL BEARING DAMAGE	
• Inspect the wheel bearings for damage. • **Are the wheel bearings OK?**	**Yes** GO to E8 . **No** INSTALL a new wheel hub and bearing assembly. Refer to the appropriate section in Group 204 for the procedure. CLEAR the DTCs. REPEAT the self-test.
E8 CHECK THE ABS MODULE OUTPUT	
NOTE: If the 2 wheel speed sensor circuits are shorted together, the anti-lock brake system (ABS) module will shut down those circuits and no voltage will be present at the connectors. If this happens, cycle the ignition key and take the measurement again, being careful not to short the 2 wheel speed sensor circuits together. • Disconnect: Suspect Wheel Speed Sensor. • Key in ON position. • **For DTC C1234** , measure the voltage between wheel speed sensor C160-2, circuit VCA05 (GY/VT), harness side and RF wheel speed sensor C160-1, circuit RCA19 (VT), harness side. • **For DTC C1233** , measure the voltage between wheel speed sensor C150-2, circuit VCA03 (VT/WH), harness side and LF wheel speed sensor C150-1, circuit RCA17 (YE), harness side. • **For DTC C1235** , measure the voltage between wheel speed sensor C426-2, circuit VCA06 (WH/OG), harness side and RR wheel speed sensor C426-1, circuit RCA20 (BN), harness side. • **For DTC C1236** , measure the voltage between wheel speed sensor C440-2, circuit VCA04 (BU/OG), harness side LR wheel speed sensor C440-1, circuit RCA18 (BN/GN), harness side. • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor — Front or Wheel Speed Sensor — Rear in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to E9 .
E9 CHECK THE ABS MODULE CONNECTORS	
• Key in OFF position. • Disconnect all the ABS connectors. • Check for: ▪ corrosion. ▪ pushed-out pins. ▪ spread terminals. • Connect all the ABS connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: DTC C1277 And C1278 — Steering Wheel Angle 1 and 2 Circuit Failure/Signal Faulted

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The steering position sensor monitors the steering wheel position when the toothed-wheel on the steering shaft passes through the magnetic field produced by the sensor.

The steering wheel position (in degrees) is sent to the anti-lock brake system (ABS) module along circuit VCS06 (GY/BN) and circuit VCS07 (VT/OG). Voltage is supplied by the ABS module along circuit CCS01 (VT/WH) and ground is provided by the ABS module along circuit RCS02 (BU/WH).

Possible Causes

- Circuit open
- Circuit shorted
- Steering position sensor
- ABS module

PINPOINT TEST F: DTC C1277 AND C1278 — STEERING WHEEL ANGLE 1 AND 2 CIRCUIT FAILURE/SIGNAL FAULTED

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
F1 MONITOR THE STEERING POSITION SENSOR PIDs	
• Connect the diagnostic tool. • Key in ON position. • Using the scan tool, monitor the ABS module steering wheel rotation sensor PIDs while rotating the steering wheel clockwise and counter-clockwise very slowly, from lock to lock. • **Do the PIDs change in intervals of 4.5 degrees?**	**Yes** CLEAR the DTCs. DRIVE the vehicle. RETRIEVE the DTCs. If DTC C1277 or C1279 are present, GO to F9 . For all other DTCs, GO to the Anti-Lock Brake System (ABS) Diagnostic Trouble Code (DTC) Chart. **No** GO to F2 .
F2 CHECK CIRCUIT CCS01 (VT/WH) FOR AN OPEN	
• Key in OFF position. • Disconnect: Steering Wheel Rotation Sensor C226. • Key in ON position. • Measure the voltage between steering wheel rotation sensor C226-4, circuit CCS01 (VT/WH), harness side and ground.  N0057967 • **Is the voltage greater than 10 volts?**	**Yes** GO to F3 . **No** REPAIR circuit CCS01 (VT/WH). CLEAR the DTCs. REPEAT the self-test.

F3 CHECK CIRCUIT RSC02 (BU/WH) FOR AN OPEN	
• Measure the voltage between steering wheel rotation sensor C226-4, circuit CCS01 (VT/WH), harness side and steering wheel rotation sensor C226-1, circuit RSC02 (BU/WH) harness side.  N0043016 • **Is the voltage greater than 9.5 volts?**	**Yes** GO to F4 . **No** REPAIR circuit RSC02 (BU/WH). CLEAR the DTCs. REPEAT the self-test.
F4 CHECK CIRCUIT VSC06 (GY/BN) FOR AN OPEN	
• Measure the voltage between steering wheel rotation sensor C226-2, circuit VSC06 (GY/BN), harness side and steering wheel rotation sensor C226-1, circuit RSC02 (BU/WH) harness side.  N0043017 • **Is the voltage between 4.75 volts and 5.25 volts?**	**Yes** GO to F5 . **No** REPAIR circuit VSC06 (GY/BN). CLEAR the DTCs. REPEAT the self-test.
F5 CHECK CIRCUIT VSC07 (VT/OG) FOR AN OPEN	
• Measure the voltage between steering wheel rotation sensor C226-3, circuit VSC07 (VT/OG), harness side and steering wheel rotation sensor C226-1, circuit RSC02 (BU/WH) harness side.  N0043018 • **Is the voltage between 4.75 volts and 5.25 volts?**	**Yes** GO to F6 . **No** REPAIR circuit VSC07 (VT/OG). CLEAR the DTCs. REPEAT the self-test.
F6 CHECK THE STEERING POSITION SENSOR CIRCUITS FOR AN OPEN	
• Key in OFF position. • Disconnect: ABS Module C135. • Measure the resistance between: ▪ ABS module C135-9, circuit VCS07 (VT/OG),	**Yes** GO to F7 . **No**

harness side and steering wheel rotation sensor C226-3, circuit VCS07 (VT/OG), harness side. ■ ABS module C135-40, circuit RCS02 (BU/WH), harness side and steering wheel rotation sensor C226-1, circuit RCS02 (BU/WH), harness side. ■ ABS module C135-41, circuit VCS06 (GY/BN), harness side and steering wheel rotation sensor C226-2, circuit VCS06 (GY/BN), harness side.  N0057968 ● **Is the resistance less than 5 ohms?**	REPAIR the affected circuit(s). CLEAR the DTCs. RECALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. REPEAT the self-test.
F7 CHECK THE STEERING POSITION SENSOR CIRCUITS FOR A SHORT TO VOLTAGE	
● Key in ON position. ● Measure the voltage between: ■ ABS module C135-9, circuit VCS07 (VT/OG), harness side and ground. ■ ABS module C135-40, circuit RCS02 (BU/WH), harness side and ground. ■ ABS module C135-41, circuit VCS06 (GY/BN), harness side and ground. ■ ABS module C135-5, circuit CCS01 (VT/WH), harness side and ground.  N0060348 ● **Is voltage present?**	**Yes** REPAIR the affected circuit(s). CLEAR the DTCs. RECALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. REPEAT the self-test. **No** GO to F8 .
F8 CHECK THE STEERING POSITION SENSOR CIRCUITS FOR A SHORT TO GROUND	
● Key in OFF position. ● Measure the resistance between: ■ ABS module C135-9, circuit VCS07 (VT/OG), harness side and ground. ■ ABS module C135-40, circuit RCS02 (BU/WH), harness side and ground. ■ ABS module C135-41, circuit VCS06 (GY/BN), harness side and ground. ■ ABS module C135-5, circuit CCS01 (VT/WH), harness side and ground.	**Yes** INSTALL a new steering wheel rotation sensor. REFER to Steering Wheel Rotation Sensor in this section. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the affected circuit(s). CLEAR the DTCs. RECALIBRATE the ABS

 • **Are the resistances greater than 10,000 ohms?**	module. FOLLOW the scan tool directions for the calibration procedure. REPEAT the self-test.
F9 CHECK FOR CORRECT ABS MODULE OPERATION	

• Disconnect the ABS connector.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect the ABS connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTCs. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: DTC C1279, C1280, C1281, C1282, C1516, C1517, C2769, C2770, C2777, C2778 and U1901 — Sensor Cluster Fault and CAN #2 Bus Network Fault

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The yaw rate sensor, roll rate sensor, lateral accelerometer and longitudinal accelerometer are contained in one assembly called the sensor cluster. The sensor cluster measures the vehicle acceleration, roll rate and yaw rate, then sends the information to the anti-lock brake system (ABS) module along the communication area network 2 (CAN2) bus.

Voltage is supplied by the ABS module along circuit CCA09 (VT/BN), ground is provided by the ABS module along circuit RCA09 (GN/VT) and the sensor information is transmitted to the ABS module along circuits VCA23 (BU/WH) and circuit VCA24 (GN/OG).

Possible Causes

- Circuit open
- Circuit shorted
- Sensor cluster incorrectly mounted
- Sensor cluster internal fault
- ABS module

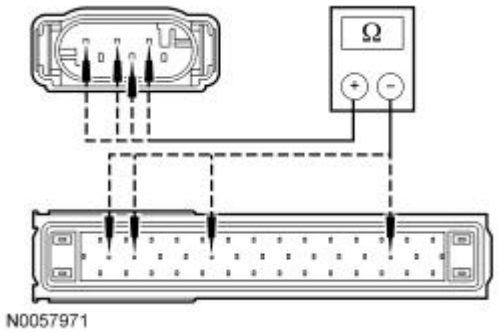
PINPOINT TEST G: DTC C1279, C1280, C1281, C1282, C1516, C1517, C2769, C2770, C2777, C2778 AND U1901— SENSOR CLUSTER FAULT AND CAN #2 BUS NETWORK FAULT

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

NOTE: The vehicle must be on level ground, not on a hoist and at a complete standstill when calibrating the sensor cluster and reading PIDs. Any vehicle movement will result in false values for this test.

Test Step	Result / Action to Take
G1 CHECK FOR DTCs FROM THE SELF-TEST	
• Connect the diagnostic tool. • Key in ON position. • Using the scan tool, carry out the ABS module self-test. • Retrieve and record any DTCs. • **Are any DTCs retrieved?**	**Yes** GO to G2 . **No** The system is operating correctly. The condition may have been caused by an incomplete or inaccurate calibration.
G2 CHECK THE VOLTAGE FROM THE ABS MODULE	
• Connect: ABS Module C135. • Key in ON position. • Measure the voltage between sensor cluster C3073-3, circuit CCA09 (VT/BN), harness side and sensor cluster C3073-5, circuit RCA09 (GN/VT), harness side.  N0057973 • **Is the voltage greater than 10 volts?**	**Yes** GO to G3 . **No** GO to G7 .
G3 CHECK THE ABS MODULE YAW RATE PID	
• Key in OFF position. • Connect: Sensor Cluster C3073. • Key in ON position. • **NOTE:** The vehicle must be on level ground and at a complete standstill. Any vehicle movement will result in false values for this test. • Monitor the ABS module yaw rate PID. • **Is the ABS module yaw rate PID value between -0.05 and 0.05?**	**Yes** GO to G4 . **No** INSTALL a new sensor cluster. REFER to Stability Control Sensor Cluster in this section. CLEAR DTCs. REPEAT the self-test.
G4 CHECK THE ABS MODULE LATERAL ACCELERATION PID	
• Enter the following diagnostic mode on the diagnostic tool: ABS Module PID. • **NOTE:** The vehicle must be on level ground and at a complete standstill. Any vehicle movement will result in false values for this test. • Monitor the ABS module lateral acceleration PID. • **Is the ABS module lateral acceleration PID value between -0.007 and 0.007?**	**Yes** GO to G5 . **No** INSTALL a new sensor cluster. REFER to Stability Control Sensor Cluster in this section. CLEAR the DTCs. REPEAT the self-test.

G5 CHECK THE ABS MODULE LONGITUDINAL ACCELERATION PID	
• Enter the following diagnostic mode on the diagnostic tool: ABS Module PID. • **NOTE:** The vehicle must be on level ground and at a complete standstill. Any vehicle movement will result in false values for this test. • Monitor the ABS module longitudinal acceleration PID. • **Is the ABS module longitudinal acceleration PID value between -0.004 and 0.004?**	**Yes** GO to G6 . **No** INSTALL a new sensor cluster. REFER to Stability Control Sensor Cluster in this section. CLEAR the DTCs. REPEAT the self-test.
G6 CHECK THE ABS MODULE ROLL RATE PID	
• Enter the following diagnostic mode on the diagnostic tool: ABS Module PID. • **NOTE:** The vehicle must be on level ground and at a complete standstill. Any vehicle movement will result in false values for this test. • Monitor the ABS module roll rate PID. • **Is the ABS module roll rate PID value between -0.05 and 0.05?**	**Yes** GO to G7 . **No** INSTALL a new sensor cluster. REFER to Stability Control Sensor Cluster in this section. CLEAR the DTCs. REPEAT the self-test.
G7 CHECK THE SENSOR CLUSTER CIRCUITS FOR AN OPEN	

• Key in OFF position.
• Disconnect: Sensor Cluster C3073.
• Disconnect: ABS Module C135.
• Measure the resistance between:
  ▪ ABS module C135-18, circuit VCA23 (BU/WH), harness side and sensor cluster C3073-2, circuit VCA23 (BU/WH), harness side.
  ▪ ABS module C135-19, circuit VCA24 (GN/OG), harness side and sensor cluster C3073-1, circuit VCA24 (GN/OG), harness side.
  ▪ ABS module C135-22, circuit CCA09 (VT/BN), harness side and sensor cluster C3073-3, circuit CCA09 (VT/BN), harness side.
  ▪ ABS module C135-29, circuit RCA09 (GN/VT), harness side and sensor cluster C3073-5, circuit RCA09 (GN/VT), harness side.
  	


N0057971
• **Is the resistances less than 5 ohms?**
	Yes
	GO to G8 .
	
	No
	REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

G8 CHECK THE SENSOR CLUSTER CIRCUITS FOR A SHORT TO VOLTAGE	

• Key in ON position.
• Measure the voltage between ground and:
  ▪ sensor cluster C3073-1, circuit VCA24 (GN/OG), harness side.
  ▪ sensor cluster C3073-2, circuit VCA23 (BU/WH),
	Yes
	REPAIR the affected circuit(s). CLEAR the DTCs. RECALIBRATE the ABS module. FOLLOW the scan tool

harness side. ■ sensor cluster C3073-3, circuit CCA09 (VT/BN), harness side. ■ sensor cluster C3073-5, circuit RCA09 (GN/VT), harness side.  N0057972 • **Is voltage present?**	directions for the calibration procedure. REPEAT the self-test. **No** GO to G9 .
G9 CHECK THE SENSOR CLUSTER CIRCUITS FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between ground and: ■ sensor cluster C3073-1, circuit VCA24 (GN/OG), harness side. ■ sensor cluster C3073-2, circuit VCA23 (BU/WH), harness side. ■ sensor cluster C3073-3, circuit CCA09 (VT/BN), harness side. ■ sensor cluster C3073-5, circuit RCA09 (GN/VT), harness side.  A0091341 • **Is the greater less than 10,000 ohms?**	**Yes** GO to G10 . **No** REPAIR the affected circuit(s). CLEAR the DTC. REPEAT the self-test.
G10 CHECK THE ABS MODULE CONNECTORS	
• Key in OFF position. • Disconnect all the ABS connectors. • Check for: ■ corrosion. ■ pushed-out pins. ■ spread terminals. • Connect all the ABS connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test H: DTC C1285 — Booster Solenoid Circuit Failure

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The active brake booster has internal solenoids that assist driver brake applications or can apply the brakes when needed if the driver loses control.

Voltage is supplied to the solenoid by the anti-lock brake system (ABS) module along circuit CCA22 (GY/YE) and ground is provided by the ABS module along circuit VCA22 (GN/BN).

Possible Causes

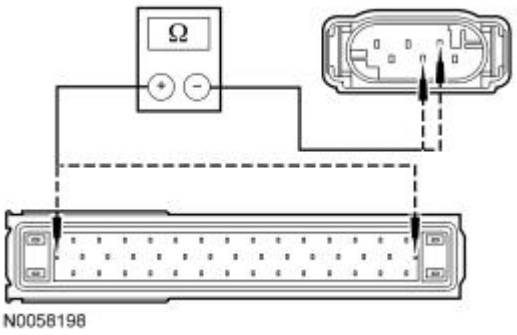
- Circuit open
- Circuit shorted
- Active brake booster
- ABS module

PINPOINT TEST H: DTC C1285 — BOOSTER SOLENOID CIRCUIT FAILURE

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

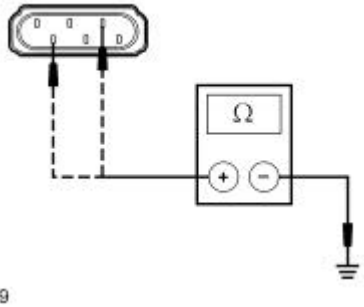
Test Step	Result / Action to Take
H1 CHECK FOR DTCs FROM THE SELF-TEST	
• Key in ON position. • Connect the diagnostic tool. • Enter the following diagnostic mode on the diagnostic tool: Clear the diagnostic trouble codes (DTCs). • Carry out the ABS module self-test using the scan tool. • Enter the following diagnostic mode on the diagnostic tool: Retrieve DTCs. • **Are any DTCs retrieved?**	**Yes** If DTC C1285 is retrieved or the brake booster portion of the recalibration procedure indicates a failure, GO to H2 . If any other DTC is retrieved, GO to the Anti-Lock Brake System (ABS) Module Diagnostic Trouble Code (DTC) Chart. **No** The system is operating correctly.
H2 CHECK THE BRAKE BOOSTER SOLENOID	
• Key in OFF position. • Disconnect: Active Brake Booster C149. • Measure the resistance between active brake booster C149 pin 3 and pin 4, component side.  A0083461	**Yes** GO to H3 . **No** INSTALL a new active brake booster. REFER to Section 206-07 . CLEAR the DTCs. REPEAT the self-test.

• **Is the resistance between 1 and 2 ohms?**	
H3 CHECK CIRCUITS CCA22 (GY/YE) AND VCA22 (GN/BN) FOR AN OPEN	

• Disconnect: ABS Module C135.
• Measure the resistance between:
  ■ ABS module C135-17, circuit CCA22 (GY/YE), harness side and active brake booster C149-3, circuit CCA22 (GY/YE), harness side
  ■ ABS module C135-31, circuit VCA22 (GN/BN), harness side and active brake booster C149-4, circuit VCA22 (GN/BN), harness side.
  	


N0058198
• **Is the resistance less than 5 ohms?**
	Yes
	GO to H4 .
	
	No
	REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

H4 CHECK CIRCUITS CCA22 (GY/YE) AND VCA22 (GN/BN) FOR A SHORT TO GROUND	

• Measure the resistance between ground and:
  ■ active brake booster C149-3, circuit CCA22 (GY/YE), harness side
  ■ active brake booster C149-4, circuit VCA22 (GN/BN) harness side.
  	


A0084049
• **Is the resistance greater than 10,000 ohms?**
	Yes
	GO to H5 .
	
	No
	REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

H5 CHECK CIRCUITS CCA22 (GY/YE) AND VCA22 (GN/BN) FOR A SHORT TO VOLTAGE	

• Key in ON position.
• Measure the voltage between ground and:
  ■ active brake booster C149-3, circuit CCA22 (GY/YE), harness side
  ■ active brake booster C149-4, circuit VCA22 (GN/BN) harness side.
	Yes
	REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
	
	No
	GO to H6 .

 A0084050 • **Is voltage present?**	
H6 CHECK THE ACTIVE BRAKE BOOSTER SOLENOID FOR CORRECT OPERATION	
• Key in OFF position. • Connect: Active Brake Booster C149. • Connect: ABS Module C135. • Start the engine and wait approximately one minute to create vacuum in the brake booster then stop the engine. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: ABS Module Active Command. • While observing the brake pedal for movement, trigger the booster solenoid ON active command. • **Does the brake pedal move?**	**Yes** GO to H7 . **No** INSTALL a new active brake booster. REFER to Section 206-07 . CLEAR the DTCs. RECALIBRATE the ABS module. REPEAT the self-test.
H7 CHECK THE ABS MODULE CONNECTORS	

• Key in OFF position.
• Disconnect all the ABS connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect all the ABS connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test I: DTC C1287 — Brake Booster Pedal Force Switch Circuit Failure

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The active brake booster contains a normally open and a normally closed pedal force switch that operates according to driver brake applications.

The anti-lock brake system (ABS) module provides a reference voltage to the pedal force switch along circuit CCA29 (GN/BU). The voltage returns along either the normally open pedal force circuit CCA26 (BU/GY) or the normally closed pedal force circuit CCA25 (VT/GY), depending on the driver brake application.

Possible Causes

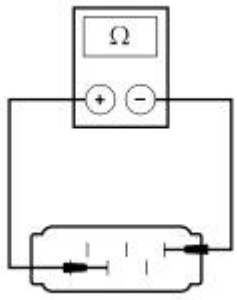
- Circuit open
- Circuit shorted
- Active brake booster

- ABS module

PINPOINT TEST I: DTC C1287 — BRAKE BOOSTER PEDAL FORCE SWITCH CIRCUIT FAILURE

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

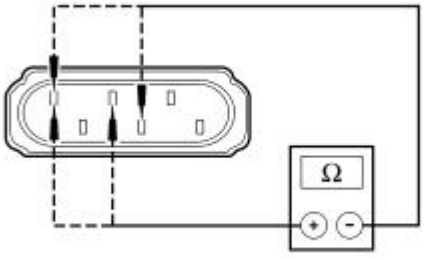
Test Step	Result / Action to Take
I1 CHECK FOR DTCs FROM THE SELF-TEST	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Clear the diagnostic trouble codes (DTCs). • Carry out the ABS module self-test using the scan tool. • Enter the following diagnostic mode on the diagnostic tool: Retrieve DTCs. • **Are any DTCs retrieved?**	**Yes** If DTC C1287 is retrieved, GO to I2 . If any other DTC is retrieved, GO to the Anti-Lock Brake System (ABS) Module Diagnostic Trouble Code (DTC) Chart. **No** The system is operating correctly.
I2 CHECK THE NORMALLY CLOSED RELEASE SWITCH	
• Key in OFF position. • Disconnect: Active Brake Booster C149. • Measure the resistance between active brake booster C149 pin 2 and pin 5, component side, while pressing and releasing the brake pedal.  A0083463 • **Is the resistance less than 5 ohms with the brake pedal released and greater than 10,000 ohms with the brake pedal applied?**	**Yes** GO to I3 . **No** INSTALL a new active brake booster. REFER to Section 206-07 . CLEAR the DTCs. REPEAT the self-test.
I3 CHECK THE NORMALLY OPEN RELEASE SWITCH	
• Measure the resistance between active brake booster C149 pin 1 and pin 5, component side, while pressing and releasing the brake pedal.	**Yes** GO to I4 . **No** INSTALL a new active brake booster. REFER to Section 206-07 . CLEAR the DTCs. REPEAT the self-test.



A0083464

- **Is the resistance greater than 10,000 ohms with the brake pedal released and less than 5 ohms with the brake pedal applied?**

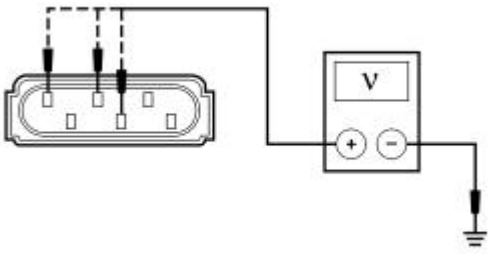
I4 CHECK THE ACTIVE BRAKE BOOSTER CIRCUITS FOR A SHORT TOGETHER	

• Disconnect: ABS Module C135.
• Measure the resistance between:
  ▪ active brake booster C149-1, circuit CCA26 (BU/GY), harness side and active brake booster C149-2, circuit CCA25 (VT/GY), harness side.
  ▪ active brake booster C149-2, circuit CCA25 (VT/GY), harness side and active brake booster C149-5, circuit CCA29 (GN/BU), harness side.
  ▪ active brake booster C149-1, circuit CCA26 (BU/GY), harness side, and active brake booster C149-5, circuit CCA29 (GN/BU), harness side.
  	


N0028814
• **Are the resistances greater than 10,000 ohms?**
	Yes
	GO to I5 .
	
	No
	REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

I5 CHECK THE ACTIVE BRAKE BOOSTER CIRCUITS FOR A SHORT TO VOLTAGE	

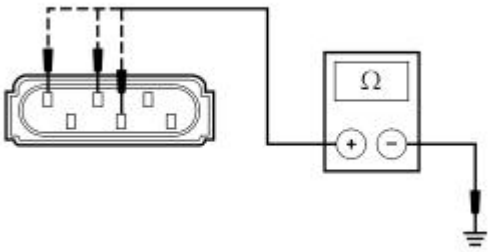
• Key in ON position.
• Measure the voltage between ground and:
  ▪ active brake booster C149-1, circuit CCA26 (BU/GY), harness side.
  ▪ active brake booster C149-2, circuit CCA25 (VT/GY), harness side.
  ▪ active brake booster C149-5, circuit CCA29 (GN/BU), harness side.
	Yes
	REPAIR the affected circuit(s). CLEAR the DTCs. RECALIBRATE the ABS module. REPEAT the self-test.
	
	No
	GO to I6 .



A0083551

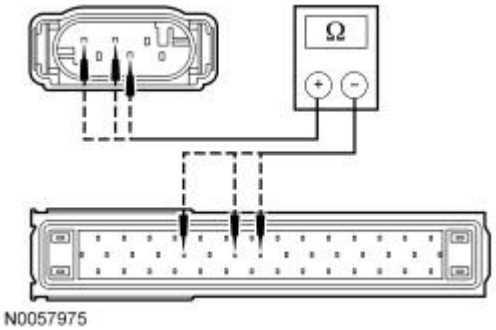
- **Is voltage present?**

I6 CHECK THE ACTIVE BRAKE BOOSTER CIRCUITS FOR SHORTS TO GROUND	

• Key in OFF position.
• Measure the resistance between ground and:
  ▪ active brake booster C149-1, circuit CCA26 (BU/GY), harness side.
  ▪ active brake booster C149-2, circuit CCA25 (VT/GY), harness side.
  ▪ active brake booster C149-5, circuit CCA29 (GN/BU), harness side.
 	
  	


A0083552
• **Are the resistances greater than 10,000 ohms?**
	Yes
	GO to I7 .
	
	No
	REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

I7 CHECK THE BRAKE BOOSTER CIRCUITS FOR AN OPEN	

• Measure the resistance between:
  ▪ active brake booster C149-1, circuit CCA26 (BU/GY), harness side and ABS module C135-23, circuit CCA26 (BU/GY), harness side.
  ▪ active brake booster C149-2, circuit CCA25 (VT/GY), harness side and ABS module C135-24, circuit CCA25 (VT/GY), harness side.
  ▪ active brake booster C149-5, circuit CCA29 (GN/BU), harness side and ABS module C135-21, circuit CCA29 (GN/BU), harness side.
 	
  	


N0057975
	Yes
	GO to I8 .
	
	No
	REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

• **Is the resistance less than 5 ohms?**	
I8 CHECK THE ABS MODULE CONNECTORS	

• Key in OFF position.
• Disconnect all the ABS connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect all the ABS connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test J: The Stability Assist System Cannot be Disabled

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

Engine torque modulation is achieved by regulating fuel and spark to the cylinders. The stability assist system operates using the anti-lock brake system (ABS) module to interact with the powertrain control module (PCM) to reduce engine torque if one or both rear wheels lose traction and begin to spin during acceleration.

The stability/traction control switch is a momentary contact switch and is part of the liftgate release and hazard switch assembly. When the switch is pressed, ABS module circuit CCA15 (YE/GY) is momentarily grounded through the switch along circuit GD138 (BK/WH). The ABS module then sends information to the PCM along the high speed communication area network (HS-CAN) to modulate the engine torque.

Possible Causes

- Circuit open
- Stability/traction control switch
- ABS module

PINPOINT TEST J: THE STABILITY ASSIST SYSTEM CANNOT BE DISABLED

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
J1 CHECK THE STABILITY/TRACTION CONTROL SWITCH PID	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: ABS Module PID. • **NOTE:** Press and hold the switch for at least one	**Yes** REFER to Section 418-00 to diagnose the HS-CAN bus. TEST the system for normal operation. **No** GO to J2 .

second. • Monitor the ABS module traction control push button input status PID while pressing and releasing the stability/traction control switch. • **Does the switch position match the PID?**	
J2 CHECK CIRCUIT CCA15 (YE/GY) FOR AN OPEN	
• Key in OFF position. • Disconnect: Stability Assist Switch C2361. • Disconnect: ABS Module C135. • Measure the resistance between ABS module C135-4, circuit CCA15 (YE/GY), harness side and stability assist switch C2361-2, circuit CCA15 (YE/GY), harness side.  N0057976 • **Is the resistance less than 5 ohms?**	**Yes** GO to J3 . **No** REPAIR circuit CCA15 (YE/GY). TEST the system for normal operation.
J3 CHECK CIRCUIT GD138 (BK/WH) FOR AN OPEN	
• Measure the resistance between stability assist switch C2361-4, circuit GD138 (BK/WH), harness side and ground.  N0057977 • **Is the resistance less than 5 ohms?**	**Yes** GO to J4 . **No** REPAIR circuit GD138 (BK/WH). TEST the system for normal operation.
J4 CHECK THE STABILITY ASSIST SWITCH FOR AN OPEN	
• Measure the resistance between stability assist switch C2361 pin 2 and pin 4, component side while pressing and releasing the switch. • **Is the resistance greater than 10,000 ohms with the switch released and less than 5 ohms with the switch pressed?**	**Yes** GO to J5 . **No** INSTALL a new stability assist switch, REFER to Stability/Traction Control Switch — Expedition or Stability/Traction Control Switch — Navigator in this section. TEST the system for normal operation.
J5 CHECK THE ABS MODULE CONNECTORS	
• Key in OFF position. • Disconnect all the ABS connectors. • Check for:	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this

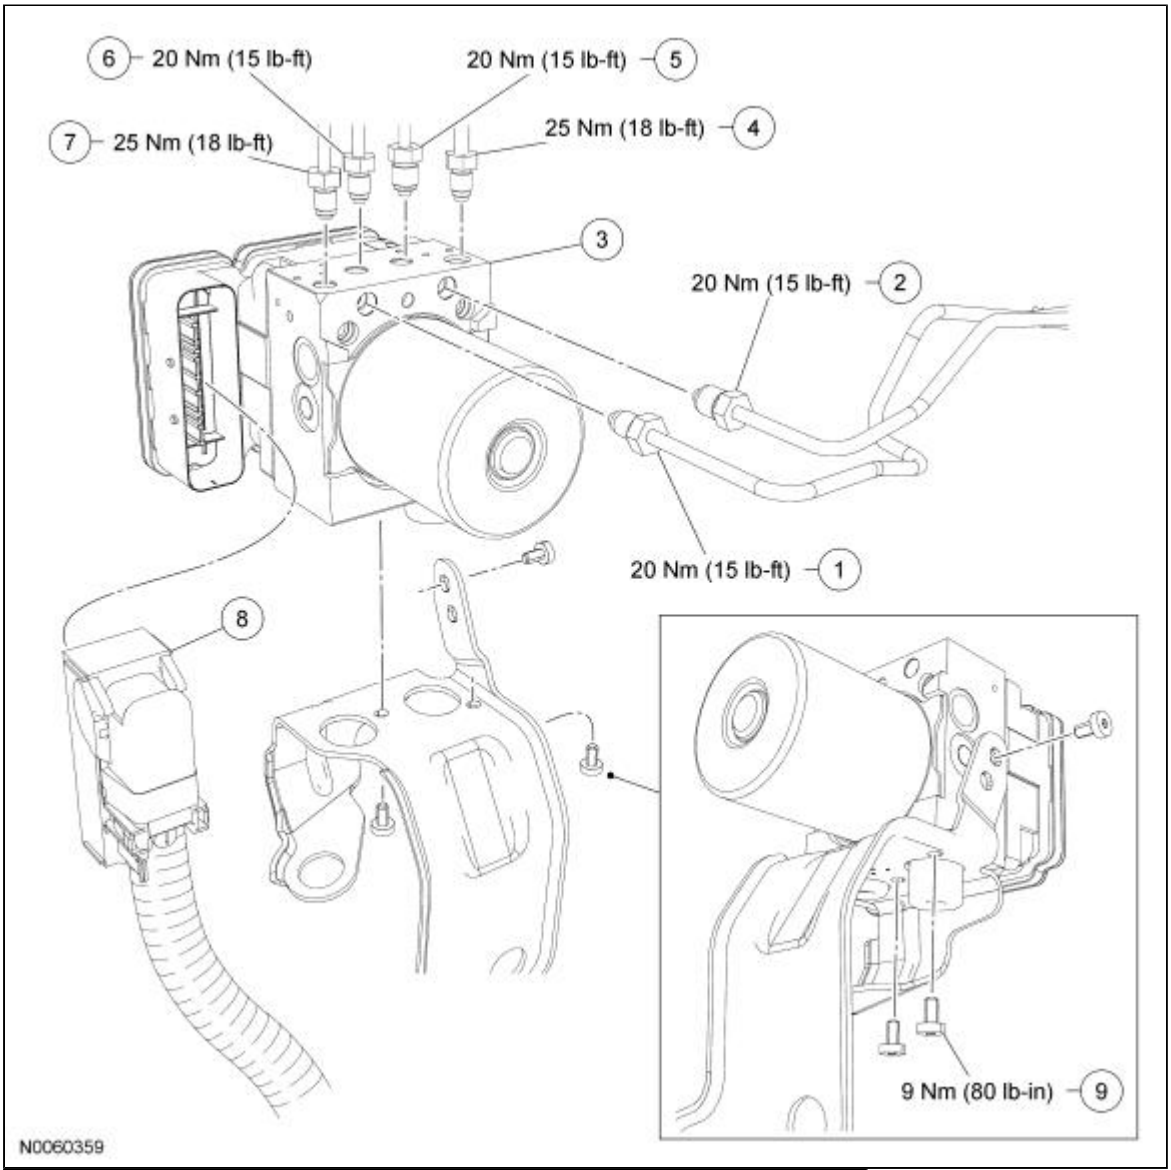
■ corrosion. ■ pushed-out pins. ■ spread terminals. ● Connect all the ABS connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Hydraulic Control Unit (HCU)

Printable View (214 KB)

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A



Item	Part Number	Description
1	2B523	Rear combination valve brake tube
2	2264	LH front brake tube
3	2C405	Hydraulic control unit (HCU)

4	2A040	Master cylinder secondary brake tube
5	2263	RH front brake tube
6	2B523	Rear combination valve brake tube
7	2B253	Master cylinder primary brake tube
8	—	Anti-lock brake system (ABS) module electrical connector (part of 14A464)
9	2C346	HCU-to-bracket bolt (3 required)

Removal and Installation

WARNING: Use of any other than approved DOT 3 motor vehicle brake fluid will cause permanent damage to brake components and will render the brakes inoperative. Failure to follow these instructions may result in personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. **CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.**

   Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

2. Disconnect the anti-lock brake system (ABS) module electrical connector.

3. **CAUTION: Only authorized inlet hydraulic brake tubes should be used. These tubes are of specific design and only authorized parts should be used when installing new inlet brake tubes.**

   NOTE: Plug each open port to prevent brake fluid from spilling.

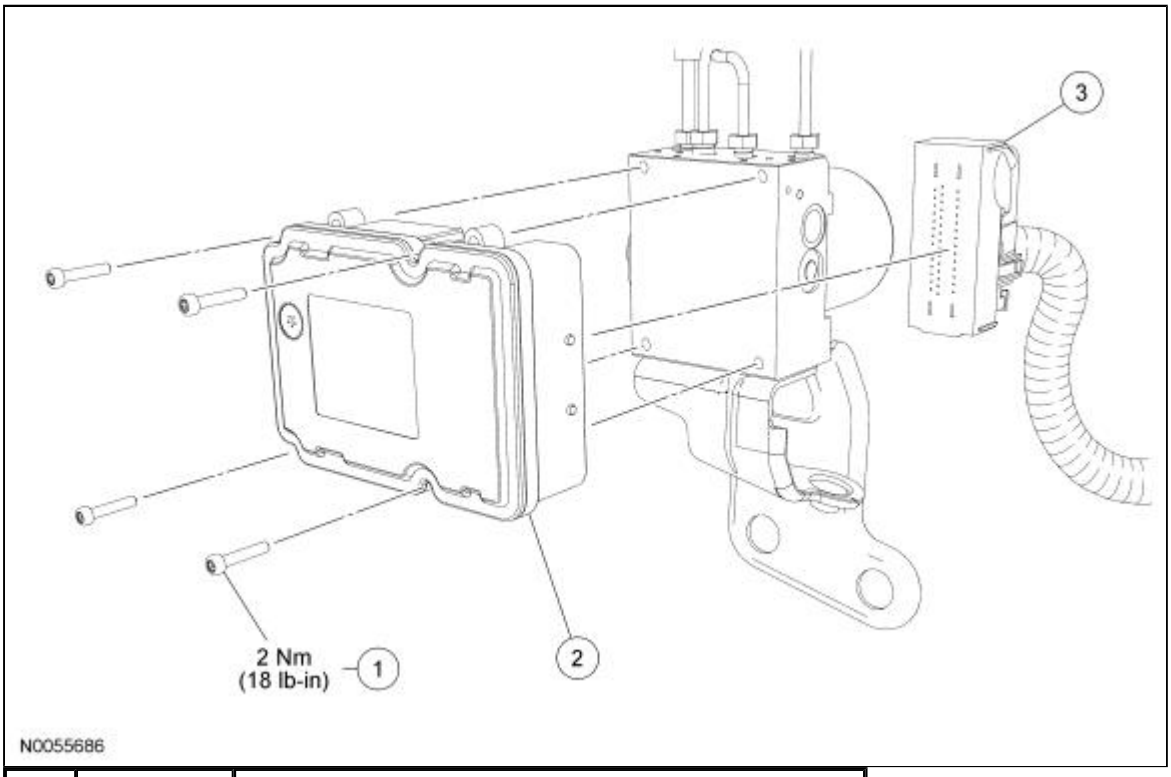
   Disconnect the 6 brake tube fittings.
   - To install:
     - tighten the master cylinder brake tube fittings to 25 Nm (18 lb-ft).
     - tighten the remaining brake tube fittings to 20 Nm (15 lb-ft).

4. Remove the 3 hydraulic control unit (HCU)-to-bracket bolts and the HCU.
   - To install, tighten to 9 Nm (80 lb-in).

5. To install, reverse the removal procedure.
   - Bleed the brake system. For additional information, refer to Section 206-00 .

Anti-Lock Brake System (ABS) Module

Printable View (141 KB)



Item	Part Number	Description
1	—	Anti-lock brake system (ABS) module bolt (4 required) (part of 2C219)
2	2C219	ABS module
3	—	ABS module electrical connector (part of 14A464)

Removal and Installation

NOTE: When installing a new module, it must be calibrated and configured (either by download/upload or uploading the as-built data method).

1. **CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.**

   Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

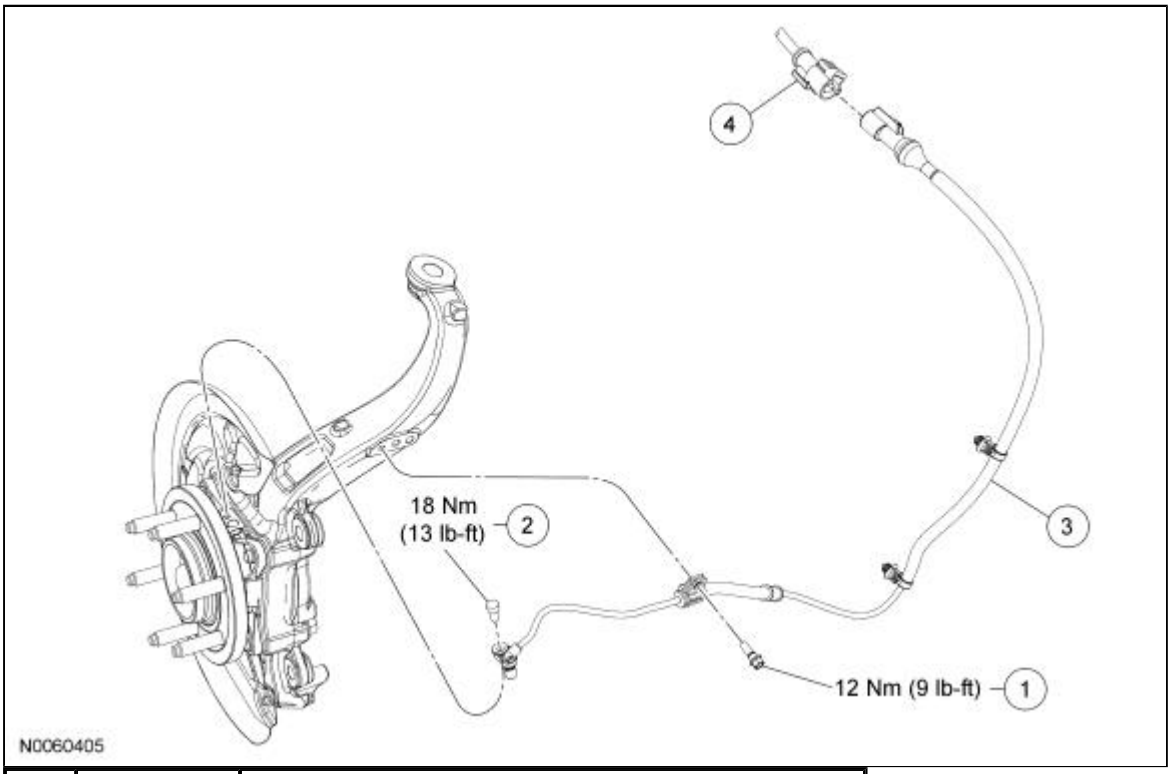
2. Disconnect the anti-lock brake system (ABS) module electrical connector.

3. Remove the 4 bolts and the ABS module.
   - To install, tighten to 2 Nm (18 lb-in).

4. To install, reverse the removal procedure.
   - If installing a new ABS module, program the module. For additional information, refer to Section 418-01 .

Wheel Speed Sensor — Front

Printable View (138 KB)



Item	Part Number	Description
1	—	Front wheel speed sensor harness retainer bolt
2	—	Front wheel speed sensor bolt
3	2C204	Front wheel speed sensor
4	—	Front wheel speed sensor electrical connector (part of 14250)

Removal and Installation

1. **NOTE:** If equipped, turn the air suspension switch to the OFF position.

   With the vehicle in NEUTRAL, position it on a hoist

2. Disconnect the wheel speed sensor electrical connector.

3. Remove the wheel speed sensor harness retainer bolt and detach the retainers.
   - To install, tighten to 12 Nm (9 lb-ft).

4. **CAUTION: Do not allow the caliper to hang from the brake hose or damage to the hose can result.**

   Remove the 2 caliper anchor bolts and position the caliper, pads and anchor plate aside.
   - Support the caliper with mechanic's wire.

- To install, tighten to 200 Nm (148 lb-ft).

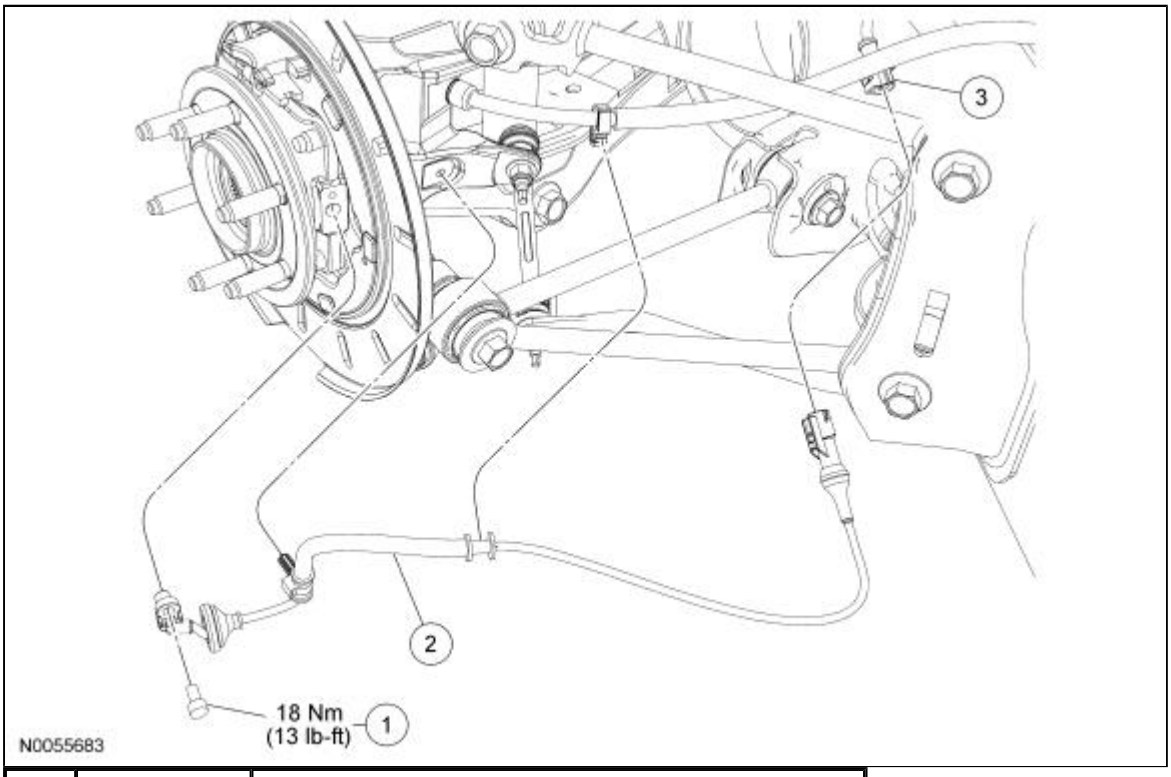
5. Remove the brake disc.

6. Remove the front wheel speed sensor bolt and the sensor.
    - To install, tighten to 18 Nm (13 lb-ft).

7. To install, reverse the removal procedure.

Wheel Speed Sensor — Rear

Printable View (168 KB)



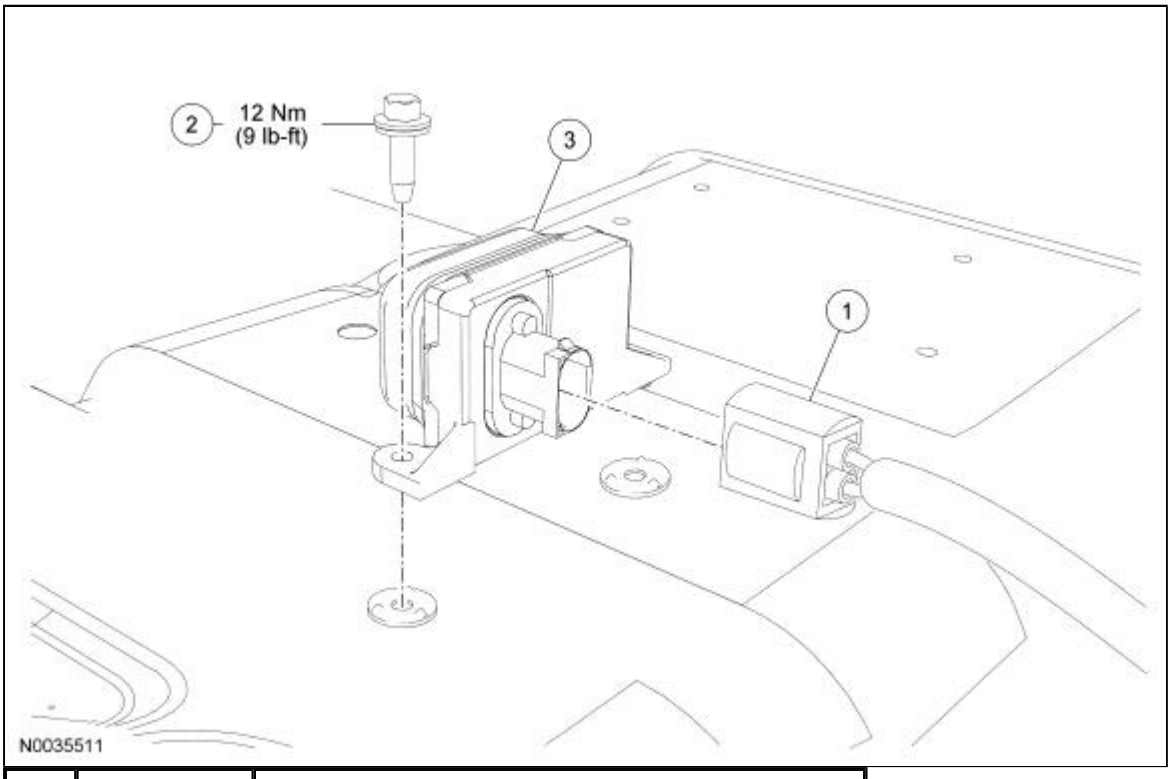
Item	Part Number	Description
1	2B663	Rear wheel speed sensor bolt
2	2C190	Rear wheel speed sensor
3	—	Body harness electrical connector (part of 14A464)

Removal and Installation

1. Remove the parking brake shoes. For additional information, refer to Section 206-05 .
2. Disconnect the wheel speed sensor harness from the retaining clips.
3. Remove the rear wheel speed sensor bolt and the sensor.
   - To install, tighten to 18 Nm (13 lb-ft).
4. To install, reverse the removal procedure.

Stability Control Sensor Cluster

Printable View (161 KB)

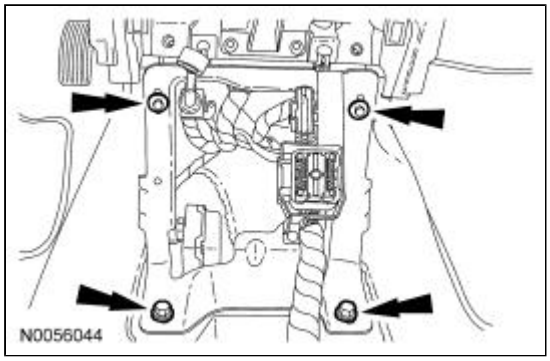


Item	Part Number	Description
1	—	Stability control sensor cluster electrical connector
2	W505255	Stability control sensor cluster bolt (2 required)
3	3C187	Stability control sensor cluster

Removal and Installation

NOTE: The lateral and longitudinal accelerometer and the roll rate sensor are located within the yaw rate sensor, stability control sensor cluster.

1. Remove the front floor console. For additional information, refer Section 501-12 .
2. Disconnect the stability control sensor cluster electrical connector.
3. Remove the 4 bolts and the bracket.
   - To install:
     - Tighten the upper bolts to 9 Nm (80 lb-in).
     - Tighten the lower bolts to 40 Nm (30 lb-ft).

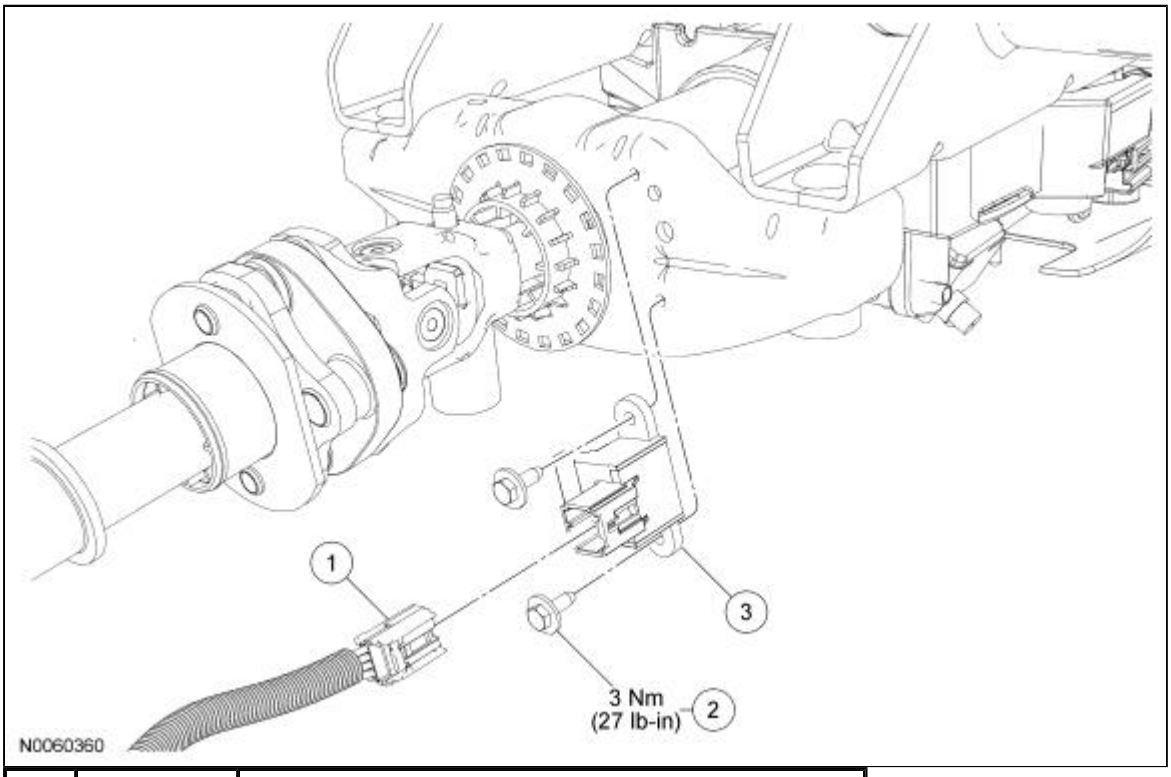


4. Remove the 2 bolts and the stability control sensor cluster.
    - To install, tighten to 12 Nm (9 lb-ft).

5. To install, reverse the removal procedure.

Steering Wheel Rotation Sensor

Printable View (156 KB)



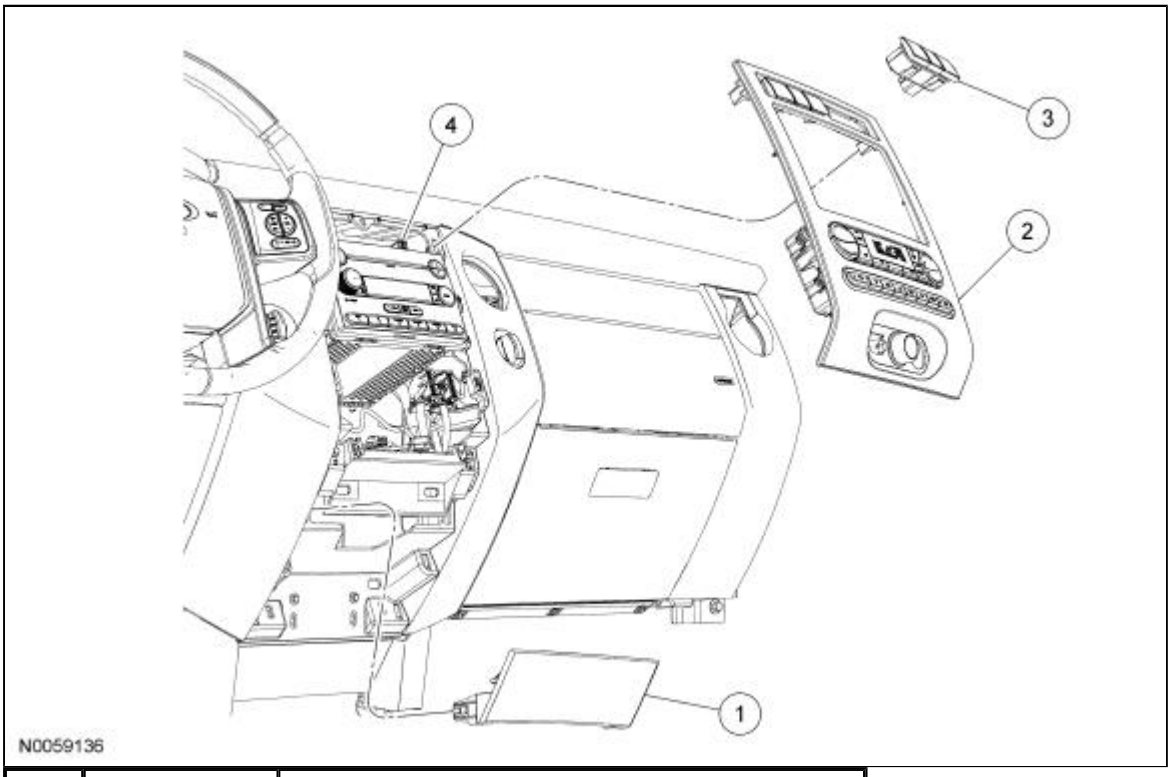
Item	Part Number	Description
1	N802141	Steering wheel rotation sensor bolts (2 required)
2	3F818	Steering wheel rotation sensor
3	—	Steering wheel rotation sensor electrical connector (part of 14489)

Removal and Installation

1. Disconnect the steering wheel rotation sensor electrical connector.
2. Remove the 2 bolts and the steering wheel rotation sensor.
   - To install, tighten to 3 Nm (27 lb-in).
3. To install, reverse the removal procedure.

Stability/Traction Control Switch — Expedition

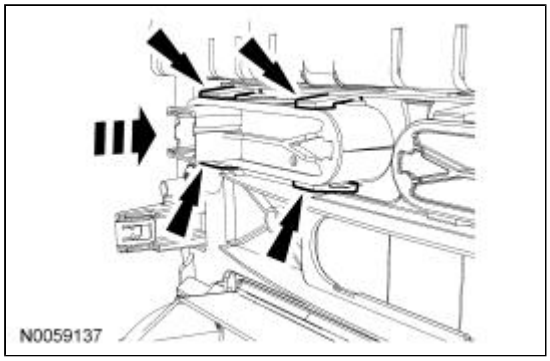
Printable View (186 KB)



Item	Part Number	Description
1	—	Lower instrument cluster center finish panel
2	04302	Upper instrument cluster center finish panel
3	13350	Traction control switch assembly
4	—	Electrical connector (part of 14401)

Removal and Installation

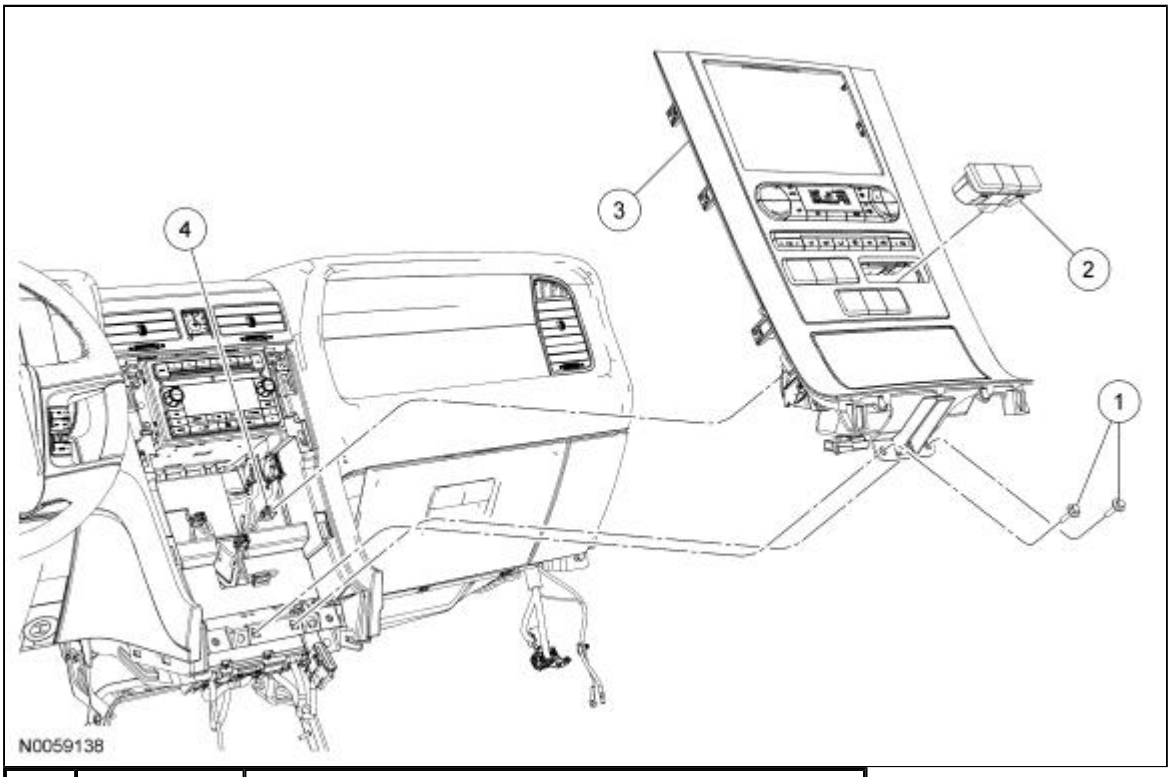
1. Remove the lower instrument cluster center finish panel.
2. Remove the upper instrument cluster center finish panel.
    - Disconnect the electrical connectors.
3. Depress the 4 tabs and remove the traction control switch assembly.



4. To install, reverse the removal procedure.

Stability/Traction Control Switch — Navigator

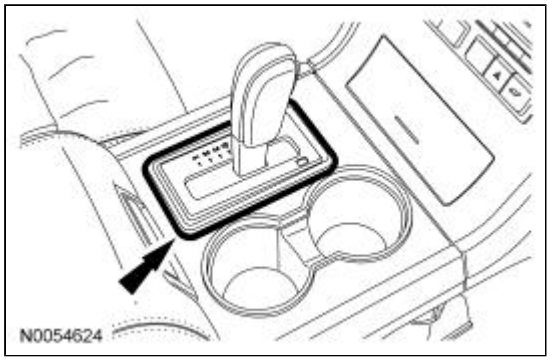
Printable View (242 KB)



Item	Part Number	Description
1	—	Instrument cluster center finish panel screws (2 required)
2	04302	Traction control switch assembly
3	13350	Lower instrument cluster center finish panel
4	—	Electrical connector (part of 14401)

Removal and Installation

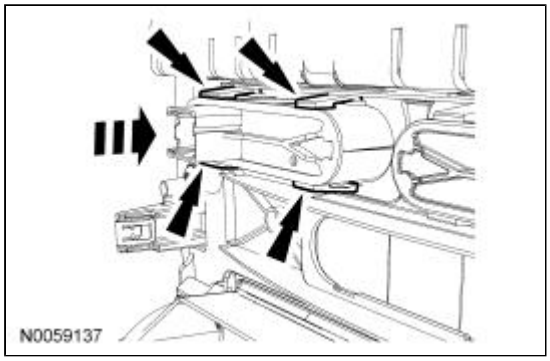
1. Apply the parking brake and move the shift lever to NEUTRAL.
2. Disconnect the battery negative cable. For additional information, refer to Section 414-01 .
3. Remove the shift lever trim ring.



4. Remove the front floor console finish panel.

5. Remove the lower instrument cluster finish panel.
    1. Remove the 2 lower instrument cluster finish panel screws.
    2. Pull out on the panel to disengage the clips.
    3. Disconnect the electrical connectors.

6. Depress the 4 tabs and remove the traction control switch assembly.



7. To install, reverse the removal procedure.

Fluid capacity (included in pump reservoir fill)	1.3L (2.7 pt) (approximate)
Power Steering Gear	
Type	Rack and Pinion
Ratio	20:1
Static steering wheel turning effort Navigator Expedition	 4.0 Nm (35 lb-in) 5.0 Nm (44 lb-in)
Turning effort Navigator Expedition	 2.14 kg (4.7 lbs) 2.68 kg (5.9 lbs)
Turns of steering wheel (lock to lock — linkage disconnected)	3.75
Tie-rod articulation torque	5 Nm (44 lb-in)
Power Steering Purge Vacuum	
Minimum vacuum	67-84 kPa (20-25 in-Hg)
Power Steering Pump	
Flow (Navigator)	11L ± 0.8L @ 345 kPa (3.0 gpm ± 0.2 gpm @ 50 psi) engine speed @ 1,200 rpm
Flow (Expedition)	11L ± 0.8L @ 345 kPa (3.0 gpm ± 0.2 gpm @ 50 psi) engine speed @ 1,200 rpm 9.5L ± 0.8L @ 345 kPa (2.6 gpm ± 0.2 gpm @ 50 psi) engine speed @ 3,000 rpm
Minimum capacity	6.6L @ 5,171 kPa (1.6 gpm @ 750 psi) engine speed @ 500 rpm
Relief pressure	8,963 - 10,204 kPa (1,300 - 1,480 psi)

Steering System

Printable View (63 KB)

The steering system consists of the following components:

- Power steering pump
- Fluid reservoir
- Steering column
- Steering gear
- Fluid cooler

For information on the power steering pump, steering gear, steering lines and fluid reservoir, refer to Section 211-02 .

For information on the steering wheel, column assembly and intermediate shaft, refer to Section 211-04 .

Inspection and Verification

CAUTION: Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump can result.

NOTE: Make the following preliminary checks before repairing the steering system:

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical
• Fluid level • Tire pressure • Tires • Drive belt • Drive belt tensioner • Steering column alignment • Tie-rod ends • Suspension components • Steering column shaft U-joints • Intermediate shaft bolts • Power steering reservoir baffle • Power steering reservoir filter • Power steering pressure lines, fittings or O-rings • Power steering return hoses and clamps • Steering gear • Power steering pump

3. **NOTE:** The areas that should be inspected for possible contamination are the power steering reservoir filter, flow control and pressure relief valve in the pump and the check valve in the inlet port on the power steering gear (if equipped).

   Inspect the power steering fluid for the following conditions:
   - Aerated or foamy: Purge the power steering system. Refer to Power Steering System Purging in this section.
   - Overheating or contamination: Flush the power steering system. Refer to Power Steering System Flushing in this section.

4. Check the power steering system for fluid leaks.
   - Check the power steering fluid level.

     NOTE: It may be necessary to add power steering fluid to achieve the correct level.

     With the ignition OFF:
   - Wipe off the power steering pump, power steering pressure hose, power steering return hose, power steering fluid cooler, hose assembly and steering gear.
   - **CAUTION: Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump can occur.**

     Start the engine and turn the steering wheel from stop-to-stop several times and check for leaks.

5. Inspect the power steering pressure and return hoses, fittings and O-rings for leaks.

- If a leak is detected at a power steering pressure or return hose, install a new hose. Refer to Section 211-02 .
- If a leak is detected between a fitting nut, seal the fitting nut using a Teflon® joint seal.
- If a leak is detected at a fitting or clamp plate, tighten to specification. If the leak is still evident,

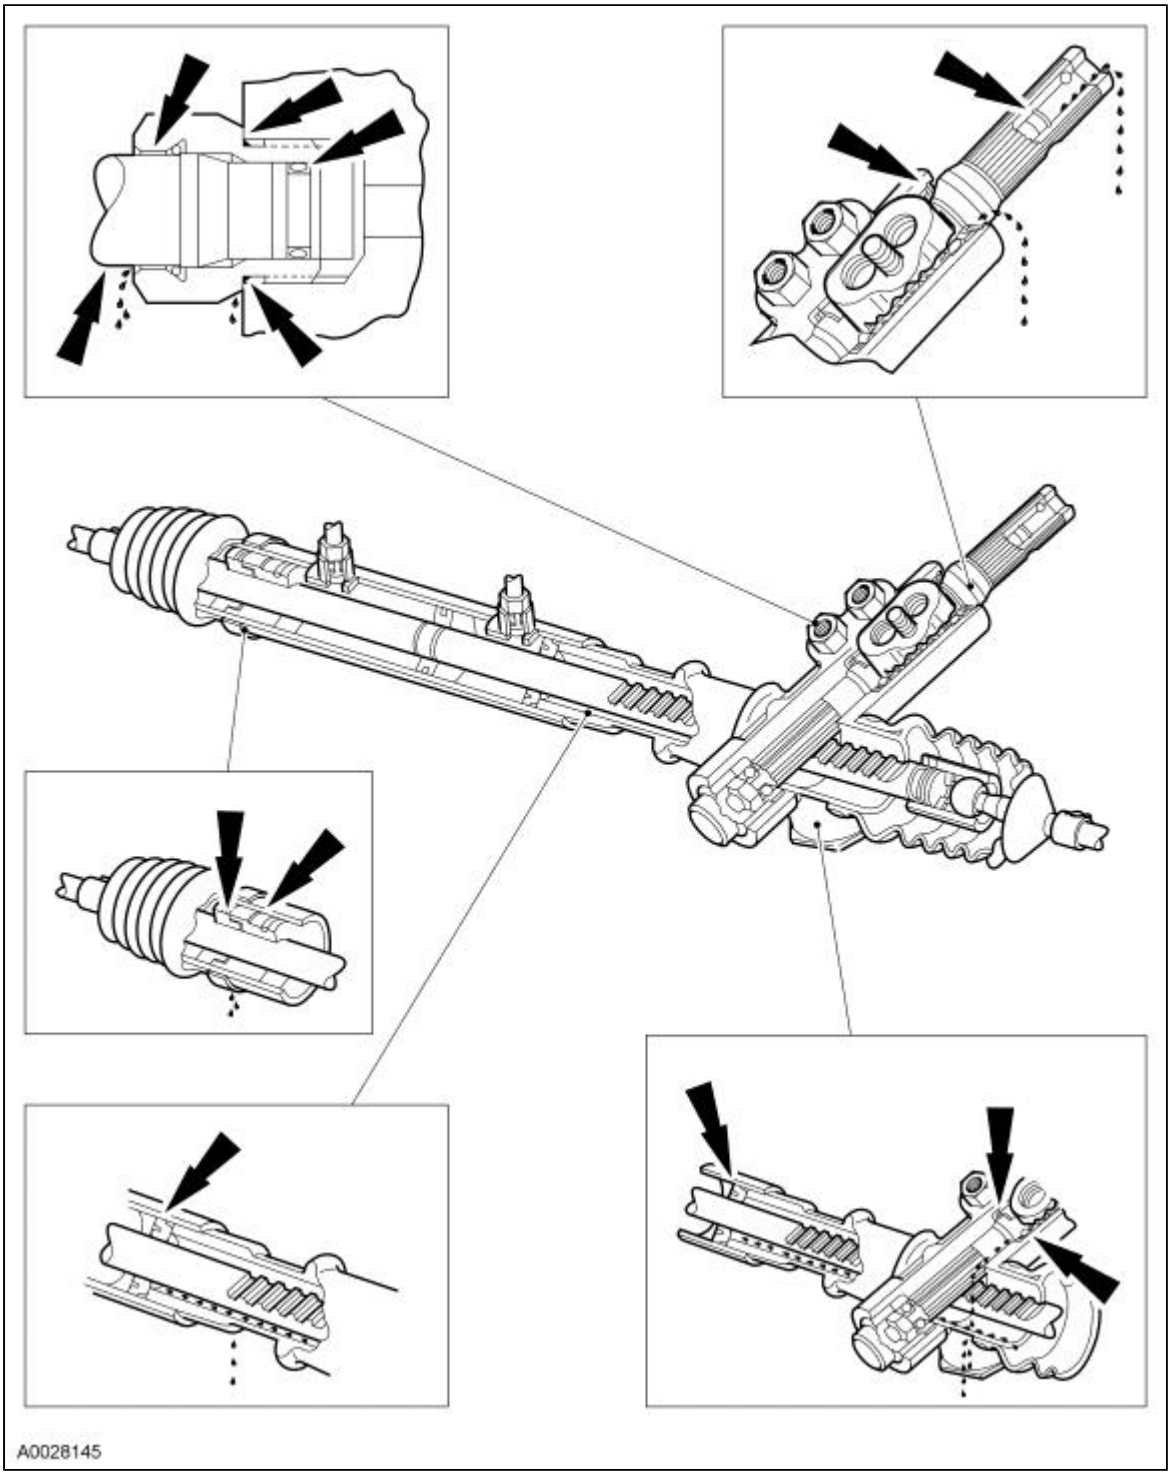
visually inspect the fittings, clamp plate, O-rings and Teflon® seals. Install new components as necessary. Refer to Section 211-02 .

- If a leak is detected at the power steering reservoir, install a new reservoir. Refer to Section 211-02 .
- If a leak is detected at a constant tension spring clamp, verify that the hose is fully installed on the fitting and that the hose clamp is correctly positioned. If the leak remains, install a new constant tension spring clamp.
- If a leak is detected at a screw clamp joint, tighten the screw clamp. If the leak remains, inspect the tube end and install a new hose. Refer to Section 211-02 .
- If a leak is detected at the power steering pump, install a new power steering pump. Refer to Section 211-02 .

NOTE: To inspect for leaks it may be necessary to remove the squeeze-type clamp from the steering gear boots.

6. Inspect the power steering gear for leaks. If a leak is detected at the power steering gear, install a new power steering gear. Refer to Section 211-02 .

External Leak Check — Potential Power Rack-and-Pinion Steering Gear Leak Points



7. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

8. If the cause is not visually evident, verify the symptom and GO to Symptom Chart .

Steering System Symptom Definitions

Drift/Pull

Pull is described as a tugging sensation, felt by the hands on the steering wheel, that must be overcome to keep the vehicle going straight.

Drift describes what a vehicle with this condition does with the hands off the steering wheel.

- A vehicle-related drift/pull, on a flat road, can cause a consistent deviation from the straight-ahead path and require constant steering input in the opposite direction to counteract the effect.
- Drift/pull can be induced by conditions external to the vehicle such as wind or road camber.

Excessive Steering Wheel Play

Excessive steering wheel play is a condition in which there is too much steering wheel movement before the wheels move. A small amount of steering wheel free play is considered normal.

Feedback

Feedback is a roughness felt in the steering wheel when the vehicle is driven over rough pavement.

Hard Steering or Lack of Assist

Hard steering or lack of assist is experienced when the steering wheel effort exceeds specifications. Hard steering can remain constant through the full turn or occur near the end of a turn. It is important to know the difference between hard steering/lack of assist and binding.

Hard steering or lack of assist can result from either hydraulic or mechanical conditions. It is extremely important to know if this concern occurs during driving or during high-effort parking maneuvers.

Nibble

Sometimes confused with shimmy, nibble is a condition resulting from tire interaction with various road surfaces and is felt by the driver as small rotational oscillations of the steering wheel.

Poor Returnability/Sticky Steering

Poor returnability and sticky steering is used to describe the poor return of the steering wheel to center after a turn, or the steering correction, is completed.

Shimmy

Shimmy, as felt by the driver, is large, consistent, rotational oscillations of the steering wheel resulting from large, side-to-side (lateral) tire/wheel movements.

Shimmy is usually experienced near 64 km/h (40 mph), and can begin or be amplified when the tire contacts pot holes or irregularities in the road surface.

Wander

Wander is the tendency of the vehicle to require frequent, random left and right steering wheel corrections to maintain a straight path down a level road.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Steering system noise	• Low fluid level • Fluid aeration	• Go To Pinpoint Test A .

	• Steering gear • Power steering pump • Loose or damaged steering linkage • Loose or damaged suspension component(s) • Steering column • Steering column boot bearing • Intermediate shaft • Loose dash boot seal	
• Steering is very difficult/very easy	• Seized intermediate shaft U-joints • Damaged, fractured steering column bearing(s) • Steering gear • Power steering pump • Power steering hoses • Binding dash boot seal	• Go To Pinpoint Test B .
• Excessive steering wheel play	• Steering gear • Steering column • Steering column intermediate shaft • Steering linkage • Ball joints	• Go To Pinpoint Test C .
• Steering system drift/pull/wander	• Tire pressure • Wheel alignment • Steering gear • Unevenly loaded vehicle • Steering column intermediate shaft • Frame alignment	• CORRECT the vehicle loading as necessary. Go To Pinpoint Test D .
• Feedback	• Loose, worn or damaged tie rod	• GO to Component Tests, Tie-Rod Articulation Torque in this section.
	• Loose, worn or damaged tie-rod ends	• GO to Component Tests, Steering Linkage in this section.
	• Loose or damaged steering gear insulators or bolts	• INSTALL new steering gear insulators or bolts if necessary, or TIGHTEN the bolts as needed.
	• Loose lower steering column shaft U-joint bolts	• INSTALL new bolts or TIGHTEN the bolts. REFER to Section 211-04 .
	• Loose suspension bushings, fasteners or ball joints	• INSTALL new components as necessary. REFER to Section 204-01A rear wheel drive (RWD) or Section 204-01B

		four wheel drive (4WD).
	• Worn or damaged steering column bearing(s)	• INSTALL new steering column bearing(s). REFER to Section 211-04 .
• Poor returnability/sticky steering	• Binding lower steering column shaft U-joints	• INSTALL a new lower steering column shaft. REFER to Section 211-04 .
	• Loose, worn or damaged tie rod	• GO to Component Tests, Tie-Rod Articulation Torque in this section.
	• Loose, worn or damaged tie-rod ends	• GO to Component Tests, Steering Linkage in this section.
	• Suspension components	• REFER to Section 204-00 .
	• Binding steering column bearing(s) • Binding dash boot seal	• INSTALL new steering column bearing(s). REFER to Section 211-04 .
• Shimmy	• Loose, worn or damaged tie-rod end	• GO to Component Tests, Steering Linkage in this section.
	• Loose, worn or damaged tie rod	• GO to Component Tests, Tie-Rod Articulation Torque in this section.
	• Suspension components	• REFER to Section 204-00 .

Pinpoint Tests

Pinpoint Test A: Steering System Noise

Normal Operation

The power steering pump, which is driven by the crankshaft through a drive belt and pulleys, develops the hydraulic pressure necessary to operate the system. When the engine is running, fluid is drawn into the power steering pump from the power steering pump reservoir. Hydraulic fluid is pressurized in the power steering pump and sent to the steering gear. The rotary valve determines fluid direction to assist the driver in the turning of the vehicle. When the steering wheel is turned, the steering gear converts this hydraulic pressure and flow into mechanical motion that will move the front wheels in the direction of the turn. The steering gear uses tie rods to connect the front knuckles, which then pivot on the ball joints, steering the vehicle.

Possible Causes

- Fluid
- Engine drive belt
- Steering column components
- Steering linkage
- Power steering gear
- Power steering pump

PINPOINT TEST A: STEERING SYSTEM NOISE

Test Step	Result / Action to Take
A1 CHECK FOR MECHANICAL NOISE • Test drive the vehicle to verify the steering system noise. • **Does the steering system make a clunk noise?**	**Yes** CHECK for loose, worn or damaged tie-rod ends. REFER to Component Tests, Steering Linkage in this section. CHECK for loose or worn steering gear isolators (if applicable). INSTALL new isolators if necessary. REFER to Section 211-02 . If the noise is from the steering column, CHECK the steering column intermediate shaft for grounding through the body and REPAIR as necessary. If the noise is from the steering column boot bearing, INSTALL a new steering column boot bearing. REFER to Section 211-04 . If the noise is from the suspension components, INSTALL new suspension components as necessary. REFER to Section 204-01A rear wheel drive (RWD) or Section 204-01B four wheel drive (4WD). If the noise is from loose, worn or damaged intermediate shaft U-joint(s), INSTALL a new lower steering column shaft. REFER to Section 211-04 . **No** If a squeak is present in the steering column, REPAIR the steering column mountings or ALIGN the steering column as necessary. REFER to Section 211-04 . For all other concerns, GO to A2 .
A2 VERIFY THE CONCERN **NOTE:** Make sure the vehicle is on a flat dry surface, the transmission is in PARK and the windows are rolled up. **NOTE:** Some power steering noise is expected. If in doubt of the acceptability of the noise level, evaluate another vehicle of the same model and powertrain. • Key in START position. • Turn the steering wheel 1/2 turn off-center to the RIGHT then 1/2 turn off-center to the LEFT. • **Is the power steering noisy?**	**Yes** If a grunt noise is present, VERIFY the steering column boot is OK and the exhaust system is not grounding out. If a moan is present, VERIFY that the tie-rod ends and ball joints are OK. GO to A3 . **No** If a squeal is present, INSPECT and INSTALL a new engine drive belt or belt tensioner as necessary. REFER to Section 303-00 . If the steering system noise is a hiss or whistle, INSPECT the steering column boot at the dash panel. REPAIR or INSTALL a new boot as necessary. REFER to Section 211-04 . INSPECT the steering gear input shaft and valve for wear or damage. REFER to Section

	211-02 . INSPECT the power steering gear, intermediate shaft and power steering lines and hoses for grounding to the body and REPAIR as necessary. INSPECT for openings or missing plugs in the instrument panel cowl and REPAIR as necessary. If there are no missing plugs or openings in the cowl, grounded power steering gear, intermediate shaft or power steering lines or hoses, GO to A6 .
A3 CHECK FOR A COLD START NOISE **NOTE:** Some noise during an extremely cold start (-25.5°C [-14°F]) is normal and should improve as the steering system warms up, usually within 60 seconds. • Key in START position. • Verify the noise condition. • **Is the noise present only during cold start up?**	**Yes** CHECK for contamination in the power steering reservoir screen. FLUSH the power steering system as necessary. REFER to Power Steering System Flushing in this section. TEST the system for normal operation. **No** GO to A4 .
A4 INSPECT THE POWER STEERING FLUID • Key in OFF position. • With the engine OFF, inspect the power steering fluid for aeration. • **Is the power steering fluid foamy or aerated?**	**Yes** GO to A5 . **No** PURGE the power steering system. REFER to Power Steering System Purging in this section. If a whine or moan is still present, INSTALL a new power steering pump. REFER to Section 211-02 . If a grunt is still present, INSTALL a new power steering gear. REFER to Section 211-02 .
A5 CHECK THE POWER STEERING FLUID LEVEL WITH THE ENGINE ON AND OFF **NOTE:** Record the vacuum level when the pump noise occurs with no steering input. Vacuum level should be greater than 10 in-Hg with the CII pump and 15 in-Hg with the CIII pump. • Key in START position. • With the engine running, inspect the power steering fluid level. • Key in OFF position. • With the engine OFF, inspect the power steering fluid level. • **Does the power steering fluid level change with the engine off?**	**Yes** PURGE the power steering system. REFER to Power Steering System Purging in this section. **No** GO to A6 .
A6 CHECK THE POWER STEERING PUMP **NOTE:** Do not turn the steering wheel to either the right or left stop. Power steering relief noise will occur and is normal at the stop positions.	**Yes** INSTALL a new power steering gear. REFER to Section 211-02 .

• Key in START position. • With the engine running, rotate the steering wheel 90 degrees to the left then 180 degrees to the right. • **Does the frequency of the hiss change between the LEFT and RIGHT positions?**	**No** INSTALL a new power steering pump. REFER to Section 211-02 .

Pinpoint Test B: Steering Is Very Difficult/Very Easy

Normal Operation

The power steering pump, which is driven by the crankshaft through a drive belt and pulleys, develops the hydraulic pressure necessary to operate the system. When the engine is running, fluid is drawn into the power steering pump from the power steering pump reservoir. Hydraulic fluid is pressurized in the power steering pump and sent to the steering gear. The rotary valve determines fluid direction to assist the driver in the turning of the vehicle. When the steering wheel is turned, the steering gear converts this hydraulic pressure and flow into mechanical motion that will move the front wheels in the direction of the turn. The steering gear uses tie rods to connect the front knuckles, which then pivot on the ball joints, steering the vehicle.

Possible Causes

- Ball joint(s)
- Steering column
- Intermediate shaft
- Steering gear
- Power steering pump

PINPOINT TEST B: STEERING IS VERY DIFFICULT/VERY EASY

Test Step	Result / Action to Take
B1 CHECK THE STEERING COLUMN BEARINGS AND THE INTERMEDIATE SHAFT	
NOTE: Be sure to keep the clockspring centered when disconnecting the intermediate shaft. Refer to Section 501-20B . • Check the steering column and intermediate shaft for grounding. • Disconnect the steering column intermediate shaft at the steering column. • Verify that the intermediate shaft U-joints do not bind and move freely and that the steering column bearing rotates freely. • **Are the steering column bearing and intermediate shaft U-joints OK?**	**Yes** GO to B2 . **No** If the steering column or the intermediate shaft are grounding, REPAIR as necessary. If the steering column bearings or the intermediate shaft are binding. INSTALL a new intermediate shaft or steering column. REFER to Section 211-04 .
B2 CHECK THE FRONT BALL JOINTS	
• Check that the front ball joints move freely and are not binding or sticking. Refer to Section 204-00 . • **Are the front ball joints OK?**	**Yes** GO to B3 . **No** INSTALL new ball joint(s) as necessary. REFER to

	Section 204-01A rear wheel drive (RWD) or Section 204-01B four wheel drive (4WD).
B3 MONITOR ENGINE RPM CHANGES	
NOTE: Make sure the vehicle is on a flat, dry surface. • Key in START position. • **CAUTION: Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump can occur.** • Turn the steering wheel once to the LEFT stop position and then to the RIGHT stop position. • Note the engine rpm during the turns. • **Does the engine rpm change when turning the steering wheel?**	**Yes** If no power steering assist is present and the engine rpm changes, INSTALL a new steering gear. REFER to Section 211-02 . If left-to-right variation is present, INSTALL a new steering gear. REFER to Section 211-02 . If no power steering assist is present and the engine rpm does not change, INSTALL a new power steering pump. REFER to Section 211-02 . If excessive effort is required in one or both directions, INSTALL a new power steering pump. REFER to Section 211-02 . **No** CARRY OUT the Pump Flow and Pressure Test. REFER to Component Tests in this section.

Pinpoint Test C: Excessive Steering Wheel Play

Normal Operation

When the steering wheel is turned, the steering shaft rotates in the steering column on bearings. This mechanical motion is then converted to hydraulic pressure that assists in the effort that it takes to steer the vehicle. The hydraulic pressure from the power steering pump to the power steering gear is then converted back to mechanical motion that will move the front wheels in the direction of the turn. The steering gear uses tie-rod ends to connect the front knuckles to one another. The knuckles then pivot on the ball joints in order to steer the vehicle.

Possible Causes

- Steering column fasteners
- Steering column
- Steering linkage component(s)

PINPOINT TEST C: EXCESSIVE STEERING WHEEL PLAY

Test Step	Result / Action to Take
C1 CHECK THE STEERING COLUMN BEARING	
• Inspect the steering column mounting fasteners and bearing for looseness. • **Are the fasteners and bearing OK?**	**Yes** GO to C2 . **No** TIGHTEN the steering column mounting fasteners or INSTALL a new steering column. REFER to Section 211-04 .
C2 CHECK THE STEERING LINKAGE FOR LOOSENESS	
• Carry out the Steering Linkage	**Yes**

component test. Refer to Component Tests in this section. • **Is the steering linkage OK?**	REFER to Section 204-00 to diagnose the suspension components. **No** INSTALL new steering linkage components as necessary. REFER to Section 211-02 .

Pinpoint Test D: Steering System Drift/Pull/Wander

Normal Operation

When the steering wheel is turned, the steering shaft rotates in the steering column on bearings. This mechanical motion is then converted to hydraulic pressure that assists in the effort that it takes to steer the vehicle. The hydraulic pressure from the power steering pump to the power steering gear is then converted back to mechanical motion that will move the front wheels in the direction of the turn. The steering gear uses tie-rod ends to connect the front knuckles to one another. The knuckles then pivot on the ball joints in order to steer the vehicle.

Possible Causes

- Tire pressure
- Tire wear
- Wheel alignment
- Steering column
- Intermediate shaft
- Steering gear mount(s)
- Steering gear
- Suspension component(s)

PINPOINT TEST D: STEERING SYSTEM DRIFT/PULL/WANDER

Test Step	Result / Action to Take
D1 CHECK FOR TIRE PULL	
• Rotate the front wheel and tire assemblies side-to-side. Refer to Section 204-04 . • Carry out a road test on a smooth, flat road. • **Does the vehicle drift/pull?**	**Yes** If the vehicle pulls in the opposite direction, GO to D2 . If the vehicle pulls in original direction, GO to D3 . **No** The concern has been corrected.
D2 ROTATE THE WHEEL AND TIRE ASSEMBLIES FRONT TO REAR	
• Rotate the wheel and tire assemblies front to rear. Refer to Section 204-04 . • Carry out a road test on a smooth, flat road. • **Does the vehicle drift/pull?**	**Yes** GO to D3 . **No** The concern has been corrected.
D3 CHECK THE STEERING COLUMN INTERMEDIATE SHAFT	
NOTE: Be sure to keep the clockspring centered when disconnecting the intermediate shaft. Refer to Section 501-20B .	**Yes** GO to D4 .

• Check the steering column and intermediate shaft for grounding. • Disconnect the steering column intermediate shaft at the steering column. • Inspect the steering column intermediate shaft U-joints for looseness or wear. • **Are the steering column intermediate shaft U-joints OK?**	**No** INSTALL a new steering column intermediate shaft. REFER to Section 211-04 .
D4 CHECK THE STEERING GEAR MOUNTING	
• Check the steering gear mounts for looseness or wear. • **Are the steering gear mounts OK?**	**Yes** GO to D5 . **No** INSTALL new steering gear mount(s). REFER to Section 211-02 .
D5 CHECK THE STEERING GEAR	
• Carry out the Steering Gear Valve component test. Refer to Component Tests in this section. • **Is the steering gear valve OK?**	**Yes** GO to D6 . **No** REPAIR or INSTALL a new steering gear. REFER to Section 211-02 .
D6 CHECK THE SUSPENSION COMPONENTS	
• Check for loose or worn suspension components. REFER to Section 204-01A rear wheel drive (RWD), Section 204-01B four wheel drive (4WD) or Section 204-02 . • **Are the suspension components OK?**	**Yes** GO to D7 . **No** INSTALL new suspension component(s). REFER to Section 204-01A rear wheel drive (RWD), Section 204-01B four wheel drive (4WD) or Section 204-02 .
D7 CHECK THE WHEEL ALIGNMENT	
NOTE: The vehicle will tend to pull toward the side with the least positive caster and the most positive camber. • Using a suitable alignment system, measure the wheel alignment settings. Refer to Section 204-00 . • **Are the alignment settings within specifications?**	**Yes** CHECK for correct frame alignments. REFER to Section 501-02 . **No** ADJUST the alignment angles to specifications. DO NOT exceed the specifications. TEST the system for normal operation.

Component Tests

Steering Linkage

1. **NOTE:** Excessive vertical motion of the studs relative to the sockets may indicate excessive wear.

   With the vehicle on the ground and the parking brake applied, start the vehicle and carry out the following:
   - Have an assistant rotate the steering wheel back and forth 360 degrees and watch for the relative motion of the studs in the steering linkage ball sockets.
   - Watch for loose steering gear mounting.

2. As an additional check, with the key ON engine OFF (KOEO) and the front wheels raised off the ground, grasp the wheel at the front and rear and watch for excessive play or binding in the joints

while trying to steer the wheels.

3. Install new components if necessary. Tighten any worn, damaged or loose components.

Turning Effort Test

NOTE: Make sure the front wheels are correctly aligned and the tire pressure is correct before checking the steering effort.

1. Park the vehicle on dry concrete and set the parking brake.
2. Insert a thermometer into the power steering fluid reservoir.
3. **CAUTION: Do not hold the steering wheel against the stops for more than 3 to 5 seconds at a time. Damage to the power steering pump can occur.**

   Idle the engine for 2 to 3 minutes. Turn the steering wheel from stop-to-stop several times to warm the fluid to 50-60°C (122-140°F).
4. With the engine running, attach the spring scale to the rim of the steering wheel.
5. Measure the pull required to turn the steering wheel one complete revolution in each direction. Refer to General Specifications, Steering Wheel Turning Effort in this section.

Pump Flow and Pressure Test

WARNING: Do not touch the flowmeter during the test procedure, or severe burns and serious injury can occur. Failure to follow these instructions may result in personal injury.

1. **CAUTION: Make sure the connection point will not interfere with any of the engine accessory drive components or drive belts.**

   Install the power steering analyzer at the high pressure port of the power steering pump. Make sure the power steering analyzer gate valve is fully open.
2. Place a dial thermometer in the power steering pump reservoir.
3. Check the power steering fluid level. If necessary, add the specified power steering fluid.
4. Install a digital tachometer.
5. **CAUTION: Do not hold the steering wheel against the stops for more than 3 to 5 seconds at a time. Damage to the power steering pump can occur.**

   Start the engine. Set the parking brake. Place the transmission in NEUTRAL. Raise the power steering fluid temperature to 74-80°C (165-175°F) by rotating the steering wheel fully to the left and right several times.
6. With the steering wheel in the straight-ahead position, set the engine speed to 2,100 rpm. Record the flow rate and pressure readings.
   - If the flow rate is below the flow rate specification, continue with the test procedure.
   - If the pressure reading is above the maximum pressure specification, check the power steering hoses for kinks and restrictions.
7. Partially close the gate valve to obtain 5,171 kPa (750 psi). Set the engine speed at idle. Record

the flow rate.

- If the flow is less than the specified flow rate, install a new power steering pump.

8. **CAUTION: Do not allow the gate valve to remain closed for more than 5 seconds.**

   Completely close and partially open the gate valve 3 times. Record the pressure relief valve actuation pressure reading.

   - If the pressure does not meet the relief pressure specification, then install a new power steering pump.

9. Set engine speed to 2,100 rpm. Record the flow rate.
   - If the flow rate varies more than 3.785 liters/minute (1 gallon/minute) from the initial flow rate reading, install a new power steering pump.

10. **CAUTION: Do not hold the steering wheel against the stops for more than 3 to 5 seconds at a time. Damage to the power steering pump can occur.**

    Set the engine speed at idle. Turn (or have an assistant turn) the steering wheel to the left and right stops. Record flow rate and pressure readings at the stops.

    - The pressure reading at both stops should be nearly the same as the maximum pump relief pressure.
    - The flow rate should drop below 1.9 liters/minute (0.5 gallons/minute).
    - If the pressure does not reach the maximum pump relief pressure or the flow rate does not drop below the specified value, excessive internal leakage is occurring. Install a new steering gear as necessary. Refer to Section 211-02 .

11. Turn (or have an assistant turn) the steering wheel slightly in both directions and release quickly while watching the pressure gauge.
    - The pressure reading should move from the normal back pressure reading and snap back as the steering wheel is released.
    - If the pressure returns slowly or sticks, the rotary valve in the steering gear is sticking or the steering column is binding. Check the steering column and linkages before repairing the steering gear.

Tie-Rod Articulation Torque

NOTE: This check may be done with the steering gear on or off the vehicle.

1. Disconnect the tie-rod end from the front wheel knuckle. Refer to Section 211-02 .

2. Move the front wheel knuckle tie rod back and forth 3 times.

3. Hook a spring scale over the tie rod, the tie-rod end or the threaded portion of the front wheel knuckle tie rod, and measure the force required to move the front wheel knuckle tie rod. Refer to General Specifications, Tie-Rod Articulation Torque in this section.

4. If the force required to move the front wheel knuckle tie rod does not meet the specifications, install a new front wheel knuckle tie rod. Refer to Section 211-02 .

Steering Gear Valve

1. With the vehicle in motion, place the transmission in NEUTRAL and turn the engine OFF.
   - If the vehicle does not pull with the engine OFF, repair or install a new steering gear. Refer to Section 211-02 .

2. If the vehicle pulls with the engine OFF, switch the right side front wheel to the left side of the

vehicle and the left side front wheel to the right side of the vehicle.

3. If the vehicle pulls to the opposite side, switch the front wheels with the rear wheels keeping them on the same side of the vehicle.

4. If the vehicle pull direction does not change, check the front suspension components, wheel alignment and frame alignment. Refer to Section 204-00 or an appropriate frame dimensions manual.

Item	Specification
MERCON® Multi-Purpose Automatic Transmission Fluid XT-2-QDX (US); XT-2-LM12 (Canada)	MERCON®

WARNING: Do not mix oil types. Any mixture or any unapproved oil can lead to seal deterioration and leaks. A leak can ultimately cause loss of fluid, which can result in a loss of power steering assist. Failure to follow these instructions may result in personal injury.

1. Remove the power steering fluid reservoir cap.
2. Using a suitable suction device, remove the power steering fluid from the reservoir.
3. Disconnect the power steering fluid return hose from the reservoir.
   - Remove the clamp.
4. Plug the power steering fluid reservoir inlet port.
5. Attach an extension hose to the power steering return hose.
6. **NOTE:** Do not reuse the power steering fluid that has been flushed from the power steering system.

   Place the open end of the extension hose into a suitable container.
7. **CAUTION: Do not overfill the reservoir.**

   Fill the power steering fluid reservoir with new fluid.
8. **CAUTION: Do not allow the power steering pump to run completely dry of power steering fluid.**

   Start the engine while simultaneously turning the steering wheel to lock and then immediately turn the ignition switch to the OFF position.
9. **CAUTION: Avoid turning the steering wheel without the engine running as this may cause air to be pulled into the steering gear.**

   CAUTION: Do not overfill the reservoir.

   Fill the power steering fluid reservoir with the approved power steering fluid.

10. Repeat Steps 8 and 9, turning the steering wheel in the opposite direction each time, until the fluid exiting the power steering fluid return hose is clean and clear of foreign material.

11. Remove the extension hose from the power steering return hose.

12. Remove the plug from the power steering fluid reservoir inlet port.

13. Install the power steering return hose to the reservoir.
    - Install the clamp.

14. **NOTE:** It is necessary to correctly fill the power steering system to remove any trapped air and completely fill the power steering system components.

    If, after correctly filling the power steering system, there is power steering noise accompanied by evidence of aerated fluid and there are no fluid leaks, it may be necessary to purge the power steering system. For additional information, refer to Power Steering System Purging in this section.

    Fill the power steering system. For additional information, refer to Power Steering System Filling in this section.

Power Steering System Purging

Printable View (97 KB)

Special Tool(s)

ST1176-A	Vacuum Pump Kit 416-D002 (D95L-7559-A) or equivalent
ST2670-A	Evacuation Cap, Power Steering 211-265 or equivalent

Material

Item	Specification
MERCON® Multi-Purpose Automatic Transmission Fluid XT-2-QDX (US); XT-2-LM12 (Canada)	MERCON®

CAUTION: If the air is not purged from the power steering system correctly, premature power steering pump failure can result. The condition can occur on pre-delivery vehicles with evidence of aerated fluid or on vehicles that have had steering component repairs.

1. **NOTE:** A whine heard from the power steering pump can be caused by air in the system. The power steering purge procedure must be carried out prior to any component repair for which power steering noise complaints are accompanied by evidence of aerated fluid.

   Remove the power steering pump reservoir cap. Check the fluid.

2. Raise the front wheels off the floor. Refer to the appropriate section in Group 100 for the procedure.

3. Tightly insert the stopper of the vacuum pump into the reservoir.

4. Start the engine.

5. Install the vacuum pump, apply vacuum and maintain the maximum vacuum of 68-85 kPa (20-25 in-Hg).

6. If equipped with Hydro-Boost®, apply the brake pedal twice.

7. **CAUTION: Do not hold the steering wheel against the stops for more than 3 to 5 seconds at a time. Damage to the power steering pump can occur.**

Cycle the steering wheel fully from stop-to-stop 10 times.

8. Stop the engine.

9. Release the vacuum and remove the vacuum pump.

10. **CAUTION: Do not overfill the reservoir.**

    Fill the reservoir.
    - Use approved transmission fluid.

11. Start the engine.

12. Install the vacuum pump. Apply and maintain the maximum vacuum of 68-85 kPa (20-25 in-Hg).

13. **CAUTION: Do not hold the steering wheel against the stops for more than 3 to 5 seconds at a time. Damage to the power steering pump can occur.**

    Cycle the steering wheel fully from stop-to-stop 10 times.

14. Stop the engine, release the vacuum and remove the vacuum pump.

15. **CAUTION: Do not overfill the reservoir.**

    Fill the reservoir as needed and install the reservoir cap.

16. Visually inspect the power steering system for leaks.

17. **CAUTION: Do not overfill the reservoir.**

    Fill the reservoir as needed and visually inspect the power steering system for leaks.

18. Install the reservoir cap.

Power Steering System Filling

Printable View (98 KB)

Special Tool(s)

ST1176-A	Vacuum Pump Kit 416-D002 (D95L-7559-A) or equivalent
ST2670-A	Evacuation Cap, Power Steering 211-265 or equivalent
ST2826-A	Fill Adapter Manifold, Power Steering 211-327 or equivalent

Material

Item	Specification
MERCON® Multi-Purpose Automatic Transmission Fluid XT-2-QDX (US); XT-2-LM12 (Canada)	MERCON®

1. **CAUTION: If the air is not purged from the power steering system correctly, premature power steering pump failure can result. The condition can occur on pre-delivery vehicles with evidence of aerated fluid or on vehicles that have had steering component repairs.**

   Remove the power steering pump reservoir cap.

2. Tightly install the evacuation cap to the power steering pump reservoir.

3. Install the hose from the fill adapter manifold tee to the evacuation cap on the power steering pump reservoir.

4. Install the vacuum pump to the fill adapter manifold control valve.

5. Install the hose to the opposite fill adapter manifold control valve and submerge the open end of the hose into a container of new power steering fluid.

6. **NOTE:** The fill adapter manifold control valves are in the open position when the point of the handles face the center of the fill adapter manifold.

Close the fill adapter manifold control valve connected to the power steering fluid container.

7. Open the fill adapter manifold control valve connected to the vacuum pump.

8. Using the vacuum pump, apply 68-85 kPa (20-25 in-Hg) of vacuum to the power steering system.

9. Observe the vacuum gauge for 30 seconds.

10. If the vacuum gauge reading drops more than 3 kPa (0.88 in-Hg), correct any leaks in the power steering system or the filling tools before proceeding.

11. **NOTE:** The vacuum pump gauge reading will drop slightly during this step.

    Slowly open the fill adapter manifold control valve connected to the power steering fluid container until power steering fluid completely fills the hose.

12. Close the fill adapter manifold control valve connected to the power steering fluid container.

13. Using the vacuum pump, apply 68-85 kPa (20-25 in-Hg) of vacuum to the power steering system.

14. Close the fill adapter manifold control valve connected to the vacuum pump.

15. Slowly open the fill adapter manifold control valve connected to the power steering fluid container.

16. When the power steering fluid has drained from the hose connected to the power steering fluid container, close the fill adapter manifold control valve connected to the power steering fluid container.

17. Remove the tools from the vehicle.

18. Install the power steering reservoir cap.

19. **CAUTION: Do not hold the steering wheel against the stops for more than 3 to 5 seconds at a time. Damage to the power steering pump can occur.**

    NOTE: There will be a slight drop in the power steering fluid level in the power steering fluid reservoir when the engine is started.

    Start the engine and turn the steering wheel from stop-to-stop.

20. If equipped with Hydro-Boost®, apply the brake pedal twice.

21. Turn the ignition switch to the OFF position.

22. **CAUTION: Do not overfill the reservoir.**

    Remove the power steering reservoir cap and fill the reservoir.

23. Install the power steering reservoir cap.

Power Steering

Printable View (64 KB)

The power steering system consists of the following:

- Power steering pump
- Power steering fluid reservoir
- Rack-and-pinion steering gear
- Power steering fluid cooler (part of A/C condenser)
- Power steering pressure and return lines/hoses

Power Steering Pump

The CIII power steering pump has the following features:

- It is a belt-driven, vane-type, power steering pump.
- It is mounted directly to the engine by 3 bolts.
- The power steering pump is replaced as an assembly.
- The identification tag attached to the power steering pump indicates the model number and bar code. Refer to the identification tags when installing a new pump.

Power Steering Gear

The steering gear has the following features:

- Torsion-bar type hydraulic assisted system
- Reduces road shock and vibration
- Includes a rotary-style hydraulic valve
- Serviceable turn tubes and seals

Steering Gear Identification

The steering gear has a bar code label on the bottom LH side of the housing. The label includes the part number as well as a manufacturing code. The code is also stamped into the housing on the web between the RH and LH mounts.

- 21306A0203

The code is interpreted as follows:

- 213 — Julian Date (August1)
- 06 — Year
- A0203 — Serial Number

Power Steering

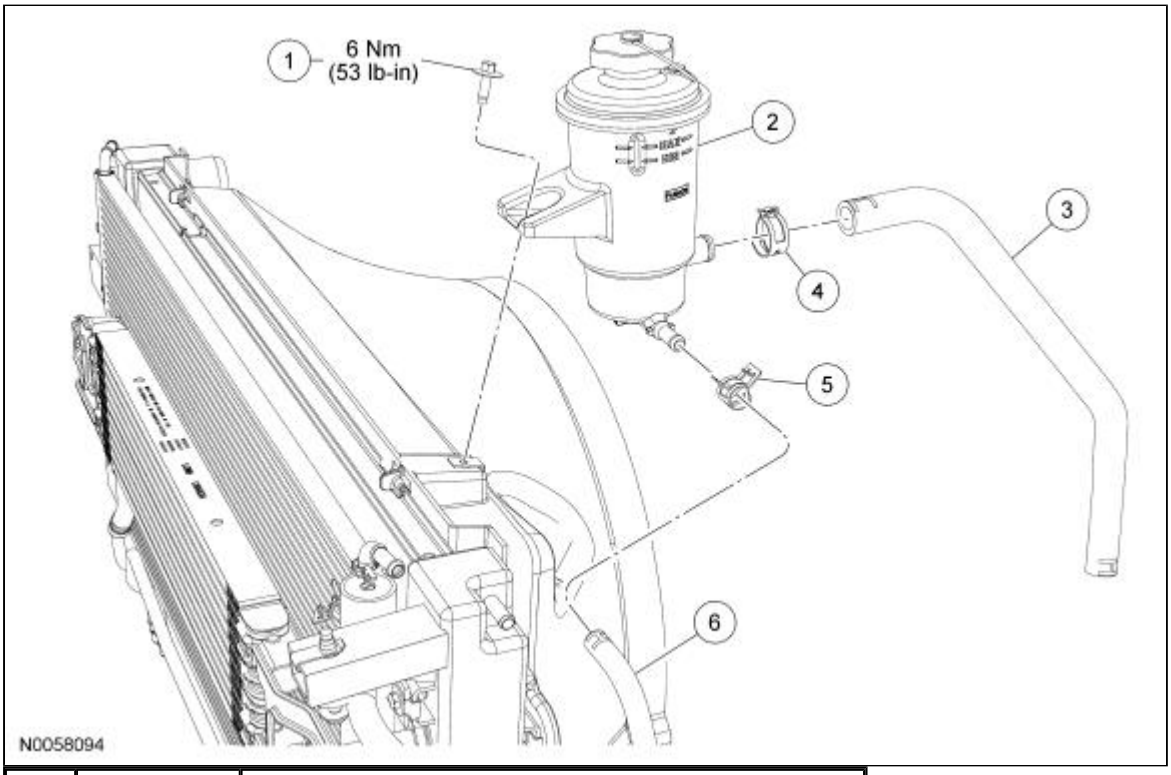
Power Steering Fluid Reservoir

Printable View (238 KB)

Material

Item	Specification
MERCON® Multi-Purpose Automatic Transmission Fluid XT-2-QDX (US); XT-2-LM12 (Canada)	MERCON®

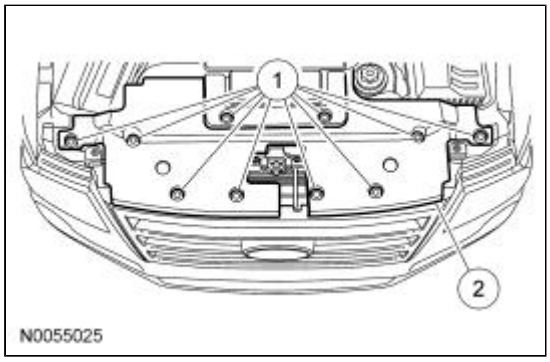


Item	Part Number	Description
1	W503924	Power steering fluid reservoir bolt
2	3A697	Power steering fluid reservoir
3	3691	Power steering fluid reservoir-to-pump supply hose
4	W525923	Clamp
5	W525960	Clamp
6	3D746	Power steering fluid cooler-to-power steering fluid reservoir hose

Removal and Installation

CAUTION: While repairing the power steering system, care should be taken to prevent the entry of contaminants or premature failure of the power steering components can result.

1. Remove the upper air deflector
    1. Remove the 10 upper air deflector pushpin-type retainers.
    2. Remove the air deflector.



2. Remove the air cleaner element. For additional information, refer to Section 303-12 .

3. Using a suitable suction device, remove the power steering fluid from the fluid reservoir.

4. Release the clamp and disconnect the power steering return hose from the power steering fluid reservoir.

5. Release the clamp and disconnect the power steering pump supply hose from the power steering fluid reservoir.

6. Remove the power steering fluid reservoir bolt and reservoir.
    - To install, tighten to 6 Nm (53 lb-in).

7. To install, reverse the removal procedure.
    - Fill the power steering system. For additional information, refer to Section 211-00 .

Power Steering Pump

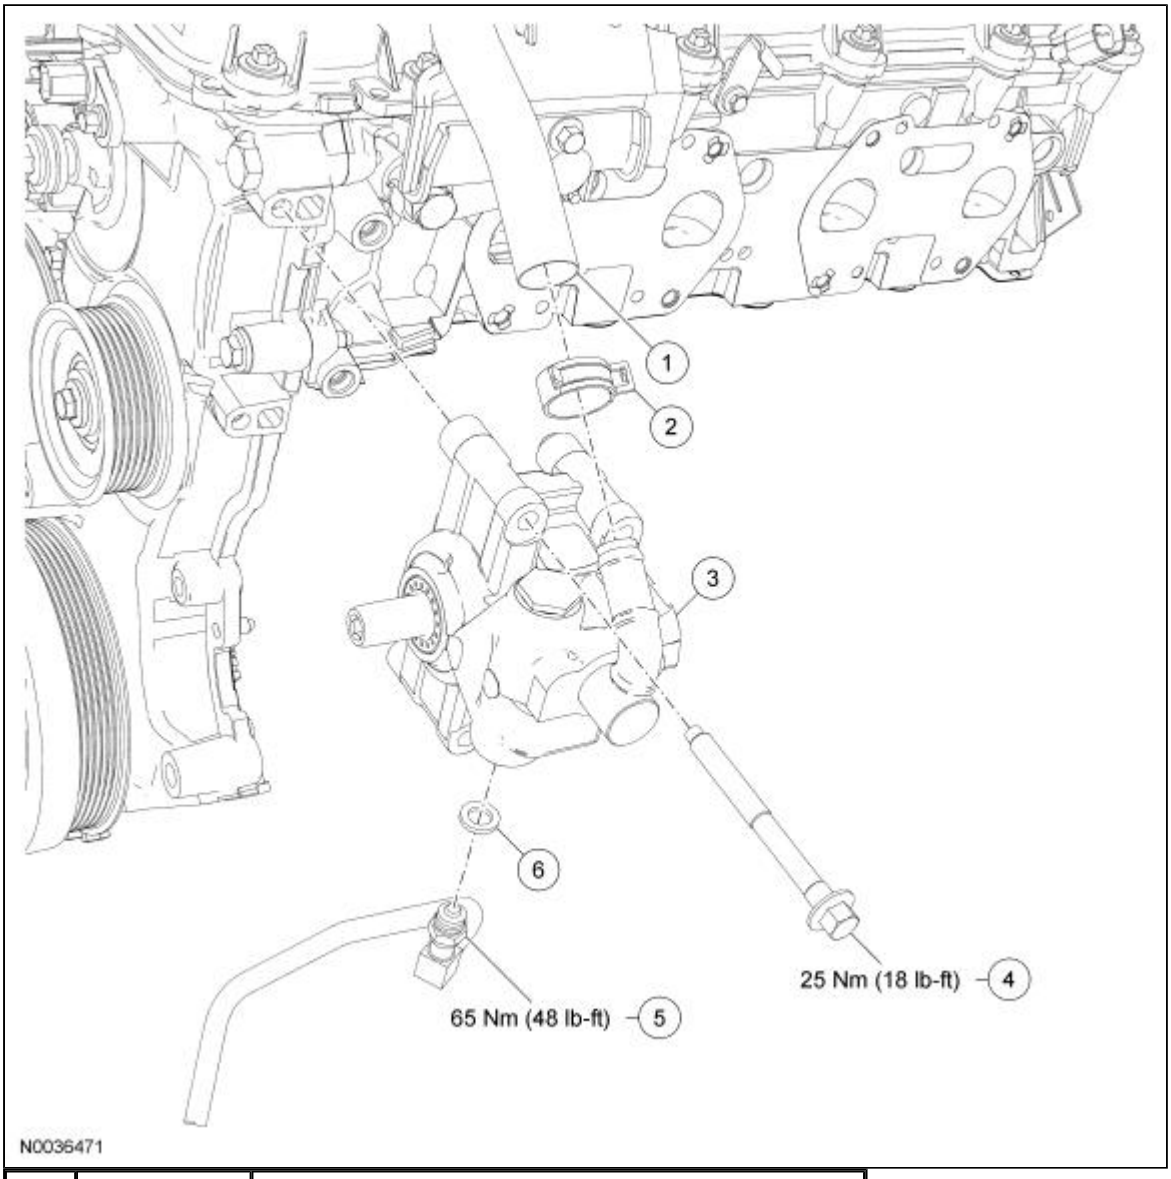
Printable View (296 KB)

Special Tool(s)

 ST1444-A	Installer Set, Teflon® Seal 211-D207 (D90P-3517-A) or equivalent

Material

Item	Specification
MERCON® Multi-Purpose Automatic Transmission Fluid XT-2-QDX (US); XT-2-LM12 (Canada)	MERCON®



Item	Part Number	Description
1	3E525	Power steering fluid reservoir-to-pump supply hose
2	W525923	Clamp
3	3A674	Power steering pump
4	W707225	Power steering pump bolt (3 required)
5	—	Power steering pressure line fitting (part of 3A719)
6	3E552	Power steering pressure line Teflon® O-ring seal

Removal and Installation

CAUTION: While repairing the power steering system, care should be taken to prevent the entry of contaminants or premature failure of the power steering components can result.

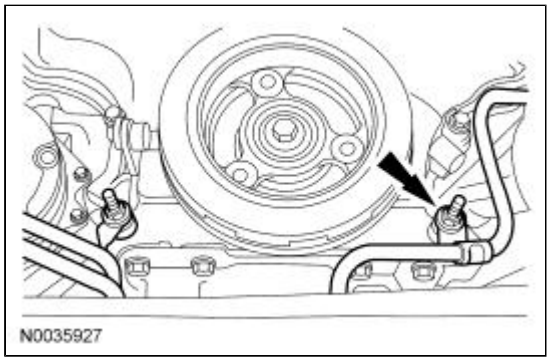
NOTE: A new Teflon® O-ring seal must be installed any time the line is disconnected from the power steering pump.

1. Remove the power steering pump pulley. For additional information, refer to Power Steering

Pump Pulley in this section.

2. Release the clamp and disconnect the supply hose from power steering pump.

3. Remove the power steering pressure line bracket-to-engine nut.
   - To install, tighten to 40 Nm (30 lb-ft).



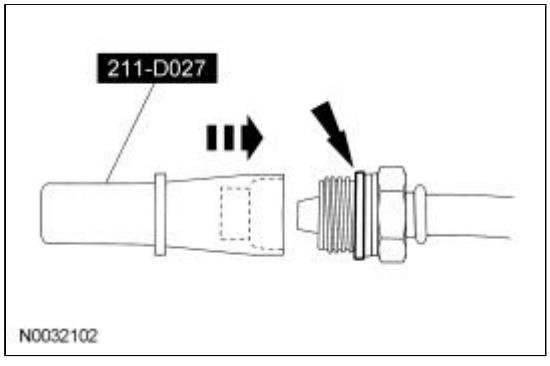
4. **NOTE:** A new Teflon® O-ring seal must be installed any time the line is disconnected from the power steering pump.

   Disconnect the power steering pressure line-to-power steering pump fitting.
   - Discard the Teflon® O-ring seal.
   - To install, tighten to 65 Nm (48 lb-ft).

5. Remove the 3 bolts and the power steering pump.
   - To install, tighten to 25 Nm (18 lb-ft).

6. **NOTE:** A new Teflon® O-ring seal must be installed any time the line is disconnected from the power steering pump.

   To install, reverse the removal procedure.
   - Using the special tool, install a new Teflon® O-ring on the pressure line-to-pump fitting.



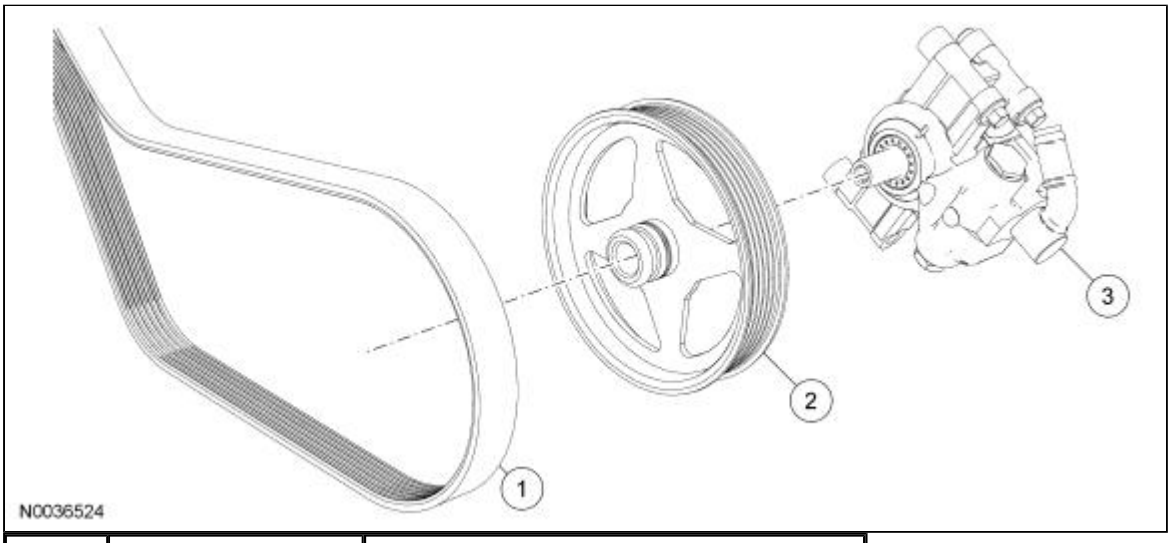
7. Fill the power steering system. For additional information, refer to Section 211-00 .

Power Steering Pump Pulley

Printable View (359 KB)

Special Tool(s)

ST1290-A	Remover, Power Steering Pump Pulley 211-016 (T69L-10300-B)
ST1586-A	Installer, Power Steering Pump Pulley 211-185 (T91P-3A733-A)

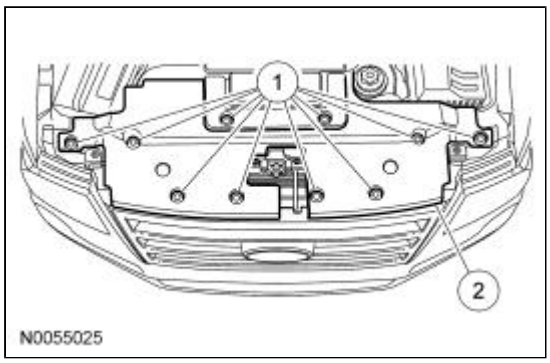


Item	Part Number	Description
1	8620	Accessory drive belt
2	3A733	Power steering pump pulley
3	3A674	Power steering pump

Removal

1. With the vehicle in NEUTRAL , position it on a hoist. For additional information, refer to Section 100-02 .

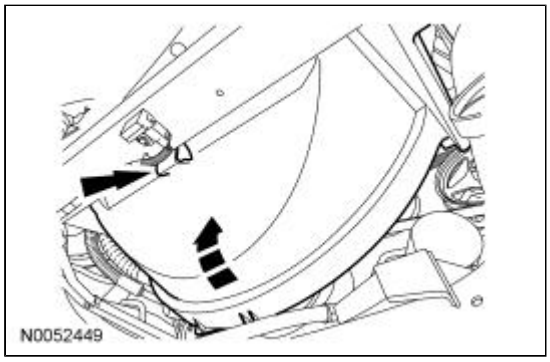
2. Remove the upper air deflector
   1. Remove the 10 upper air deflector pushpin-type retainers.
   2. Remove the air deflector.



3. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

4. Remove the 2 upper cooling fan shroud bolts.

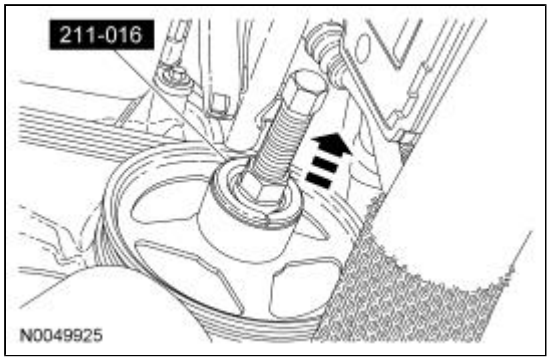
5. Release the lower cooling fan shroud tab and rotate the shroud upwards.



6. Rotate the accessory drive belt tensioner clockwise and remove the accessory drive belt from the power steering pump pulley.

7. Position the cooling fan shroud assembly upward to gain clearance to install the special tool.

8. Using the special tool, remove the power steering pump pulley.

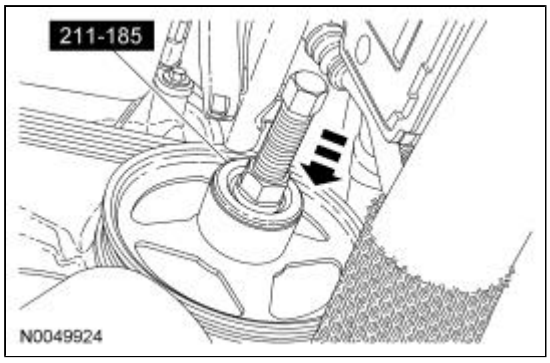


Installation

1. **CAUTION: If the pulley has been removed and installed twice, install a new power steering pump pulley.**

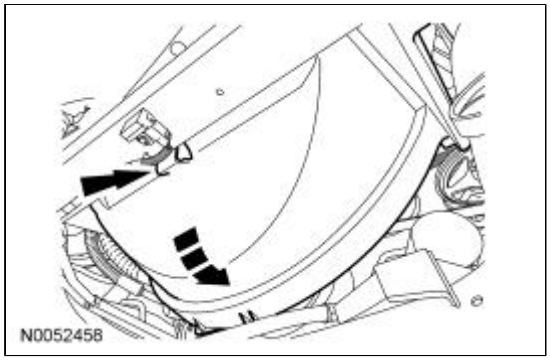
   CAUTION: Inspect the pulley for paint marks in the web area near the hub. If there are 2 paint marks, install a new pulley. If there is 1 paint mark or none at all, use a paint pencil to mark the web area of the pulley near the hub.

Using the special tool, install the power steering pump pulley.



2. Rotate the accessory drive belt tensioner clockwise and install the accessory drive belt to the power steering pump pulley. For additional information on accessory drive belt routing, refer to Section 303-05 .

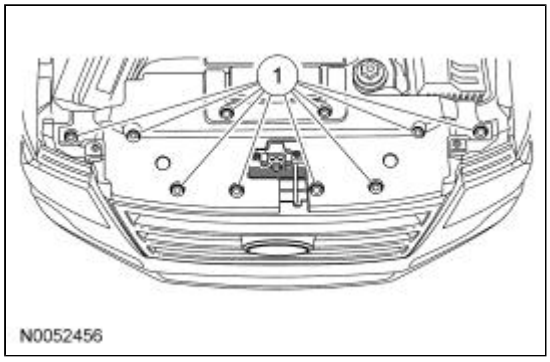
3. Lower the cooling fan shroud assembly.
   - Release the lower cooling fan shroud tab, rotate shroud downward.



4. Install the 2 upper cooling fan shroud bolts.
   - Tighten to 3 Nm (27 lb-in).

5. Install the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

6. Install the upper air deflector and the 10 pushpin-type retainers.

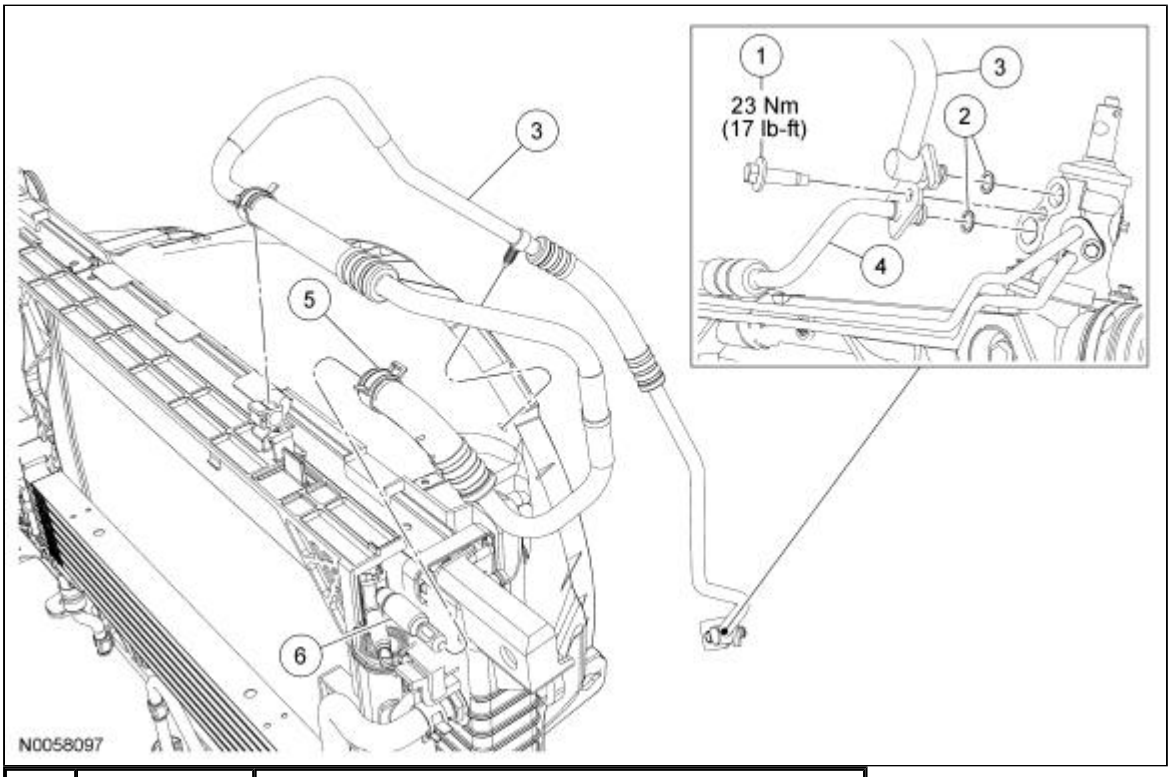


Steering Gear to Fluid Cooler Return Hose

Printable View (295 KB)

Material

Item	Specification
MERCON® Multi-Purpose Automatic Transmission Fluid XT-2-QDX (US); XT-2-LM12 (Canada)	MERCON®



Item	Part Number	Description
1	W707622	Power steering line clamp plate bolt
2	3F886/ 3F886	O-ring seals (2 required)
3	W525923	Power steering gear-to-fluid cooler return hose
4	3A719	Power pressure steering pump line
5	W525923	Power steering gear-to-fluid cooler return hose clamp

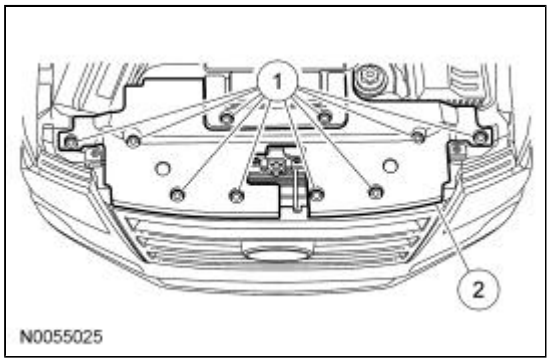
Removal and Installation

CAUTION: While repairing the power steering system, care should be taken to prevent the entry of contaminants or premature failure of the power steering components can result.

NOTE: New O-ring seals must be installed any time the lines are disconnected from the steering gear.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the upper air deflector.
    1. Remove the 10 upper air deflector pushpin-type retainers.
    2. Remove the air deflector.

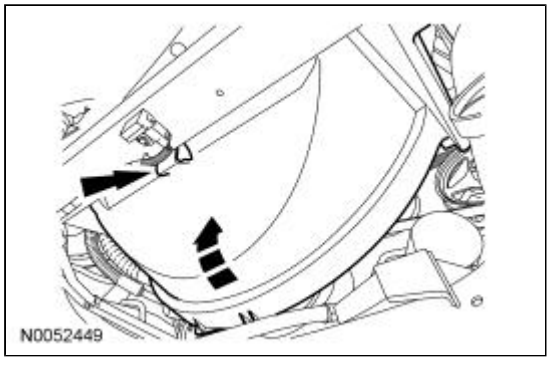


3. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

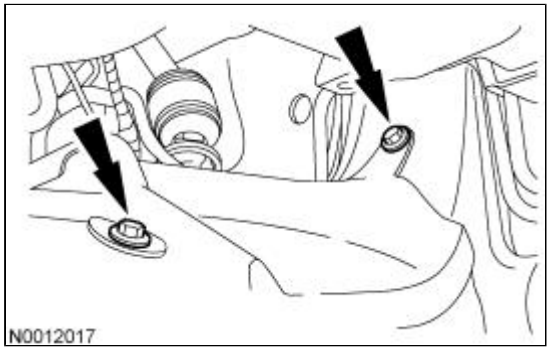
4. Release the clamp and disconnect the power steering return hose from the power steering fluid cooler.

5. Release the power steering return hose from the cooling fan shroud clips.

6. Release the lower cooling fan shroud tab and rotate the shroud upward.



7. Remove the 2 bolts and the oil drip shield.
    - To install, tighten to 11 Nm (8 lb-ft).



8. **NOTE:** New O-ring seals must be installed any time the lines are disconnected from the steering gear.

    Remove the power steering line clamp plate bolt, rotate the clamp plate and disconnect the power

steering return line from the power steering gear.

- To install, tighten to 23 Nm (17 lb-ft).
- Discard the steering line O-ring seals.

9. **NOTE:** New O-ring seals must be installed any time the lines are disconnected from the steering gear.

   To install, reverse the removal procedure.

   - Fill the power steering system. For additional information, refer to Section 211-00 .

Power Steering Pump to Steering Gear Pressure Line

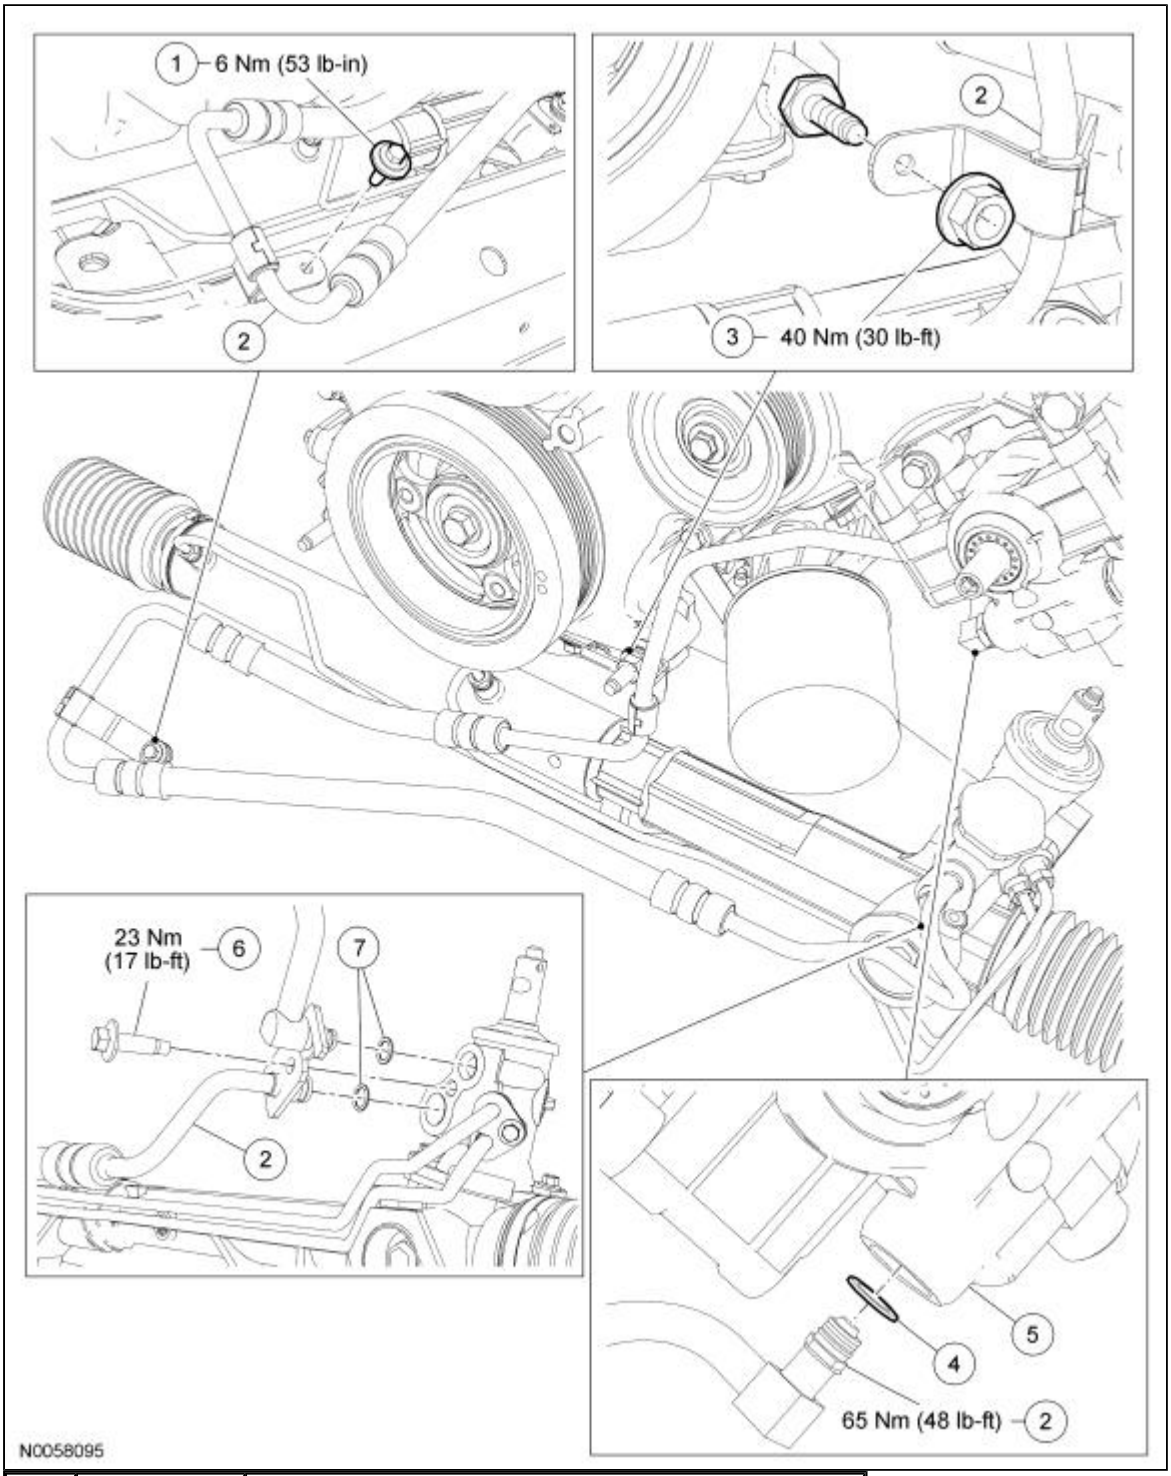
Printable View (428 KB)

Special Tool(s)

 ST1444-A	Installer Set, Teflon® Seal 211-D207 (D90P-3517-A) or equivalent

Material

Item	Specification
MERCON® Multi-Purpose Automatic Transmission Fluid XT-2-QDX (US); XT-2-LM12 (Canada)	MERCON®



Item	Part Number	Description
1	W701834	Power steering pressure line bracket-to-crossmember bolt
2	3A719	Power steering pressure lines
3	N621939	Power steering pressure line bracket-to-engine nut
4	3E552	Power steering pressure line Teflon® O-ring seal
5	3A674	Power steering pump
6	W704331	Power steering line clamp plate bolt
7	3F886	O-ring seals (2 required)

Removal and Installation

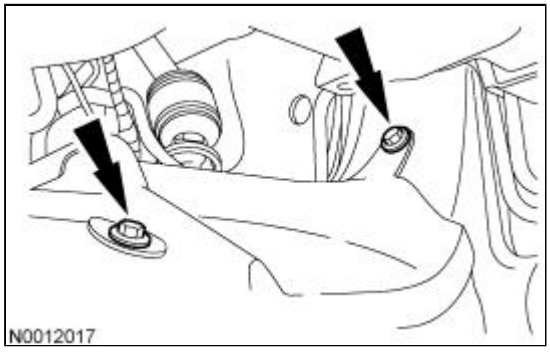
CAUTION: While repairing the power steering system, care should be taken to prevent the entry of contaminants or premature failure of the power steering components can result.

NOTE: New O-ring seals must be installed any time the lines are disconnected from the steering gear.

NOTE: A new Teflon® O-ring seal must be installed any time the power steering line is disconnected from the power steering pump.

1. Remove the power steering pump pulley. For additional information, refer to Power Steering Pump Pulley in this section.

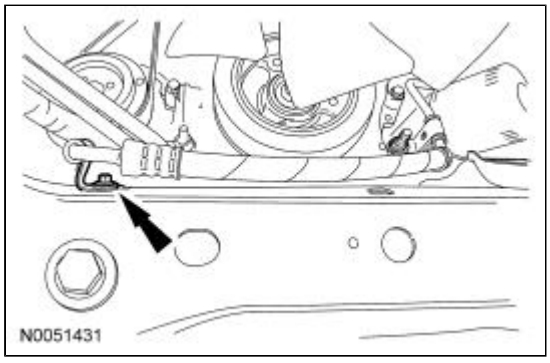
2. Remove the 2 bolts and the oil drip shield.
   - To install, tighten to 11 Nm (8 lb-ft).



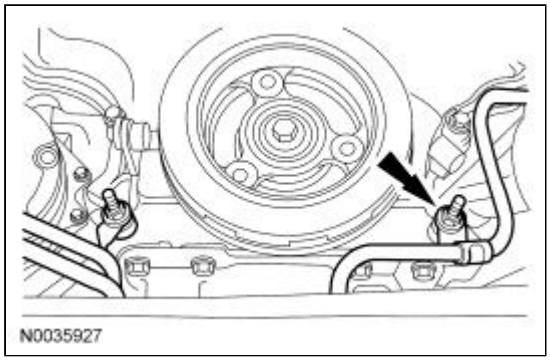
3. **NOTE:** A new Teflon® O-ring seal must be installed any time the power steering line is disconnected from the power steering pump.

   Disconnect the power steering pressure line-to-power steering pump fitting.
   - Discard the Teflon® O-ring seal.
   - To install, tighten to 65 Nm (48 lb-ft).

4. Remove the power steering pressure line bracket-to-crossmember bolt.
   - To install, tighten to 6 Nm (53 lb-in).



5. Remove the power steering pressure line bracket-to-engine nut.
   - To install, tighten to 40 Nm (30 lb-ft).



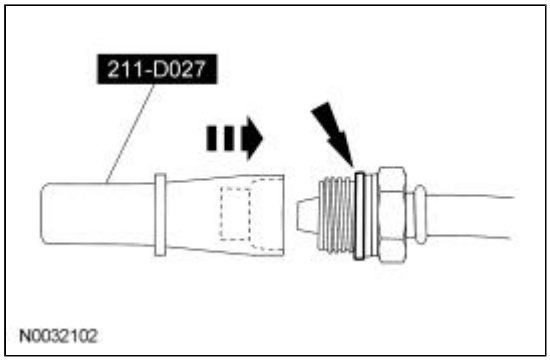
6. **NOTE:** A new O-ring seal must be installed any time the power steering line is disconnected from the power steering gear.

   Remove the power steering line clamp plate bolt, rotate the clamp plate and disconnect the power steering line.
   - Discard the O-ring seals.
     - To install, tighten to 23 Nm (17 lb-ft).

7. **NOTE:** A new O-ring seal must be installed any time the power steering line is disconnected from the power steering gear.

   NOTE: A new Teflon® O-ring seal must be installed any time the power steering line is disconnected from the power steering pump.

   To install, reverse the removal procedure.
   - Using the special tool, install a new Teflon® O-ring on the pressure line-to-pump fitting and pressure line-to-steering gear.



8. Fill the power steering system. For additional information, refer to Section 211-00 .

Power Steering Fluid Cooler

Printable View (62 KB)

1. The power steering fluid cooler is integral to the A/C condenser core. For additional information, refer to Section 412-01 .

Steering Gear

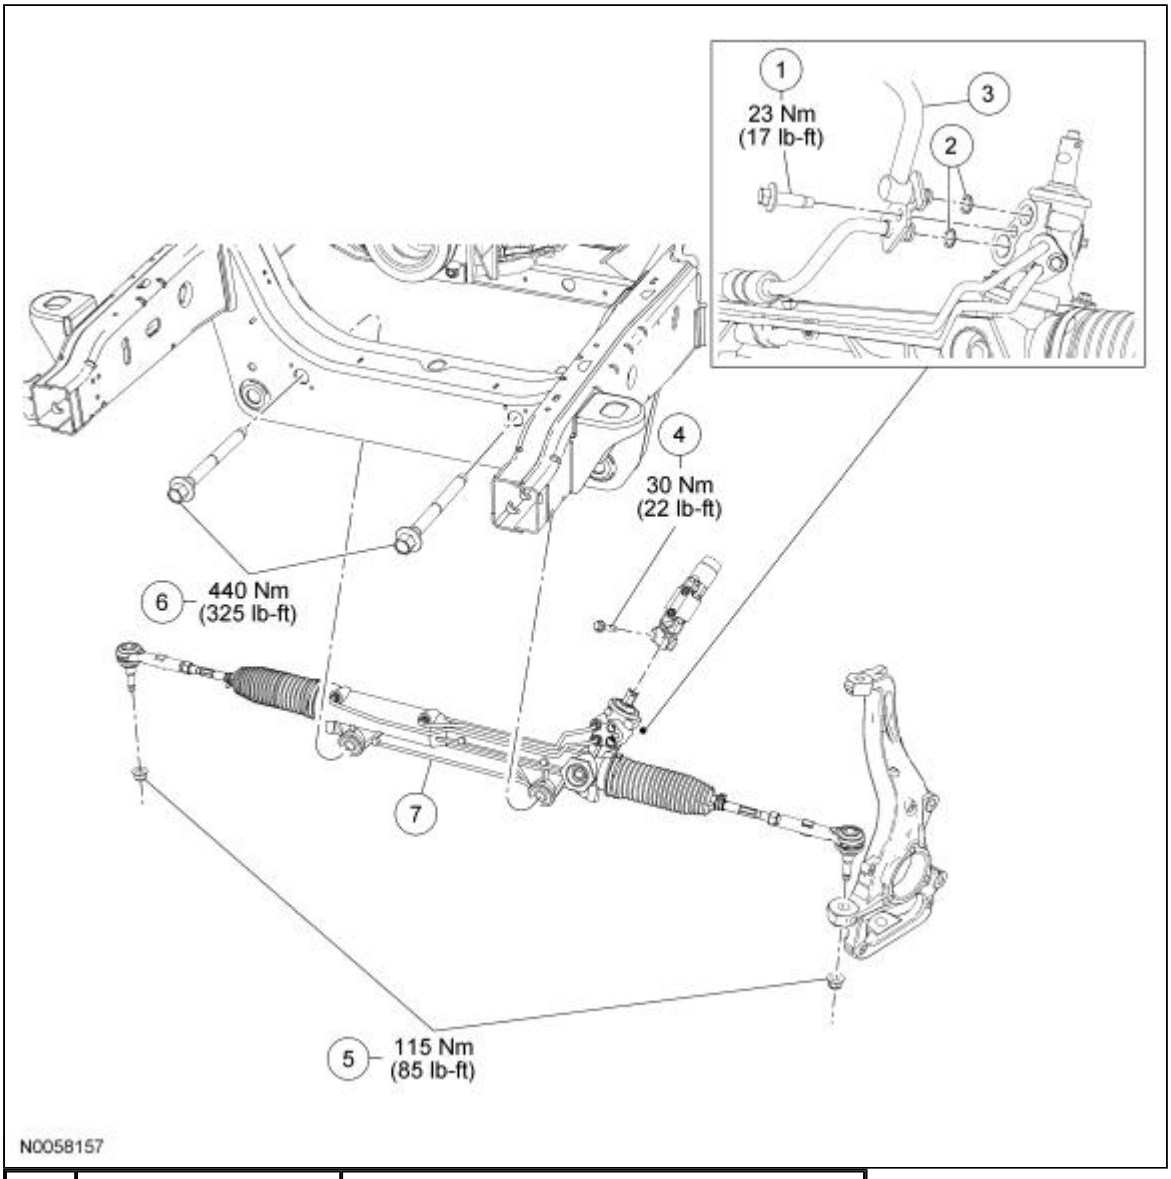
Printable View (421 KB)

Special Tool(s)

ST2945-A	Seperator, Ball Joint Tool 204-592

Material

Item	Specification
MERCON® Multi-Purpose Automatic Transmission Fluid XT-2-QDX (US); XT-2-LM12 (Canada)	MERCON®



Item	Part Number	Description
1	W707622	Power steering line clamp plate bolt
2	3F886-AA/ 3F886-BB	Power steering line O-ring seals (2 required)
3	3D746	Power steering return line
4	N808684	Steering column shaft-to-steering gear bolt
5	W520215	Outer tie-rod end nuts (2 required)
6	W711590	Steering gear bolts (2 required)
7	3504	Steering gear

Removal and Installation

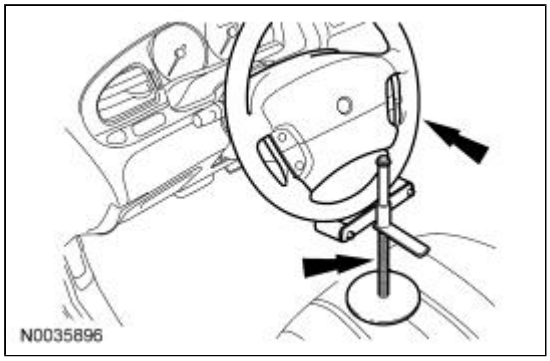
CAUTION: While repairing the power steering system, care should be taken to prevent the entry of contaminants or premature failure of the power steering components can result.

NOTE: New O-ring seals must be installed any time the lines are disconnected from the steering gear.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **CAUTION: Do not allow the steering column shaft to rotate while disconnected from the gear or damage to the clockspring can occur. if there is evidence that the steering column shaft has rotated, the clockspring must be recentered. For additional information, refer to Section 501-20B .**

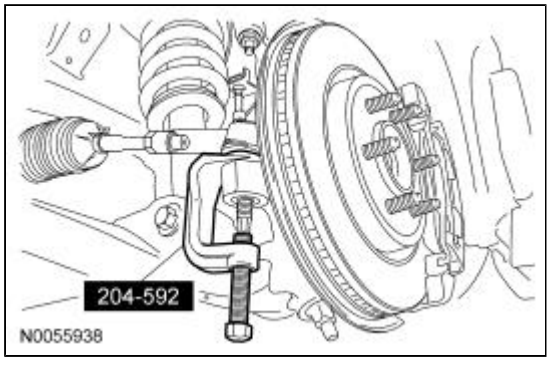
   Hold the steering wheel in the straight ahead position using a suitable holding device.



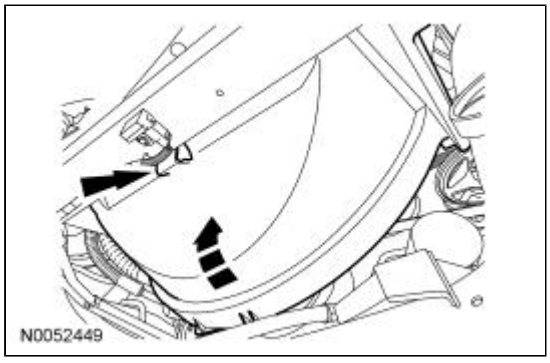
3. Remove and discard the tie-rod end nuts.

4. **CAUTION: Do not damage the tie-rod boot when installing the special tool.**

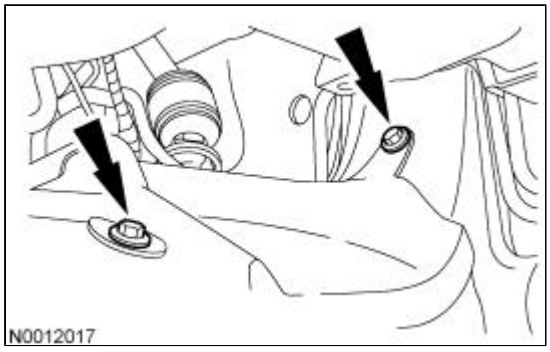
   Using the special tool, disconnect the tie-rod ends from the wheel knuckles.



5. Release the lower cooling fan shroud tab and rotate the shroud upward.



6. Remove the 2 bolts and the oil drip shield.



7. **CAUTION: Do not allow the steering column shaft to rotate while it is disconnected from the steering gear or damage to the clockspring can result. If there is evidence that the steering column shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

   Remove the steering column shaft-to-steering gear bolt and disconnect the steering column shaft from the steering gear.

8. **CAUTION: New O-ring seals must be installed any time the lines are disconnected from the steering gear.**

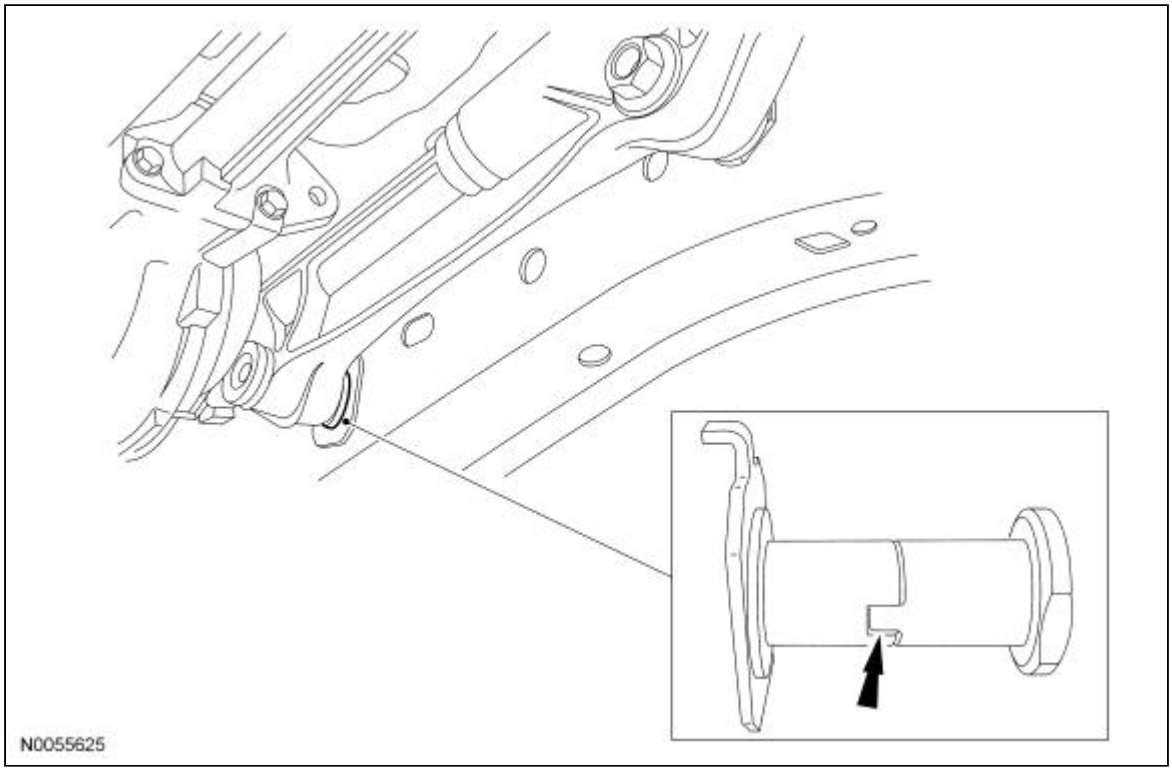
   Remove the steering line clamp plate bolt, rotate the clamp plate and disconnect the power steering lines.
   - Discard the O-rings seals.

9. Remove the 2 steering gear bolts and remove the steering gear.
   - Discard the bolts.

Installation

1. **CAUTION: Make sure the LH steering gear bushing is seated correctly or premature failure of the steering gear can occur. The RH side bushing does not have locking tabs.**

   Position the steering gear and install the 2 steering gear bolts.
   - Tighten to 440 Nm (325 lb-ft).

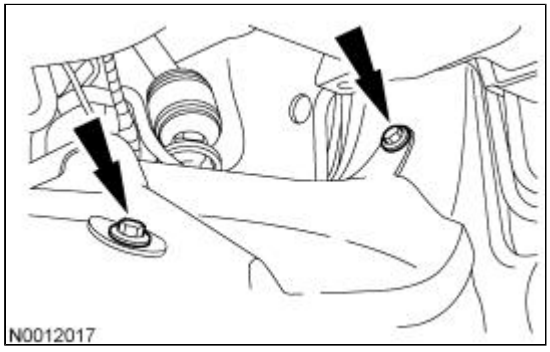


2. Connect the steering column shaft and install the bolt.
    - Tighten to 30 Nm (22 lb-ft).

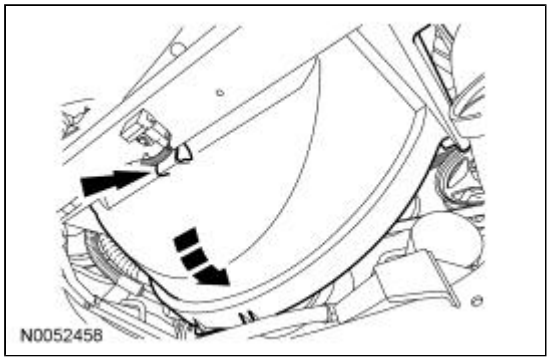
3. **NOTE:** New O-ring seals must be installed any time the line is disconnected from the power steering gear.

   Connect the steering lines, rotate the clamp plate and install the clamp plate bolt.
    - Tighten to 23 Nm (17 lb-ft).

4. Install the oil drip shield and the 2 bolts.
    - Tighten to 11 Nm (8 lb-ft).

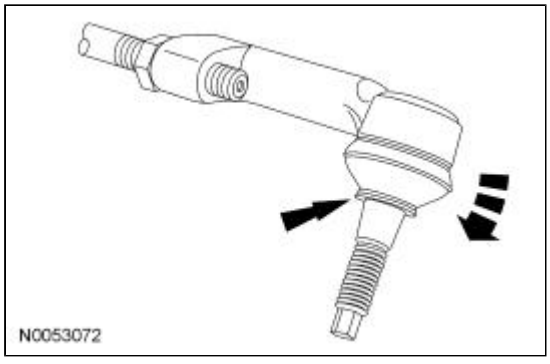


5. Release the lower cooling fan shroud tab and rotate the shroud downward.



6. **CAUTION: Make sure that the tie-rod end boots are seated correctly on the tie-rod ends or premature failure can occur.**

   Connect the tie-rod ends to the wheel knuckles and install the nuts.
   - Tighten to 115 Nm (85 lb-ft).



7. Fill the power steering system. For additional information, refer to Section 211-00 .

8. Check and, if necessary, align the front end. For additional information, refer to Section 204-00 .

Inner Tie Rod

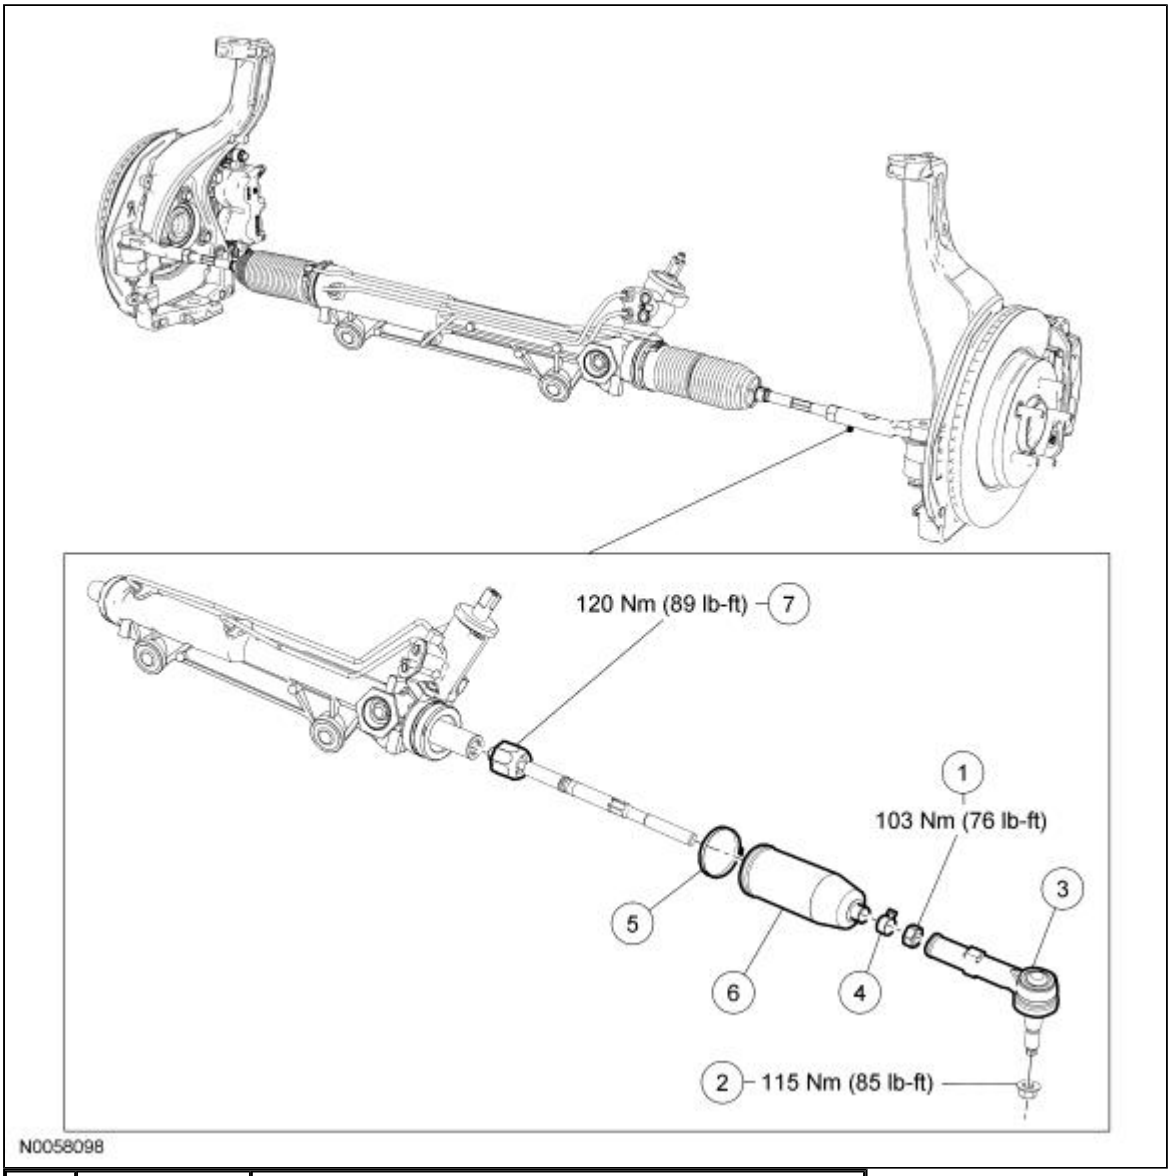
Printable View (306 KB)

Special Tool(s)

ST2945-A	Separator Ball Joint Tool 204-592
ST1427-A	Inner Tie-Rod Socket Tool 211-D029 or equivalent
 ST1525-A	Boot Clamp Pliers 205-D067 (D87P-1098-A) or equivalent

Material

Item	Specification
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B



Item	Part Number	Description
1	W711590	Outer tie-rod end jam nut (part of 3280) (2 required)
2	W520215	Outer tie-rod end nut (2 required)
3	3A130	Outer tie-rod end (2 required)
4	3C650A	Outer bellows boot clamp (2 required)
5	3C650B	Inner bellows boot clamp (2 required)
6	3K661	Steering gear bellows boot (2 required)
7	3280	Inner tie rod (2 required)

Removal

CAUTION: The steering gear bellows boots and clamps are designed to provide an airtight seal and protect the internal components of the steering gear. If the seal is not airtight, the vacuum generated during turning will draw water and contamination into the gear, causing premature damage.

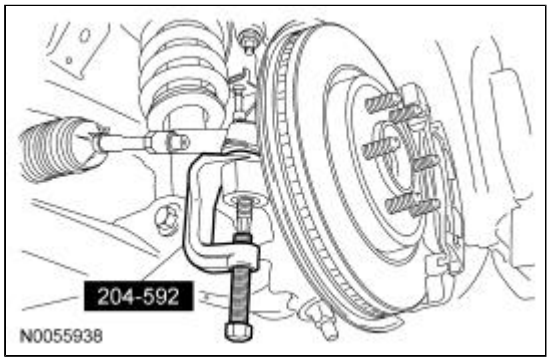
CAUTION: Zip ties do not produce an airtight seal and must not be used.

CAUTION: The inner tie-rod ball joint grease is not compatible with water. Contamination trapped in the grease will degrade the life of the joint.

CAUTION: If present, the orientation of the vent tube must be noted so the boots and vent tubes can be installed in the correct location.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Loosen the tie-rod end jam nut.
3. Remove and discard the tie-rod end nut.
4. **CAUTION: Careful not to damage the tie-rod boot when installing the special tool.**

   Using the special tool, disconnect the tie-rod end from the wheel knuckle.



5. **NOTE:** Count the number of turns required to remove the tie-rod end for reference during installation.

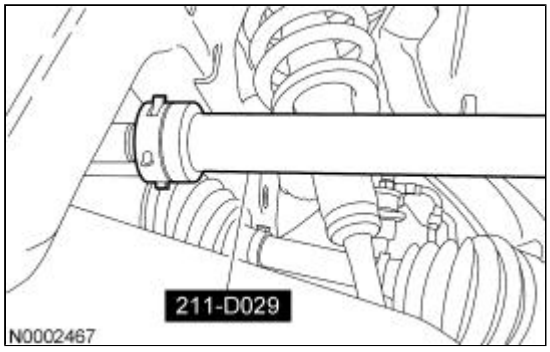
   Remove the tie-rod end.
6. Remove the tie-rod end jam nut.
7. **NOTE:** New bellows boot clamps must be installed.

   Remove and discard the inner and outer bellows boot clamp.
8. Remove the steering gear bellows boot.
9. **CAUTION: Place the steering gear at the center position. Use a 1-1/16 inch crowfoot on the flat of the rack gear to resist rotation and to prevent damage during removal and installation of the inner tie rod.**

   NOTE: If repairing the RH side, it will be necessary to pull back the LH inner tie-rod boot to hold the steering gear.

   NOTE: An assistant may be needed for removal of the RH inner tie rod.

   Using the special tool, remove the inner tie rod.

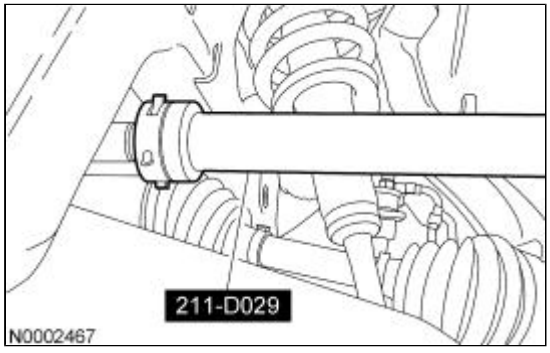


10. **CAUTION: Thoroughly remove any abrasive material. This material is extremely harmful to the steering gear.**

    Thoroughly clean and inspect all the parts to be reused. Install new parts as necessary.

Installation

1. Using the special tool, install the inner tie rod.
   - Tighten to 120 Nm (89 lb-ft).

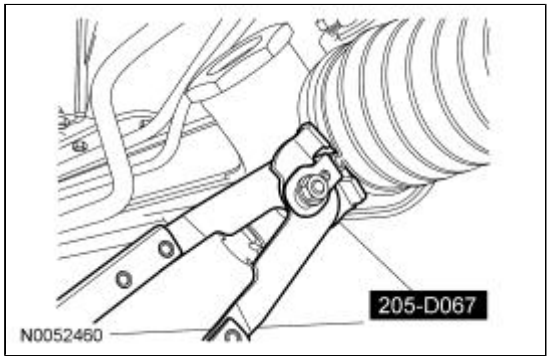


2. **NOTE:** Apply steering gear grease to the steering gear bellows boot groove in the inner tie rod.

   NOTE: Make sure the steering gear bellows boot is positioned correctly over the steering gear housing bead and the groove in the inner tie rod.

   Install the steering gear bellows boot.

3. Using the special tool, install a new inner bellows boot clamp.



4. **NOTE:** Make sure the end of the steering gear bellows is positioned between the 2 grooves on the inner tie rod or an internal leak can result.

Install a new outer bellows boot clamp.

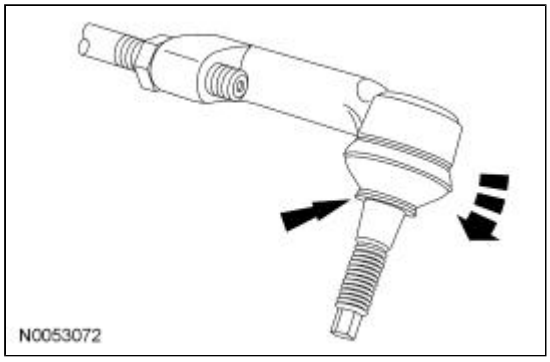
5. Thread the tie-rod end jam nut onto the inner tie rod.

6. **NOTE:** Install the tie-rod end the same number of turns as recorded during the removal.

   Install the tie-rod end to the inner tie rod.

7. **CAUTION: Make sure that the tie-rod end boots are seated correctly on the tie-rod ends or premature failure can occur.**

   Connect the tie-rod end to the wheel knuckle and install a new tie-rod end nut.
   - Tighten to 115 Nm (85 lb-ft).



8. Tighten the tie-rod end jam nut.
   - Tighten to 103 Nm (76 lb-ft).

9. Check and, if necessary, align the front end. For additional information, refer to Section 204-00 .

Principles of Operation

Steering Column

The steering column is the mechanical linkage between the steering wheel and the steering gear. It houses the steering column switches and is able to tilt to various positions for driver preference. The steering wheel is bolted to the steering column shaft that runs down the center of the steering column. The steering column shaft goes through the dash panel and connects to the steering gear. The steering column shaft connections are made by U-joint type couplings. The steering column shaft is centered by roller ball bearings, which are contained within the steering column. The power tilt steering column is controlled by an electrical motor that is activated by a rocker-type switch located on the LH side of the steering column just below the multi-function switch. When the power tilt switch is pressed, it allows the steering column to adjust up or down. The switch is not serviceable, if a new switch is needed then a new steering column lower shroud must be installed. The power tilt motor is not serviceable, if a new motor is needed then a new steering column must be installed. The other steering column switches (multi-function and ignition) are mounted to the steering column. These switches are covered by the upper and lower steering column shrouds and can be accessed by removing the shrouds.

Programming Power Tilt Steering Column Positions

A power tilt steering column position can be stored at any time.

Programming power tilt steering column positions can be accomplished by doing the following:

- To store the power tilt steering column position to memory, the driver must move the steering column to the preferred position using the power tilt switch. The driver must then depress the memory SET switch. Within 5 seconds, the driver must select a memory position. Memory No. 1 is selected by depressing the 1 switch. Memory No. 2 is selected by depressing the 2 switch.

- If no memory switch input is received within the 5 second time limit, the operation is aborted. If one of the following inputs is received during the 5 second programming limit, the operation is also aborted:
  - Power tilt switch
  - Adjustable pedal switch
  - Power driver seat switch
  - Power outside rearview mirrors switch
  - Memory SET switch

To program the remote keyless entry (RKE) transmitter, refer to Section 501-14 .

Recalling a Power Tilt Steering Column Position

Once the driver has stored a preferred power tilt steering column position, the driver can recall the setting by depressing the corresponding memory switch or by using a programmed remote transmitter. Recalling a stored power tilt steering column position can be accomplished by doing the following:

- The driver can recall a preferred power tilt steering column position by depressing one or both of the memory recall switches. Pressing memory switch 1 will initiate a recall of the power tilt steering column position stored in memory No. 1. Pressing memory switch 2 will initiate a recall of the power tilt steering column position stored in memory No. 2.
- A remote transmitter can be used to recall previously set memory positions. The remote transmitters are manufactured with an assigned personality number (1 or 2) and are so designated on the back of the remote transmitter case. The remote transmitters assigned with personalities 1 and 2 can only recall memory positions 1 and 2, respectively.
- Memory recall occurs when the unlock switch is pressed on the remote transmitters. A second press of the unlock switch, which unlocks the passenger doors, does not initiate a memory recall.
- A memory recall in progress does not prohibit the initiation of another memory recall; the most recently requested memory recall will be executed.

Easy Entry/Easy Exit

The easy exit function moves the steering column to the full upward position when the ignition key is removed from the ignition switch. The driver seat module (DSM) receives a key out command over the MS-CAN communication network and powers the steering column upward. This function will not operate if the steering column is less than the travel distance to the full upward position or the function has been deactivated. The DSM will also cancel this operation if a valid input command is received, such as the power tilt column switch or memory recall request.

The DSM will record the current steering column position before powering the steering column for an easy exit function. This recorded position will be used to return the steering column to this position on the easy entry operation. During easy entry operation, the steering column is returned to the position previous to the easy exit operation. Easy entry operation will be cancelled if a valid input command is received by the DSM.

The easy exit/easy entry feature can be activated or deactivated using a scan tool or via the message center (if equipped). Refer to Section 418-01 or the owner's literature.

Power Tilt Steering Column Hard Stop/Soft Stop

A hard stop occurs when the power tilt column physically reaches the end of travel either up or down and cannot go any further. A soft stop occurs when the power tilt column stops before physically reaching the end of travel. The hard stop is set by steering column design and cannot be changed or adjusted. The soft stop is set by the DSM. To prevent necessary stress on the power tilt column and motor, the DSM will set 2 soft stop positions, one for tilt up and one for tilt down. The DSM will use a preset distance from the hard stop to determine where the soft stop will occur.

The soft stops must be relearned by the DSM whenever a new steering column or DSM is installed. Refer to the Setting the Soft Stop procedure.

Setting the Soft Stop

Use the following procedure to set the soft stops once a new power tilt steering column or a DSM has been installed.

During the setting procedure, one second after the power tilt column reaches the full range of travel either up or down, the DSM will move the column a small amount in the opposite direction that the switch is being pressed. Once the steering column has moved this small amount the soft stop is set and the switch can be released.

1. Turn the ignition key to the ON position.
2. Press the power tilt column switch to the up position.
3. Keep the switch pressed, one second after the column reaches the full range of travel up, it will then move down a small amount. The up soft stop has been set, release the switch.
4. Press the power tilt column switch to the down position.
5. Keep the switch pressed, one second after the column reaches the full range of travel down, it will then move up a small amount. The down soft stop has been set, release the switch.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
● Power column tilt switch ● Power column tilt motor ● Steering column ● Steering column shrouds	● Circuitry ● Driver seat module (DSM)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).
5. **NOTE:** The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.

- check the scan tool connection to the VCM.
- refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record continuous memory diagnostic trouble codes (DTCs).

8. Clear the continuous DTCs and carry out the self-test diagnostics for the driver seat module (DSM).

9. If the DTCs retrieved are related to the concern, go to Driver Seat Module (DSM) Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Driver Seat Module (DSM) Diagnostic Trouble Code (DTC) Chart

DTC	Description	Source	Action

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The tilt adjustment is inoperative — using the power tilt switch	• Circuitry • Power column tilt switch • Power column tilt motor • DSM	• Go To Pinpoint Test A .

• The tilt adjustment is inoperative — using the memory SET switch	• Circuitry • Memory SET switch • Power column tilt motor • DSM	• If the seats and mirrors are also inoperative using the memory SET switch, REFER to Section 501-10 . • If only the tilt adjustment is inoperative using the memory SET switch, Go To Pinpoint Test B .
• The tilt adjustment is inoperative — using the remote transmitter	• Circuitry • Keyless entry transmitter • Power column tilt motor • DSM	• If the seats and mirrors are also inoperative using the remote transmitter, REFER to Section 501-10 . • If only the tilt adjustment is inoperative using the remote transmitter, Go To Pinpoint Test B .
• The tilt adjustment is inoperative — using the easy entry/exit feature	• Power tilt adjustment not programmed into the easy entry/exit feature • Circuitry • Power column tilt motor • DSM	• PROGRAM the power tilt into the easy entry/exit feature using the scan tool or the message center (if equipped). • If the seats and mirrors are also inoperative using the easy entry/exit feature, REFER to Section 501-10 . • If only the tilt adjustment is inoperative using the easy entry/exit feature, Go To Pinpoint Test B .

Pinpoint Tests

Pinpoint Test A: The Tilt Adjustment is Inoperative — Using the Power Tilt Switch or DTC B2341 — Tilt Steering Column Motor Stalled

Refer to Wiring Diagrams Cell 128 , Adjustable Steering Column for schematic and connector information.

Normal Operation

To tilt the steering column up, the power column tilt switch provides a ground path for the driver seat module (DSM) along circuit CPP14 (BN/WH), through the power column tilt switch and finally along circuit GD133 (BK). The DSM then provides voltage to the power column tilt motor along circuit CPP04 (GY), into the adjustable pedal motor and back into the DSM along circuit CPP05 (WH/VT).

To tilt the steering column down, the power column tilt switch provides a ground path for the DSM along circuit CPP15 (YE/VT), through the adjustable pedal switch and finally along circuit GD133 (BK). The DSM then provides voltage to the power column tilt motor along circuit CPP05 (WH/VT), into the power column tilt motor and back into the DSM along circuit CPP04 (GY).

The power column tilt motor includes a Hall-effect position sensor, the DSM supplies a reference voltage and ground to this sensor. This enables the position sensor to send a signal back to the DSM to indicate the position of the power column tilt motor. The DSM uses this information to return the column to a stored preprogrammed position when pressing the memory SET switch or a remote transmitter. Refer to Section 501-10 and the owner's guide for information on programming the DSM for storing memory seat, adjustable pedal, adjustable mirror and adjustable steering column positions.

The power tilt switch is not serviceable, if a new switch is needed then a new steering column lower shroud must be installed. The power tilt motor and Hall-effect position sensor assembly are not serviceable, if a new assembly is needed then a new steering column must be installed.

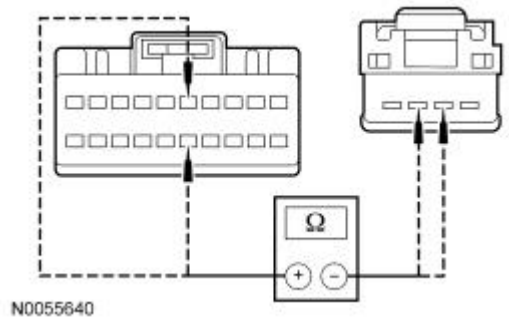
Possible Causes

- Circuit open
- Power column tilt switch
- Power column tilt motor
- DSM

PINPOINT TEST A: THE TILT ADJUSTMENT IS INOPERATIVE — USING THE POWER TILT SWITCH OR DTC B2341 — TILT STEERING COLUMN MOTOR STALLED

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
A1 CHECK THE DSM FOR CORRECT POWER TILT PIDS • Connect the diagnostic tool. • Key in ON position. • Monitor the DSM tilt steering column input switch status PIDs while activating the power tilt switch in both directions. • **Does the PID value agree with the switch position within one second of releasing the switch?**	**Yes** Go To Pinpoint Test B . **No** GO to A2 .

A2 CHECK CIRCUITS CPP14 (BN/WH) AND CPP15 (YE/VT) FOR AN OPEN
• Key in OFF position.
• Disconnect: DSM C341d.
• Disconnect: Power Tilt Switch C2250.
• Measure the resistance between:
  ▪ power tilt switch C2250-2, circuit CPP14 (BN/WH), harness side and DSM C341d-5, circuit CPP14 (BN/WH), harness side.
  ▪ power tilt switch C2250-3, circuit CPP15 (YE/VT), harness side and DSM C341d-15, circuit CPP15 (YE/VT), harness side.
  	


• **Is the resistance greater than 10,000 ohms?**
	Yes
	REPAIR the affected circuit (s). CLEAR the DTCs. REPEAT the self-test.
	
	No
	GO to A3 .

A3 CHECK CIRCUITS CPP14 (BN/WH) AND CPP15 (YE/VT) FOR A SHORT TO GROUND • Measure the resistance between ground and: ▪ power tilt switch C2250-2, circuit CPP14 (BN/WH), harness side.	**Yes** REPAIR the affected circuit (s). CLEAR the DTCs.

▪ power tilt switch C2250-3, circuit CPP15 (YE/VT), harness side.  N0055642 • **Is the resistance less than 5 ohms?**	REPEAT the self-test. **No** GO to A4 .
A4 CHECK CIRCUIT GD133 (BK) FOR AN OPEN	
• Measure the resistance between power tilt switch C2250-1, circuit GD133 (BK), harness side and ground.  N0055643 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR circuit GD133 (BK). CLEAR the DTCs. REPEAT the self-test. **No** GO to A5 .
A5 CHECK THE POWER TILT SWITCH FOR A SHORT	
• Measure the resistance between: ▪ power tilt switch C2250 pin-1 and pin-2, component side. ▪ power tilt switch C2250 pin-1 and pin-3, component side. ▪ power tilt switch C2250 pin-2 and pin-3, component side. • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new steering column lower shroud (the power tilt switch is part of the lower shroud). CLEAR the DTCs. REPEAT the self-test. **No** GO to A6 .
A6 CHECK THE POWER TILT SWITCH FOR AN OPEN	
• While pushing the switch in the up position, measure the resistance between power tilt switch C2250 pin-1 and pin-2, component side. • While pushing the switch in the down position, measure the resistance between power tilt switch C2250 pin-2 and pin-3, component side. • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new steering column lower shroud (the power tilt switch is part of the lower shroud). CLEAR the DTCs. REPEAT the self-test. **No** GO to A7 .
A7 CHECK THE DSM CONNECTOR	
• Check DSM connector C341d for: ▪ corrosion. ▪ pushed-out pins. ▪ spread terminals. • Connect: DSM C341d. • Connect: Power Tilt Switch C2250. • Make sure the connectors are seated correctly then operate	**Yes** INSTALL a new DSM. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test. **No**

the system and verify the concern is still present. • **Is the concern still present?**	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test B: The Tilt Adjustment is Inoperative — Using the Memory Set Switch/Using the Remote Transmitter/Using the Easy Entry/Exit Feature

Refer to Wiring Diagrams Cell 128 , Adjustable Steering Column for schematic and connector information.

Normal Operation

To move the power tilt column to position 1, the memory SET switch provides a ground for the driver seat module (DSM) through circuit CPS15 (VT/WH), through the memory SET switch internal resistor and finally through circuit GD133 (BK). The DSM then sends voltage to the power tilt motor through circuits CPP04 (GY) and CPP05 (WH/VT) depending on the current column position. To move the power tilt column to position 2, the memory SET switch provides a ground for the DSM through circuit CPS16 (YE), through the memory SET switch internal resistor and finally through circuit GD133 (BK).

The DSM sends voltage to the power tilt motor through circuits CPP04 (GY) and CPP05 (WH/VT) depending on the current column position. The DSM uses a Hall-effect position sensor, attached to the column motor assembly, to identify the current column position. The DSM sends a reference voltage along circuit LPP08 (BU), through the Hall-effect position sensor and back to the DSM along the signal return circuit, RPP08 (GY/BU).

The power tilt motor and Hall-effect position sensor assembly are not serviceable, if a new assembly is needed then a new steering column must be installed.

Possible Causes

- Circuit open
- Circuit shorted
- Memory SET switch
- Remote transmitter
- Power tilt motor
- DSM

PINPOINT TEST B: THE TILT ADJUSTMENT IS INOPERATIVE — USING THE MEMORY SET SWITCH/USING THE REMOTE TRANSMITTER/USING THE EASY ENTRY/EXIT FEATURE

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
B1 CHECK THE DSM FOR CORRECT POWER TILT OUTPUT	
• **NOTE:** When commanded, the DSM will move the steering column a maximum of 1 second. • Using the scan tool, activate the following DSM tilt steering column commands: TILT UP and TILT DOWN. • **Does the steering column move in the appropriate direction when commanded?**	**Yes** The system is operating correctly at this time. Concern may have been caused by a loose connector. CHECK the power tilt motor connector, the power tilt switch connector and the DSM connectors for looseness. CLEAR the DTCs. REPEAT the self-test.

	No GO to B2 .
B2 CHECK THE POWER TILT MOTOR CIRCUITS FOR AN OPEN	

• Key in OFF position.
• Disconnect: DSM C341b.
• Disconnect: DSM C341d.
• Disconnect: DSM C341e.
• Disconnect: Power Tilt Motor C227.
• Measure the resistance between:
  ▪ DSM C341b-1, circuit CPP04 (GY), harness side and power tilt switch C227-3, circuit CPP04 (GY), harness side.
  ▪ DSM C341b-9, circuit CPP05 (WH/VT), harness side and power tilt switch C227-1, circuit CPP05 (WH/VT), harness side.
  ▪ DSM C341d-6, circuit RPP08 (GY/BU), harness side and power tilt switch C227-2, circuit RPP08 (GY/BU), harness side.
  ▪ DSM C341e-7, circuit LPP08 (BU), harness side and power tilt switch C227-4, circuit LPP08 (BU), harness side.
• **Is the resistance greater than 10,000 ohms?**
	Yes
	REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
	
	No
	GO to B3 .

B3 CHECK THE POWER TILT MOTOR CIRCUITS FOR A SHORT TO GROUND	

• Measure the resistance between ground and:
  ▪ DSM C341b-1, circuit CPP04 (GY), harness side.
  ▪ DSM C341b-9, circuit CPP05 (WH/VT), harness side.
  ▪ DSM C341d-6, circuit RPP08 (GY/BU), harness side.
  ▪ DSM C341e-7, circuit LPP08 (BU), harness side.
• **Is the resistance less than 5 ohms?**
	Yes
	REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
	
	No
	GO to B4 .

B4 CHECK THE POWER TILT MOTOR CIRCUITS FOR A SHORT TO POWER	

• Key in ON position.
• Measure the voltage between ground and:
  ▪ DSM C341b-1, circuit CPP04 (GY), harness side.
  ▪ DSM C341b-9, circuit CPP05 (WH/VT), harness side.
  ▪ DSM C341d-6, circuit RPP08 (GY/BU), harness side.
  ▪ DSM C341e-7, circuit LPP08 (BU), harness side.
• **Is any voltage present?**
	Yes
	REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
	
	No
	GO to B5 .

B5 CHECK THE POWER TILT MOTOR OPERATION	
• Key in OFF position. • Connect a fused (10A) jumper wire between power tilt motor C227-1, circuit CPP04 (GY), component side and the battery positive terminal. Momentarily connect a jumper wire between power tilt motor C227-3, circuit CPP05 (WH/VT), component side. • Connect a fused (10A) jumper wire between	**Yes** GO to B6 . **No** INSTALL a new steering column (the power tilt motor is part of the steering column). CLEAR the DTCs. REPEAT the self-test. REFER to Steering Column in

power tilt motor C227-3, circuit CPP05 (WH/VT), component side and the battery positive terminal. Momentarily connect a jumper wire between power tilt motor C227-1, circuit CPP04 (GY), component side. • **Does the power tilt motor operate first in one direction and then in the opposite direction?**	this section. CLEAR the DTCs. REPEAT the self-test.

B6 CHECK THE DSM CONNECTOR
• Check DSM connectors C341b, C341d and C341e for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect: DSM C341b.
• Connect: DSM C341d.
• Connect: DSM C341e.
• Connect: Power Tilt Motor C227.
• Make sure the connectors are seated correctly then operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new DSM. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test C: DTCs B2A42 And B2A43 — Tilt Steering Column Up Switch Circuit Short to Ground and Tilt Steering Column Down Switch Circuit Short to Ground

Refer to Wiring Diagrams Cell 128 , Adjustable Steering Column for schematic and connector information.

Normal Operation

To tilt the steering column up, the power column tilt switch provides a ground path for the driver seat module (DSM) along circuit CPP14 (BN/WH), through the power column tilt switch and finally along circuit GD133 (BK). The DSM then provides voltage to the power column tilt motor along circuit CPP04 (GY), into the adjustable pedal motor and back into the DSM along circuit CPP05 (WH/VT).

To tilt the steering column down, the power column tilt switch provides a ground path for the DSM along circuit CPP15 (YE/VT), through the adjustable pedal switch and finally along circuit GD133 (BK). The DSM then provides voltage to the power column tilt motor along circuit CPP05 (WH/VT), into the power column tilt motor and back into the DSM along circuit CPP04 (GY).

The power tilt switch is not serviceable, if a new switch is needed then a new steering column lower shroud must be installed.

Possible Causes

- Circuit shorted
- Power column tilt switch
- DSM

PINPOINT TEST C: DTCS B2A42 AND B2A43 — TILT STEERING COLUMN UP SWITCH CIRCUIT SHORT TO GROUND AND TILT STEERING COLUMN DOWN SWITCH CIRCUIT SHORT TO GROUND

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
C1 CHECK CIRCUIT CPP14 (BN/WH) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: DSM C341d. • Disconnect: Power Tilt Switch C2250. • Measure the resistance between power tilt switch C2250-2, circuit CPP14 (BN/WH), harness side and ground.  N0055644 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR circuit CPP14 (BN/WH). CLEAR the DTCs. REPEAT the self-test. **No** GO to C2 .
C2 CHECK CIRCUIT CPP15 (YE/VT) FOR A SHORT TO GROUND	
• Measure the resistance between power tilt switch C2250-3, circuit CPP15 (YE/VT), harness side and ground.  N0055645 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR circuit CPP15 (YE/VT). CLEAR the DTCs. REPEAT the self-test. **No** GO to C3 .
C3 CHECK CIRCUITS CPP15 (YE/VT) AND CPP14 (BN/WH) FOR A SHORT TOGETHER	
• Measure the resistance between power tilt switch C2250-3, circuit CPP15 (YE/VT), harness side and power tilt switch C2250-2, circuit CPP14 (BN/WH), harness side.  N0055646 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the affected circuit (s). CLEAR the DTCs. REPEAT the self-test. **No** GO to C4 .
C4 CHECK THE POWER TILT SWITCH FOR A SHORT	
• Measure the resistance between: ▪ power tilt switch C2250 pin-1 and pin-2, component side.	**Yes** INSTALL a new steering column lower shroud (the

▪ power tilt switch C2250 pin-1 and pin-3, component side. ▪ power tilt switch C2250 pin-2 and pin-3, component side. • **Is the resistance less than 5 ohms?**	power tilt switch is part of the lower shroud). CLEAR the DTCs. REPEAT the self-test. **No** GO to C5 .
C5 CHECK THE DSM CONNECTORS	
• Check DSM connector C341d for: ▪ corrosion. ▪ pushed-out pins. ▪ spread terminals. • Connect: DSM C341d. • Make sure the connector is seated correctly then operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new DSM. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test D: DTCs B2334 and B2335 — Tilt Steering Column Up/Down Position Feedback Circuit Short to Battery/Open Circuit and Tilt Steering Column Up/Down Position Feedback Circuit Short to Ground

Refer to Wiring Diagrams Cell 128 , Adjustable Steering Column for schematic and connector information.

Normal Operation

The power column tilt motor includes a Hall-effect position sensor, the driver seat module (DSM) supplies a reference voltage and ground to this sensor. This enables the position sensor to send a variable voltage back to the DSM to indicate the position of the power column tilt motor. The DSM uses this information to return the column to a stored preprogrammed position when pressing the memory SET switch or a remote transmitter. Refer to Section 501-10 and the owner's literature for information on programming the DSM for storing memory seat, adjustable pedal, adjustable mirror and adjustable steering column positions.

The power tilt motor and Hall-effect position sensor assembly are not serviceable, if a new assembly is needed then a new steering column must be installed.

Possible Causes

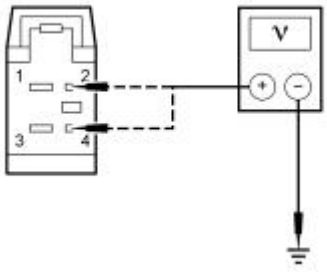
- Power tilt motor
- DSM

PINPOINT TEST D: DTCS B2334 AND B2335 — TILT STEERING COLUMN UP/DOWN POSITION FEEDBACK CIRCUIT SHORT TO BATTERY/OPEN CIRCUIT AND TILT STEERING COLUMN UP/DOWN POSITION FEEDBACK CIRCUIT SHORT TO GROUND

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

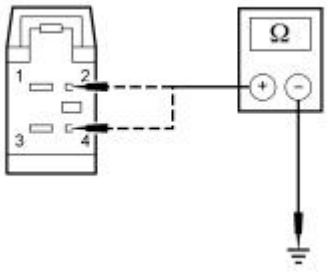
Test Step	Result / Action to Take
D1 CHECK CIRCUITS RPP08 (GY/BU) AND LPP08 (BU) FOR A	

SHORT TO VOLTAGE	

• Key in OFF position.
• Disconnect: DSM C341d.
• Disconnect: DSM C341e.
• Disconnect: Power Tilt Motor C227.
• Key in ON position.
• Measure the voltage between ground and:
  ▪ power tilt motor C227-2, circuit RPP08 (GY/BU), harness side.
  ▪ power tilt motor C227-4, circuit LPP08 (BU), harness side.
  	


N0059038
• **Is any voltage present?**
	Yes
	REPAIR the affected circuit (s). CLEAR the DTCs. REPEAT the self-test.
	
	No
	GO to D2 .

D2 CHECK CIRCUITS RPP08 (GY/BU) AND LPP08 (BU) FOR A SHORT TO GROUND	

• Key in OFF position.
• Measure the resistance between ground and:
  ▪ power tilt motor C227-2, circuit RPP08 (GY/BU), harness side.
  ▪ power tilt motor C227-4, circuit LPP08 (BU), harness side.
  	


N0059039
• **Is the resistance less than 5 ohms?**
	Yes
	REPAIR the affected circuit (s). CLEAR the DTCs. REPEAT the self-test.
	
	No
	GO to D3 .

D3 CHECK CIRCUITS RPP08 (GY/BU) AND LPP08 (BU) FOR AN OPEN	

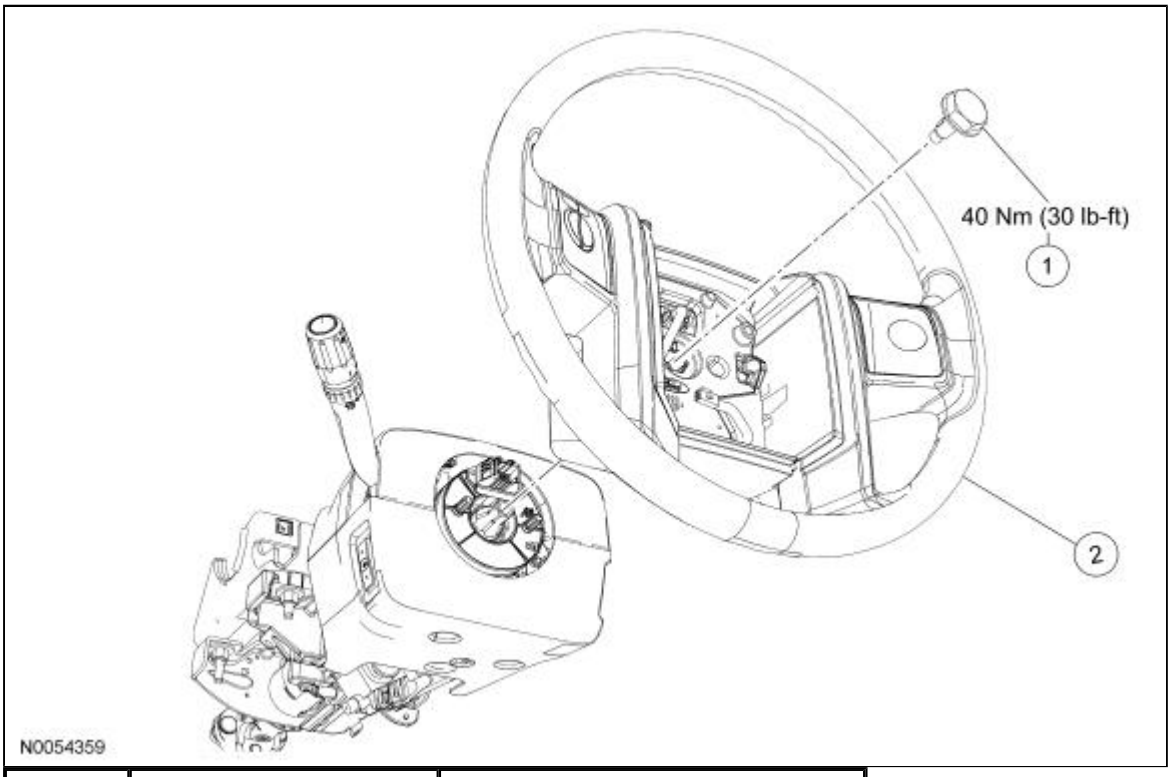
• Measure the resistance between ground and:
  ▪ power tilt motor C227-2, circuit RPP08 (GY/BU), harness side and DSM C341d-6, circuit RPP08 (GY/BU), harness side.
  ▪ power tilt motor C227-4, circuit LPP08 (BU), harness side and DSM C341e-7, circuit LPP08 (BU), harness side.
	Yes
	REPAIR the affected circuit (s). CLEAR the DTCs. REPEAT the self-test.
	
	No
	GO to D4 .

 N0059040 • **Is the resistance greater than 10,000 ohms?**	
D4 CHECK THE DSM CONNECTORS	

• Check DSM connectors C341d and C341e for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect: DSM C341d.
• Connect: DSM C341e.
• Make sure the connectors are seated correctly then operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new DSM. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Steering Wheel

Printable View (169 KB)



Item	Part Number	Description
1	N807493	Steering wheel bolt
2	3600	Steering wheel

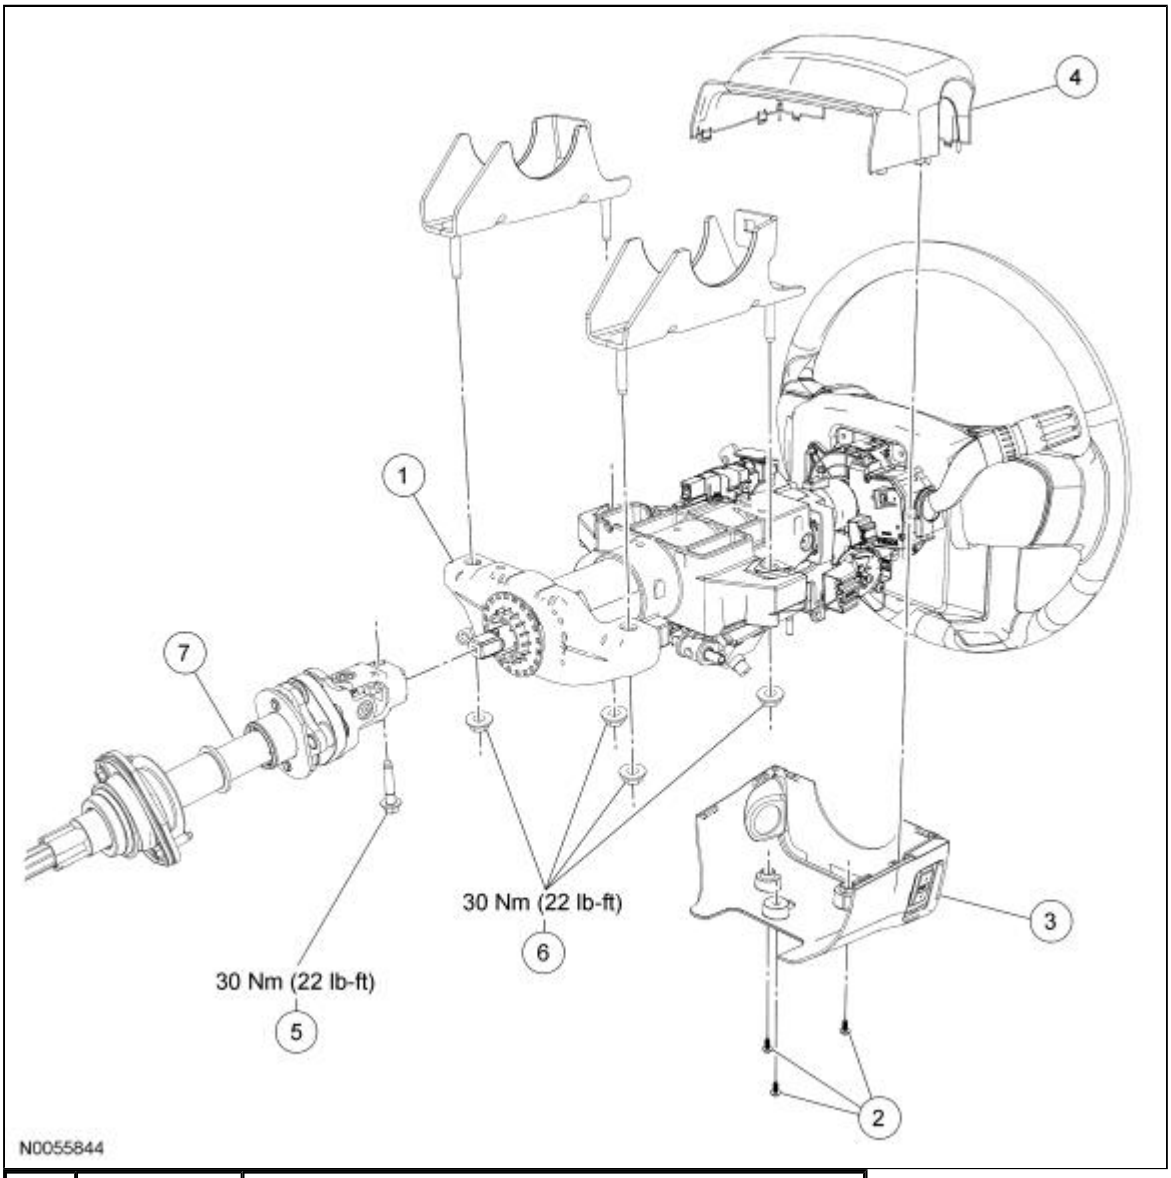
Removal and Installation

1. Remove the driver air bag module. For additional information, refer to Section 501-20B .
2. Turn the steering wheel to the straight-ahead position.
3. Remove and discard the steering wheel bolt.
   - To install, tighten to 40 Nm (30 lb-ft).
4. Remove the steering wheel while routing the wires from the clockspring through the steering wheel.
5. **NOTE:** A new steering wheel bolt must be installed.

   To install, reverse the removal procedure.

Steering Column

Printable View (401 KB)



Item	Part Number	Description
1	3C529	Steering column
2	W710485	Lower steering column shroud screws (3 required)
3	3533	Lower steering column shroud
4	3530	Upper steering column shroud
5	N808684	Upper steering column shaft-to-steering column bolt
6	N806423	Steering column support-to-instrument panel nuts (4 required)
7	14A099	Upper steering column shaft

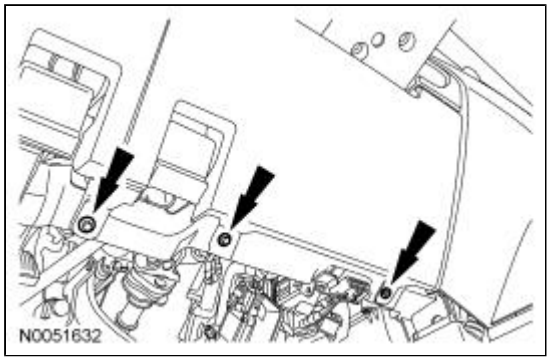
Removal and Installation

All vehicles

1. Place the steering wheel in the straight-ahead position and turn the ignition switch to the OFF position.
    - Remove the key.

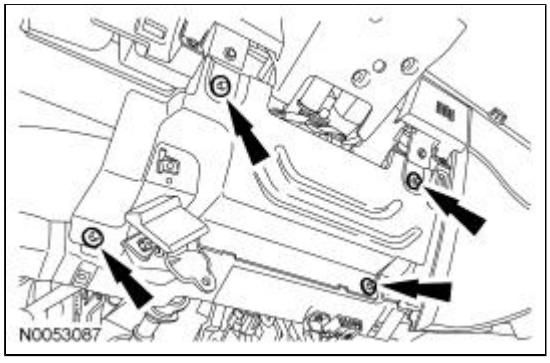
2. Depower the supplemental restraint system (SRS). For additional information, refer to Section 501-20B .

3. Remove the lower steering column opening cover.
    - Remove the 3 screws and pull out to release the top retaining clips and remove the lower steering column opening cover.



4. Remove the 2 bolts and position aside the hood release handle.

5. Remove the 4 bolts and the steering column reinforcement cover.
    - To install, tighten to 9 Nm (80 lb-in).



Vehicles with column shift

6. Release the tabs and slide the gear selector cover away from the steering column shrouds.

All vehicles

7. Remove the 3 screws and the upper and lower steering column shrouds.
    - If equipped, disconnect the power tilt electrical connector switch from the lower shroud.
    - To install, tighten to 2 Nm (18 lb-in).

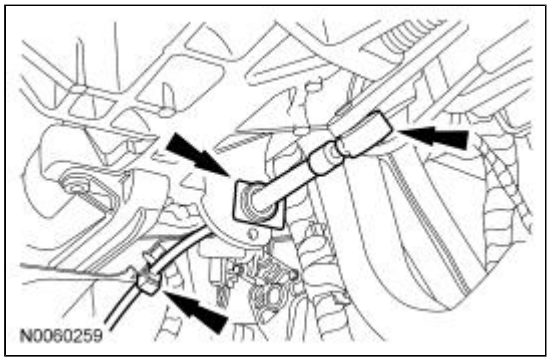
8. Disconnect the following electrical connectors.
    - Clockspring
    - PATS transceiver
    - Ignition switch
    - Multi-function switch
    - Steering angle rotational sensor
    - Key release interlock actuator (if equipped).

Vehicles with power tilt

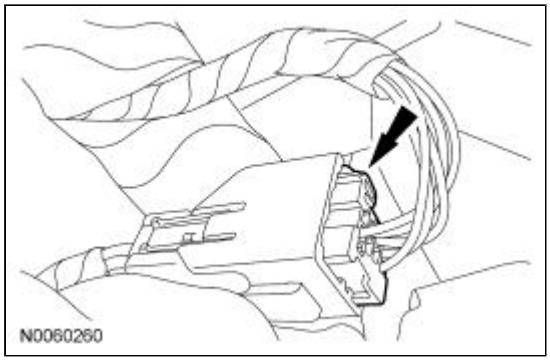
9. Disconnect the power tilt motor electrical connector.

Vehicles with column shift

10. Detach the shift cable from the steering column and the bracket.

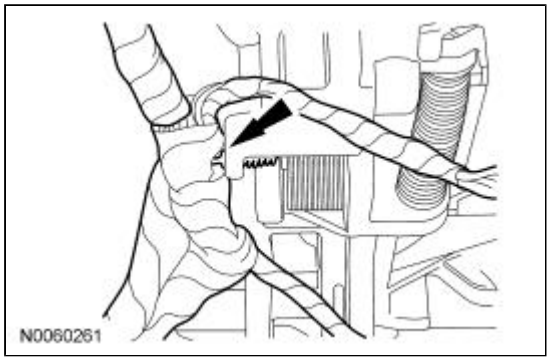


11. Disconnect the overdrive cancel switch and brake shift interlock solenoid jumper harness connector located at the top of the lower steering column support bracket.



All vehicles

12. Detach the wiring harness retainer from the steering column and position the wiring harness aside.



13. **CAUTION: Do not allow the steering column shaft to rotate while the intermediate shaft is disconnected or damage to the clockspring can result. If there is evidence that the shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

    Remove the bolt and detach the upper steering column shaft from the steering column.
    - Discard the bolt.
    - To install, tighten to 30 Nm (22 lb-ft).

14. Remove the 4 nuts and the steering column.
    - Discard the nuts.
        - To install, tighten to 30 Nm (22 lb-ft).

15. **CAUTION: Make sure that the steering column support is flush with the instrument panel before tightening the nuts.**

    CAUTION: Make sure the electrical wiring harness is routed correctly and secured to the steering column or damage to the wires and/or connectors can occur.

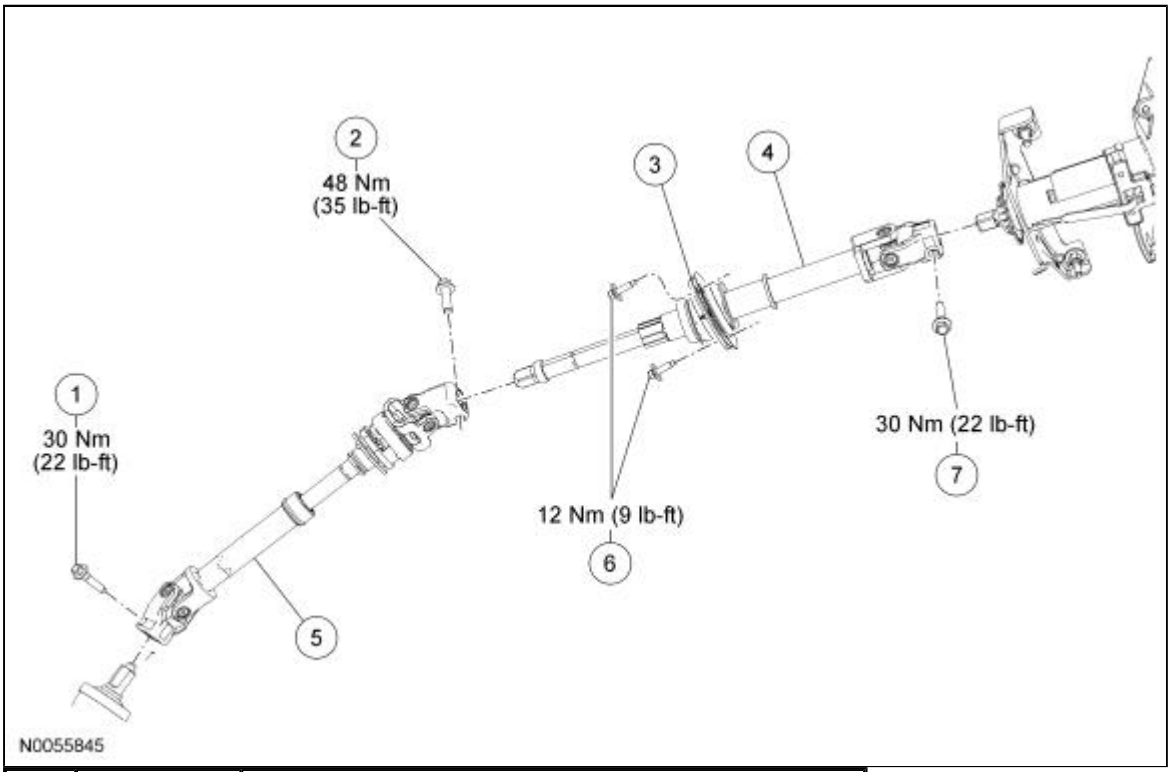
    To install, reverse the removal procedure.

Vehicles with power tilt

16. Reset the steering column soft stops. For additional information, refer to Diagnosis and Testing in this section.

Steering Column Shaft

Printable View (152 KB)



Item	Part Number	Description
1	N808684	Lower steering column shaft-to-steering gear bolt
2	N801614	Lower steering column shaft-to-upper steering column shaft bolt
3	3D677	Steering column shaft dash seal
4	3E751	Upper steering column shaft
5	3B676	Lower steering column shaft
6	W705132	Steering column shaft dash seal bolts
7	N808684	Upper steering column shaft-to-steering column bolt

Removal and Installation

1. With the vehicle in NEUTRAL, position the vehicle on a hoist. For additional information, refer to Section 100-02 .

2. Place the steering wheel and the front wheels in the straight-ahead position. Turn the ignition switch to the OFF position and remove the key.

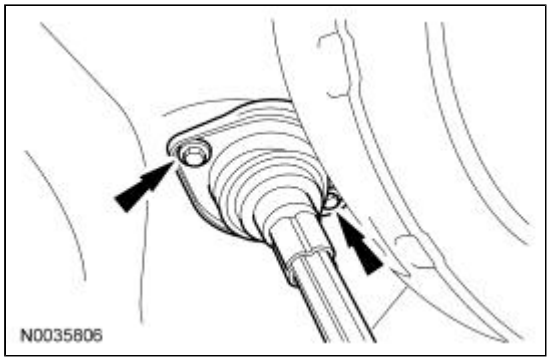
3. **CAUTION: Do not allow the steering column shaft to rotate while the intermediate shaft is disconnected or damage to the clockspring can result. If there is evidence that the shaft has rotated, the clock spring must be recentered. For additional information, refer to Section 501-20B .**

Remove the bolt and disconnect the steering column shaft from the steering column.

- Discard the bolt.
- To install, tighten to 30 Nm (22 lb-ft).

4. Remove the bolt and disconnect the upper intermediate shaft from the lower intermediate shaft.
   - Discard the bolt.
   - To install, tighten to 48 Nm (35 lb-ft).

5. Remove the 2 bolts, the dash seal and the upper intermediate shaft.
   - To install, tighten to 12 Nm (9 lb-ft).



6. Remove the bolt and disconnect the lower steering column shaft from the steering gear.
   - Discard the bolt.
   - To install, tighten to 30 Nm (22 lb-ft).

7. **CAUTION: New steering column shaft bolts must be installed.**

   To install, reverse the removal procedure.

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2574-A	Flex Probe Kit 105-R025B or equivalent

Principles of Operation

Ignition Switch

The ignition switch is controlled by the ignition lock cylinder with a key. When the ignition lock cylinder is turned using the key, a mechanical connection positions the ignition switch to the selected position and allows the ignition switch to send voltage to specific components.

Multi-function Switch

The multi-function switch (high beam/low beam, flash-to-pass, turn signal and windshield wiper) controls the various components electrically. The headlamp switch sends constant voltage to the headlamps when placed in the ON position, while the flash-to-pass is a momentary switch used to send voltage to the headlamp high beams only. The headlamp high beam/low beam switch sends voltage to the low or high beam headlamps while the headlamps are on. The turn signal switch portion of the multi-function switch operates the left and right turn signals. The windshield wiper switch function uses a ground signal to activate the various wiper modes and the wiper/washer.

Key Release Interlock Actuator

On vehicles equipped with a floor-mounted transmission selector lever, the key release interlock actuator (also known as the key removal inhibit solenoid) is an electronically controlled solenoid that prevents the ignition key from being removed from the ignition cylinder unless the transmission selector lever is in the PARK position. The actuator is mounted to the steering column directly behind the ignition cylinder.

When the transmission selector lever is placed in a position other than PARK, the park detection switch opens and the key release interlock engages. This prevents the ignition key from being removed from

the ignition cylinder.

When the transmission selector lever is placed in the PARK position, the park detection switch closes and the key release interlock disengages, allowing the ignition key to be removed from the ignition cylinder.

On vehicles equipped with a column-mounted transmission selector lever, the key release interlock actuator is a mechanically controlled device that prevents the ignition key from being removed from the ignition cylinder unless the transmission selector lever is in the PARK position.

When the transmission selector lever is placed in a position other than PARK, the shift assembly cable moves to block the ignition key from being removed from the ignition cylinder.

When the transmission selector lever is placed in the PARK position, the shift assembly cable moves to allow the ignition key to be removed from the ignition cylinder.

Inspection and Verification

1. Verify the customer concern by operating the multi-function switch or ignition switch.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Multi-function switch
• Ignition switch
• Key efforts
• Steering column shrouds
	• Battery junction box (BJB) fuse 46 (40A)
	• Smart junction box (SJB) fuse(s):
	  ▪ 27 (20A)
	  ▪ 28 (5A)
	• Circuitry
	• Instrument cluster
	• Passive anti-theft system (PATS) module
	• Wiring harness

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the powertrain control module

(PCM).

7. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
    - If the network test passes, retrieve and record continuous memory diagnostic trouble codes (DTCs).

8. Clear the continuous DTCs and carry out the self-test diagnostics for the smart junction box (SJB).

9. If the DTCs retrieved are related to the concern, go to Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Ignition Switch Mechanical Check

Test the mechanical operation of the ignition switch by rotating the lock cylinder through all switch positions. The movement should not stick or bind and should return from the START position back to the RUN position without assistance (spring return). If sticking or binding is encountered, check for the following:

- Burrs on the lock cylinder key
- Insufficient lube on the lock cylinder
- Bent or damaged the ignition rod
- Object rubbing against the ignition rod
- Excessive rubbing of the actuator against the transmission shift socket
- Binding lock cylinder
- Shroud rubbing the against lock cylinder
- Burrs or foreign material around the rack and pinion actuator in the lock cylinder housing
- Insufficient lube on the actuator (Do not apply lubricant to the inside of the ignition switch.)
- Binding ignition switch

If the steering wheel lock is engaged with the wheels loaded against a curb, high effort will be necessary to turn the key from lock. Turn the steering wheel to either side of the lock to unload the system.

Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart

DTC	Description	Source	Action
B2A20	Ignition Stuck In START	Smart junction box (SJB)	Go To Pinpoint Test F .

removed from the ignition cylinder regardless of gear selector position (vehicles equipped with a floor-mounted transmission selector lever)	• Key release interlock actuator • Park detection switch (part of the transmission selector lever)	Test F .

Pinpoint Tests

Pinpoint Test A: The Ignition Switch is Inoperative

Refer to Wiring Diagrams Cell 13 , Power Distribution/SJB for schematic and connector information.

Normal Operation

The ignition switch receives fused battery voltage along circuit SBP27 (BU/RD) from smart junction box (SJB) fuse 27 (20A). The ignition switch then sends that voltage out to various systems depending on ignition switch position. The ignition switch has 4 possible states:

- OFF — No power on any circuits
- ACC — Power on circuit CDC33 (VT/GN)
- RUN — Power on circuits CDC34 (WH/OG), CDC33 (VT/GN) and CDC32 (BN/YE)
- START — Power on circuits CDC35 (BU/WH)

Possible Causes

- Fuse
- Circuit open
- Ignition switch

PINPOINT TEST A: THE IGNITION SWITCH IS INOPERATIVE

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
A1 CHECK FOR VOLTAGE AT SJB FUSE 27 (20A)	
• Key in OFF position. • Disconnect: SJB Fuse 27 (20A). • Measure the voltage between SJB fuse 27, input side and ground.	**Yes** GO to A2 . **No** INSTALL a new SJB. TEST the system for normal operation.

 N0053987 • **Is the voltage greater than 10 volts?**	

A2 CHECK FOR VOLTAGE ON CIRCUIT SBP27 (BU/RD)
• Connect: SJB fuse 27 (20A).
• Disconnect: Ignition Switch C250.
• Measure the voltage between ground and:
  ▪ ignition switch C250-8, circuit SBP27 (BU/RD), harness side.
  ▪ ignition switch C250-9, circuit SBP27 (BU/RD), harness side.
 N0053938
• **Are the voltages greater than 10 volts?**
	Yes
	INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation.
	
	No
	VERIFY SJB fuse 27 (20A) is OK. If OK, REPAIR circuit SBP27 (BU/RD). TEST the system for normal operation.

Pinpoint Test B: No Power in ACC

Refer to Wiring Diagrams Cell 13 , Power Distribution/SJB for schematic and connector information.

Normal Operation

When the ignition switch is placed in ACC, fused ignition voltage is sent to smart junction box (SJB) C2280f-3 along circuit CDC33 (VT/GN).

Possible Causes

- Fuse(s)
- Circuit open
- Ignition switch
- Smart junction box

PINPOINT TEST B: NO POWER IN ACC

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
B1 CHECK THE IGNITION SWITCH	
• Carry out the Ignition Switch Component Test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the ignition switch OK?**	**Yes** GO to B2 . **No** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation.
B2 CHECK FOR VOLTAGE ON CIRCUIT CDC33 (VT/GN)	
• Key in OFF position. • Disconnect: SJB C2280f. • Key in ACCESSORY position. • Measure the voltage between SJB C2280f-3, circuit CDC33 (VT/GN), harness side and ground.  N0053939 • **Is the voltage greater than 10 volts?**	**Yes** VERIFY SJB fuse 43 (10A) and 45 (5A) are OK. If OK, GO to B4 . **No** GO to B3 .
B3 CHECK CIRCUIT CDC33 (VT/GN) FOR AN OPEN	
• Key in OFF position. • Disconnect: Ignition Switch C250. • Measure the resistance between ignition switch C250-5, circuit CDC33 (VT/GN), harness side and SJB C2280f-3, circuit CDC33 (VT/GN), harness side.  N0053940 • **Is the resistance greater than 10,000 ohms?**	**Yes** VERIFY SJB fuse 43 (10A) and 45 (5A) are OK. If OK, REPAIR circuit CDC33 (VT/GN). TEST the system for normal operation. **No** GO to B4 .
B4 CHECK THE SJB CONNECTORS	

• Check SJB C2208f for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminal.
• Connect: SJB C2280f.
• Make sure the connector is seated correctly, then operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or

	corroded connector.

Pinpoint Test C: No Power in RUN

Refer to Wiring Diagrams Cell 13 , Power Distribution/SJB for schematic and connector information.

Normal Operation

When the ignition switch is placed in RUN, fused ignition voltage is sent to:

- Smart junction box (SJB) C2280f-3 along circuit CDC33 (VT/GN)
- SJB C2280f-4 along circuit CDC32 (BN/YE)
- SJB C2208g-45 along circuit CDC34 (WH/OG)
- Pin 1 of the run/start relay in the battery junction box (BJB) along circuit CDC34 (WH/OG)

Fused battery voltage is provided to pin 3 of the run/start relay from BJB fuse 46 (40A).

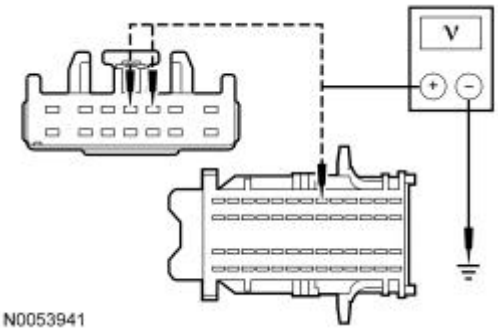
Possible Causes

- Fuse(s)
- Circuit open
- Run/start relay
- Ignition switch
- Smart junction box
- Battery junction box

PINPOINT TEST C: NO POWER IN RUN

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
C1 CHECK THE IGNITION SWITCH	
• Carry out the Ignition Switch Component Test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the ignition switch OK?**	**Yes** GO to C2 . **No** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation.
C2 CHECK FOR VOLTAGE AT THE SJB	
• Key in OFF position. • Disconnect: SJB C2280f. • Disconnect: SJB C2280g. • Key in ON position. • Measure the voltage between ground and: ▪ SJB C2280f-3, circuit CDC33 (VT/GN), harness side. ▪ SJB C2280f-4, circuit CDC32 (BN/YE), harness side. ▪ SJB C2280g-45, circuit CDC34 (WH/OG), harness side.	**Yes** GO to C3 . **No** REPAIR the affected circuit(s). TEST the system for normal operation.



N0053941

- **Are the voltages greater than 10 volts?**

C3 CHECK FOR VOLTAGE AT THE RUN/START RELAY	
• Key in OFF position. • Connect: SJB C2280f. • Connect: SJB C2280g. • Disconnect: Run/Start Relay. • Key in ON position. • Measure the voltage between run/start relay cavity 1, circuit CDC34 (WH/OG), harness side and ground.  N0053942 • **Is the voltage greater than 10 volts?**	**Yes** GO to C4 . **No** REPAIR circuit CDC34 (WH/OG). TEST the system for normal operation.
C4 CHECK THE RUN/START RELAY	
• Carry out the Mini ISO Relay Component Test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the relay OK?**	**Yes** GO to C5 . **No** INSTALL a new relay. TEST the system for normal operation.
C5 CHECK FOR VOLTAGE AT BJB FUSE 46 (40A)	
• Key in OFF position. • Connect: Run/Start Relay. • Disconnect: BJB Fuse 46.	**Yes** GO to C6 .

• Key in ON position. • Measure the voltage between BJB fuse 46 input side and ground.  • **Is the voltage greater than 10 volts?**	**No** VERIFY BJB fuse 46 (40A) is OK. If OK, INSTALL a new BJB. TEST the system for normal operation.
C6 CHECK THE SJB CONNECTORS	

• Disconnect: SJB C2280g.
• Disconnect: SJB C2280h.
• Check the connectors for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminal.
• Connect: SJB C2280g.
• Connect: SJB C2280h.
• Make sure the connectors are seated correctly, then operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test D: No Power in START

Refer to Wiring Diagrams Cell 13 , Power Distribution/SJB for schematic and connector information.

Normal Operation

When the ignition switch is placed in START, fused ignition voltage is sent to:

- Smart junction box (SJB) C2280g-32 along circuit CDC35 (BU/WH)
- SJB C2208g-45 along circuit CDC34 (WH/OG)
- Pin 1 of the run/start relay in the BJB along circuit CDC34 (WH/OG)

Fused battery voltage is provided to pin 3 of the run/start relay from BJB fuse 46 (40A) and to pin 3 of the starter motor relay from BJB fuse 40 (30A).

Possible Causes

- Fuse(s)

- Circuit open
- Run/start relay
- Starter motor relay
- Ignition switch
- Smart junction box
- Battery junction box

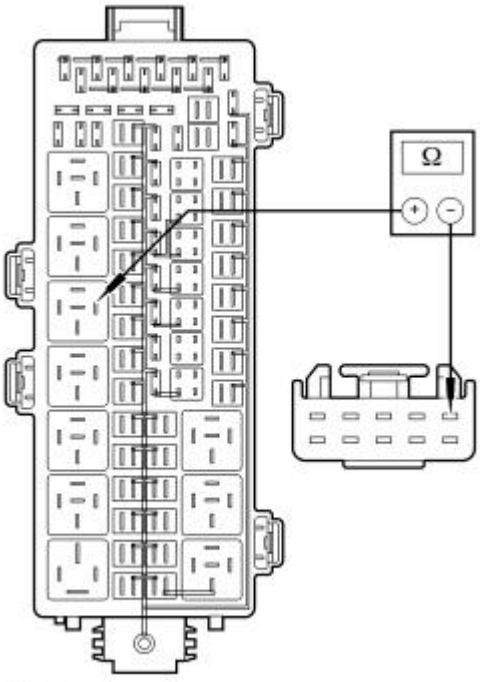
PINPOINT TEST D: NO POWER IN START

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
D1 CHECK THE IGNITION SWITCH • Carry out the Ignition Switch Component Test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the ignition switch OK?**	**Yes** GO to D2 . **No** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation.

D2 CHECK START AND RUN CIRCUITS FOR AN OPEN
• Key in OFF position.
• Disconnect: Ignition Switch C250.
• Disconnect: SJB C2280g.
• Measure the resistance between:
  ▪ ignition switch C250-7, circuit CDC32 (BN/YE), harness side and SJB C2280g-4, circuit CDC32 (BN/YE), harness side.
  ▪ ignition switch C250-10, circuit CDC35 (BU/WH), harness side and SJB C2280g-32, circuit CDC35 (BU/WH), harness side.
• **Are the resistances greater than 10,000 ohms?**
	Yes
	REPAIR the affected circuit(s). TEST the system for normal operation.
	
	No
	GO to D3 .

D3 CHECK CIRCUIT CDC34 (WH/OG) FOR AN OPEN • Disconnect: Run/Start Relay. • Measure the resistance between ignition switch C250-1, circuit CDC34 (WH/OG) and run/start relay cavity 1, circuit CDC34 (WH/OG), harness side.	**Yes** REPAIR circuit CDC34 (WH/OG). TEST the system for normal operation. **No** GO to D4 .



- **Is the resistance greater than 10,000 ohms?**

D4 CHECK THE RUN/START RELAY	
• Carry out the Mini ISO Relay Component Test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the relay OK?**	**Yes** GO to D5 . **No** INSTALL a new relay. TEST the system for normal operation.
D5 CHECK CIRCUIT CDC38 (WH/VT) FOR AN OPEN	
• Disconnect: Starter Motor Relay. • Disconnect: SJB C2280a. • Measure the resistance between SJB C2280a-8, circuit CDC38 (WH/VT), harness side and starter motor relay cavity 1, circuit CDC38 (WH/VT), harness side.	**Yes** REPAIR circuit CDC38 (WH/VT). TEST the system for normal operation. **No** GO to D6 .

 • **Is the resistance greater than 10,000 ohms?**	
D6 CHECK THE STARTER MOTOR RELAY	**Yes** GO to D7 . **No** INSTALL a new relay. TEST the system for normal operation.
• Carry out the Mini ISO Relay Component Test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the relay OK?**	
D7 CHECK THE SMART JUNCTION BOX (SJB) CONNECTORS	**Yes** INSTALL a new SJB. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

• Check SJB connectors C2280a, C2280g and C2280h for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminal.
• Connect: SJB C2280a.
• Connect: SJB C2280g.
• Connect: SJB C2280h.
• Make sure the connectors are seated correctly, then operate the system and verify the concern is still present.
• **Is the concern still present?**	

Pinpoint Test E: The Ignition Key is Hard to Turn

Normal Operation

The ignition lock cylinder is the mechanical link to the ignition switch.

Possible Causes

- Ignition switch
- Ignition key
- Ignition lock cylinder

PINPOINT TEST E: THE IGNITION KEY IS HARD TO TURN

Test Step	Result / Action to Take
E1 CHECK THE STEERING WHEEL POSITION	
NOTE: The ignition lock cylinder should return from the START position back to the RUN position without assistance. • Check to see if the steering wheel is turned and locked full left or full right. • **Is the steering wheel locked full left or full right?**	**Yes** APPLY turning effort to the steering wheel in the direction of lock while turning the key to the RUN position. TEST the system for normal operation. **No** GO to E2.
E2 CHECK THE IGNITION LOCK CYLINDER KEY	
• Check the ignition lock cylinder key for burrs, damaged key or incorrect key cut. • **Is the key OK?**	**Yes** GO to E3. **No** INSTALL a new ignition key. TEST the system for normal operation.
E3 CHECK THE IGNITION LOCK CYLINDER	
• Remove the ignition lock cylinder. Refer to Section 501-14. • Check the ignition lock cylinder by rotating the ignition lock cylinder through all of the switch positions. • **Does the ignition lock cylinder stick or bind in any of the positions?**	**Yes** INSTALL a new ignition lock cylinder. REFER to Section 501-14. **No** GO to E4.
E4 CHECK THE IGNITION LOCK CYLINDER HOUSING	
• Check for binding or sticking ignition switch actuating rod, burrs around the rack-and-pinion actuator in the ignition lock cylinder housing, or insufficient lubrication. • **Is the ignition switch actuating rod, rack-and-pinion actuator and lubrication OK?**	**Yes** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation. **No** REPAIR or LUBRICATE as necessary. TEST the system for normal operation.

Pinpoint Test F: B2A20 — Ignition Stuck in START

Refer to Wiring Diagrams Cell 13, Power Distribution/SJB for schematic and connector information.

Normal Operation

The smart junction box (SJB) continuously monitors the ignition switch state, if the SJB receives a START signal for more than 30 seconds, DTC B2A20 will be set.

The ignition switch is spring loaded to automatically return to the RUN position after being placed in the START position.

Possible Causes

- Circuit shorted
- Ignition switch
- Smart junction box

PINPOINT TEST F: B2A20 — IGNITION STUCK IN START

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
F1 CHECK THE IGNITION SWITCH MECHANICAL FUNCTION • Inspect the ignition switch for mechanical function. Refer to Ignition Switch Mechanical Check in Inspection and Verification. • **Is the ignition switch OK?**	**Yes** GO to F2 . **No** Go To Pinpoint Test E .
F2 CHECK THE IGNITION SWITCH FOR A SHORT • Carry out the ignition switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the ignition switch OK?**	**Yes** GO to F3 . **No** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation.
F3 CHECK CIRCUIT CDC35 (BU/WH) FOR A SHORT TO VOLTAGE • Key in OFF position. • Disconnect: Ignition Switch C250. • Disconnect: SJB C2280g. • Measure the voltage between ignition switch C250-10, circuit CDC35 (BU/WH), harness side and ground.  • **Is voltage present?**	**Yes** REPAIR circuit CDC35 (BU/WH). TEST the system for normal operation. **No** GO to F4 .
F4 CHECK CIRCUIT CBP28 (GY/VT) FOR A SHORT TO VOLTAGE • Disconnect: Radio C240a. • Measure the voltage between SJB C2280g-2, circuit CBP28 (GY/VT), harness side and ground.	**Yes** REPAIR circuit CBP28 (GY/VT). TEST the system for normal operation. **No** GO to F5 .

 N0053947 • **Is any voltage present?**	
F5 CHECK THE SJB FOR A SHORT TO VOLTAGE	
• Disconnect: SJB fuse 28 (5A). • Measure the voltage between SJB fuse 28 (5A), input side and ground.  N0053986 • **Is voltage present?**	**Yes** INSTALL a new SJB. REPEAT the self-test. **No** GO to F6 .
F6 CHECK THE SJB CONNECTORS	
• Check SJB connectors C2280a and C2280h for: ▪ corrosion. ▪ pushed-out pins. ▪ spread terminal. • Connect: SJB C2280a. • Connect: SJB C2280h. • Make sure the connectors are seated correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test G: DTCs B2844 and U2472 — Ignition Fault and Unexpected Ignition State

Refer to Wiring Diagrams Cell 13 , Power Distribution/SJB for schematic and connector information.

Normal Operation

The smart junction box (SJB) continuously monitors the ignition switch state. If the SJB receives an invalid ignition state or cannot receive the ignition switch state during normal operation, DTC B2844 is set. If the SJB does not receive the ignition RUN signal, or any ignition switch signal, while performing an SJB self test, DTC U2472 is set.

Possible Causes

- Circuit open
- Circuit shorted
- Ignition switch
- SJB

PINPOINT TEST G: DTCs B2844 AND U2472 — IGNITION FAULT AND UNEXPECTED IGNITION STATE

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
G1 RETRIEVE THE DIAGNOSTIC TROUBLE CODES (DTCs)	
• Connect the diagnostic tool. • Key in ON position. • Carry out the on-demand self test for the SJB. Retrieve and record any DTCs. • **Is DTC U2472 present?**	**Yes** GO to G2. **No** For DTC B2844, GO to G5. For DTC B2A20, Go To Pinpoint Test F. For all other SJB DTCs, REFER to Section 419-10.
G2 CHECK THE IGNITION SWITCH	
• Key in OFF position. • Carry out the Ignition Switch Component Test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the ignition switch OK?**	**Yes** GO to G3. **No** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation.
G3 CHECK CIRCUIT CDC33 (VT/GN) FOR AN OPEN	
• Disconnect: Ignition Switch C250. • Disconnect: SJB C2280f. • Measure the resistance between ignition switch C250-5, circuit CDC33 (VT/GN), harness side and SJB C2280f-3, circuit CDC33 (VT/GN), harness side.  N0053940 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR circuit CDC33 (VT/GN). TEST the system for normal operation. **No** GO to G4.
G4 CHECK CIRCUIT CDC34 (WH/OG) FOR AN OPEN	
• Disconnect: SJB C2280g. • Measure the resistance between ignition switch C250-1, circuit CDC34 (WH/OG), harness side and SJB C2280g-45, circuit CDC34 (WH/OG), harness side.	**Yes** REPAIR circuit CDC34 (WH/OG). TEST the system for normal operation.

 • **Is the resistance greater than 10,000 ohms?**	**No** GO to G7 .
G5 CHECK THE IGNITION CIRCUITS FOR A SHORT TO VOLTAGE	

• Key in OFF position.
• Disconnect: Ignition Switch C250.
• Disconnect: SJB C2280g.
• Disconnect: SJB C2280f.
• Disconnect: Run/Start Relay.
• Measure the voltage between ground and:
  ▪ SJB C2280f-3, circuit CDC33 (VT/GN), harness side.
  ▪ SJB C2280f-4, circuit CDC32 (BN/YE), harness side.
  ▪ SJB C2280g-32, circuit CDC35 (BU/WH), harness side.
  ▪ SJB C2280g-45, circuit CDC34 (WH/OG), harness side.
  ▪ run/start relay cavity 1, circuit CDC34 (WH/OG), harness side.
• **Is voltage present?**
	Yes
	REPAIR the affected circuit(s). TEST the system for normal operation.
	
	No
	GO to G6 .

G6 CHECK THE IGNITION CIRCUITS FOR AN OPEN	

• Measure the resistance between:
  ▪ ignition switch C250-5, circuit CDC33 (VT/GN), harness side and SJB C2280f-3, circuit CDC33 (VT/GN), harness side.
  ▪ ignition switch C250-7, circuit CDC32 (BN/YE), harness side and SJB C2280f-4, circuit CDC32 (BN/YE), harness side.
  ▪ ignition switch C250-10, circuit CDC35 (BU/WH), harness side and SJB C2280g-32, circuit CDC35 (BU/WH), harness side.
  ▪ ignition switch C250-1, circuit CDC34 (WH/OG), harness side and SJB C2280g-45, circuit CDC34 (WH/OG), harness side.
  ▪ ignition switch C250-1, circuit CDC34 (WH/OG), harness side and run/start relay cavity 1, circuit CDC34 (WH/OG), harness side.
• **Are any of the resistances greater than 10,000 ohms?**
	Yes
	REPAIR the affected circuit(s). TEST the system for normal operation.
	
	No
	GO to G7 .

G7 CHECK THE SJB CONNECTORS	

• Check SJB connectors C2280g and C2280f for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminal.
• Connect: SJB C2280g.
• Connect: SJB C2280f.
• Make sure the connectors are seated correctly, then operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test H: The Key Release Interlock Actuator is Inoperative

Refer to Wiring Diagrams Cell 37 , Shift Interlock for schematic and connector information.

Normal Operation

The key release interlock actuator receives fused battery voltage from smart junction box (SJB) fuse 27 (20A) along circuit SBP27 (BU/RD). Ground for the actuator is provided along circuit CDC41 (WH/BN), through the park detection switch and then along circuit GD143 (BK/VT). When the transmission selector lever is placed in PARK, the park detection switch closes and circuit CDC41 (WH/BN) is connected to circuit GD143 (BK/VT), this grounds the key release actuator and prevents the key from being removed.

Possible Causes

- Circuit open
- Circuit shorted
- Key release interlock actuator
- Park detection switch (part of the transmission selector lever assembly)

PINPOINT TEST H: THE KEY RELEASE INTERLOCK ACTUATOR IS INOPERATIVE

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

Test Step	Result / Action to Take
H1 CHECK CIRCUIT SBP27 (BU/RD) FOR VOLTAGE	
NOTE: Battery voltage must be greater than 10 volts. • Key in OFF position. • Disconnect: Key Release Interlock Actuator C2139. • Measure the voltage between key release interlock actuator C2139-1, circuit SBP27 (BU/RD), harness side and ground.  N0058221 • **Is the voltage greater than 10 volts?**	**Yes** GO to H2 . **No** VERIFY SJB fuse 27 (20A) is OK. If OK, REPAIR circuit SBP27 (BU/RD). TEST the system for normal operation.
H2 CHECK CIRCUIT CDC41 (WH/BN) FOR A SHORT	
• Disconnect: Floor Shifter C2096. • Measure the resistance between key release interlock actuator C2139-2, circuit CDC41 (WH/BN), harness side and ground.	**Yes** REPAIR circuit CDC41 (WH/BN). TEST the system for normal operation. **No** GO to H3 .

 N0058222 • **Is the resistance less than 5 ohms?**	
H3 CHECK CIRCUIT CDC41 (WH/BN) FOR AN OPEN	
• Measure the resistance between key release interlock actuator C2139-2, circuit CDC41 (WH/BN), harness side and floor shifter C2096-2, circuit CDC41 (WH/BN), harness side.  N0058223 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR circuit CDC41 (WH/BN). TEST the system for normal operation. **No** GO to H4 .
H4 CHECK CIRCUIT GD143 (BK/VT) FOR AN OPEN	
• Measure the resistance between floor shifter C2096-4, circuit GD143 (BK/VT), harness side and ground.  N0058224 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR circuit GD143 (BK/VT). TEST the system for normal operation. **No** GO to H5 .
H5 CHECK THE KEY RELEASE INTERLOCK ACTUATOR FOR AN OPEN	
NOTE: At room temperature, the resistance across the solenoid should be 50 ± 10 ohms. • Measure the resistance between key release interlock actuator C2139, pin-1 and pin-2, component side. • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new key release interlock actuator. REFER to Key Release Interlock Actuator in this section. TEST the system for normal operation. **No** GO to H6 .
H6 CHECK THE KEY RELEASE INTERLOCK ACTUATOR FOR A SHORT	

NOTE: At room temperature, the resistance across the solenoid should be 50 ± 10 ohms. • Measure the resistance between key release interlock actuator C2139 pin-1 and pin-2, component side. • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new key release interlock actuator. REFER to Key Release Interlock Actuator in this section. TEST the system for normal operation. **No** GO to H7 .
H7 CHECK THE PARK DETECTION SWITCH FOR AN OPEN	
• With the transmission selector lever in PARK, measure the resistance between floor shifter C2096 pin-1 and pin-2, component side. • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new floor shift selector lever assembly. REFER to Section 307-05 . TEST the system for normal operation. **No** GO to H8 .
H8 CHECK THE PARK DETECTION SWITCH FOR A SHORT	
• With the transmission selector lever in NEUTRAL, measure the resistance between floor shifter C2096 pin-1 and pin-2, component side. • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new floor shift selector lever assembly. REFER to Section 307-05 . TEST the system for normal operation. **No** The system is functioning correctly at this time. The concern may have been caused by a loose or corroded connection. INSPECT the electrical connectors, REPAIR as necessary. TEST the system for normal operation.

Component Tests

Ignition Switch Continuity Check

Refer to Wiring Diagrams Cell 149 for schematic and connector information.

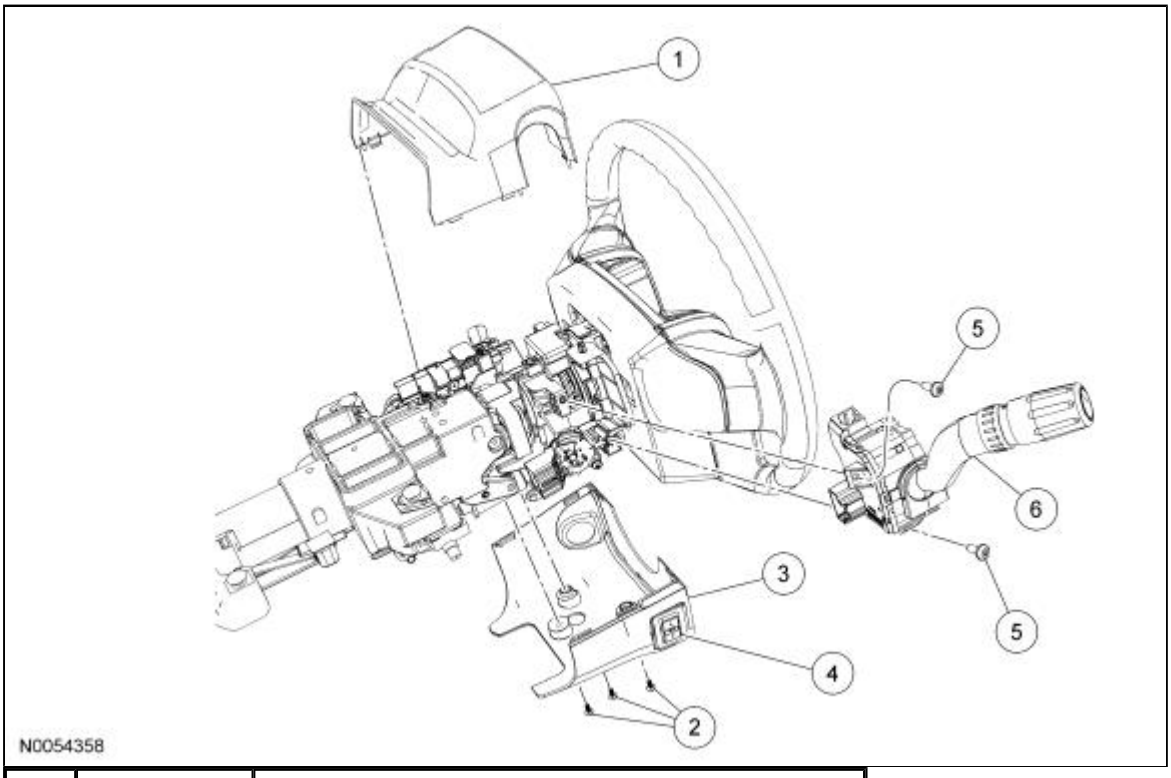
Multi-function Switch

Refer to Wiring Diagrams Cell 149 for schematic and connector information.

Steering Column Multifunction Switch

Printable View (207 KB)

NOTE: Power tilt column shown, manual tilt similar.

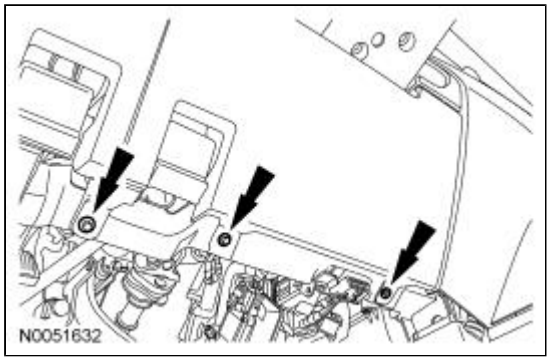


Item	Part Number	Description
1	3530A	Upper steering column shroud
2	W710485	Lower steering column shroud screws (3 required)
3	3530B	Lower steering column shroud
4	3B504	Power tilt switch
5	W506943	Multi-function switch screws (2 required)
6	13K359	Multi-function switch

Removal and Installation

All vehicles

1. Remove the 3 screws, pull out to release the top retaining clips and remove the lower steering column opening cover.



Vehicles with power tilt

2. Remove the 3 screws and the upper and lower steering column shrouds.
    - Disconnect the power tilt electrical connector switch from the lower shroud.

Vehicles with manual tilt

3. If equipped, release the tabs and slide the gear selector cover away from the steering column shrouds.

4. Remove the 3 screws and the upper and lower steering column shrouds.

All vehicles

5. Disconnect the multi-function switch electrical connector.

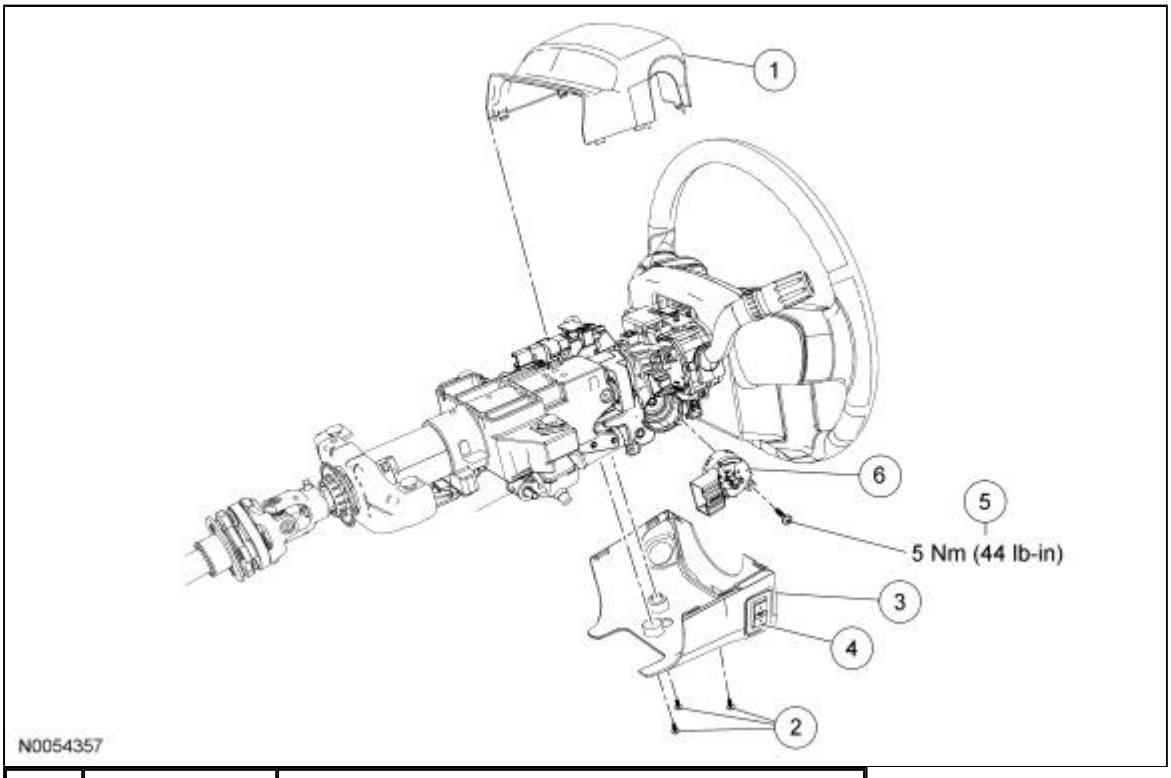
6. Remove the 2 screws and the multi-function switch.

7. To install, reverse the removal procedure.

Ignition Switch

Printable View (298 KB)

NOTE: Power tilt column shown, manual tilt similar.



Item	Part Number	Description
1	3530A	Steering column upper shroud
2	W705314	Steering column shroud screws (3 required)
3	3530B	Steering column lower shroud
4	3B504	Power tilt switch
5	11B572	Ignition switch screw
6	11572	Ignition switch

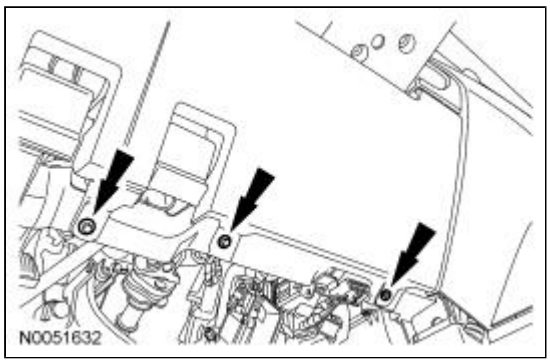
Removal and Installation

All vehicles

1. Depower the supplemental restraints system (SRS). For additional information, refer to Section 501-20B .

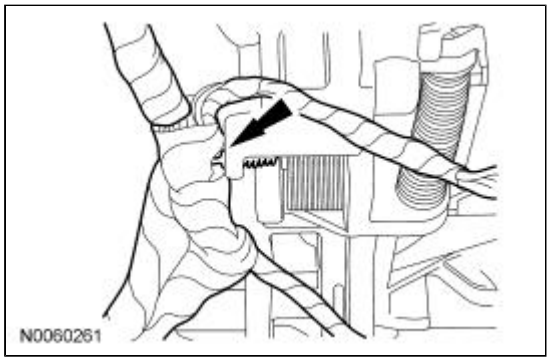
Vehicles with power tilt

2. Remove the 3 screws, pull out to release the top retaining clips and remove the lower steering column opening cover.



3. Remove the 3 screws and the upper and lower steering column shrouds.
    - Disconnect the power tilt electrical connector switch from the lower shroud.

4. Detach the wiring harness retainer from the steering column.



5. Disconnect the following electrical connectors to access the ignition switch.
    - Multi-function switch
    - Clockspring
    - EPATS connector
    - Key release interlock actuator (if equipped)

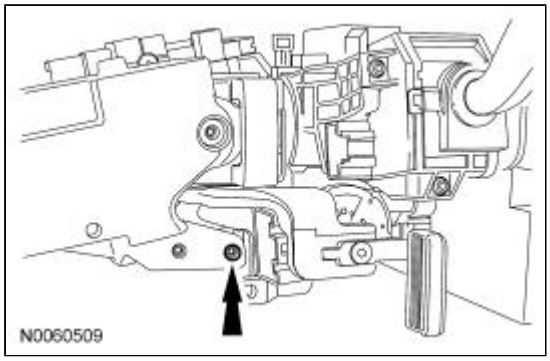
6. Disconnect the ignition switch electrical connector.

Vehicles with manual tilt

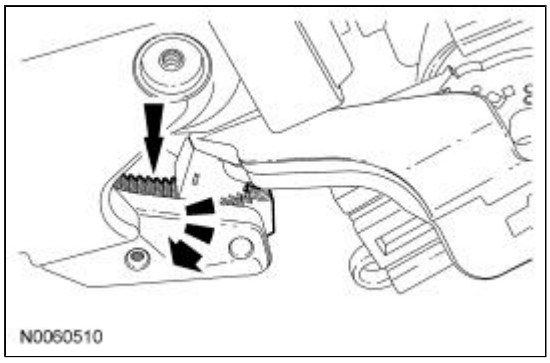
7. Remove the steering column. For additional information, refer to Section 211-04 .
    - Place the steering column on a clean workbench.

8. Position the column in the full up position.

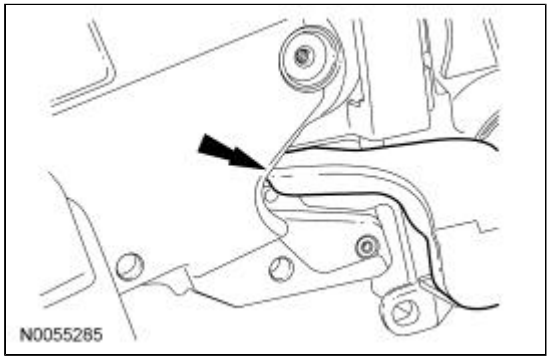
9. Using suitable tools, push the first roll pin out of the fixed shoe.



10. Pivoting on the second roll pin, tilt the fixed shoe down.



11. Position the tilt lever to rest against the steering column housing.



All vehicles

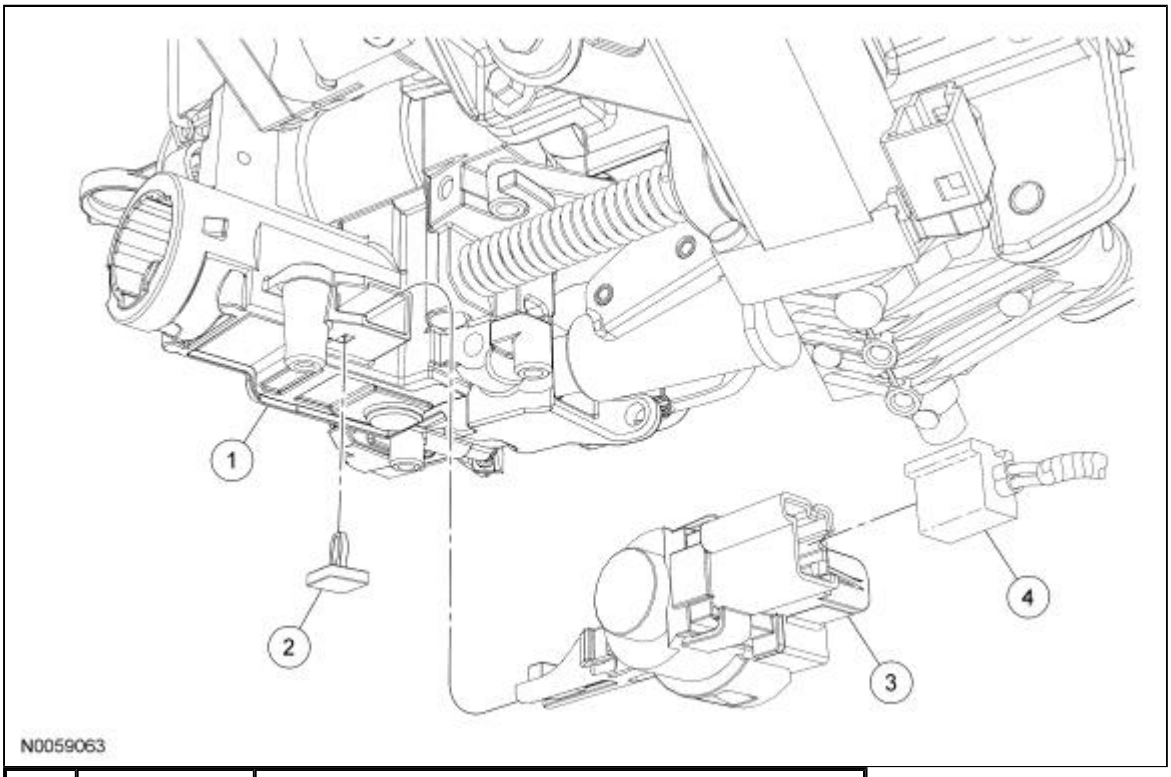
12. Remove the ignition switch screw and ignition switch.
    - To install, tighten to 5 Nm (44 lb-in).

13. **CAUTION: Make sure the electrical wiring harness is routed correctly and secured to the steering column or damage to the wires and/or connectors can occur.**

    To install, reverse the removal procedure.

Key Release Interlock Actuator

Printable View (331 KB)



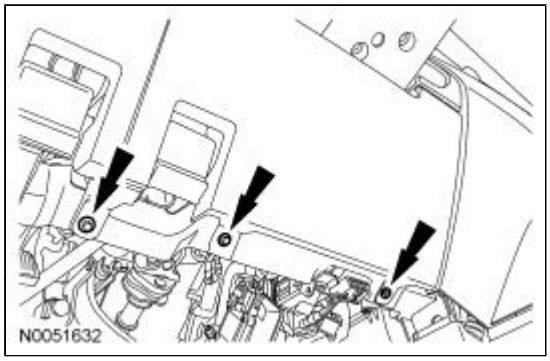
Item	Part Number	Description
1	3C529	Steering column
2	3E636	Locking clip
3	3B658	Key release interlock actuator
4	—	Key release interlock actuator electrical connector

Removal and Installation

All vehicles

1. Place the ignition switch in the off position.
   - Remove key.

2. Remove the lower steering column opening cover.
   - Remove the 3 screws and pull out to release the top retaining clips and remove the lower steering column opening cover.



Vehicle with power tilt

3. Remove the 3 screws and the upper and lower steering column shrouds.
    - Disconnect the power tilt electrical connector switch from the lower shroud.
        - To install, tighten to 2 Nm (18 lb-in).

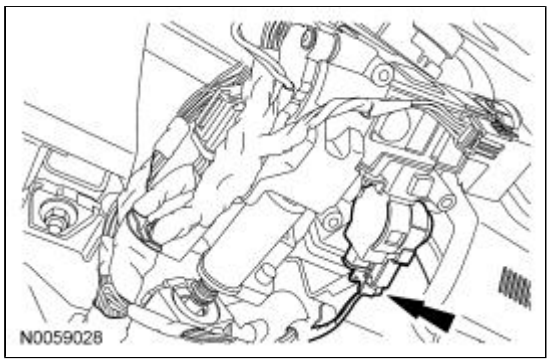
Vehicles with manual tilt

4. If equipped, release the tabs and slide the gear selector cover away from the steering column shrouds.

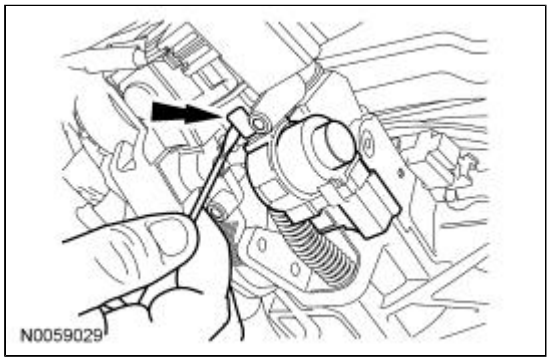
5. Remove the 3 screws and the upper and lower steering column shrouds.
    - To install, tighten to 2 Nm (18 lb-in).

All vehicles

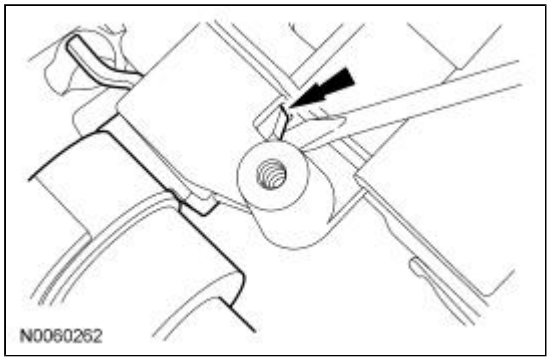
6. Disconnect the key release interlock actuator electrical connector.



7. Remove and discard the locking clip.



8. Using a suitable tool, release the tab and remove the key release interlock actuator.



9. To install, reverse removal procedure.

Engine

Printable View (80 KB)

CAUTION: When repairing engines, all parts must be contamination free. If contamination/foreign material is present when repairing an engine, premature engine failure can occur.

NOTE: This section contains information, steps and procedures that may not be specific to your engine.

This section covers general procedures and diagnosis and testing of the engine system, except for exhaust emission control devices, which are covered in the Powertrain Control/Emissions Diagnosis Manual.

The engine incorporates the following features:

- a closed positive crankcase ventilation (PCV) system. For additional information, refer to Section 303-08 .
- an evaporative emission control system. For additional information, refer to Section 303-13 .

Some engines incorporate a fail-safe cooling system. Refer to the appropriate section in Group 303 for the procedure.

The engine, fuel system, ignition system, emissions system and exhaust system all affect exhaust emission levels and must be maintained according to the maintenance schedule. Refer to the scheduled Maintenance Guide.

Correct engine identification is required to order parts. Refer to the appropriate section in Group 303 for the procedure.

Inspection and Verification

1. Verify the customer concern by operating the engine to duplicate the condition.
2. Visually inspect for obvious signs of mechanical damage. Refer to the following chart.

Visual Inspection Chart

Mechanical
• Engine coolant leaks • Engine oil leaks • Fuel leaks • Damaged or severely worn parts • Loose mounting bolts, studs and nuts

3. If the inspection reveals obvious concerns that can be readily identified, repair as necessary.
4. If the concerns remain after the inspection, determine the symptoms. GO to Symptom Chart .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Difficult starting	• Damaged ignition system	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Damaged fuel system	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

	• Damaged starting system	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Damaged charging system/battery	• REFER to Section 414-00 .
	• Burnt valve	• INSTALL a new valve.
	• Worn piston	• INSTALL a new piston.
	• Worn piston rings	• INSTALL new piston rings.
	• Worn cylinder	• REPAIR or INSTALL a new cylinder block.
	• Damaged head gasket	• INSTALL a new head gasket.
	• Damaged cooling system	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
• Poor idling	• Vacuum leaks	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Malfunctioning or damaged ignition system	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Malfunctioning or damaged fuel system	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Damaged hydraulic lash adjuster	• INSTALL a new hydraulic lash adjuster.
	• Incorrect valve-to-valve seat contact	• REPAIR or INSTALL a new valve or valve seat.
	• Damaged head gasket	• INSTALL a new head gasket.
• Abnormal combustion	• Malfunctioning or damaged fuel system	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Malfunctioning or damaged ignition system	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Malfunctioning or damaged air intake system	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Damaged hydraulic	• INSTALL a new hydraulic lash

	lash adjuster • Burnt or sticking valve • Weak or broken valve spring • Carbon accumulation in combustion chamber	adjuster. • REPAIR or INSTALL a new valve. • INSTALL a new valve spring. • ELIMINATE carbon buildup.
• Excessive oil consumption	• Leaking oil • Malfunctioning PCV system • Worn valve stem seal • Worn valve stem or valve guide • Sticking piston rings • Worn piston ring groove • Worn piston or cylinder	• REPAIR oil leakage. • REPAIR or INSTALL new necessary components. • INSTALL a new valve stem seal. • INSTALL a new valve and valve guide. • REPAIR or INSTALL new piston rings. • INSTALL a new piston and piston pin. • REPAIR or INSTALL a new piston or cylinder block.
• Engine noise	• Leaking exhaust system • Incorrect drive belt tension • Malfunctioning generator bearing • Malfunctioning water pump bearing • Malfunctioning or damaged cooling system • Malfunctioning or damaged fuel system • Loose timing chain/belt • Damaged timing chain tensioner • Excessive main bearing clearance • Seized or heat damaged crankshaft main	• REPAIR exhaust leakage. • REFER to Section 303-05 . • Refer to the appropriate section in Group 414 for the procedure. • REFER to Section 303-03 . • REFER to Section 303-03 . • Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. • ADJUST or INSTALL a new timing chain/belt. • INSTALL a new timing chain tensioner. • **CAUTION: Remove the cylinder heads before removing the crankshaft. Failure to do so can result in engine damage.** INSTALL a new crankshaft main bearing. • INSTALL a new crankshaft main bearing.

	bearing	
	• Excessive crankshaft end play	• INSTALL a new thrust bearing or crankshaft.
	• Excessive connecting rod bearing clearance	• INSTALL a new connecting rod bearing or connecting rod.
	• Heat damaged connecting rod bearing	• INSTALL a new connecting rod bearing.
	• Damaged connecting rod bushing	• INSTALL a new connecting rod bushing.
	• Worn cylinder	• REPAIR or INSTALL a new cylinder block.
	• Worn piston or piston pin	• INSTALL a new piston or piston pin.
	• Damaged piston rings	• INSTALL new piston rings.
	• Bent connecting rod	• INSTALL a new connecting rod.
	• Malfunctioning hydraulic lash adjuster	• INSTALL a new hydraulic lash adjuster.
	• Broken valve spring	• INSTALL a new valve spring.
	• Excessive valve guide clearance	• ADJUST clearance or INSTALL a new valve guide or valve.
• Insufficient power	• Malfunctioning or damaged ignition system	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Malfunctioning or damaged fuel system	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Malfunctioning or damaged air intake system	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Damaged or plugged exhaust system	• INSPECT exhaust system.
	• Incorrect tire size	• REFER to Section 204-00 .
	• Dragging brakes	• REFER to Section 206-00 .
	• Slipping transmission	• Refer to the appropriate section in Group 307 for the procedure.
	• Malfunctioning hydraulic lash adjuster	• INSTALL a new hydraulic lash adjuster.
	• Compression leakage at valve seat	• REPAIR or INSTALL a new valve, valve seat or cylinder head.

	• Seized valve stem	• INSTALL a new valve.
	• Weak or broken valve spring	• INSTALL a new valve spring.
	• Worn or damaged camshaft	• INSTALL a new camshaft.
	• Damaged head gasket	• INSTALL a new head gasket.
	• Cracked or distorted cylinder head	• INSTALL a new cylinder head.
	• Damaged, worn or sticking piston ring (s)	• REPAIR or INSTALL a new piston ring(s).
	• Worn or damaged piston	• INSTALL a new piston and piston pin.

Component Tests

Engine Oil Leaks

CAUTION: If an overnight drive is done, the fan air or road air blast can cause erroneous readings.

NOTE: When diagnosing engine oil leaks, the source and location of the leak must be positively identified prior to repair.

Prior to carrying out this procedure, clean all sealing surface areas with a suitable solvent to remove all traces of oil.

Engine Oil Leaks — Fluorescent Oil Additive Method

Use the UV Leak Detector Kit to carry out the following procedure for oil leak diagnosis.

1. Add 29.6 ml (1 ounce) of fluorescent additive to a minimum of 0.47L (1/2 qt) and a maximum of 0.95L (1 qt) engine oil and fill through the engine oil fill. If the oil is not premixed, the fluorescent additive will not have enough time to reach the crankcase, oil galleries and seal surfaces during this particular 15 minute test. The additive must be mixed with oil and added through the oil fill. Check the level on the oil level indicator to determine what amount of oil to premix. If it is in the middle of the crosshatch area or below the full mark, use 0.95L (1 qt). If it is at the full mark, use 0.47L (1/2 qt).

2. Run the engine for 15 minutes. Stop the engine and inspect all seal and gasket areas for leaks using the UV Leak Detector Kit. A clear bright yellow or orange area will identify the leak. For extremely small leaks, several hours may be required for the leak to appear.

3. At the end of test, make sure the oil level is within the upper and lower oil indicator marks. Remove oil as necessary if it registers above the full mark.

Leakage Points — Underhood

Examine the following areas for oil leakage:

- Valve cover gaskets
- Intake manifold gaskets
- Cylinder head gaskets

- Oil bypass filter
- Oil filter adapter
- Engine front cover
- Oil filter adapter and filter body
- Oil level indicator tube connection
- Oil pressure sensor

Leakage Points — Under Engine — With Vehicle on Hoist

Examine the following areas for oil leakage:

- Oil pan gaskets
- Oil pan sealer
- Oil pan rear seal
- Engine front cover gasket
- Crankshaft front seal
- Crankshaft rear seal
- Crankshaft main bearing cap side bolts
- Oil filter adapter and filter body
- Oil cooler, if equipped

Leakage Points — With Transmission and Flywheel Removed

Examine the following areas for oil leakage:

- Crankshaft rear seal
- Rear main bearing cap parting line
- Rear main bearing cap and seals
- Flywheel mounting bolt holes (with flywheel installed)
- Camshaft rear bearing covers or pipe plugs at the end of oil passages

Oil leaks at crimped seams in sheet metal parts and cracks in cast or stamped parts can be detected when using the dye method.

Compression Test — Compression Gauge Check

1. Make sure the oil in the crankcase is of the correct viscosity and at the correct level and that the battery is correctly charged. Operate the vehicle until the engine is at normal operating temperature. Turn the ignition switch to the OFF position, then remove all the spark plugs.

2. Set the throttle plates in the wide-open position.

3. Install a compression gauge such as the Compression Tester in the No. 1 cylinder.

4. Install an auxiliary starter switch in the starting circuit. With the ignition switch in the OFF position, and using the auxiliary starter switch, crank the engine a minimum of 5 compression strokes and record the highest reading. Note the approximate number of compression strokes required to obtain the highest reading.

5. Repeat the test on each cylinder, cranking the engine approximately the same number of compression strokes.

Compression Test — Test Results

The indicated compression pressures are considered within specification if the lowest reading cylinder is at least 75% of the highest reading. Refer to the Compression Pressure Limit Chart.

Compression Pressure Limit Chart

Maximum Pressure	Minimum Pressure	Maximum Pressure	Minimum Pressure	Maximum Pressure	Minimum Pressure	Maximum Pressure	Minimum Pressure
924 kPa (134 psi)	696 kPa (101 psi)	1131 kPa (164 psi)	848 kPa (123 psi)	1338 kPa (194 psi)	1000 kPa (145 psi)	1544 kPa (224 psi)	1158 kPa (168 psi)
938 kPa (136 psi)	703 kPa (102 psi)	1145 kPa (166 psi)	855 kPa (124 psi)	1351 kPa (196 psi)	1014 kPa (147 psi)	1558 kPa (226 psi)	1165 kPa (169 psi)
952 kPa (138 psi)	717 kPa (104 psi)	1158 kPa (168 psi)	869 kPa (126 psi)	1365 kPa (198 psi)	1020 kPa (148 psi)	1572 kPa (228 psi)	1179 kPa (171 psi)
965 kPa (140 psi)	724 kPa (105 psi)	1172 kPa (170 psi)	876 kPa (127 psi)	1379 kPa (200 psi)	1034 kPa (150 psi)	1586 kPa (230 psi)	1186 kPa (172 psi)
979 kPa (142 psi)	738 kPa (107 psi)	1186 kPa (172 psi)	889 kPa (129 psi)	1303 kPa (189 psi)	1041 kPa (151 psi)	1600 kPa (232 psi)	1200 kPa (174 psi)
933 kPa (135 psi)	745 kPa (108 psi)	1200 kPa (174 psi)	903 kPa (131 psi)	1407 kPa (204 psi)	1055 kPa (153 psi)	1055 kPa (153 psi)	1207 kPa (175 psi)
1007 kPa (146 psi)	758 kPa (110 psi)	1214 kPa (176 psi)	910 kPa (132 psi)	1420 kPa (206 psi)	1062 kPa (154 psi)	1627 kPa (236 psi)	1220 kPa (177 psi)
1020 kPa (148 psi)	765 kPa (111 psi)	1227 kPa (178 psi)	917 kPa (133 psi)	1434 kPa (208 psi)	1075 kPa (156 psi)	1641 kPa (238 psi)	1227 kPa (178 psi)
1034 kPa (150 psi)	779 kPa (113 psi)	1241 kPa (180 psi)	931 kPa (135 psi)	1448 kPa (210 psi)	1083 kPa (157 psi)	1655 kPa (240 psi)	1241 kPa (180 psi)
1048 kPa (152 psi)	786 kPa (114 psi)	1255 kPa (182 psi)	936 kPa (136 psi)	1462 kPa (212 psi)	1089 kPa (158 psi)	1669 kPa (242 psi)	1248 kPa (181 psi)
1062 kPa (154 psi)	793 kPa (115 psi)	1269 kPa (184 psi)	952 kPa (138 psi)	1476 kPa (214 psi)	1103 kPa (160 psi)	1682 kPa (244 psi)	1262 kPa (183 psi)
1076 kPa (156 psi)	807 kPa (117 psi)	1282 kPa (186 psi)	965 kPa (140 psi)	1489 kPa (216 psi)	1117 kPa (162 psi)	1696 kPa (246 psi)	1269 kPa (184 psi)
1089 kPa (158 psi)	814 kPa (118 psi)	1296 kPa (188 psi)	972 kPa (141 psi)	1503 kPa (218 psi)	1124 kPa (163 psi)	1710 kPa (248 psi)	1202 kPa (174 psi)
1103 kPa (160 psi)	827 kPa (120 psi)	1310 kPa (190 psi)	979 kPa (142 psi)	1517 kPa (220 psi)	1138 kPa (165 psi)	1724 kPa (250 psi)	1289 kPa (187 psi)
1110 kPa (161 psi)	834 kPa (121 psi)	1324 kPa (192 psi)	993 kPa (144 psi)	1631 kPa (237 psi)	1145 kPa (166 psi)	—	—

If one or more cylinders reads low, squirt approximately one tablespoon of engine oil on top of the pistons in the low-reading cylinders. Repeat the compression pressure check on these cylinders.

Compression Test — Interpreting Compression Readings

1. If compression improves considerably, piston rings are faulty.

2. If compression does not improve, valves are sticking or seating incorrectly.

3. If 2 adjacent cylinders indicate low compression pressures and squirting oil on each piston does not increase compression, the head gasket may be leaking between cylinders. Engine oil or coolant in cylinders could result from this condition.
   Use the Compression Pressure Limit Chart when checking cylinder compression so that the lowest reading is within 75% of the highest reading.

Cylinder Leakage Detection

When a cylinder produces a low reading, use of the Engine Cylinder Leak Detection/Air Pressurization Kit will be helpful in pinpointing the exact cause.

The leakage detector is inserted in the spark plug hole, the piston is brought up to dead center on the compression stroke and compressed air is admitted.

Once the combustion chamber is pressurized, a special gauge included in the kit will read the percentage of leakage. Leakage exceeding 20% is excessive.

While the air pressure is retained in the cylinder, listen for the hiss of escaping air. A leak at the intake valve will be heard in the throttle body. A leak at the exhaust valve can be heard at the tail pipe. Leakage past the piston rings will be audible at the positive crankcase ventilation (PCV) connection. If air is passing through a blown head gasket to an adjacent cylinder, the noise will be evident at the spark plug hole of the cylinder into which the air is leaking. Cracks in the cylinder block or gasket leakage into the cooling system may be detected by a stream of bubbles in the radiator.

Excessive Engine Oil Consumption

Nearly all engines consume oil, which is essential for normal lubrication of the cylinder bore walls and pistons and rings. Determining the level of oil consumption may require testing by recording how much oil is being added over a given set of miles.

Customer driving habits greatly influence oil consumption. Mileage accumulated during towing or heavy loading generates extra heat. Frequent short trips, stop-and-go type traffic or extensive idling, prevent the engine from reaching normal operating temperature. This prevents component clearances from reaching specified operating ranges.

The following diagnostic procedure may be utilized to determine internal oil consumption. Make sure that the concern is related to internal oil consumption, and not external leakage, which also consumes oil. Verify there are no leaks before carrying out the test. Once verified, the rate of internal oil consumption can be tested.

A new engine may require extra oil in the early stages of operation. Internal piston-to-bore clearances and sealing characteristics improve as the engine breaks in. Engines are designed for close tolerances and do not require break-in oils or additives. Use the oil specified in the Owner Guide. Ambient temperatures may determine the oil viscosity specification. Verify that the correct oil is being used for the vehicle in the geographic region in which it is driven.

Basic Pre-checks

1. For persistent complaints of oil consumption, interview the customer to determine the oil consumption characteristics. If possible, determine the brand and grade of oil currently in the oil pan. Look at the oil filter or oil-change station tags to determine if Ford-recommended maintenance schedules have been followed. Make sure that the oil has been changed at the specified mileage intervals. If vehicle mileage is past the first recommended drain interval, the OEM production filter should have been changed.

2. Ask how the most current mileage was accumulated. That is, determine whether the vehicle was driven under the following conditions:
    - Extended idling or curbside engine operation
    - Stop-and-go traffic or taxi operation
    - Towing a trailer or vehicle loaded heavily
    - Frequent short trips (engine not up to normal operating temperature)

- Excessive throttling or high engine-rpm driving

3. Verify that there are no external leaks. If necessary, review the diagnostic procedure under Engine Oil Leaks in the Diagnosis and Testing portion of this section.

4. Inspect the crankcase ventilation system for:
   - disconnected hoses at the valve cover or throttle body.
   - loose or missing valve cover fill cap.
   - missing or incorrectly seated engine oil level indicator.
   - incorrect or dirty PCV valve.
   - a PCV valve grommet unseated in the valve cover (if so equipped)

5. Inspect for signs of sludge. Sludge affects PCV performance and can plug or restrict cylinder head drainback wells. It can also increase oil pressure by restricting passages and reducing the drainback capability of piston oil control rings. Sludge can result from either excessive water ingestion in the crankcase or operation at extremely high crankcase temperatures.

6. Inspect the air filter for dirt, sludge or damage. A hole in the filter element will allow unfiltered air to bypass into the air induction system. This can cause premature internal wear (engine dusting), allowing oil to escape past rings, pistons, valves and guides.

7. If the engine is hot or was recently shut down, wait at least 5 minutes to allow the oil to drain back. Ask the customer if this requirement has been followed. Adding oil without this wait period can cause an overfill condition, leading to excessive oil consumption and foaming which may cause engine damage.

8. Make sure the oil level indicator (dipstick) is correctly and fully seated in the indicator tube. Remove the oil level indicator and record the oil level.

Detailed Pre-checks

1. Check the thermostat opening temperature to make sure that the cooling system is operating at the specified temperature. If it is low, internal engine parts are not running at specified internal operating clearances.

2. Verify the spark plugs are not oil saturated. Oil leaking into one or more cylinders will appear as an oil soaked condition on the plug. If a plug is saturated, a compression check may be necessary at the conclusion of the oil consumption test.

Oil Consumption Test

Once all of the previous conditions are met, carry out an oil consumption test.

1. Drain the engine oil and remove the oil filter. Install a new manufacturer-specified oil filter. Make sure the vehicle is positioned on a level surface. Refill the oil pan to a level **one liter (quart) less** than the specified fill level, using manufacturer-specified oil.

2. Run the engine for 3 minutes (if hot) or 10 minutes (if cold). Allow for a minimum 5-minute drainback period and then record the oil level shown on the oil level indicator. Place a mark on the backside of the oil level indicator noting the oil level location.

3. Add the final 0.95L (1 qt) to complete the normal oil fill. Restart the engine and allow it to idle for 2 minutes. Shut the engine down.

4. After a 5-minute drainback period, record the location of the oil level again. Mark the oil level indicator with the new oil level location. (Note: Both marks should be very close to the MIN-MAX upper and lower limits or the upper and lower holes on the oil level indicator. These marks will exactly measure the engine's use of oil, with a one quart differential between the new marks.) Demonstrate to the customer that the factory-calibrated marks on the oil level indicator are where

the oil should fall after an oil change with the specified fill amount. Explain however, that this may vary slightly between MIN-MAX or the upper and lower holes on the oil level indicator.

5. Record the vehicle mileage.

6. Advise the customer that oil level indicator readings must be taken every 320 km (200 miles) or weekly, using the revised marks as drawn. Remind the customer that the engine needs a minimum 5-minute drainback for an accurate reading and that the oil level indicator must be firmly seated in the tube prior to taking the reading.

7. When the subsequent indicator readings demonstrate a full quart (liter) has been used, record the vehicle mileage. The mileage driven between the 2 readings should not be less than 1,500 miles. The drive cycle the vehicle has been operated under must be considered when making this calculation. It may be necessary to have the customer bring the vehicle in for a periodic oil level indicator reading to closely monitor oil usage.

Post Checks, Evaluation and Corrective Action

1. If test results indicate excessive oil consumption, carry out a cylinder compression test. The cylinder compression test should be carried out with a fully charged battery and all spark plugs removed. See the Compression Test Chart in this section for pressure range limits.

2. Compression should be consistent across all cylinders. Refer to the Compression Testing portion of this section. If compression tested within the specifications found in this section, the excessive oil consumption may be due to wear on the valve guides, valves or valve seals.

3. A cylinder leak detection test can be carried out using an Engine Cylinder Leak Detection/Air Pressurization Kit. This can help identify valves, piston rings, or worn valve guides/valve stems, inoperative valve stem seals or other related areas as the source of oil consumption.

NOTE: An oil-soaked appearance on the porcelain tips of the spark plugs also indicates excessive oil use. A typical engine with normal oil consumption will exhibit a light tan to brown appearance. See Spark Plug Analysis in this section for details. A single or adjoining, multiple cylinder leak can be traced by viewing the tips.

4. If an internal engine part is isolated as the root cause, determine if the repair will exceed cost limits and proceed with a repair strategy as required.

5. Once corrective action to engine is complete and verifying that all pre-check items were eliminated in the original diagnosis, repeat the Oil Consumption Test as described above and verify consumption results.

Intake Manifold Vacuum Test

Bring the engine to normal operating temperature. Connect the Vacuum/Pressure Tester to the intake manifold. Run the engine at the specified idle speed.

The vacuum gauge should read between 51-74 kPa (15-22 in-Hg) depending upon the engine condition and the altitude at which the test is performed. Subtract 4.0193 kPa (1 in-Hg) from the specified reading for every 304.8 m (1,000 feet) of elevation above sea level.

The reading should be steady. If necessary, adjust the gauge damper control (where used) if the needle is fluttering rapidly. Adjust the damper until the needle moves easily without excessive flutter.

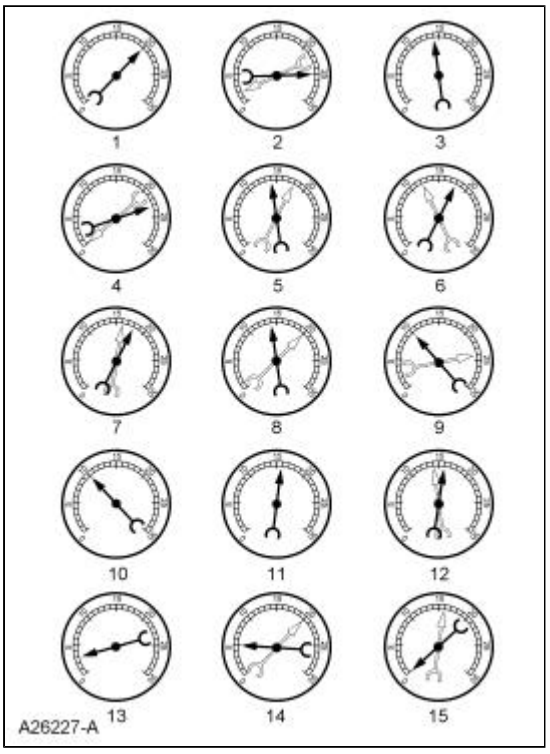
Intake Manifold Vacuum Test — Interpreting Vacuum Gauge Readings

A careful study of the vacuum gauge reading while the engine is idling will help pinpoint trouble areas.

Always conduct other appropriate tests before arriving at a final diagnostic decision. Vacuum gauge readings, although helpful, must be interpreted carefully.

Most vacuum gauges have a normal band indicated on the gauge face.

The following are potential gauge readings. Some are normal; others should be investigated further.



1. NORMAL READING: Needle between 51-74 kPa (15-22 in-Hg) and holding steady.

2. NORMAL READING DURING RAPID ACCELERATION AND DECELERATION: When the engine is rapidly accelerated (dotted needle), the needle will drop to a low reading (not to zero). When the throttle is suddenly released, the needle will snap back up to a higher than normal figure.

3. NORMAL FOR HIGH-LIFT CAMSHAFT WITH LARGE OVERLAP: The needle will register as low as 51 kPa (15 in-Hg) but will be relatively steady. Some oscillation is normal.

4. WORN RINGS OR DILUTED OIL: When the engine is accelerated (dotted needle), the needle drops to 0 kPa (0 in-Hg). Upon deceleration, the needle runs slightly above 74 kPa (22 in-Hg).

5. STICKING VALVES: When the needle (dotted) remains steady at a normal vacuum but occasionally flicks (sharp, fast movement) down and back about 13 kPa (4 in-Hg), one or more valves may be sticking.

6. BURNED OR WARPED VALVES: A regular, evenly-spaced, downscale flicking of the needle indicates one or more burned or warped valves. Insufficient hydraulic lash adjuster or hydraulic lash adjuster (HLA) clearance will also cause this reaction.

7. POOR VALVE SEATING: A small but regular downscale flicking can mean one or more valves are not seating.

8. WORN VALVE GUIDES: When the needle oscillates over about a 13 kPa (4 in-Hg) range at idle speed, the valve guides could be worn. As engine speed increases, the needle will become steady if guides are responsible.

9. WEAK VALVE SPRINGS: When the needle oscillation becomes more violent as engine rpm is increased, weak valve springs are indicated. The reading at idle could be relatively steady.

10. LATE VALVE TIMING: A steady but low reading could be caused by late valve timing.

11. IGNITION TIMING RETARDING: Retarded ignition timing will produce a steady but somewhat low reading.

12. INSUFFICIENT SPARK PLUG GAP: When spark plugs are gapped too close, a regular, small pulsation of the needle can occur.

13. INTAKE LEAK: A low, steady reading can be caused by an intake manifold or throttle body gasket leak.

14. BLOWN HEAD GASKET: A regular drop of fair magnitude can be caused by a blown head gasket or warped cylinder head-to-cylinder block surface.

15. RESTRICTED EXHAUST SYSTEM: When the engine is first started and is idled, the reading may be normal, but as the engine rpm is increased, the back pressure caused by a clogged muffler, kinked tail pipe or other concerns will cause the needle to slowly drop to 0 kPa (0 in-Hg). The needle then may slowly rise. Excessive exhaust clogging will cause the needle to drop to a low point even if the engine is only idling.

16. When vacuum leaks are indicated, search out and correct the cause. Excess air leaking into the system will upset the fuel mixture and cause concerns such as rough idle, missing on acceleration or burned valves. If the leak exists in an accessory unit such as the power brake booster, the unit will not function correctly. Always fix vacuum leaks.

Oil Pressure Test

1. Disconnect and remove the oil pressure sensor from the engine.

2. Connect the Oil Pressure Gauge to the oil pressure sender oil galley port.

3. Run the engine until normal operating temperature is reached.

4. Run the engine at the specified rpm and record the gauge reading.

5. The oil pressure should be within specifications; refer to the specification chart in the appropriate engine section.

6. If the pressure is not within specification, check the following possible sources:
    - Insufficient oil
    - Oil leakage
    - Worn or damaged oil pump
    - Oil pump screen cover and tube
    - Excessive main bearing clearance
    - Excessive connecting rod bearing clearance

Valve Train Analysis — Engine Off — Valve Cover Removed

Check for damaged or severely worn parts and correct assembly. Make sure correct parts are used with the static engine analysis as follows.

Valve Train Analysis — Engine Off, Camshaft Roller Followers and Hydraulic Lash Adjusters, Overhead Camshaft

- Check for loose mounting bolts on camshaft carriers.
- Check for plugged oil feed in the camshaft roller followers, lash adjusters or cylinder heads.

Valve Train Analysis — Engine Off, Camshaft — Engines

- Check for broken or damaged parts.

Valve Train Analysis — Valve Springs

- Check for broken or damaged parts.

Valve Train Analysis — Engine Off, Valve Spring Retainer and Valve Spring Retainer Keys

- Check for correct seating of the valve spring retainer key on the valve stem and in valve spring retainer.
- Check for correct seating on the valve stem.

Valve Train Analysis — Engine Off, Valves and Cylinder Head

- Check for plugged oil drain back holes.
- Check for worn or damaged valve tips.
- Check for missing or damaged guide-mounted valve stem seal.
- Check for damaged hydraulic lash adjuster.
- Check installed valve spring height.
- Check for missing or worn valve spring seats.
- Check for plugged oil metering orifice in cylinder head oil reservoir (if equipped).

Static checks (engine off) are to be made on the engine prior to the dynamic procedure.

Valve Train Analysis — Engine Running, Valves and Cylinder Head

- Check for plugged oil drain back holes.
- Check for missing or damaged valve stem seals or guide mounted valve stem seals.
- Check for a plugged oil metering orifice in the cylinder head oil reservoir (4.6L engine only).

If insufficient oiling is suspected, check oil passages for blockage, then accelerate the engine to 1,200 rpm with the transmission in NEUTRAL and the engine at normal operating temperature. Oil should spurt from the rocker arm oil holes such that valve tips and camshaft roller followers are well oiled. With the valve covers off, some oil splash may overshoot camshaft roller followers.

Valve Train Analysis — Engine Running, Camshaft Lobe Lift

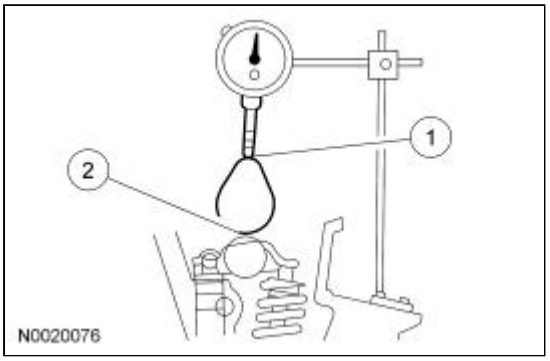
Check the lift of each camshaft lobe in consecutive order and make a note of the readings.

1. Remove the valve covers.

2. Remove the spark plugs.

3. Install the Dial Indicator Gauge with Holding Fixture so the rounded tip of indicator is on top of the camshaft lobe and on the same plane as the hydraulic lash adjuster.

4. Rotate the crankshaft using a breaker bar and socket attached to the crankshaft pulley retainer bolt. Rotate the crankshaft until the base circle of the camshaft lobe is reached.



5. Zero the dial indicator. Continue to rotate the crankshaft until the (1) high-lift point of the camshaft lobe is in the fully-raised position (highest indicator reading).

6. To check the accuracy of the original indicator reading, continue to rotate crankshaft until the (2) base circle is reached. The indicator reading should be zero. If zero reading is not obtained, repeat Steps 1 through 6.

7. **NOTE:** If the lift on any lobe is below specified service limits, install a new camshaft, and new camshaft roller followers.

   Remove the Dial Indicator Gauge with Holding Fixture.

8. Install the spark plugs.

9. Install the valve covers.

Sprockets

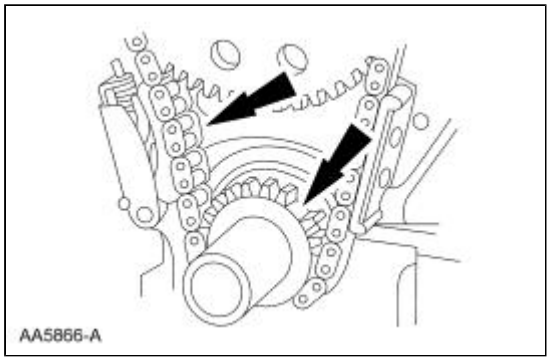
Printable View (104 KB)

1. **WARNING: To avoid the possibility of personal injury or damage to the vehicle, do not operate the engine with the hood open until the fan blade has been examined for possible cracks and separation.**

   NOTE: Specifications show the expected minimum or maximum condition. Refer to the appropriate section in Group 303 for the procedure.

   NOTE: If a component fails to meet the specifications, it is necessary to install a new component or refinish. If the component can be refinished, wear limits are provided as an aid to making a decision. A new component must be installed for any component that fails to meet specifications and cannot be refinished.

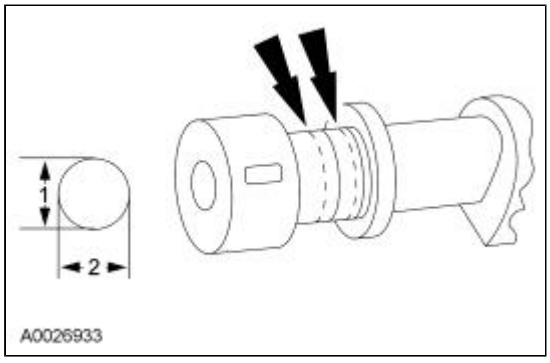
   Inspect the timing chain/belt and the sprockets.
   - Install new components as necessary. Refer to the appropriate section in Group 303 for the procedure.



Camshaft Bearing Journal Diameter

Printable View (75 KB)

1. Measure each camshaft journal diameter in 2 directions.
    - If out of specification, install new components as necessary. Refer to the appropriate section in Group 303 for the procedure.



Camshaft Journal to Bearing Clearance

Printable View (97 KB)

Special Tool(s)

ST1280-A	Plastigage 303-D031 (D81L-6002-B) or equivalent

NOTE: The camshaft journals must meet specifications before checking camshaft journal clearance.

1. Remove the camshaft bearing cap and lay Plastigage across the surface. Refer to the appropriate section in Group 303 for the procedure.

2. **NOTE:** Do not turn the camshaft while carrying out this procedure.

   Position the camshaft bearing cap and install the bolts. Refer to the appropriate section in Group 303 for the procedure.

      AA3651-A

3. Use Plastigage to verify the camshaft journal clearance.
   - If out of specification, install new components as necessary. Refer to the appropriate section in Group 303 for the procedure.

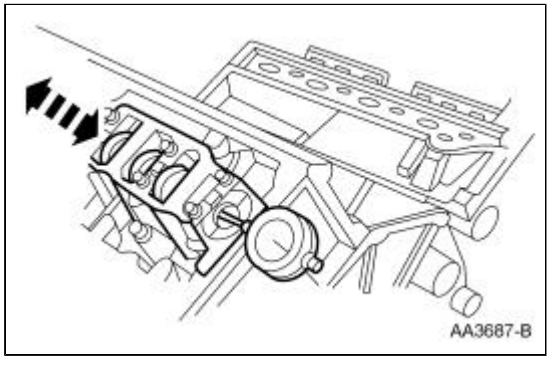
Camshaft End Play

Printable View (98 KB)

Special Tool(s)

 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent

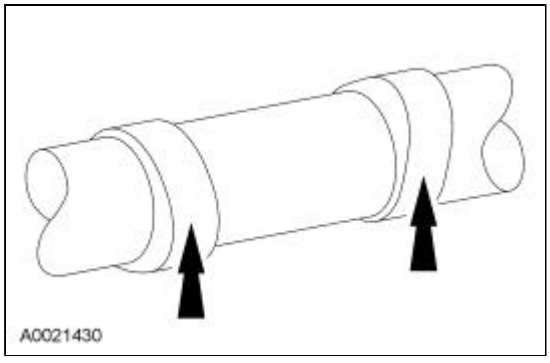
1. Use a Dial Indicator Gauge with Holding Fixture to measure camshaft end play.
2. Position the camshaft to the rear of the cylinder head.
3. Zero the indicator.
4. Move the camshaft to the front of the cylinder head. Note and record the camshaft end play.
   - If camshaft end play exceeds specifications, install new camshaft and recheck end play. Refer to the appropriate section in Group 303 for the procedure.
   - If camshaft end play exceeds specification after camshaft installation, install a new cylinder head. Refer to the appropriate section in Group 303 for the procedure.



Camshaft Surface Inspection

Printable View (73 KB)

1. Inspect camshaft lobes for pitting or damage in the contact area. Minor pitting is acceptable outside the contact area.
    - If excessive pitting or damage is present, install new components as necessary. Refer to the appropriate section in Group 303 for the procedure.



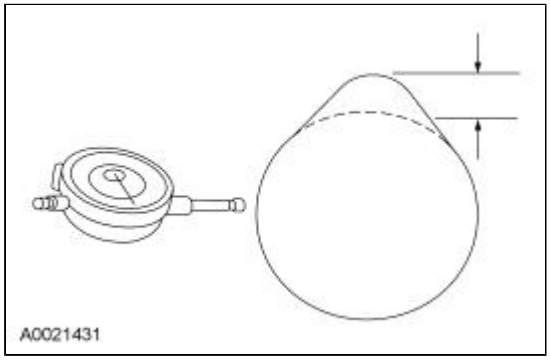
Camshaft Lobe Lift

Printable View (78 KB)

Special Tool(s)

 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent

1. Use a Dial Indicator Gauge with Holding Fixture to measure camshaft intake/exhaust lobe lift.
   - Rotate the camshaft and subtract the lowest indicator reading from the highest indicator reading to figure the camshaft lobe lift.
   - Refer to the appropriate section in Group 303 for the procedure.



Camshaft Runout

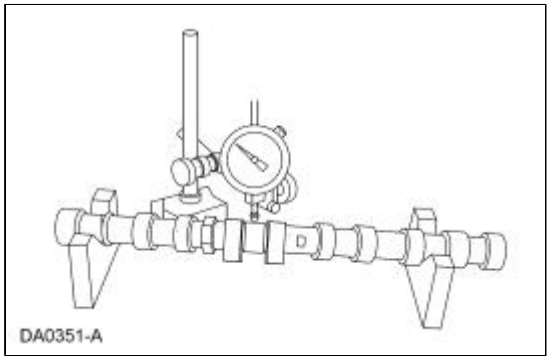
Printable View (97 KB)

Special Tool(s)

 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent

1. **NOTE:** Camshaft journals must be within specifications before checking runout.

   Use a Dial Indicator Gauge with Holding Fixture to measure the camshaft runout.
   - Rotate the camshaft and subtract the lowest indicator reading from the highest indicator reading.
   - For additional information, refer to the specification chart in the appropriate engine section.
   - If out of specification, install new components as necessary. Refer to the appropriate section in Group 303 for the procedure.

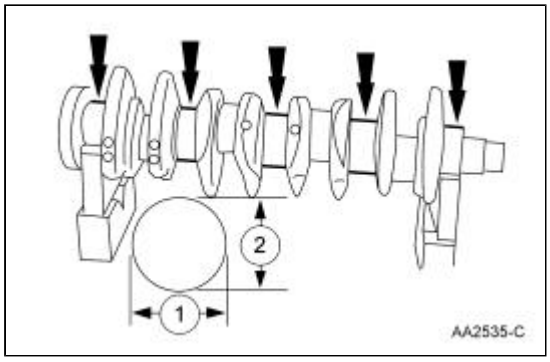


DA0351-A

Crankshaft Main Bearing Journal Diameter

Printable View (81 KB)

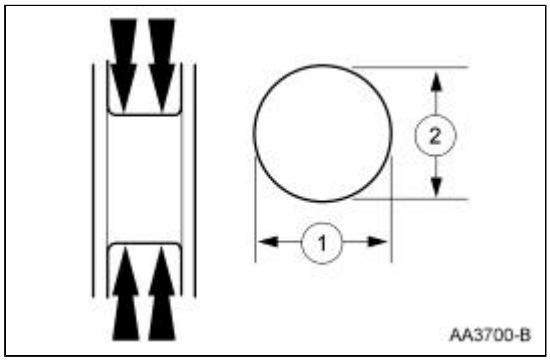
1. Measure each of the crankshaft main bearing journal diameters in at least 2 directions.
   - Refer to the appropriate section in Group 303 for the procedure.
   - If out of specification, install new components as necessary. Refer to the appropriate section in Group 303 for the procedure.



Crankshaft Main Bearing Journal Taper and Out-of-Round

Printable View (70 KB)

1. Measure each of the crankshaft main bearing journal diameters in at least 2 directions at each end of the main bearing journal.
   - Refer to the appropriate section in Group 303 for the procedure.
   - If out of specification, install new components as necessary. Refer to the appropriate section in Group 303 for the procedure.



Crankshaft Main Bearing Journal-to-Bearing Clearance

Printable View (102 KB)

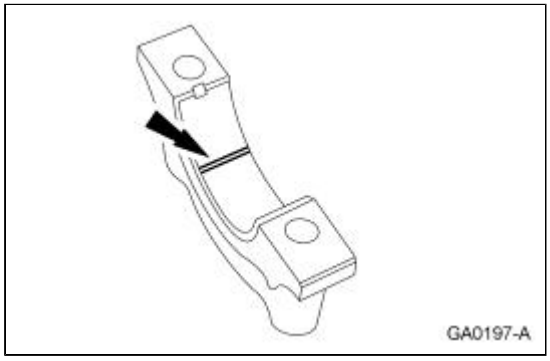
Special Tool(s)

ST1280-A	Plastigage 303-D031 (D81L-6002-B) or equivalent

NOTE: Crankshaft main bearing journals must be within specifications before checking journal clearance.

1. Remove the crankshaft main bearing caps and crankshaft main bearing.

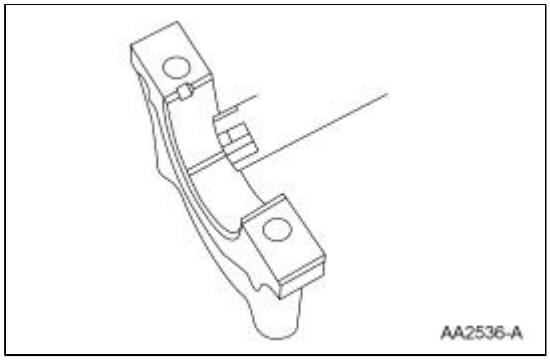
2. Lay a piece of Plastigage across the face of each crankshaft main bearing surface.



3. **NOTE:** Do not turn the crankshaft while carrying out this procedure.

   Install and remove the crankshaft main bearing cap.

4. Verify the crankshaft journal clearance.
   - Refer to the appropriate section in Group 303 for the procedure.
   - If out of specification, install new components as necessary. Refer to the appropriate section in Group 303 for the procedure.



Crankshaft End Play

Printable View (79 KB)

Special Tool(s)

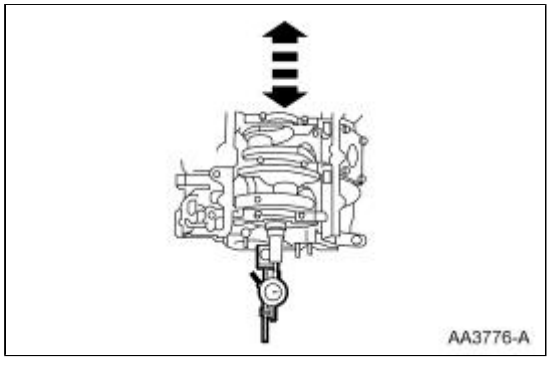
 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent

1. Measure the crankshaft end play. Use a Dial Indicator Gauge with Holding Fixture to measure crankshaft end play.

2. Position the crankshaft to the rear of the cylinder block.

3. Zero the indicator.

4. Move the crankshaft to the front of the cylinder block. Note and record the crankshaft end play.
   - If crankshaft end play exceeds specifications, install a new crankshaft thrust washer or crankshaft thrust main bearing. Refer to the appropriate section in Group 303 for the procedure.



Crankshaft Runout

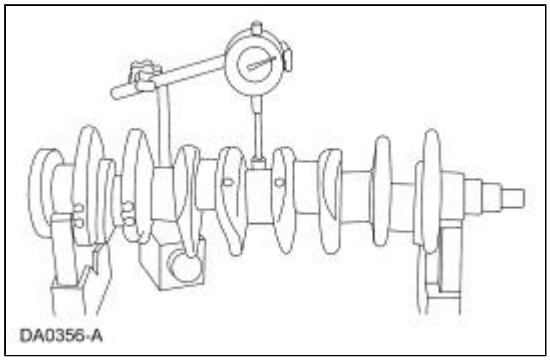
Printable View (103 KB)

Special Tool(s)

 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent

1. **NOTE:** Crankshaft main bearing journals must be within specifications before checking runout.

   Use the Dial Indicator Gauge with Holding Fixture to measure the crankshaft runout.
   - Refer to the appropriate section in Group 303 for the procedure.
   - Rotate the crankshaft and subtract the lowest dial indicator reading from the highest dial indicator reading to figure the crankshaft runout. If it is out of specification, install new components as necessary. Refer to the appropriate section in Group 303 for the procedure.

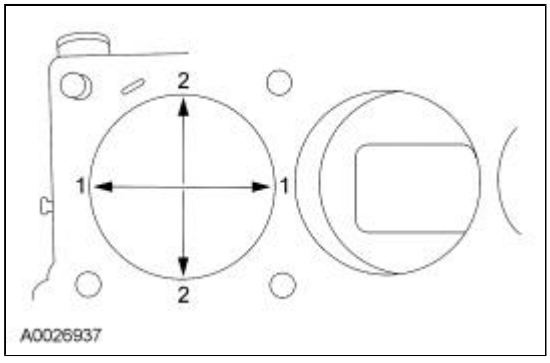


DA0356-A

Cylinder Bore Taper

Printable View (74 KB)

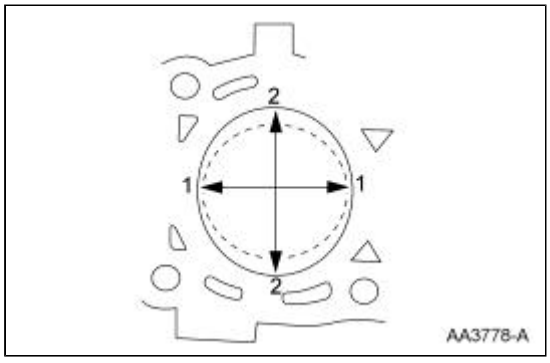
1. Measure the cylinder bore at the top, middle and bottom of piston ring travel in 2 directions as indicated. Verify the cylinder bore is within the wear limit. The difference indicates the cylinder bore taper. Bore the cylinder to the next oversize.
   - Refer to the appropriate section in Group 303 for the procedure.



Cylinder Bore Out-of-Round

Printable View (72 KB)

1. Measure the cylinder bore in 2 directions. The difference is the out-of-round. Verify the out-of-round is within the wear limit and bore the cylinder to the next oversize limit.
   - Refer to the appropriate section in Group 303 for the procedure.



Piston Inspection

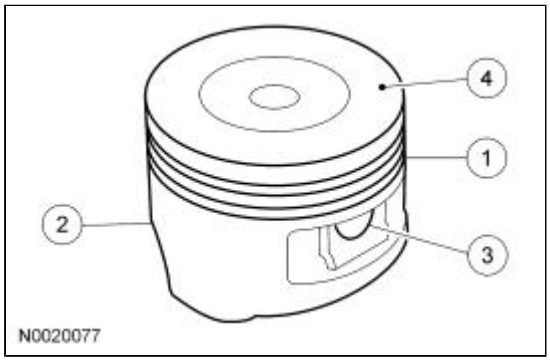
Printable View (111 KB)

Special Tool(s)

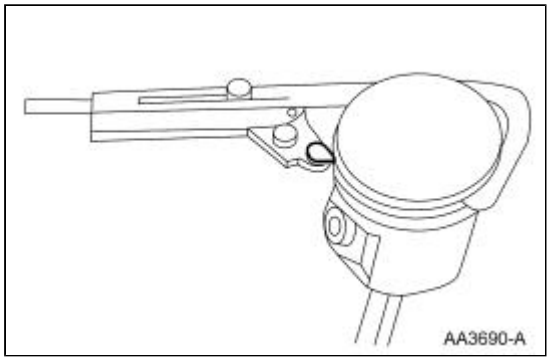
ST1279-A	Scraper, Piston Ring Groove 303-D033 (D81L-6002-D) or equivalent

CAUTION: Do not use a caustic cleaning solution or a wire brush to clean the pistons or damage can occur.

1. Clean and inspect the (1) ring lands, (2) skirts, (3) pin bosses and the (4) tops of the pistons. If wear marks, scores or glazing is found on the piston skirt, check for a bent or twisted connecting rod.



2. Use the Piston Ring Groove Scraper to clean the piston ring grooves.
   - Make sure the oil ring holes are clean.



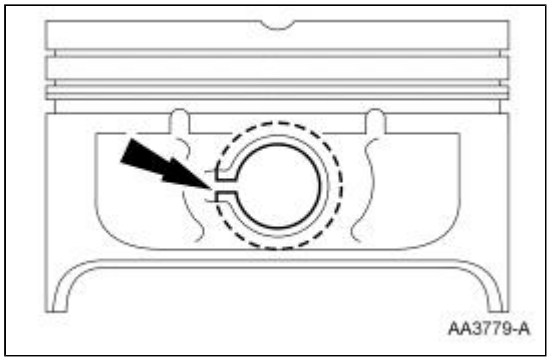
Piston Pin to Bore Diameter

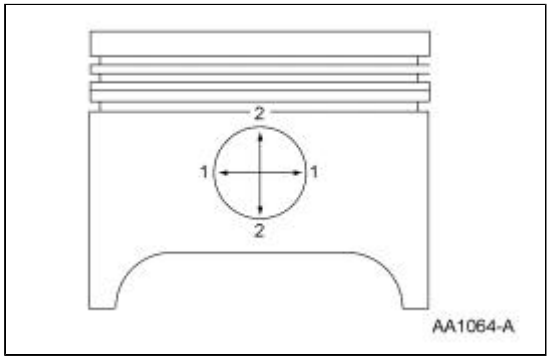
Printable View (95 KB)

1. **WARNING: Cover the end of the pin bore with a hand or shop rag when removing the retainer ring, since it has a tendency to spring out. Wear eye protection.**

   NOTE: Piston and piston pins are a matched set and should not be interchanged.

   Measure the piston pin bore diameter in 2 directions on each side. Verify the diameter is within specification.
   - If out of specification, install new components as necessary. Refer to the appropriate section in Group 303 for the procedure.

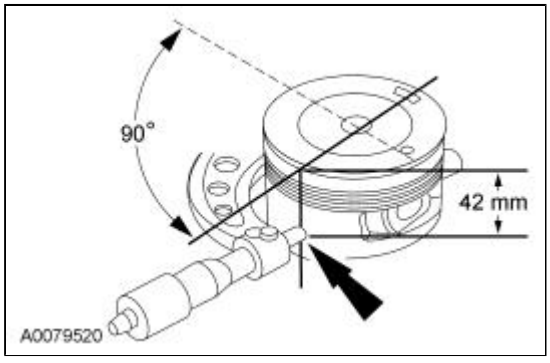




Piston Diameter

Printable View (82 KB)

1. Measure the piston diameter 90 degrees from the piston pin and 42 mm down from the top of the piston at the point indicated. Refer to the appropriate section in Group 303 for the procedure.
    - If out of specification, install new components as necessary. Refer to the appropriate section in Group 303 for the procedure.



Piston To Cylinder Bore Clearance

Printable View (62 KB)

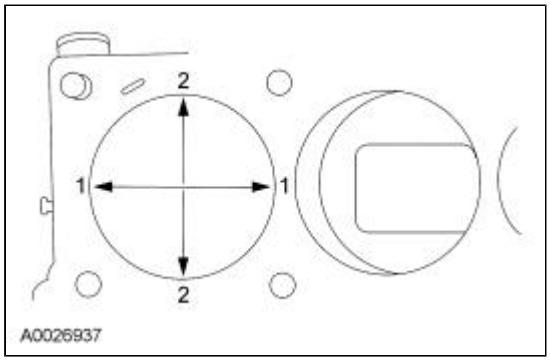
1. Subtract the piston diameter from the cylinder bore diameter to find the piston-to-cylinder bore clearance.

Piston Selection

Printable View (106 KB)

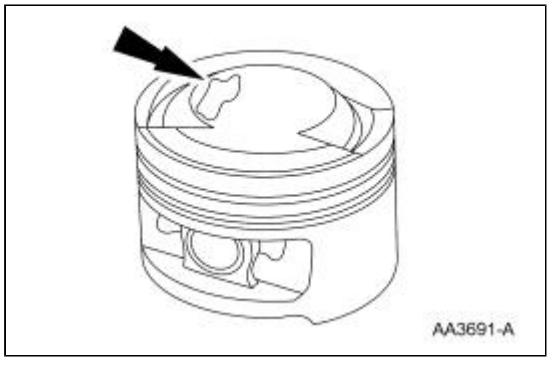
NOTE: The cylinder bore must be within the specifications for taper and out-of-round before fitting a piston.

1. Select a piston size based on the cylinder bore.



2. **NOTE:** For precision fit, new pistons are divided into 3 categories within each size range based on their relative position within the range. A paint spot on the new pistons indicates the position within the size range.

   Choose the piston with the correct paint color.
   - Refer to the appropriate section in Group 303 for the procedure.



Piston Ring End Gap

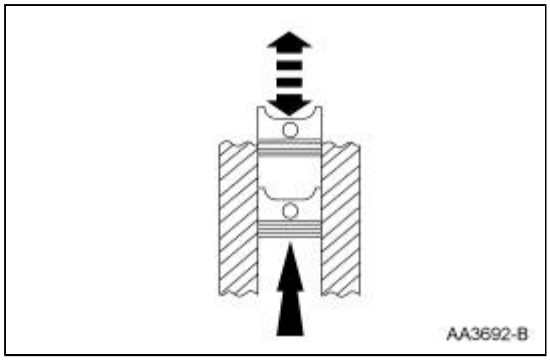
Printable View (107 KB)

CAUTION: Use care when fitting piston rings to avoid possible damage to the piston ring or the cylinder bore.

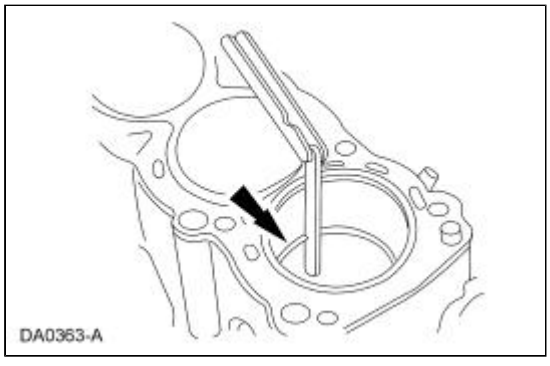
CAUTION: Piston rings should not be transferred from one piston to another.

NOTE: Cylinder bore must be within specification for taper and out-of-round.

1. Use a piston without rings to push a piston ring in a cylinder to the bottom of ring travel.



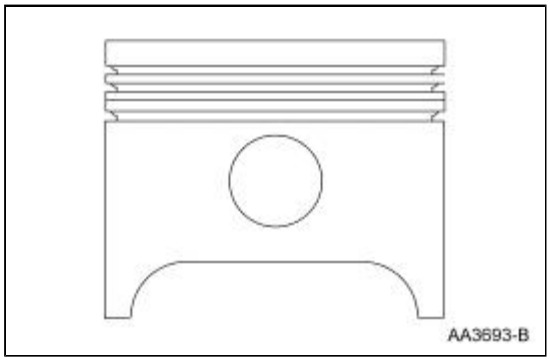
2. Use a feeler gauge to measure the top piston ring end gap and the second piston ring end gap.
   - Refer to the appropriate section in Group 303 for the procedure.



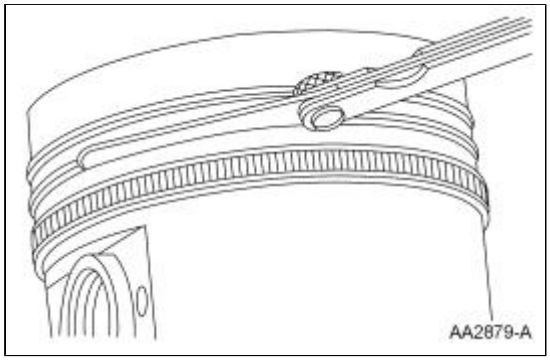
Piston Ring-to-Groove Clearance

Printable View (91 KB)

1. Inspect the piston for ring land damage or accelerated wear.



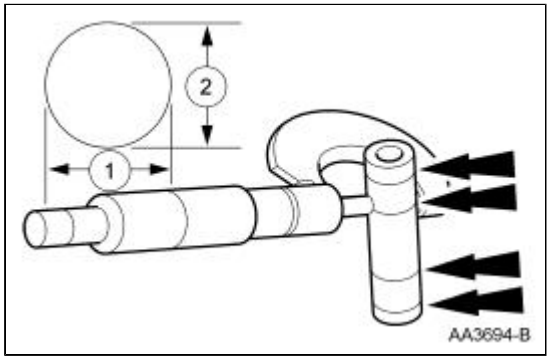
2. Measure the piston ring-to-groove clearance.
   - Refer to the appropriate section in Group 303 for the procedure.
   - If out of specification, install new components as necessary. Refer to the appropriate section in Group 303 for the procedure.



Piston Pin Diameter

Printable View (76 KB)

1. Measure the piston pin diameter in 2 directions at the points shown. Verify the diameter is within specification.
   - Refer to the appropriate section in Group 303 for the procedure.
   - If out of specification, install new components as necessary. Refer to the appropriate section in Group 303 for the procedure.



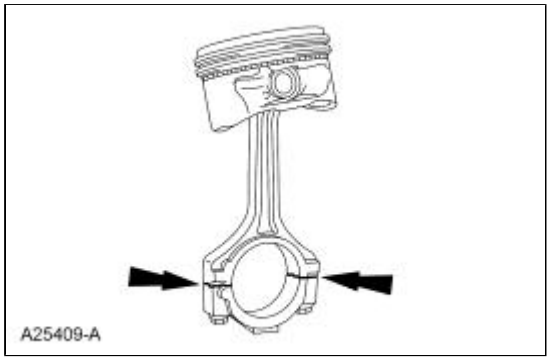
Connecting Rod Cleaning

Printable View (91 KB)

CAUTION: Do not use a caustic cleaning solution or damage to connecting rods can occur.

1. **NOTE:** The connecting rod large end is a matched set. The connecting rod cap must be installed on the original connecting rod in the original position. Do not reverse the cap. Parts are not interchangeable.

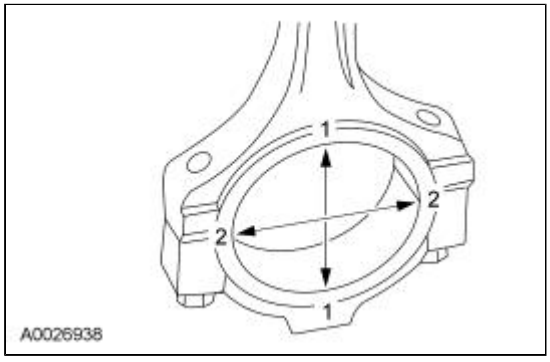
   Mark and separate the parts and clean with solvent. Clean the oil passages.



Connecting Rod Large End Bore

Printable View (78 KB)

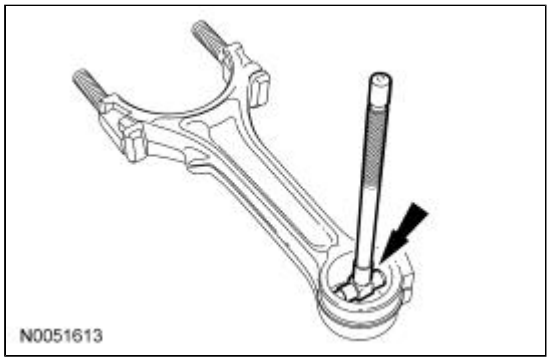
1. Tighten the bolts to specification, then measure the bore in 2 directions. The difference is the connecting rod bore out-of-round. Verify the out-of-round is within specification.
    - Refer to the appropriate section in Group 303 for the procedure.
    - If out of specification, install new components as necessary. Refer to the appropriate section in Group 303 for the procedure.



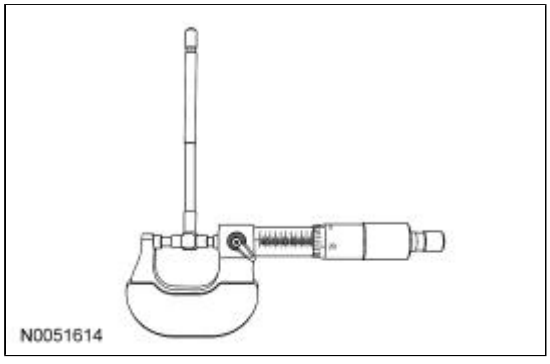
Connecting Rod Bushing Diameter

Printable View (88 KB)

1. Use a telescoping gauge to determine the inner diameter of the connecting rod bushing, if equipped.



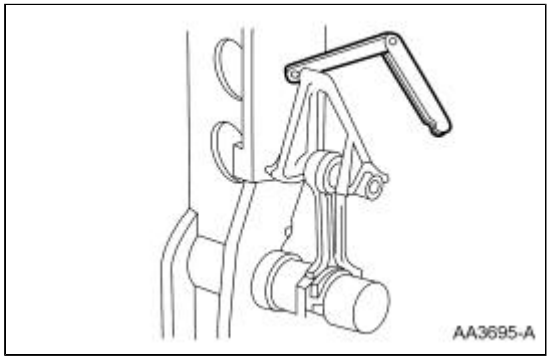
2. Measure the telescoping gauge with a micrometer. Verify the diameter is within specification.
   - Refer to the appropriate section in Group 303 for the specification.
   - If out of specification, install new components as necessary.



Connecting Rod Bend

Printable View (79 KB)

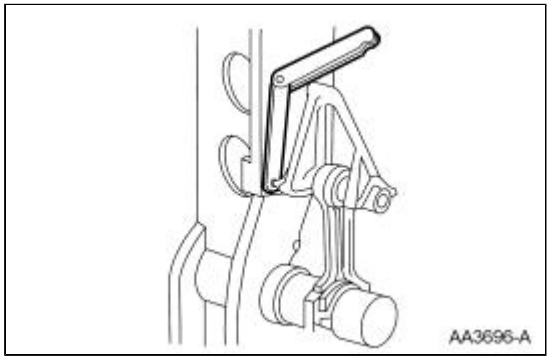
1. Measure the connecting rod bend on a suitable alignment fixture. Follow the instructions of the fixture manufacturer. Verify the bend measurement is within specification.
   - Refer to the appropriate section in Group 303 for the procedure.
   - If out of specification, install new components as necessary. Refer to the appropriate section in Group 303 for the procedure.



Connecting Rod Twist

Printable View (79 KB)

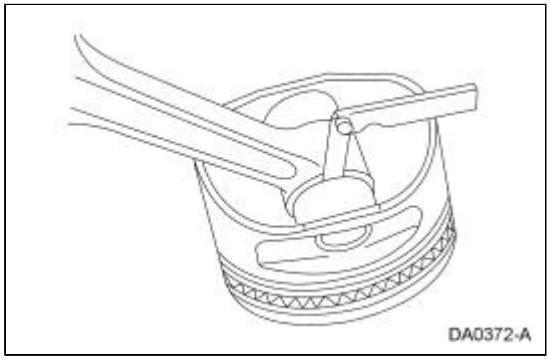
1. Measure the connecting rod twist on a suitable alignment fixture. Follow the instructions of the fixture manufacturer. Verify the measurement is within specification.
   - Refer to the appropriate section in Group 303 for the procedure.
   - If out of specification, install new components as necessary. Refer to the appropriate section in Group 303 for the procedure.



Connecting Rod-to-Piston Clearance

Printable View (80 KB)

1. Measure the clearance between the connecting rod and the piston. Verify the measurement is within specification.
    - Refer to the appropriate section in Group 303 for the procedure.
    - If out of specification, install new components as necessary. Refer to the appropriate section in Group 303 for the procedure.



Connecting Rod Bearing Journal-to-Bearing Clearance

Printable View (103 KB)

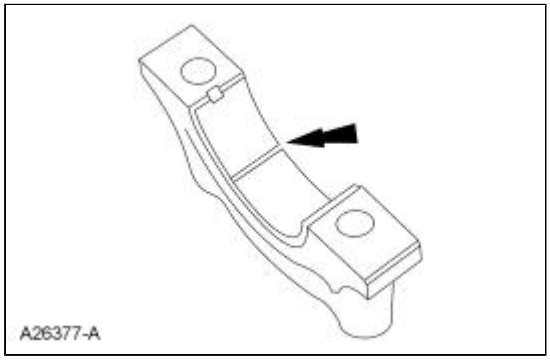
Special Tool(s)

ST1280-A	Plastigage 303-D031 (D81L-6002-B) or equivalent

NOTE: The crankshaft connecting rod journals must be within specifications to check the connecting rod bearing journal clearance.

1. Remove the connecting rod bearing cap.

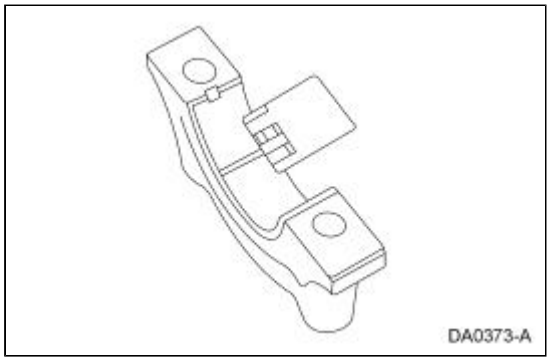
2. Position a piece of Plastigage across the bearing surface.



3. **NOTE:** Do not turn the crankshaft during this step.

   Install and tighten to specifications, then remove the connecting rod bearing cap.

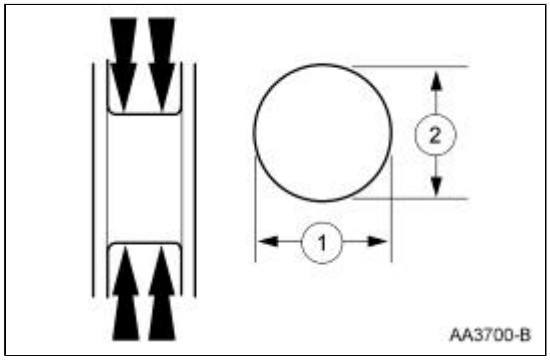
4. Measure the Plastigage to get the connecting rod bearing journal clearance. The Plastigage should be smooth and flat. A changing width indicates a tapered or damaged connecting rod or connecting rod bearing.
   - Refer to the appropriate section in Group 303 for the procedure.
   - If out of specification, install new components as necessary. Refer to the appropriate section in Group 303 for the procedure.



Connecting Rod Bearing Journal Taper and Out-of-Round

Printable View (70 KB)

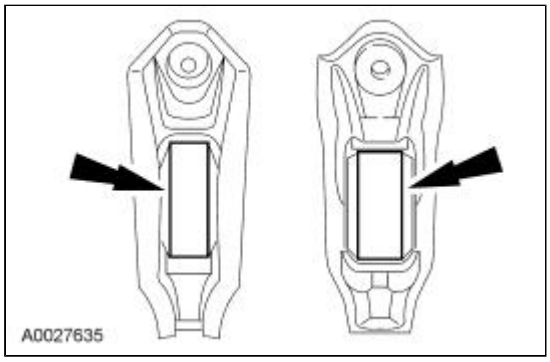
1. Measure the crankshaft connecting rod journal diameters in 2 directions perpendicular to one another at each end of the connecting rod journal. The difference in the measurements from one end to the other is the taper. Verify measurement is within the wear limit.
   - Refer to the appropriate section in Group 303 for the procedure.
   - If out of specification, install new components as necessary. Refer to the appropriate section in Group 303 for the procedure.



Roller Follower Inspection

Printable View (80 KB)

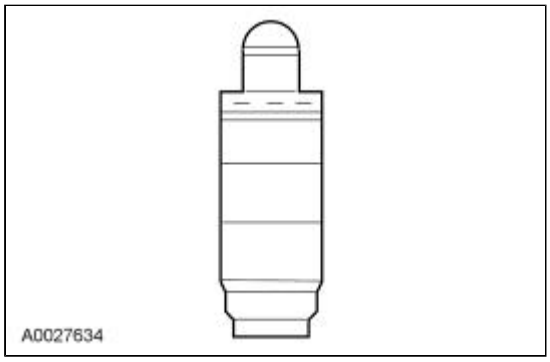
1. Inspect the roller follower for flat spots or scoring. If any damage is found, inspect the camshaft lobes and hydraulic lash adjuster for damage.



Hydraulic Lash Adjuster Inspection

Printable View (65 KB)

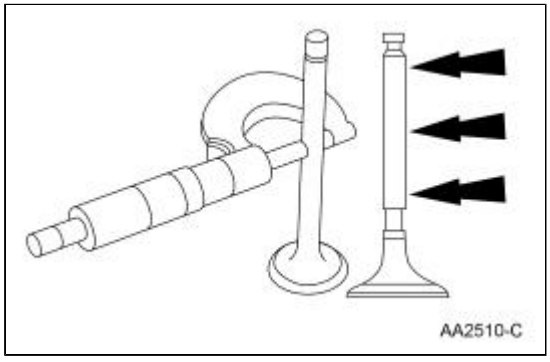
1. Inspect the hydraulic lash adjuster and roller follower for damage. If any damage is found, inspect the camshaft lobes and valves for damage.



Valve Stem Diameter

Printable View (75 KB)

1. Measure the diameter of each intake and exhaust valve stem at the points shown. Verify the diameter is within specification.
    - Refer to the appropriate section in Group 303 for the procedure.
    - If out of specification, install new components as necessary. Refer to the appropriate section in Group 303 for the procedure.



Valve Stem to Valve Guide Clearance

Printable View (109 KB)

Special Tool(s)

 ST1214-A	Dial Indicator with Bracketry 100-002 (TOOL-4201-C) or equivalent
 ST1251-A	Valve Stem Checking Tool 303-004 (TOOL-6505-E) or equivalent

NOTE: Valve stem diameter must be within specifications before checking valve stem to valve guide clearance.

1. **NOTE:** If necessary, use a magnetic base.

   Install a Valve Stem Clearance Tool on the valve stem and install a Dial Indicator with Bracketry. Lower the valve until the Valve Stem Clearance Tool contacts the upper surface of the valve guide.

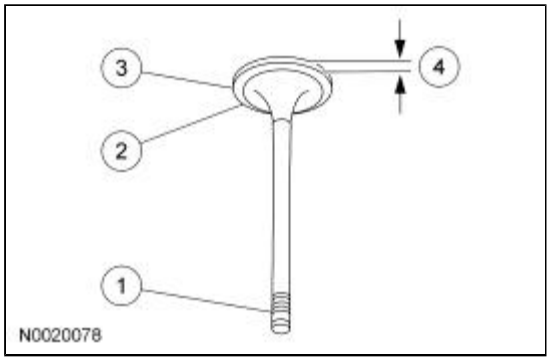
      AA3790-B

2. Move the Valve Stem Clearance Tool toward the indicator and zero the indicator. Move the Valve Stem Clearance Tool away from the indicator and note the reading. The reading will be DOUBLE the valve stem-to-valve guide clearance. Valves with oversize stems will need to be installed if out of specification.

Valve Inspection

Printable View (70 KB)

1. Inspect the following valve areas:
    1. the end of the stem for grooves or scoring
    2. the valve face and the edge for pits, grooves or scores
    3. the valve head for signs of burning, erosion, warpage and cracking
    4. the valve margin for wear

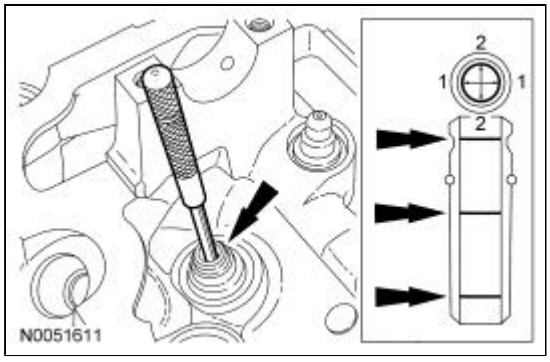


Valve Guide Inner Diameter

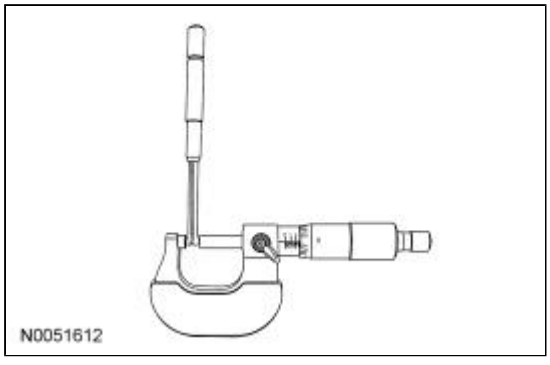
Printable View (115 KB)

1. **NOTE:** Valve guides tend to wear in an hourglass pattern. The ball gauge can be inserted into the combustion chamber side of the valve guide if necessary.

   Use a ball gauge to determine the inner diameter of the valve guides in 2 directions at the top, middle and bottom of the valve guide.



2. Measure the ball gauge with a micrometer.
   - Refer to the appropriate section in Group 303 for the specification.

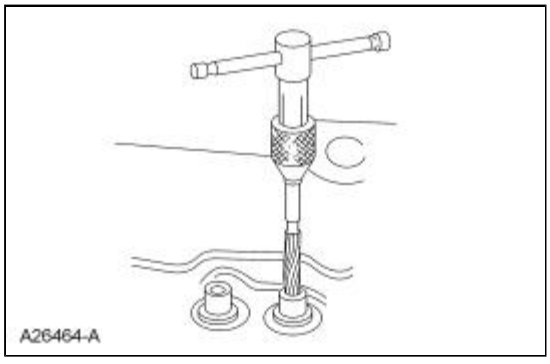


3. If the valve guide is not within specifications, ream the valve guide and install a valve with an oversize stem or remove the valve guide and install a new valve guide.

Valve Guide Reaming

Printable View (73 KB)

1. Use a hand-reaming kit to ream the valve guide.

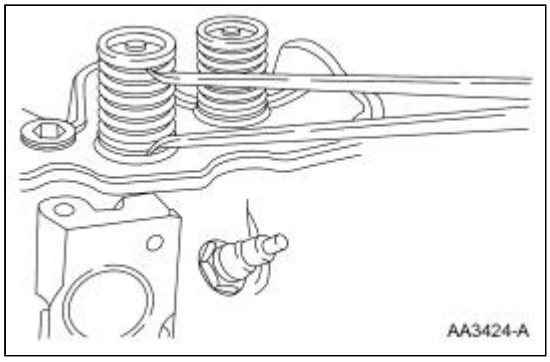


2. Reface the valve seat.
3. Clean the sharp edges left by reaming.

Valve Spring Installed Length

Printable View (84 KB)

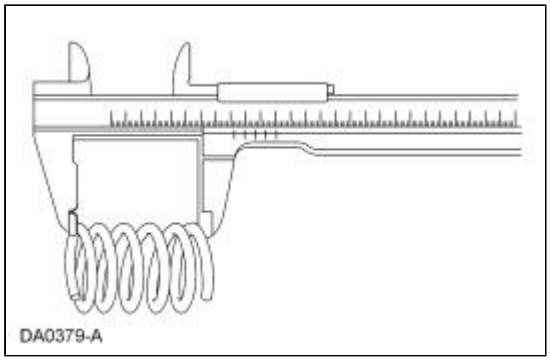
1. Measure the installed length of each valve spring.
   - Refer to the appropriate section in Group 303 for the procedure.
   - If out of specification, install new components. Refer to the appropriate section in Group 303 for the procedure.



Valve Spring Free Length

Printable View (72 KB)

1. Measure the free length of each valve spring.
   - Refer to the appropriate section in Group 303 for the procedure.
   - If out of specification, install new components as necessary. Refer to the appropriate section in Group 303 for the procedure.

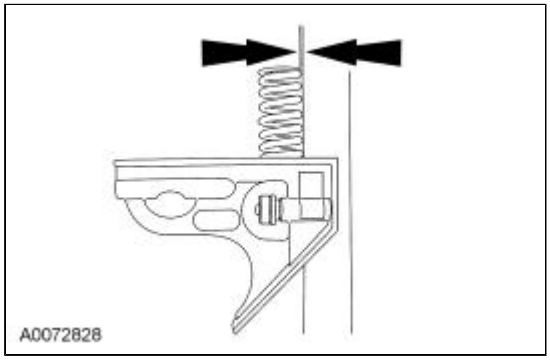


Valve Spring Squareness

Printable View (88 KB)

1. **NOTE:** This procedure only applies to cylindrical valve springs.

   Measure the out-of-square on each valve spring.
   - Turn the valve spring and observe the space between the top of the valve spring and the square. Install a new valve spring if out of square. Refer to the appropriate section in Group 303 for the procedure.



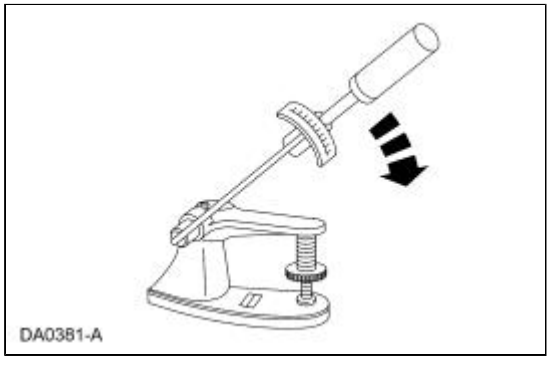
Valve Spring Strength

Printable View (78 KB)

Special Tool(s)

ST1278-A	Pressure Gauge, Valve/Clutch Spring 303-006 (TOOL-6513-DD) or equivalent

1. Use a Valve/Clutch Spring Pressure Gauge to check the valve spring for correct strength at the specified valve spring length.
   - Refer to the appropriate section in Group 303 for the procedure.
   - If out of specification, install new components as necessary. Refer to the appropriate section in Group 303 for the procedure.



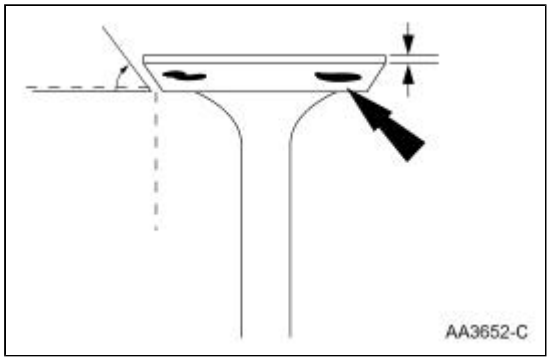
Valve Seat Inspection

Printable View (85 KB)

Valve and Seat Refacing Measurements

CAUTION: After grinding valves or valve seats, check valve clearance.

1. Check the valve head and seat.
   - Check valve angles.
   - Check margin width.
   - Refer to the appropriate section in Group 303 for the procedure.
   - Be sure margin width is within specification.

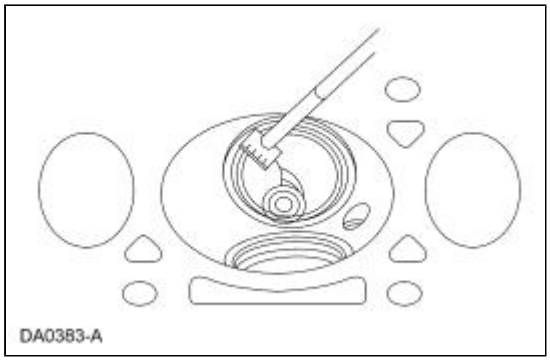


2. Inspect for abnormalities on the valve face and seat.

Valve Seat Width

Printable View (78 KB)

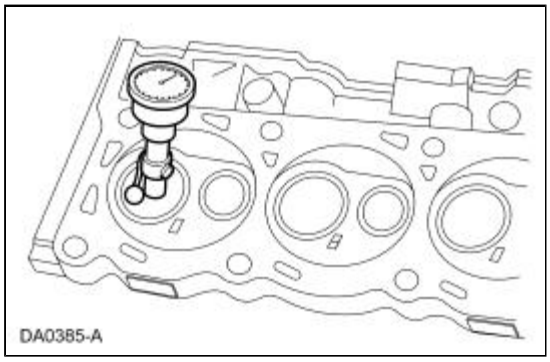
1. Measure the valve seat width. If necessary, grind the valve seat to specification.
    - Measure the intake valve seat width.
    - Measure the exhaust valve seat width.
    - Recheck the valve spring installed length after the seats have been ground, and shim the valve springs as necessary to achieve the correct installed spring length.
    - Refer to the appropriate section in Group 303 for the procedure.



Valve Seat Runout

Printable View (89 KB)

1. Use the Valve Seat Runout Gauge to check valve seat runout.



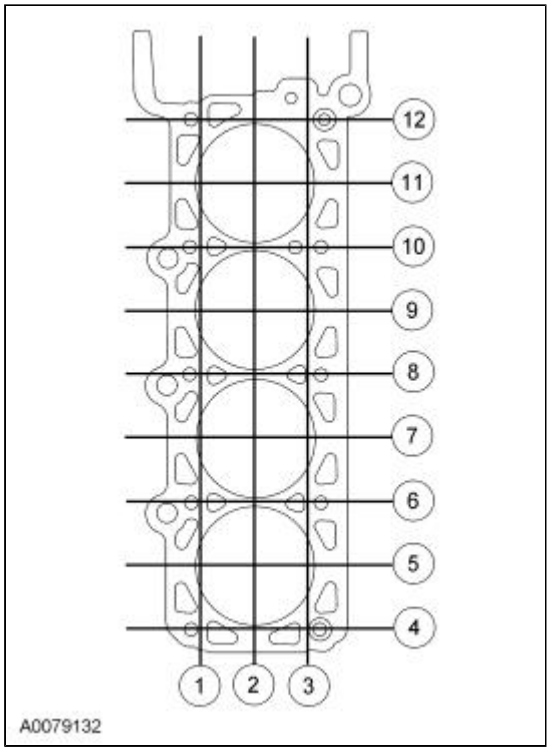
Cylinder Head Distortion

Printable View (107 KB)

1. **NOTE:** Make sure all cylinder head surfaces are clear of any gasket material, RTV, oil and coolant. The cylinder head surface must be clean and dry before running a flatness check.

   NOTE: Use a straightedge that is calibrated by the manufacturer to be flat with 0.0002 in (0.005 mm) per running foot length. For example, if the straightedge is 24 inches (61 cm) long, the machined edge must be flat with 0.0004 in (0.010 mm) from end to end.

   Using a straightedge and a feeler gauge, inspect the cylinder head for flatness in the sequence shown. If the cylinder head is distorted, install a new cylinder head.



Cylinder Bore Cleaning

Printable View (79 KB)

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

1. **CAUTION: If these procedures are not followed, rusting of the cylinder bores may occur.**

   Clean the cylinder bores with soap or detergent and water.

2. Thoroughly rinse with clean water and wipe dry with a clean, lint-free cloth.

3. Use a clean, lint-free cloth and lubricate the cylinder bores.
   - Use clean engine oil meeting Ford specification.

Cylinder Block Core Plug Replacement

Printable View (122 KB)

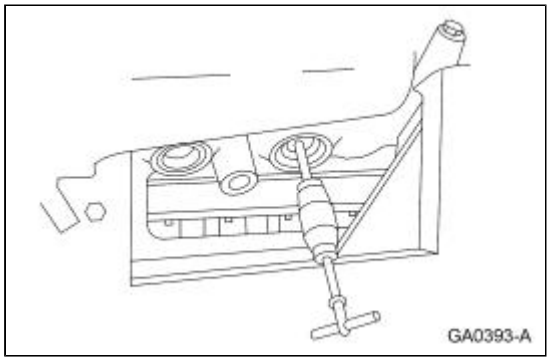
Special Tool(s)

ST1185-A	Slide Hammer 100-001 (T50T-100-A)

Material

Item	Specification
Threadlock 262 TA-26 or equivalent	WSK-M2G351-A6

1. Use a slide hammer or tools suitable to remove the cylinder block core plug.



2. Inspect the cylinder block plug bore for any damage that would interfere with the correct sealing of the plug. If the cylinder block plug bore is damaged, bore for the next oversize plug.

3. **NOTE:** Oversize plugs are identified by the OS stamped in the flat located on the cup side of the plug.

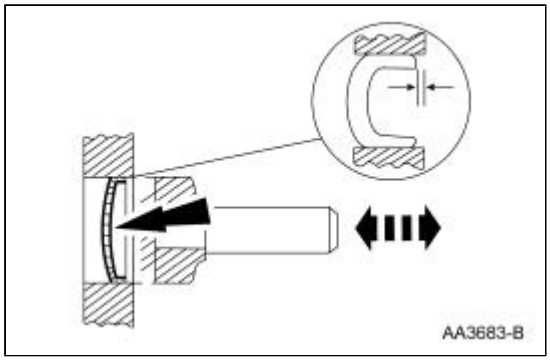
   Coat the cylinder block core plug and bore lightly with threadlock and install the cylinder block core plug.

Cup-Type

1. **CAUTION: Use care during this procedure so as not to disturb or distort the cup sealing surface.**

   CAUTION: When installed, the flanged edge must be below the chamfered edge of the bore to effectively seal the bore.

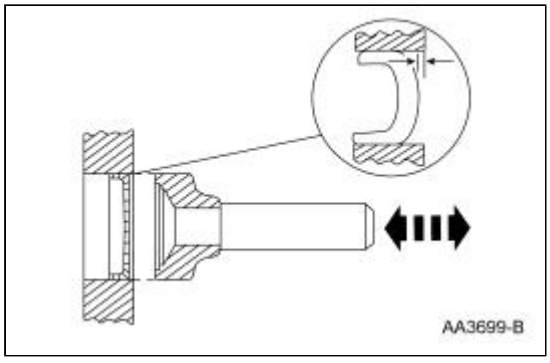
   Use a tool suitable to seat the cup-type cylinder block core plug.



Expansion-Type

1. **CAUTION: Do not contact the crown when installing an expansion-type cylinder block core plug. This could expand the plug before seating and result in leakage.**

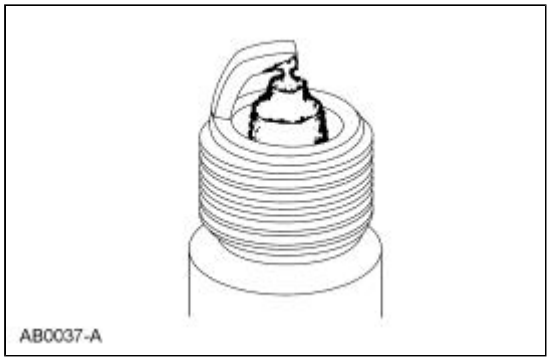
   Use a tool suitable to seat the expansion-type cylinder block core plug.



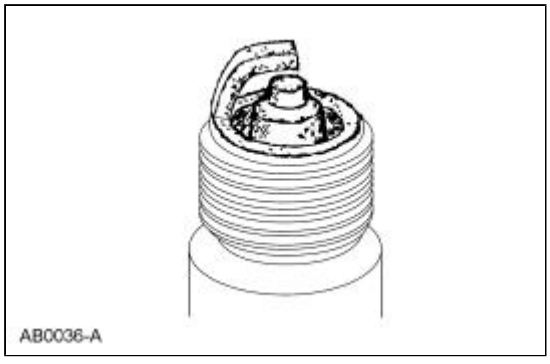
Spark Plug Inspection

Printable View (160 KB)

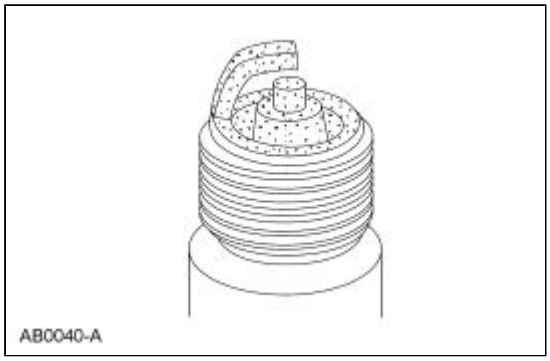
1. Inspect the spark plug for a bridged gap.
   - Check for deposit build-up closing the gap between the electrodes. Deposits are caused by oil or carbon fouling.
   - Clean the spark plug.



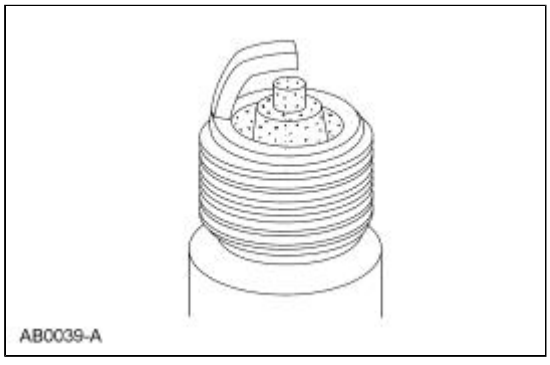
2. Check for oil fouling.
   - Check for wet, black deposits on the insulator shell bore electrodes, caused by excessive oil entering the combustion chamber through worn rings and pistons, excessive valve-to-guide clearance or worn or loose bearings.
   - Correct the oil leak concern.
   - Install a new spark plug.



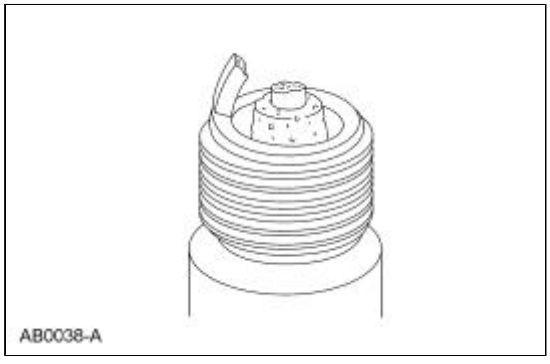
3. Inspect for carbon fouling. Look for black, dry, fluffy carbon deposits on the insulator tips, exposed shell surfaces and electrodes, caused by a spark plug with an incorrect heat range, dirty air cleaner, too rich a fuel mixture or excessive idling.
   - Clean the spark plug.



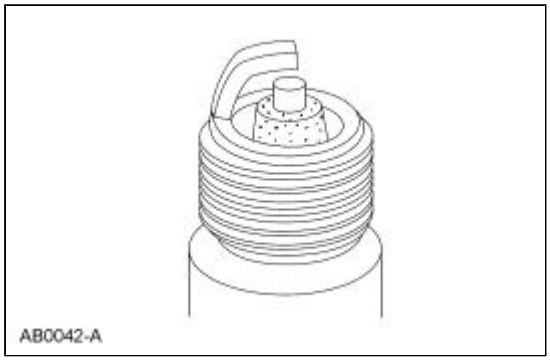
4. Inspect for normal burning.
    - Check for light tan or gray deposits on the firing tip.



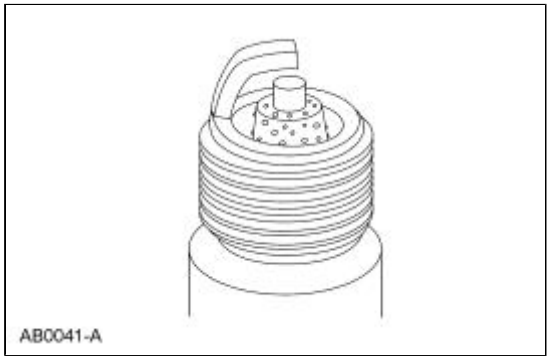
5. Inspect for pre-ignition, identified by melted electrodes and a possibly damaged insulator. Metallic deposits on the insulator indicate engine damage. This may be caused by incorrect ignition timing, wrong type of fuel or the unauthorized installation of a heli-coil insert in place of the spark plug threads.
    - Install a new spark plug.



6. Inspect for overheating, identified by a white or light gray spots and with bluish-burnt appearance of electrodes. This is caused by engine overheating, wrong type of fuel, loose spark plugs, spark plugs with an incorrect heat range, low fuel pump pressure or incorrect ignition timing.
    - Install a new spark plug.



7. Inspect for fused deposits, identified by melted or spotty deposits resembling bubbles or blisters. These are caused by sudden acceleration.
    - Clean the spark plug.



Exhaust Manifold Cleaning and Inspection

Printable View (91 KB)

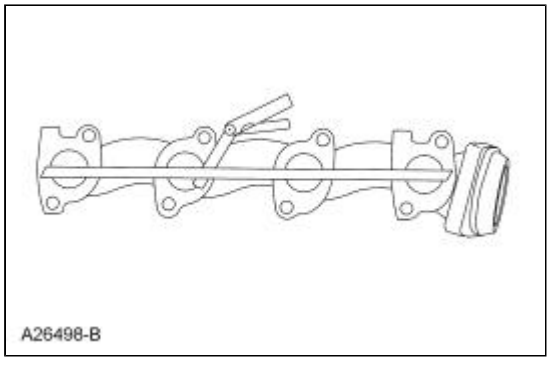
Special Tool(s)

ST1246-A	Straight Edge 303-D039 (D83L-4201-A) or equivalent

1. Clean the exhaust manifold using a suitable solvent. Use a plastic scraping tool to clean the gasket sealing surfaces.

2. **NOTE:** New exhaust manifold gaskets, studs, nuts and/or bolts must be installed when an exhaust manifold is serviced.

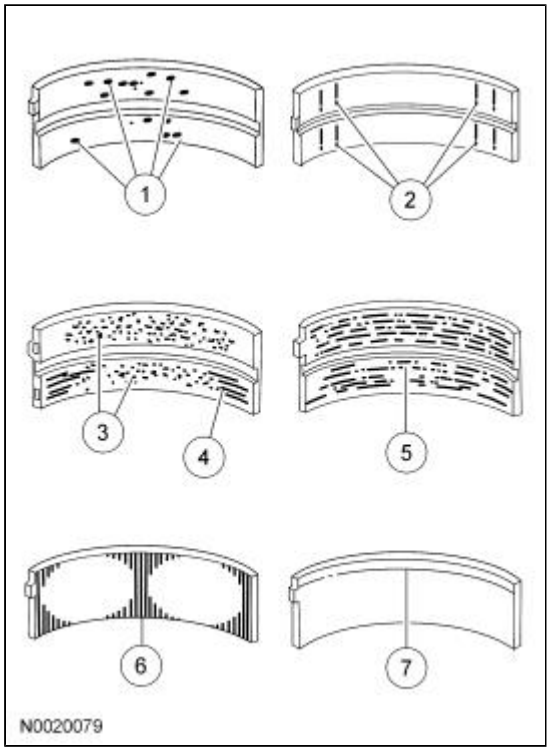
   Using the special tool (or a precision straight edge) and a feeler gauge, check the exhaust manifold sealing surface for warpage. If the warpage is greater than 0.76 mm (0.0299 in), install a new exhaust manifold.



Bearing Inspection

Printable View (97 KB)

1. Inspect bearings for the following defects. Possible causes are shown:
    1. Cratering — fatigue failure.
    2. Spot polishing — incorrect seating.
    3. Imbedded dirt engine oil.
    4. Scratching — dirty engine oil.
    5. Base exposed — poor lubrication.
    6. Both edges worn — journal damaged.
    7. One edge worn — journal tapered or bearing not seated.



Printable View (93 KB)

General Specifications

Item	Specification
Lubricants and Sealants	
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A
Motorcraft Premium Gold Engine Coolant with Bittering Agent (US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color)	WSS-M97B51-A1
Motorcraft Metal Surface Prep ZC-31	—
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Silicone Gasket Remover ZC-30	—
Engine	
Displacement	5.4L (330 CID)
Number of cylinders	8
Bore	90.2 mm (3.55 in)
Stroke	105.8 mm (4.17 in)
Firing order	1-3-7-2-6-5-4-8
Oil pressure minimum at 2,000 rpm (engine at normal operating temperature)	517 kPa (75 psi)
Oil capacity	6.6L (7.0 qt) with filter
Compression ratio	9.8:1
Cylinder Head and Valve Train	
Combustion chamber volume	48.1-51.1 cc (2.94-3.12 cu in)
Valve arrangement (front to rear) — LH	I-E-I-I-E-I-I-E-I-I-E-I
Valve arrangement (front to rear) — RH	I-E-I-I-E-I-I-E-I-I-E-I
Valve guide bore diameter	6.015-6.044 mm (0.237-0.238 in)
Valve stem diameter — intake	5.975-5.995 mm (0.235-0.236 in)
Valve stem diameter — exhaust	5.95-5.97 mm (0.234-0.235 in)
Valve stem-to-guide clearance — intake	0.020-0.045 mm (0.001-0.002 in)
Valve stem-to-guide clearance — exhaust	0.069-0.094 mm (0.003-0.004 in)
Valve head diameter — intake	33.62-33.98 mm (1.324-1.338 in)
Valve head diameter — exhaust	37.32-37.68 mm (1.469-1.483 in)

Valve face runout	0.05 mm (0.002 in)
Valve face angle	45.5 degrees
Valve seat width — intake	1.2-1.4 mm (0.047-0.055 in)
Valve seat width — exhaust	1.4-1.6 mm (0.055-0.063 in)
Valve seat angle	44.5-45.0 degrees
Valve spring free length	55.7 mm (2.19 in)
Valve spring compression pressure	350 N (79 lbs) ± 17.5 N (4 lbs) @ 42.04 mm (1.66 in)
Valve spring installed height	42.04 mm (1.66 in)
Valve spring installed pressure	350 N (79 lbs) ± 17.5 N (4 lbs) @ 42.04 mm (1.66 in)
Roller follower ratio	—
Hydraulic Lash Adjuster	
Diameter	15.988-16.000 mm (0.6294-0.6299 in)
Clearance-to-bore	0.018-0.069 mm (0.0007-0.0027 in)
Service limit	—
Hydraulic leakdown rate	5-25 seconds [a]
Collapsed lash adjuster gap	0.45-0.85 mm (0.018-0.033 in)
Camshaft	
Theoretical valve lift @ 0 lash — intake	11.1 mm (0.437 in)
Theoretical valve lift @ 0 lash — exhaust	11.0 mm (0.433 in)
Lobe lift — intake	5.520 mm (0.217 in)
Lobe lift — exhaust	5.506 mm (0.217 in)
Allowable lobe lift loss	0.127 mm (0.005 in)
Journal diameter	28.607-28.633 mm (1.126-1.127 in)
Camshaft journal bore inside diameter	28.657-28.682 mm (1.128-1.129 in)
Camshaft journal-to-bearing clearance	0.024-0.075 mm (0.001-0.003 in)
Runout	0.03 mm (0.001 in)
End play	0.075-0.185 mm (0.003-0.007 in)
Cylinder Block	
Cylinder bore diameter — Grade 1	90.200-90.210 mm (3.5512-3.5516 in)
Cylinder bore diameter — Grade 2	90.210-90.220 mm (3.5516-3.5520 in)
Cylinder bore diameter — Grade 3	0.220-90.230 mm (3.5520-3.5524 in)
Cylinder bore maximum taper	0.006 mm (0.0002 in)

Cylinder bore maximum out-of-round	0.020 mm (0.0008 in)
Main bearing bore inside diameter	72.400-72.424 mm (2.850-2.851 in)
Crankshaft	
Main bearing journal diameter	67.481-67.505 mm (2.6567-2.6576 in)
Main bearing journal maximum taper	0.004 mm (0.0002 in)
Main bearing journal maximum out-of-round	0.0075 mm (0.0003 in) between cross sections
Main bearing journal-to-cylinder block clearance	0.048-0.024 mm (0.0019-0.0009 in)
Connecting rod journal diameter	53.003-52.983 mm (2.0867-2.0859 in)
Connecting rod journal maximum taper	0.004 mm (0.0002 in)
Connecting rod journal maximum out-of-round	0.0075 mm (0.0003 in) between cross sections
Crankshaft maximum end play	0.075-0.377 mm (0.0030-0.0148 in)
Piston and Connecting Rod	
Piston diameter — Grade 1 (at right angle to pin bore)	90.175-90.165 mm (3.5502-3.5498 in)
Piston diameter — Grade 2 (at right angle to pin bore)	90.185-90.175 mm (3.5506-3.5502 in)
Piston diameter — Grade 3 (at right angle to pin bore)	90.195-90.185 mm (3.5510-3.5506 in)
Piston-to-cylinder bore clearance (at grade size)	0.025-0.045 mm (0.0010-0.0018 in)
Piston ring end gap — top	0.15-0.30 mm (0.006-0.012 in)
Piston ring end gap — intermediate	0.25-0.50 mm (0.0098-0.0197 in)
Piston ring end gap — oil control	0.15-0.65 mm (0.0059-0.0256 in)
Piston ring groove width — top	1.52-1.55 mm (0.0598-0.0610 in)
Piston ring groove width — intermediate	1.52-1.54 mm (0.0598-0.0606 in)
Piston ring groove width — oil control	3.030-3.050 mm (0.1193-0.1201 in)
Piston ring width — top and intermediate	1.50-1.47 mm (0.0590-0.0578 in)
Piston ring-to-groove clearance — top	0.020-0.080 mm (0.0008-0.0031 in)
Piston ring-to-groove clearance — intermediate	0.030-0.070 mm (0.0012-0.0028 in)
Piston pin bore diameter	22.008-22.014 mm (0.8665-0.8667 in)
Piston pin diameter	22.0010-22.0030 mm (0.8662-0.8663 in)

Piston pin length	61.8 mm (2.433 in)
Piston pin-to-piston fit	0.005-0.013 mm (0.0002-0.0005 in)
Connecting rod-to-pin clearance	0.009-0.0235 mm (0.0004-0.0093 in)
Connecting rod pin bore diameter	22.012-22.024 mm (0.8666-0.8671 in)
Connecting rod length (center-to-center)	169.1 mm (6.6575 in)
Connecting rod maximum allowed bend	± 0.038 mm (0.0015 in)
Connecting rod maximum allowed twist [b]	± 0.05 mm (0.0020 in)
Connecting rod bearing bore diameter (with assembled liners)	53.049-53.027 mm (2.0885-2.0877 in)
Connecting rod bearing-to-crankshaft clearance	0.064-0.026 mm (0.0025-0.0010 in)
Connecting rod side clearance	0.475-0.125 mm (0.0187-0.0049 in)

[a] The time required for the plunger to leak down 1.6 mm (0.062 in) of travel with 222 N force and leak-down fluid in the lash adjuster.
[b] The pin bore and crank bearing bore must be parallel and in the same vertical plane within the specified total difference when measured at the ends of a 203 mm bar, 105.5 mm on each side of rod centerline.

Variable camshaft timing (VCT) sprocket assembly bolts [a]	—	—	—

[a] Refer to the procedure in this section.

Engine

Printable View (85 KB)

NOTE: Refer to the exploded view under the assembly procedure in this section.

The 5.4L (3V) is a V-8 engine with the following features:

- Single overhead camshafts
- Three valves per cylinder
- Sequential multi-port fuel injection (SFI)
- Aluminum cylinder heads
- Cast iron, 60-degree V cylinder block
- Variable camshaft timing (VCT)
- Individually chain-driven camshafts with a hydraulic timing chain tensioner on each timing chain
- Distributorless ignition system

Identification

Always refer to these labels when installation of new parts is necessary, or when checking engine calibrations. The engine parts often differ within a CID family. Verification of the identification codes will make sure that the correct parts are obtained. These codes contain all the pertinent information relating to the dates, optional equipment and revisions. The Ford Master Parts Catalog contains a complete listing of the codes and their application.

Code Information

The engine code information label, located on the side of the valve cover and the front side of the valve cover, contains the following:

- Engine build date
- Engine plant code
- Engine code

Exhaust Emission Control System

Operation and necessary maintenance of the exhaust emission control devices used on this engine are covered in the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Induction System

The sequential multi-port fuel injection (SFI) provides the fuel/air mixture needed for combustion in the cylinders. The 8 solenoid-operated fuel injectors:

- are mounted in the intake manifold.
- meter fuel into the air intake stream in accordance with engine demand.
- are positioned so that their tips direct fuel just ahead of the engine intake valves.
- supply fuel from the fuel tank with a fuel pump mounted in the fuel tank.

Valve Train

The valve train operates as follows:

- Ball-tip hydraulic lash adjusters provide automatic lash adjustment.
- Roller followers ride on the camshaft lobe, transferring the up-and-down motion of the camshafts to the valves in the cylinder heads.

Positive Crankcase Ventilation System

All engines are equipped with a closed-type positive crankcase ventilation system recycling the crankcase vapors to the upper intake manifold.

Lubrication System

The engine lubrication system operates as follows:

- Oil is drawn into the oil pump through the oil pump screen cover and tube in the sump of the oil pan.
- Oil is pumped through the oil filter on the left front side of the cylinder block.
- Oil enters the main gallery where it is distributed to the crankshaft main journals and to both cylinder heads.
- From the main journals, the oil is routed through cross-drilled passages in the crankshaft to lubricate the connecting rod bearings. Controlled leakage through the crankshaft main bearings and connecting rod bearings is slung radially outward to cool and lubricate the cylinder walls as well as the entire connecting rod, piston and piston ring assembly.
- The left cylinder head is fed from a drilling into the supply passage feeding the main gallery at the front of the cylinder block. The right cylinder head is fed from a drilling into the rear of the main gallery. Main gallery pressure is reduced as it enters the cylinder head galleries through fixed serviceable orifices, located at the upper part of the feed passages. It is this reduced pressure in the cylinder head galleries which feeds the camshaft journals, the hydraulic lash adjusters and the primary and secondary timing chain tensioners.
- The camshaft lobe and roller followers are lubricated by splash created through valve train operation.

Oil Pump

The lubrication system of the 5.4L (3V) engine is designed to provide optimum oil flow to critical components of the engine through its entire operating range. The heart of the system is a positive displacement internal gear oil pump using top seal rotors. Generically this design is known as a gerotor pump, which operates as follows:

- The oil pump is mounted on the front face of the cylinder block.
- The inner rotor is piloted on the crankshaft post and is driven through flats on the crankshaft.
- System pressure is limited by an integral, internally-vented relief valve which directs the bypassed oil back to the inlet side of the oil pump.
- Oil pump displacement has been selected to provide adequate volume to make sure of correct oil pressure, both at hot idle and maximum speed.
- The relief valve calibration protects the system from excessive pressure during high viscosity conditions.
- The relief valve is designed to provide adequate connecting rod bearing lubrication under high-temperature and high-speed conditions.

Engine

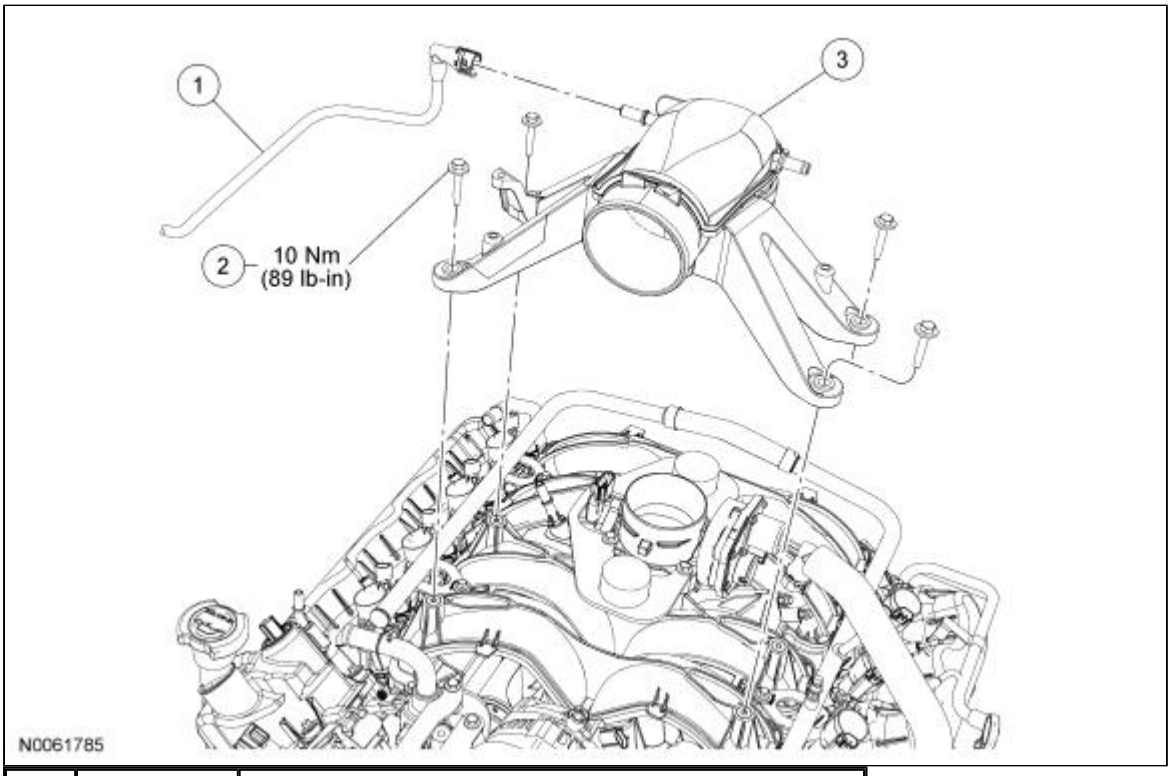
For basic engine mechanical concerns, refer to Section 303-00 . For driveability concerns, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Intake Manifold

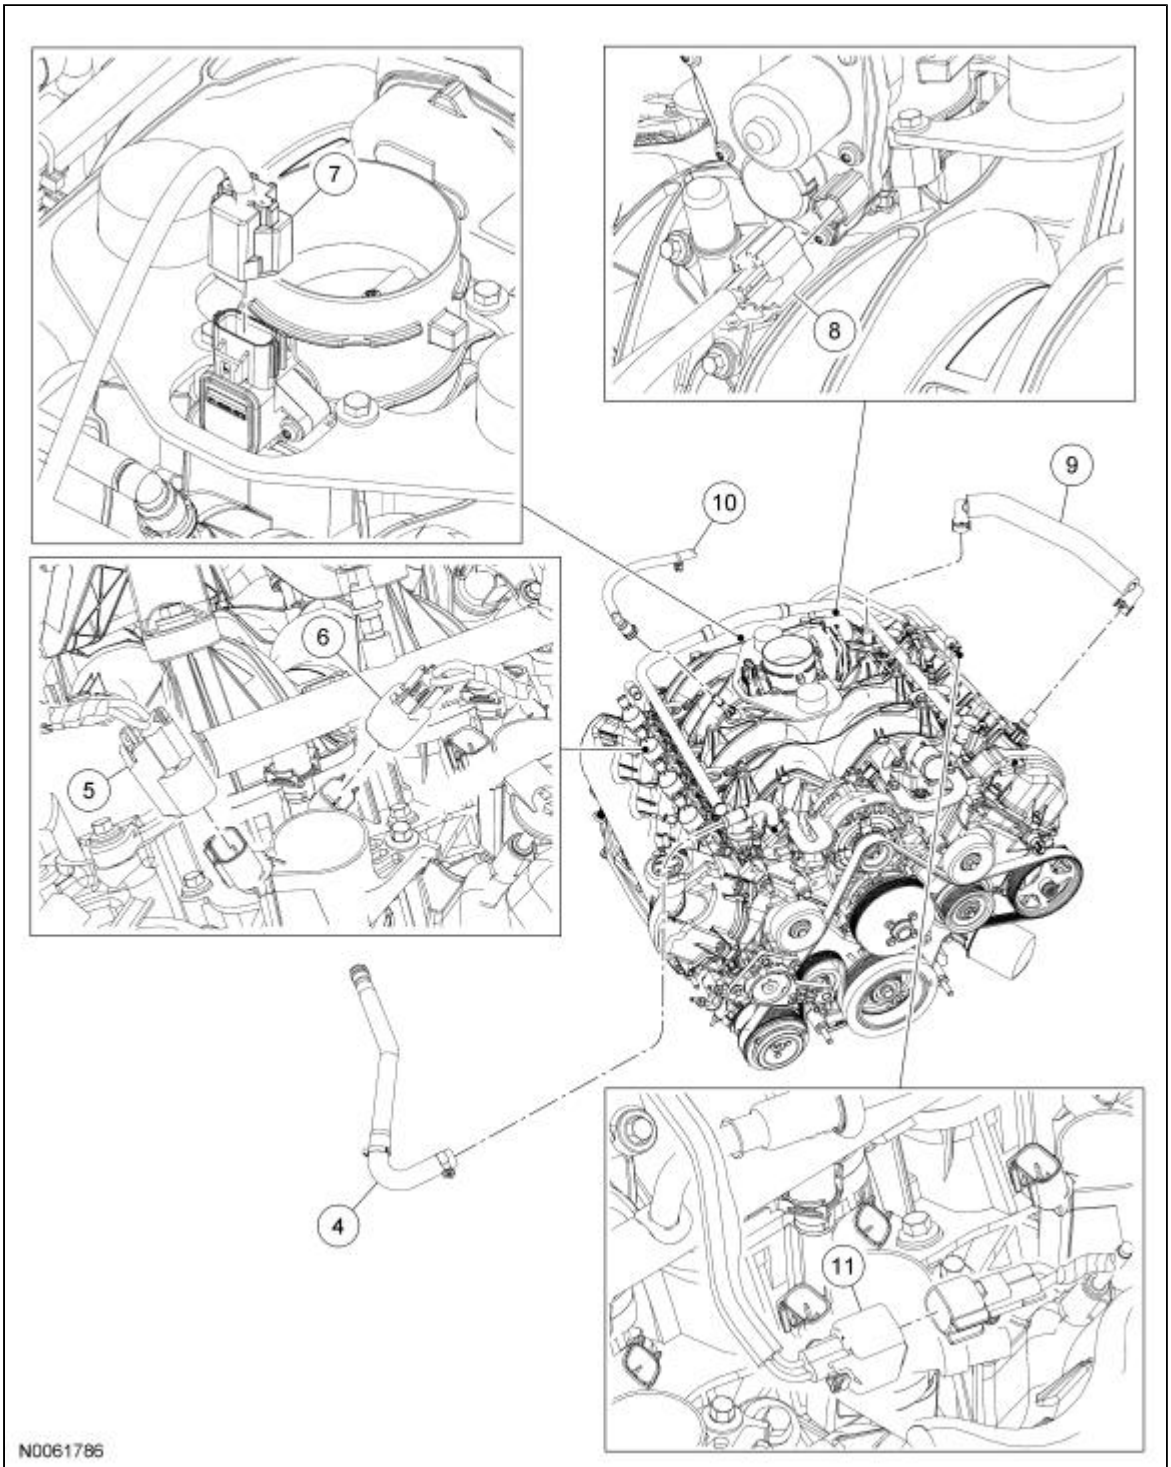
Printable View (942 KB)

Material

Item	Specification
Motorcraft Metal Surface Prep ZC-31	—
Silicone Gasket Remover ZC-30	—

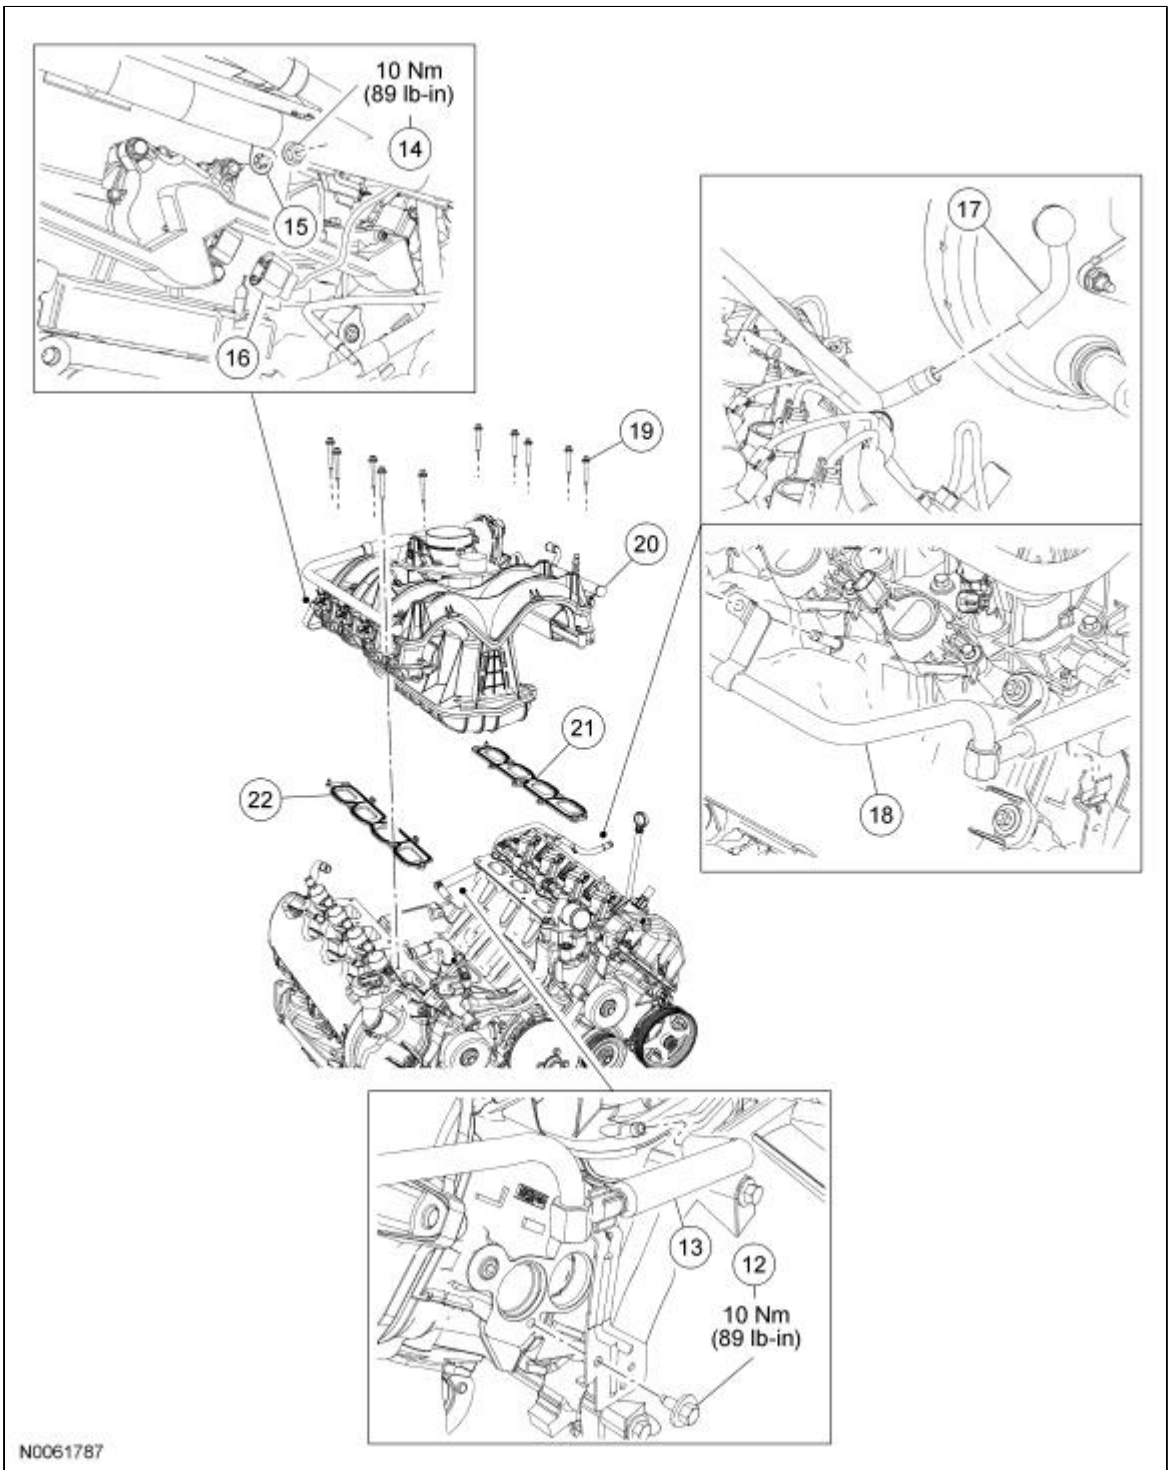


Item	Part Number	Description
1	6758	Crankcase ventilation tube
2	W505426	Air cleaner outlet pipe-to-throttle body (TB) adapter bolt (4 required)
3	9A589	Air cleaner outlet pipe-to-TB adapter



Item	Part Number	Description
4	9229	Heater coolant hose
5	—	Ignition coil electrical connector (8 required) (part of 12B637)
6	—	Fuel injector electrical connector (8 required) (part of 12B637)
7	—	Throttle position (TP) sensor electrical connector (part of 12B637)
8	—	Electronic acceleration control electrical connector (part of 12B637)9

9	6K817	Positive crankcase ventilation (PCV) tube
10	—	Evaporative emissions (EVAP) system tube quick connect coupling
11	—	Heated PCV intake fitting electrical connector (part of 12B637)



Item	Part Number	Description
12	—	Intake manifold vacuum tube support bracket bolt
13	—	Intake manifold vacuum tube-to-intake manifold

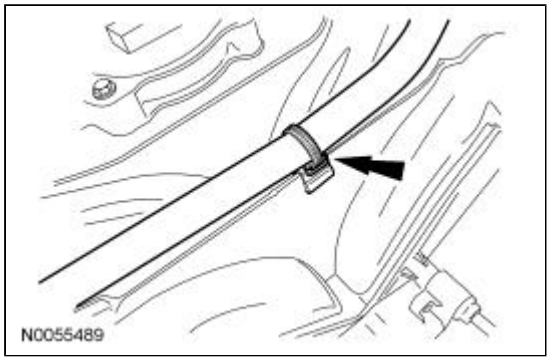
		hose (part of 9A474)
14	N621903	Engine wiring harness retainer nut
15	—	Engine wiring harness retainer (part of 12B637)
16	—	Charge motion control valve (CMCV) electrical connector (part of 12B637)
17	—	Intake manifold vacuum tube-to-brake booster hose (part of 9A474)
18	9D446	Intake manifold vacuum tube
19	W710758	Intake manifold bolt (10 required)
20	9Y451	Intake manifold assembly
21	9441	LH intake manifold gasket
22	9439	RH intake manifold gasket

Removal

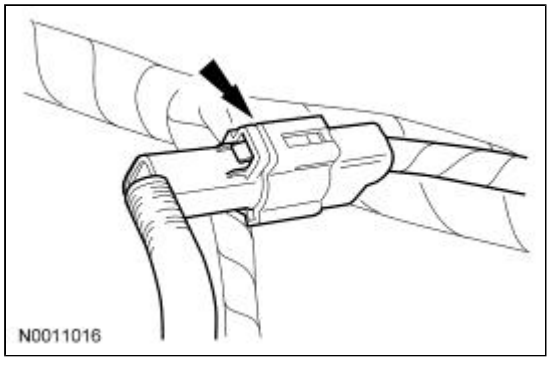
WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.

WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before servicing or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved to prevent accidental spraying of fuel. Failure to follow these instructions may result in personal injury.

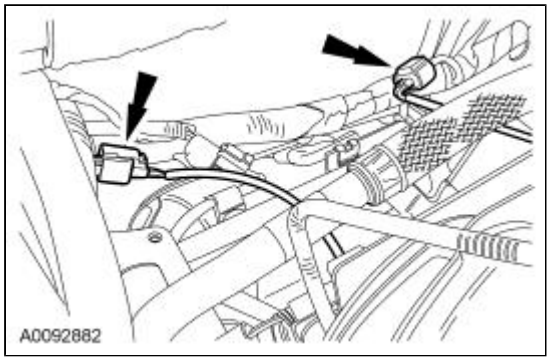
1. Drain the cooling system. For additional information, refer to Section 303-03 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Disconnect the fuel supply hose spring lock coupling from the fuel rail. For additional information, refer to Section 310-00 .
4. Remove the generator. For additional information, refer to Section 414-02 .
5. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .
6. Disconnect the crankcase ventilation tube quick connect coupling from the intake manifold. For additional information, refer to Section 310-00 .
7. Disconnect the quick connect coupling and remove the evaporative emissions system (EVAP) hose from the intake manifold. For additional information, refer to Section 310-00 .
8. Disconnect the EVAP hose position retainer from the intake manifold.



9. Remove the 4 bolts and the air cleaner outlet pipe-to-TB adapter.
10. Disconnect the heater coolant hose from the coolant bypass tube.
11. Disconnect the quick connect couplings and remove the positive crankcase ventilation (PCV) tube. For additional information, refer to Section 310-00 .
12. Disconnect the 8 fuel injector electrical connectors.
13. Disconnect the 8 ignition coil electrical connectors.
14. Disconnect the throttle position (TP) sensor and electronic acceleration control electrical connectors.
15. Disconnect the heated PCV intake fitting electrical connector.
16. Remove the intake manifold vacuum tube support bracket bolt and disconnect the intake manifold vacuum tube-to-intake manifold hose.
17. Disconnect the brake booster vacuum hose from the intake manifold vacuum tube.
18. Disconnect the intake manifold vacuum tube support retainer from the valve cover and position the intake manifold vacuum tube aside.
19. Remove the 10 intake manifold bolts.
20. Disconnect the charge motion control valve (CMCV) electrical connector.
21. Disconnect the cylinder head temperature (CHT) sensor jumper harness electrical connector.



22. Disconnect the LH and RH knock sensor (KS) electrical connectors.



23. Remove the nut and disconnect the engine wiring harness retainer from the CMCV stud.

24. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    Remove the intake manifold and discard the gaskets.
    - Inspect and clean the sealing surfaces with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

Installation

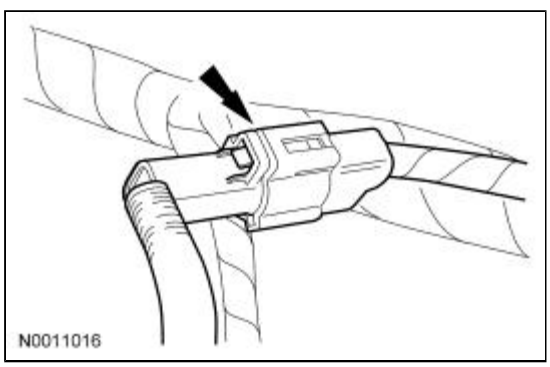
1. **NOTE:** Electrical and vacuum harnesses must not restrict movement of the CMCV control rods at rear of the intake manifold. Use extreme care on installation of the intake manifold to prevent any pinching of electrical and vacuum harnesses.

   Using new intake manifold gaskets, position the intake manifold.

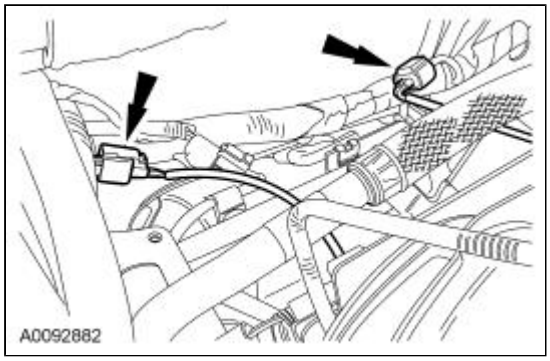
2. Connect the engine wiring harness retainer to the CMCV stud and install the nut.
   - Tighten to 10 Nm (89 lb-in).

3. Connect the CMCV electrical connector.

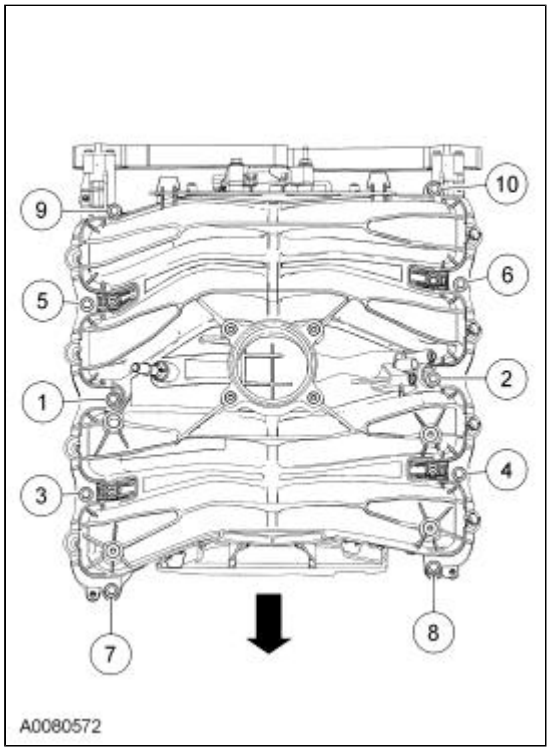
4. Connect the CHT sensor jumper harness electrical connector.



5. Connect the LH and RH KS electrical connectors.



6. Install the intake manifold bolts and tighten in 2 stages, in the sequence shown.
    - Stage 1: Tighten to 2 Nm (18 lb-in).
    - Stage 2: Tighten to 10 Nm (89 lb-in).



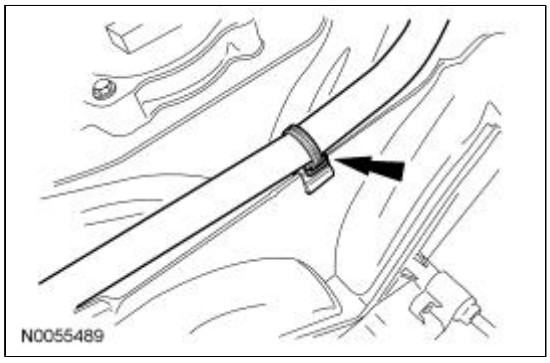
7. Install the intake manifold vacuum tube support bracket bolt and connect the intake manifold vacuum tube-to-intake manifold hose.
    - Tighten to 10 Nm (89 lb-in).
8. Connect the intake manifold vacuum tube support retainer to the valve cover and position the intake manifold vacuum tube aside.
9. Connect the brake booster vacuum hose to the intake manifold vacuum tube.
10. Connect the heated PCV intake fitting electrical connector.
11. Connect the TP sensor and electronic acceleration control electrical connectors.
12. Connect the 8 fuel injector electrical connectors.
13. Connect the 8 ignition coil electrical connectors.
14. Position the air cleaner outlet pipe-to-TB adapter and install the 4 bolts.

- Tighten to 10 Nm (89 lb-in).

15. Connect the crankcase ventilation tube quick connect coupling to the intake manifold. For additional information, refer to Section 310-00 .

16. Position the EVAP hose and connect the quick connect coupling to the intake manifold. For additional information, refer to Section 310-00 .

17. Connect the EVAP hose position retainer to the intake manifold.



18. Position the PCV tube and connect the quick connect couplings. For additional information, refer to Section 310-00 .

19. Connect the heater coolant hose to the coolant bypass.

20. Connect the fuel supply spring lock coupling to the fuel rail. For additional information, refer to Section 310-00 .

21. Install the generator. For additional information, refer to Section 414-02 .

22. Install the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

23. Connect the battery ground cable. For additional information, refer to Section 414-01 .

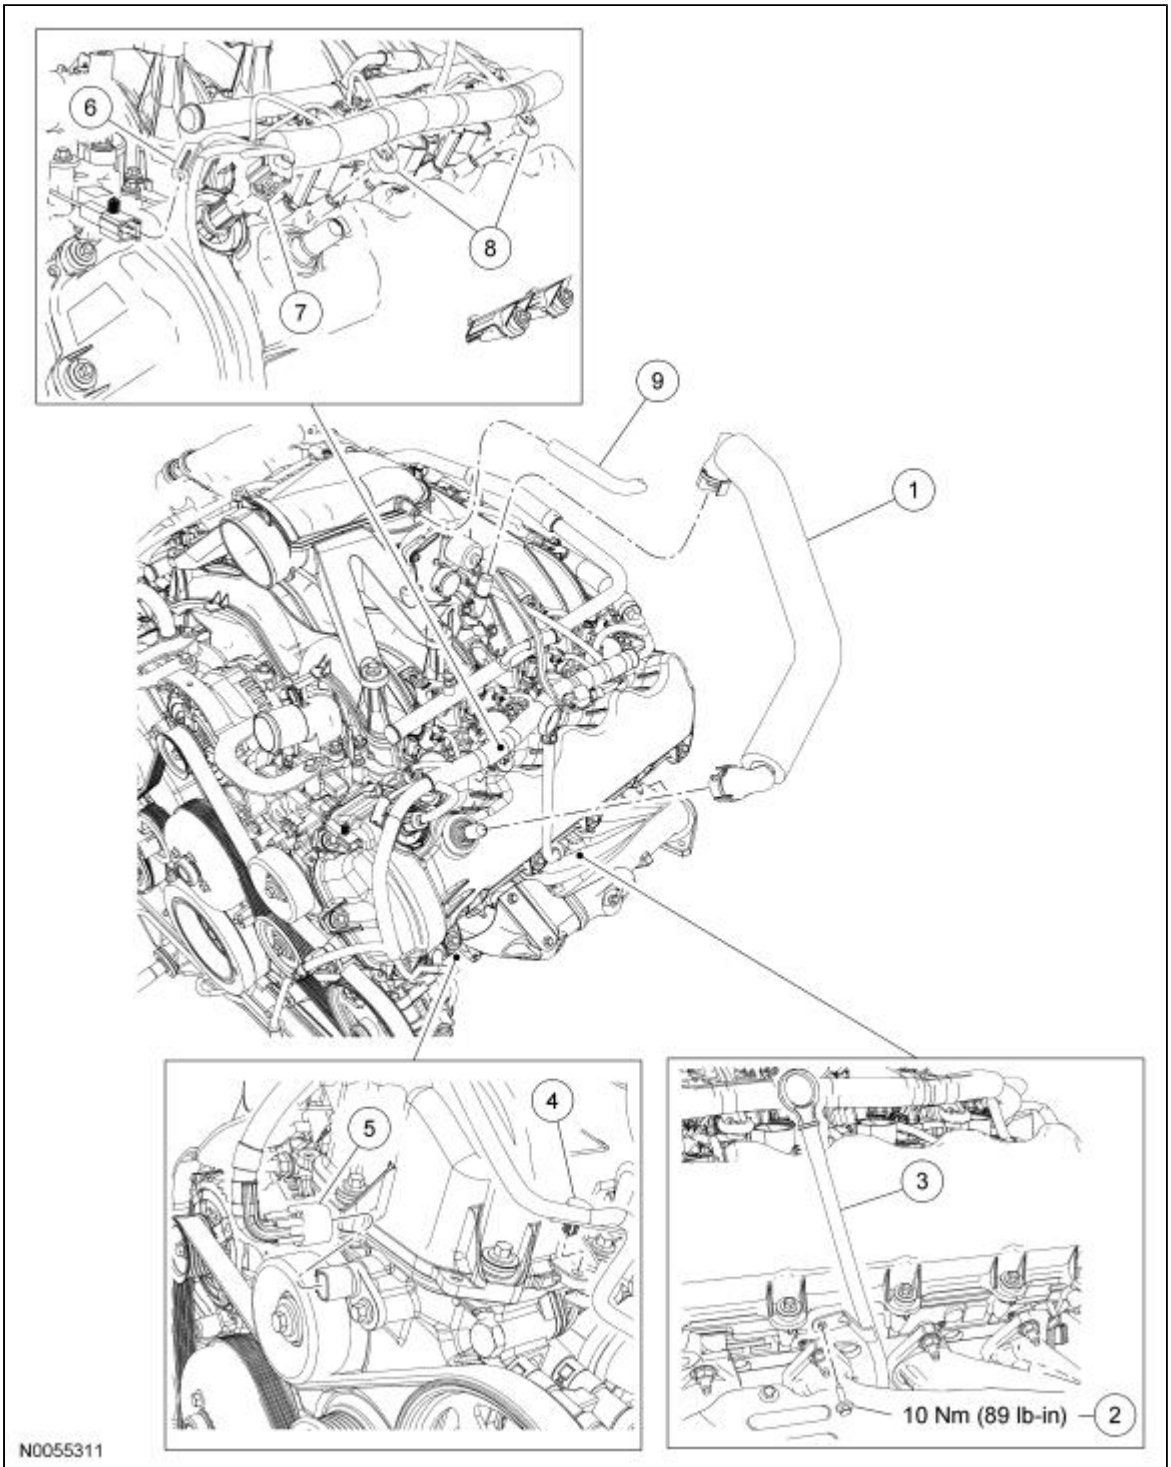
24. Fill and bleed the engine cooling system. For additional information, refer to Section 303-03 .

Valve Cover — LH

Printable View (700 KB)

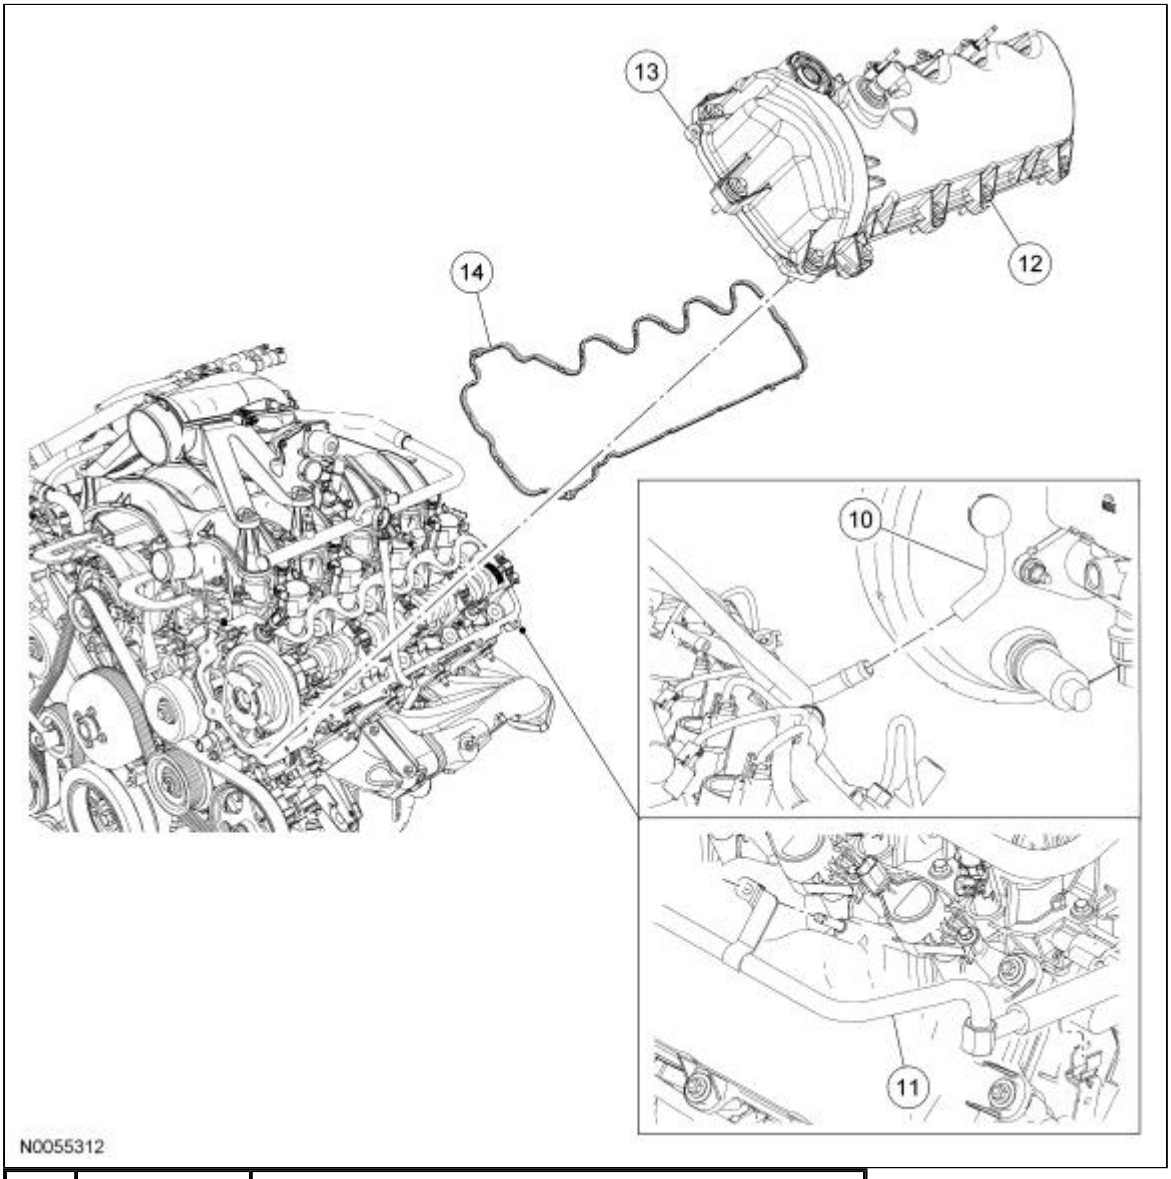
Material

Item	Specification
Motorcraft Metal Surface Prep ZC-31	—
Silicone Gasket Remover ZC-30	—
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4



Item	Part Number	Description
1	6K817	Positive crankcase ventilation (PCV) tube
2	N605892	Oil level indicator and tube bolt
3	6K873	Oil level indicator and tube
4	—	Engine wiring harness retainer (part of 12B637)
5	—	LH camshaft position (CMP) sensor electrical connector (part of 12B637)
6	—	LH radio ignition interference capacitor electrical connector (part of 12B637)

7	—	LH variable camshaft timing (VCT) solenoid electrical connector (part of 12B637)
8	—	Engine wiring harness retainers (part of 12B637)
9	—	Vacuum hose



Item	Part Number	Description
10	—	Intake manifold vacuum tube-to-brake booster hose
11	9D446	Intake manifold vacuum tube
12	—	LH valve cover bolt (15 required) (part of 6582)
13	6A505	LH valve cover
14	6A559	LH valve cover gasket

Removal

1. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

2. Remove the degas bottle. For additional information, refer to Section 303-03 .

3. Remove the LH ignition coils. For additional information, refer to Section 303-07 .

4. Disconnect the quick connect couplings and remove the positive crankcase ventilation (PCV) tube. For additional information, refer to Section 310-00 .

5. Remove the bolt and position the oil level indicator tube aside.

6. Disconnect the LH radio ignition interference capacitor electrical connector.

7. Disconnect the LH variable camshaft timing (VCT) solenoid electrical connector and the wiring harness retainers.

8. Disconnect the intake manifold vacuum tube hose from the brake booster.

9. Disconnect the intake manifold vacuum tube assembly from the support bracket and the valve cover stud and position aside.

10. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    CAUTION: When removing the valve cover, make sure to avoid damaging the VCT solenoid.

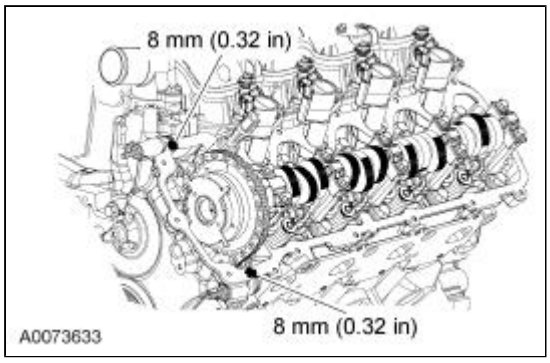
    NOTE: The fasteners are part of the valve cover and should not be removed.

    Fully loosen the 15 fasteners and remove the LH valve cover and gasket.
    - Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
    - Discard the valve cover gasket. Clean the valve cover gasket groove with soap and water or a suitable solvent.

Installation

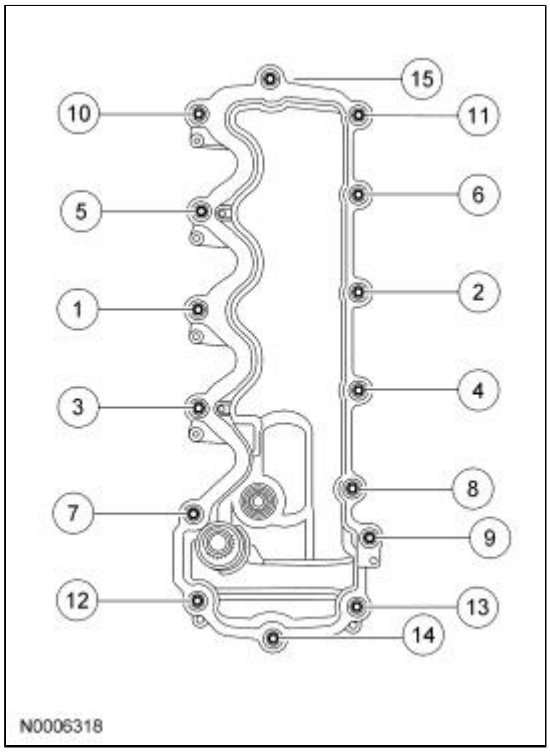
1. **NOTE:** If the valve cover is not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with metal surface prep and silicone gasket remover. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

   Apply a bead of silicone gasket and sealant in 2 places where the engine front cover meets the cylinder head.



2. **CAUTION: When installing the valve cover, make sure to avoid damaging the VCT solenoid.**

   Position the LH valve cover and new gasket on the cylinder head and tighten the fasteners in the sequence shown.
   - Tighten to 10 Nm (89 lb-in).



3. Position the intake manifold vacuum tube assembly onto the support bracket and the valve cover stud.

4. Connect the intake manifold vacuum tube hose to the brake booster.

5. Connect the VCT solenoid electrical connector and the wiring harness retainers.

6. Connect the radio ignition interference capacitor electrical connector.

7. Position the oil level indicator tube and install the bolt.
   - Tighten to 10 Nm (89 lb-in).

8. Position the PCV tube and connect the quick connect couplings. For additional information, refer to Section 310-00 .

9. Install the LH ignition coils. For additional information, refer to Section 303-07 .

10. Install the degas bottle. For additional information, refer to Section 303-03 .

11. Install the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

Valve Cover — RH

Printable View (786 KB)

Item	Part Number	Description
4	—	RH valve cover bolt (15 required) (part of 6582)
5	6582	RH valve cover
6	6584	RH valve cover gasket

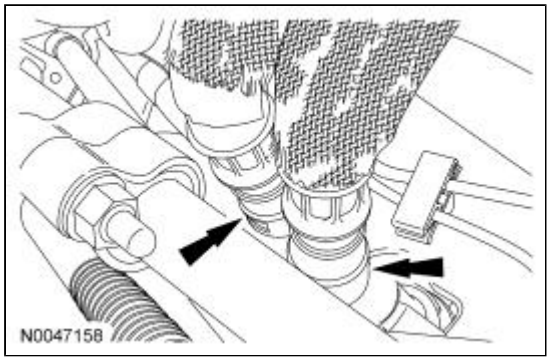
Removal

All vehicles

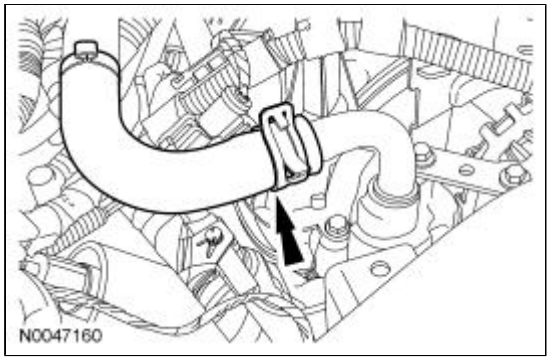
1. Recover the refrigerant. For additional information, refer to Section 412-00 .

Vehicles with auxiliary heat

2. Drain the cooling system. For additional information, refer to Section 303-03 .
3. Disconnect the 2 auxiliary heat coolant hoses.



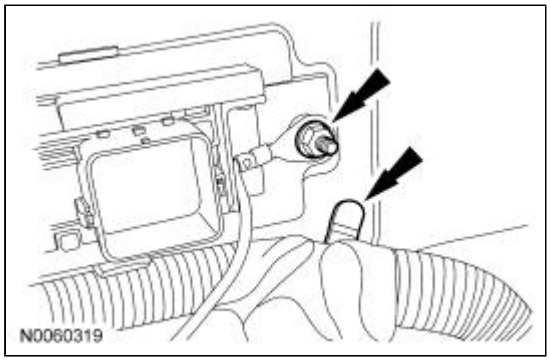
4. Disconnect the coolant hose from the intake manifold and position the coolant hose assembly aside.



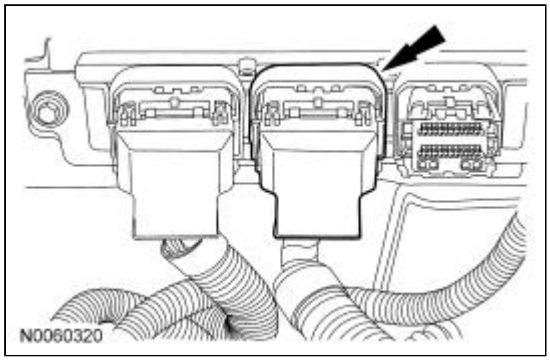
All vehicles

5. Disconnect the quick connect couplings and remove the crankcase vent tube. For additional information, refer to Section 310-00 .

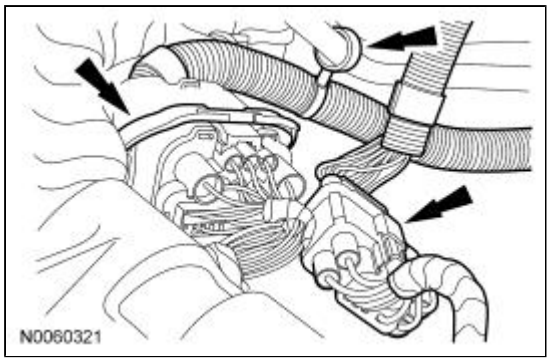
6. Remove the nut and the ground cable and disconnect the wiring harness retainer.



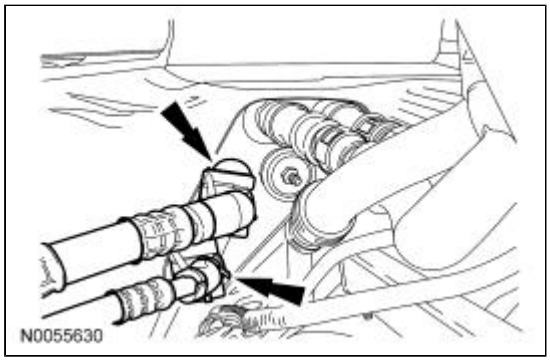
7. Disconnect the powertrain control module (PCM) electrical connector.



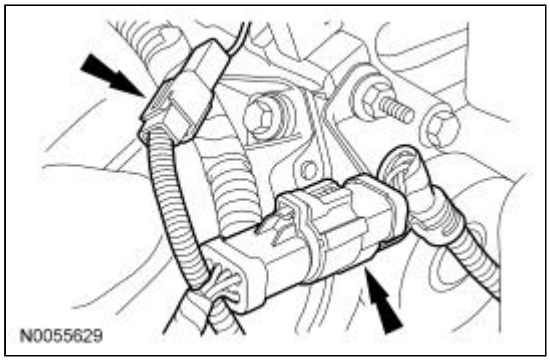
8. Disconnect the 2 electrical connectors and the wiring harness retainer.



9. Disconnect the evaporator outlet and inlet fittings.
    - Discard the O-ring seals.



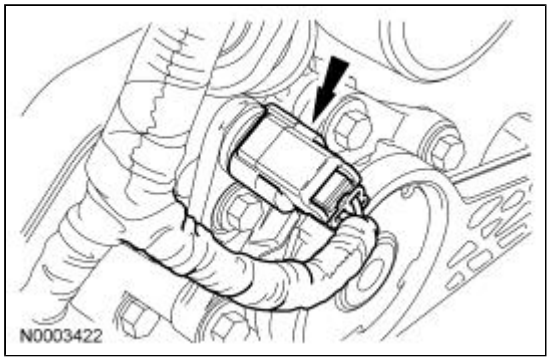
10. Disconnect the RH radio ignition interference capacitor and engine cooling fan clutch electrical connectors.



11. Remove the RH ignition coils. For additional information, refer to Section 303-07 .

12. Disconnect the RH variable camshaft timing (VCT) solenoid electrical connector.

13. Disconnect the RH camshaft position (CMP) sensor electrical connector.



14. Disconnect the 2 engine wiring harness retainers from the RH valve cover studs.

15. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    CAUTION: When removing the valve cover, make sure to avoid damaging the VCT solenoid.

    NOTE: The fasteners are part of the valve cover and should not be removed.

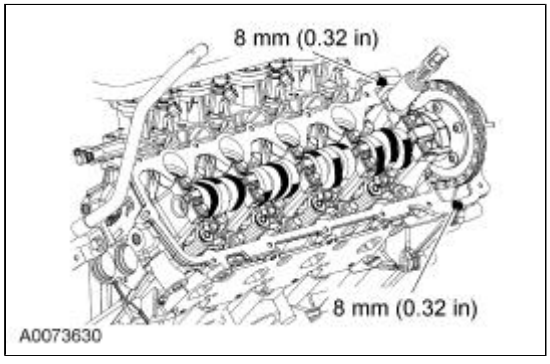
    Fully loosen the 15 fasteners and remove the RH valve cover and gasket.
    - Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
    - Discard the valve cover gasket. Clean the valve cover gasket groove with soap and water or a suitable solvent.

Installation

All vehicles

1. **NOTE:** If the valve cover is not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with metal surface prep and silicone gasket remover. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

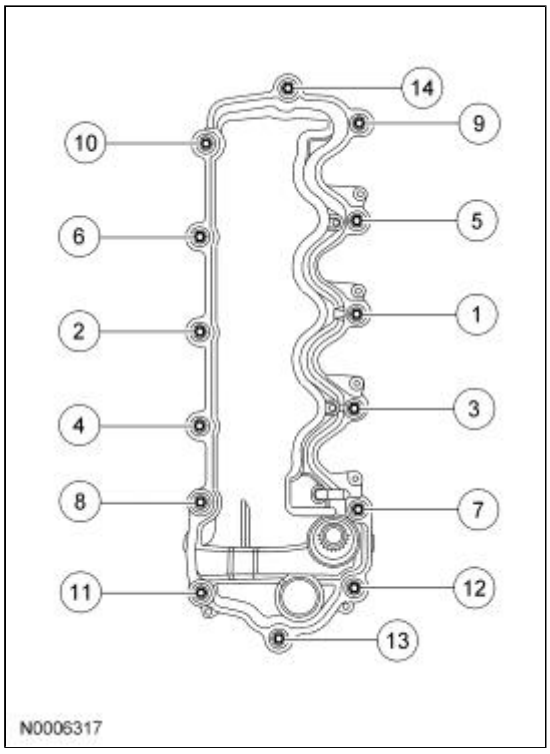
   Apply a bead of silicone gasket and sealant in 2 places where the engine front cover meets the cylinder head.



2. **CAUTION: When installing the valve cover, make sure to avoid damaging the VCT solenoid.**

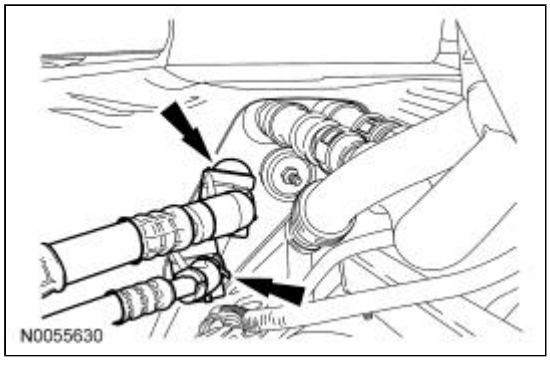
Position the LH valve cover and new gasket on the cylinder head and tighten the fasteners in the sequence shown.

- Tighten to 10 Nm (89 lb-in).

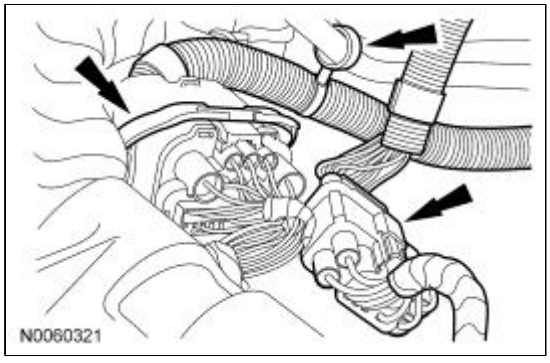


3. Install the RH ignition coils. For additional information, refer to Section 303-07 .

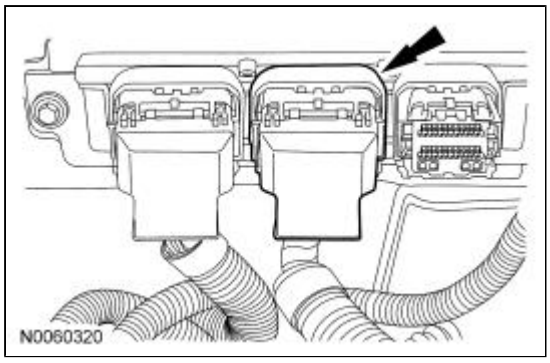
4. Using new O-ring seals, connect the evaporator outlet and inlet fittings.
   - Lubricate the O-ring seals with PAG oil prior to installation.



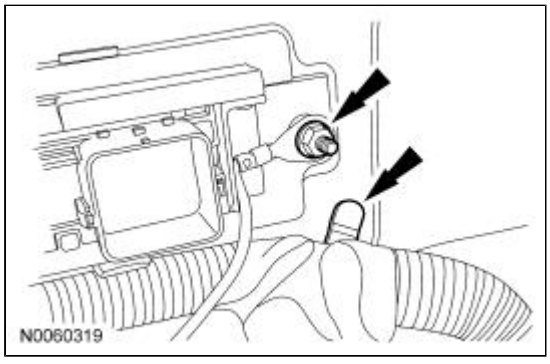
5. Connect the 2 electrical connectors and the wiring harness retainer.



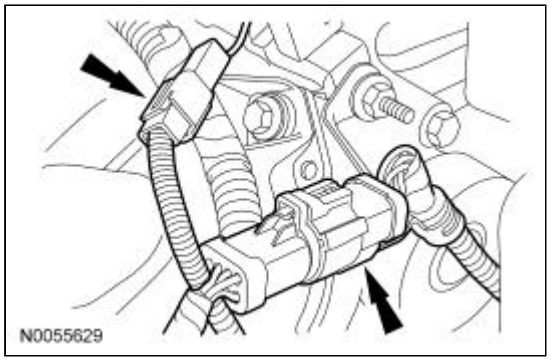
6. Connect the PCM electrical connector.



7. Connect the wiring harness retainer and ground cable and install the nut.
    - tighten to 10 Nm (89 lb-in).



8. Connect the RH radio ignition interference capacitor and engine cooling fan clutch electrical connectors.



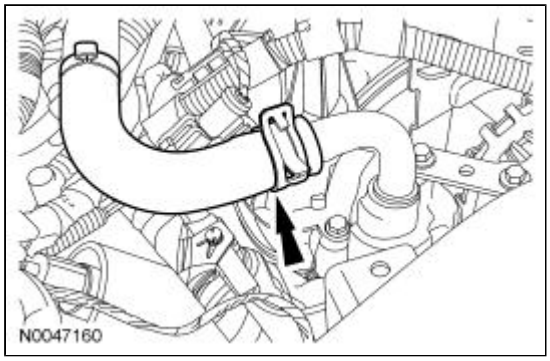
9. Connect the RH VCT solenoid electrical connector.

10. Connect the wiring harness retainers to the valve cover.

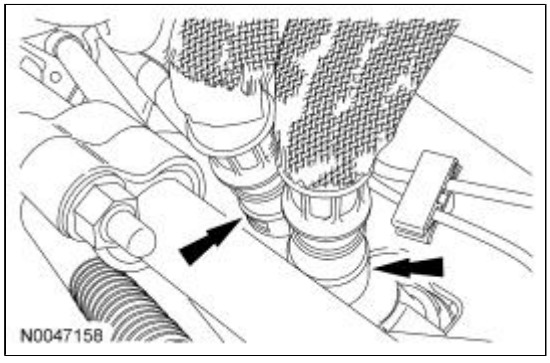
11. Position the crankcase vent tube and connect the quick connect couplings. For additional information, refer to Section 310-00 .

Vehicles with auxiliary heat

12. Position the coolant hose assembly and connect the coolant hose to the intake manifold.



13. Connect the 2 auxiliary heat coolant hoses.



14. Fill and bleed the coolant system. For additional information, refer to Section 303-03 .

All vehicles

15. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Crankshaft Pulley

Printable View (385 KB)

Special Tool(s)

ST1286-A	Remover, Crankshaft Vibration Damper 303-009 (T58P-6316-D)

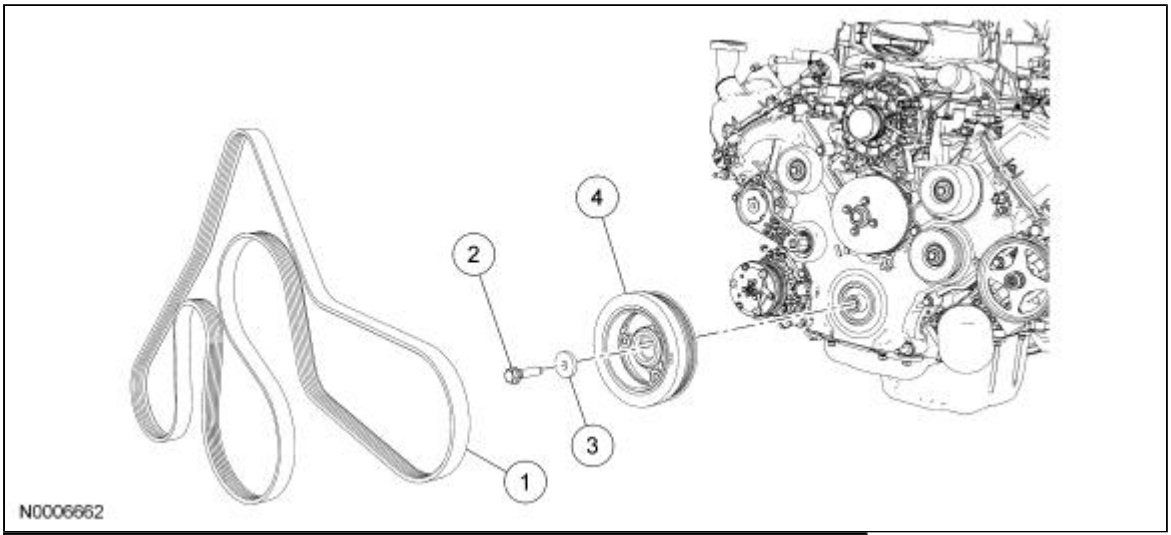
Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A
Motorcraft Metal Surface Prep ZC-31	—
Silicone Gasket Remover ZC-30	—
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4



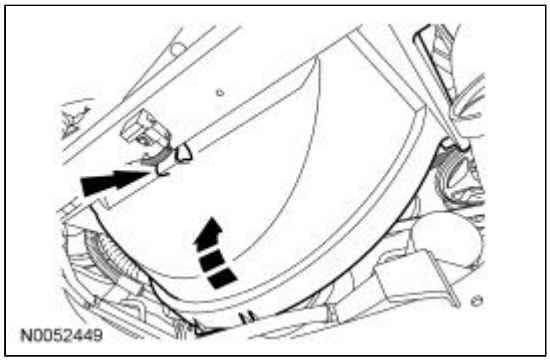
Item	Part Number	Description

1	8620	Accessory drive belt
2	W701512	Crankshaft pulley bolt
3	N806165	Crankshaft pulley bolt washer
4	6316	Crankshaft pulley

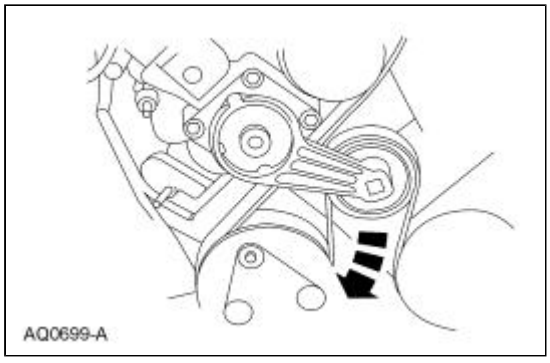
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Release the cooling fan shroud position tab and rotate the shroud upward until the lower tab locks into position.

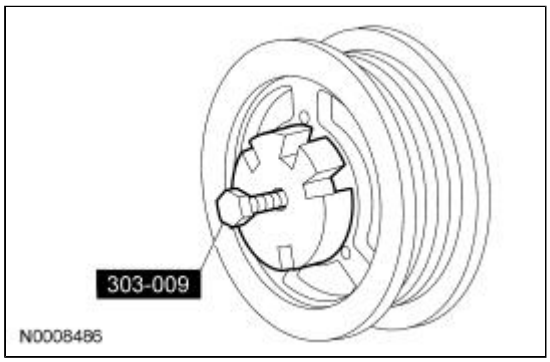


3. Rotate the tensioner clockwise and remove the accessory drive belt from the crankshaft pulley.



4. Remove the crankshaft pulley bolt and washer.
   - Discard the crankshaft pulley bolt.

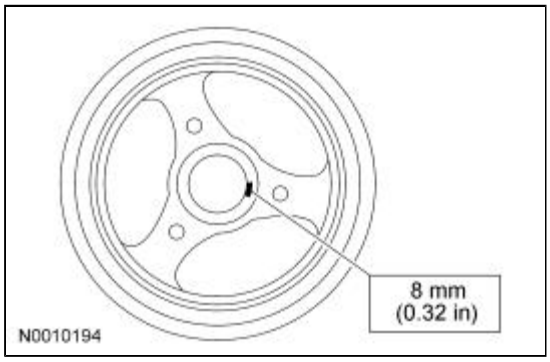
5. Using the special tool, remove the crankshaft pulley.



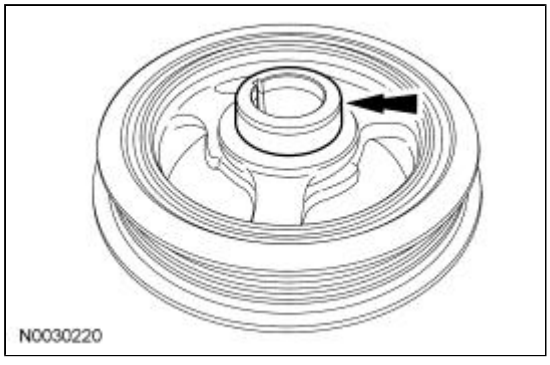
Installation

1. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with metal surface prep and silicone gasket remover. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

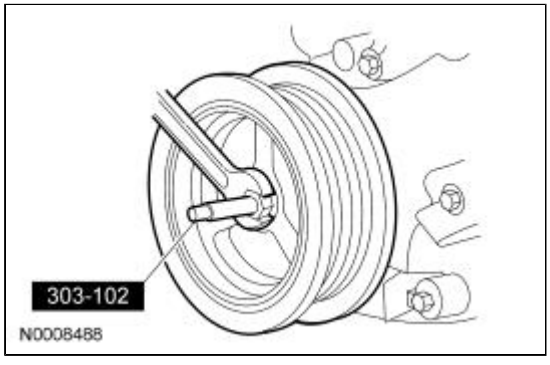
   Apply silicone gasket and sealant to the Woodruff key slot in the crankshaft pulley.



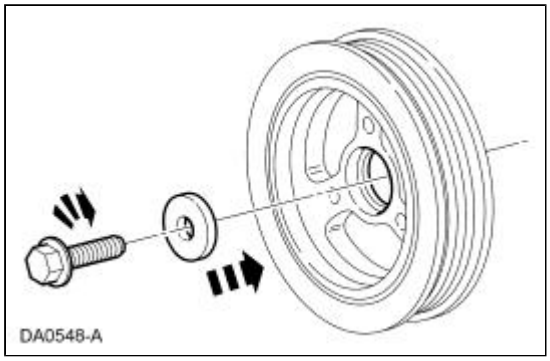
2. Lubricate the crankshaft pulley sealing area with clean engine oil prior to installation.



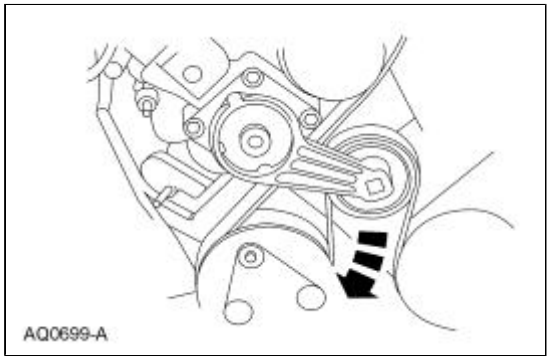
3. Using the special tool, install the crankshaft pulley.



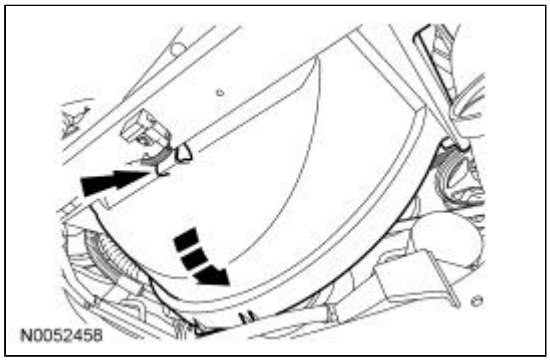
4. Using a new crankshaft pulley bolt, install the bolt and washer and tighten the bolt in 4 stages.
   - Stage 1: Tighten to 90 Nm (66 lb-ft).
   - Stage 2: Loosen 360 degrees.
   - Stage 3: Tighten to 50 Nm (37 lb-ft).
   - Stage 4: Tighten an additional 90 degrees.



5. Rotate the tensioner clockwise and install the accessory drive belt onto the crankshaft pulley.



6. Release the cooling fan shroud position tab and rotate the shroud downward until the tab locks into position.



Crankshaft Front Seal

Printable View (431 KB)

Special Tool(s)

ST2197-A	Installer, Crankshaft Front Seal 303-635
 ST1328-A	Installer, Front Cover Seal 303-335 (T88T-6701-A)

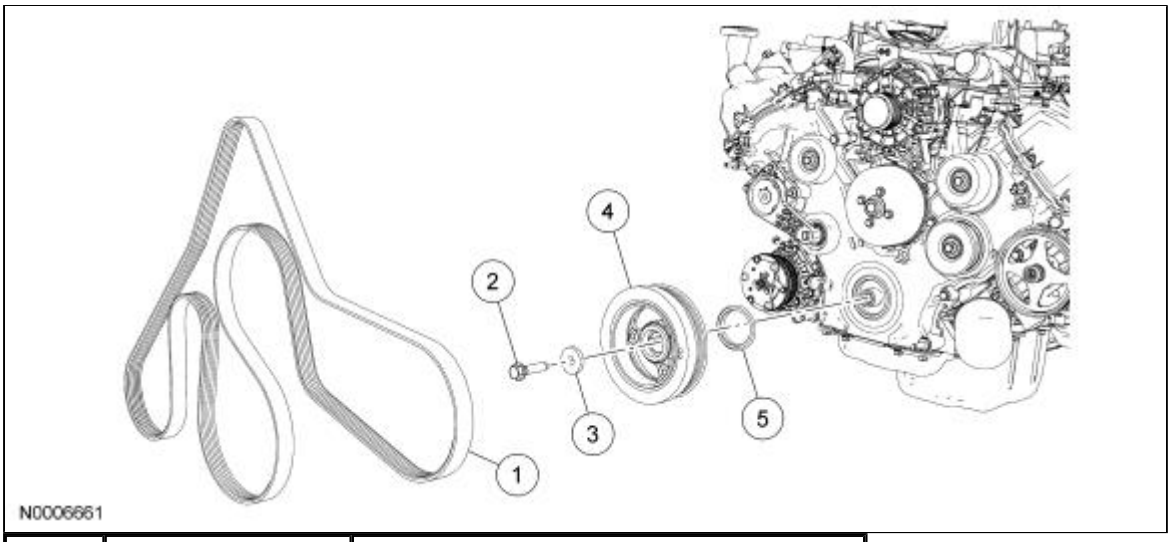
Silicone Gasket and Sealant	WSE-

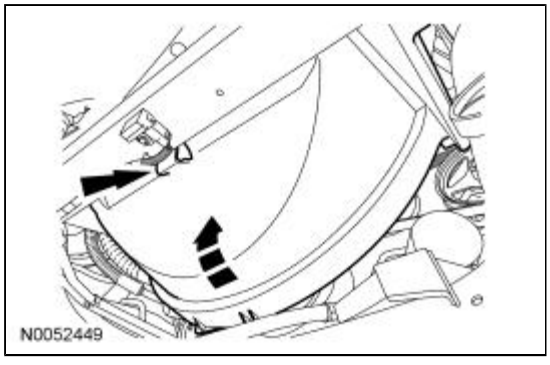


Item	Part Number	Description
1	8620	Accessory drive belt
2	W701512	Crankshaft pulley bolt
3	N806165	Crankshaft pulley bolt washer
4	6316	Crankshaft pulley
5	6700	Crankshaft front seal

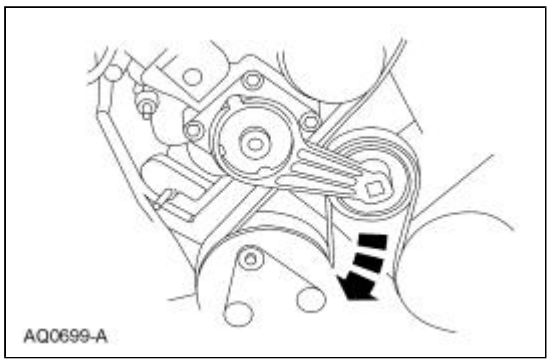
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Release the cooling fan shroud position tab and rotate the shroud upward until the lower tab locks into position.

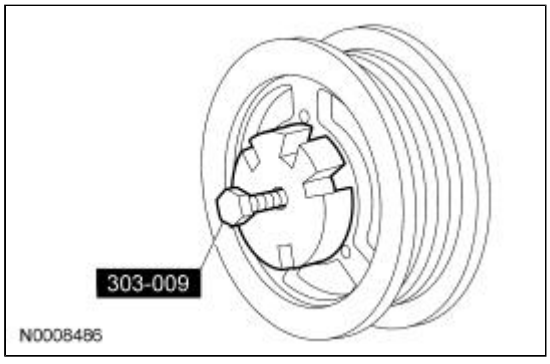


3. Rotate the tensioner clockwise and remove the accessory drive belt from the crankshaft pulley.

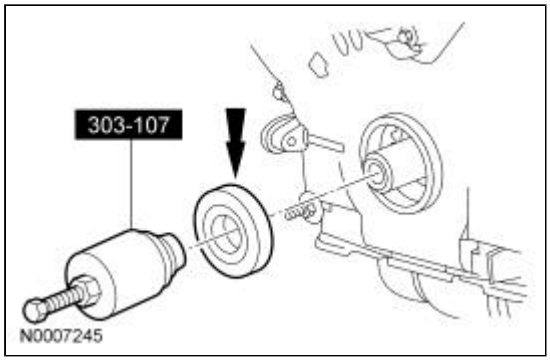


4. Remove the crankshaft pulley bolt and washer.
    - Discard the crankshaft pulley bolt.

5. Using the special tool, remove the crankshaft pulley.

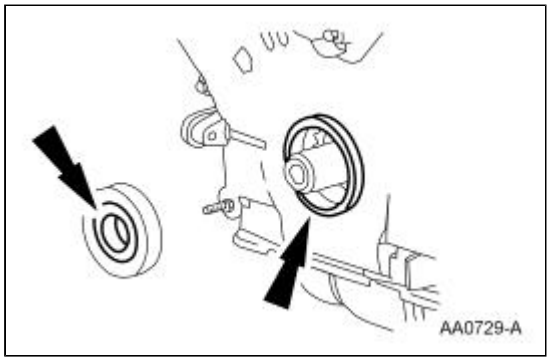


6. Using the special tool, remove and discard the crankshaft front seal.

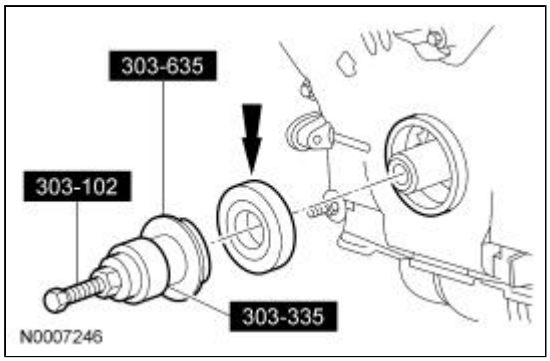


Installation

1. Lubricate the engine front cover and the new crankshaft front seal inner lip with clean engine oil.

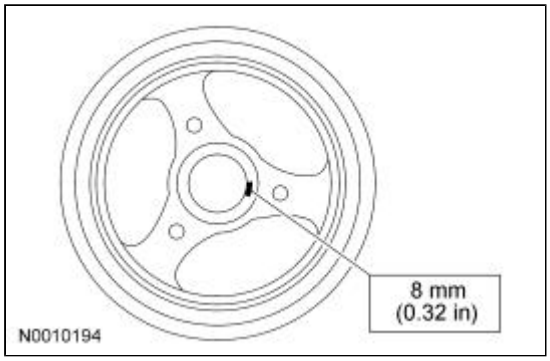


2. Using the special tools, install the new crankshaft front seal.

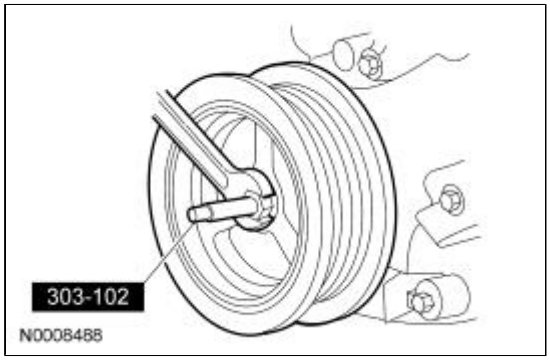


3. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with metal surface prep and silicone gasket remover. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

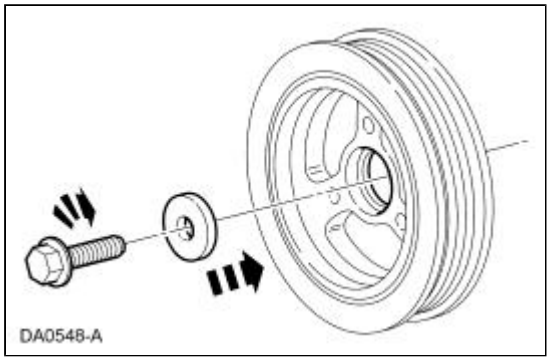
   Apply silicone gasket and sealant to the Woodruff key slot in the crankshaft pulley.



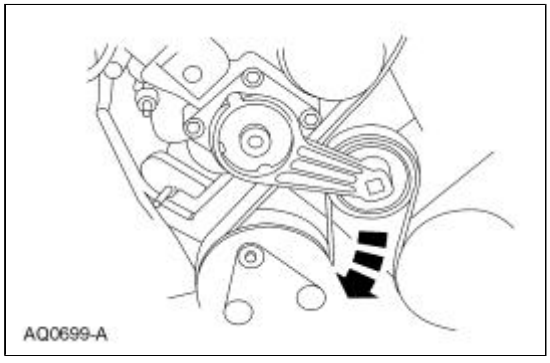
4. Using the special tool, install the crankshaft pulley.



5. Using a new crankshaft pulley bolt, install the bolt and washer and tighten the bolt in 4 stages.
   - Stage 1: Tighten to 90 Nm (66 lb-ft).
   - Stage 2: Loosen 360 degrees.
   - Stage 3: Tighten to 50 Nm (37 lb-ft).
   - Stage 4: Tighten an additional 90 degrees.



6. Rotate the tensioner clockwise and install the accessory drive belt onto the crankshaft pulley.



7. Release the cooling fan shroud position tab and rotate the shroud downward until the tab locks into position.

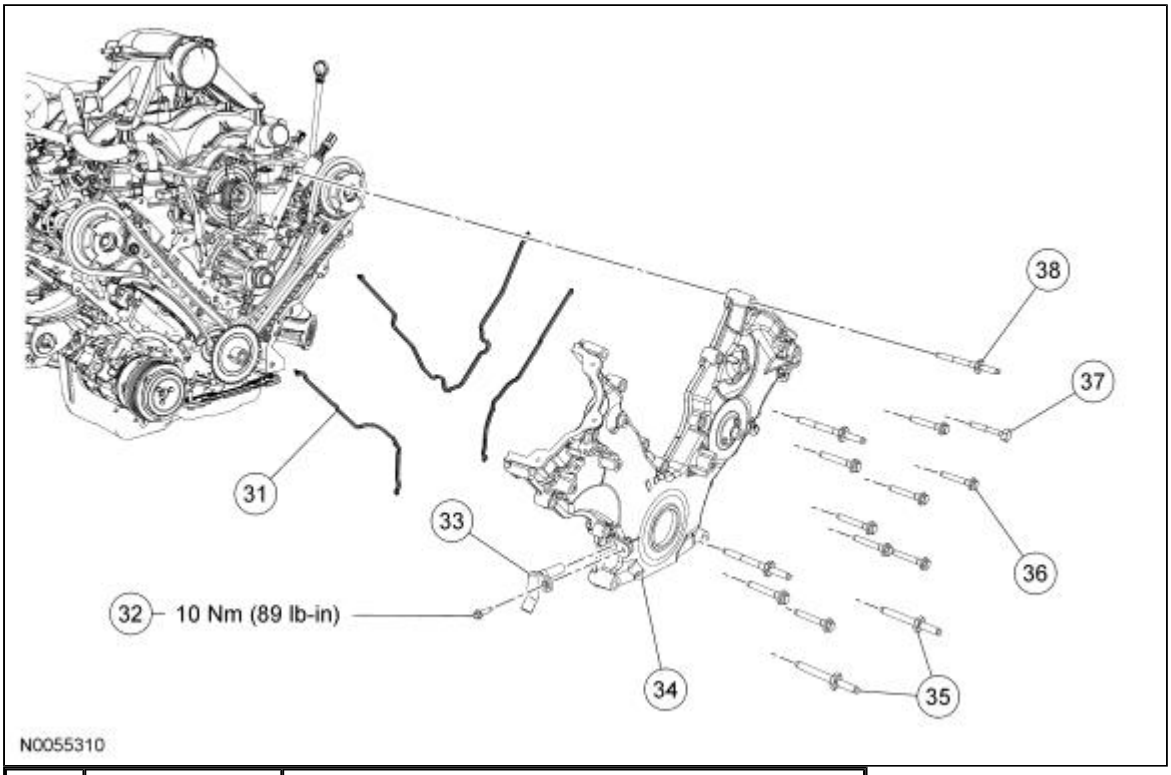
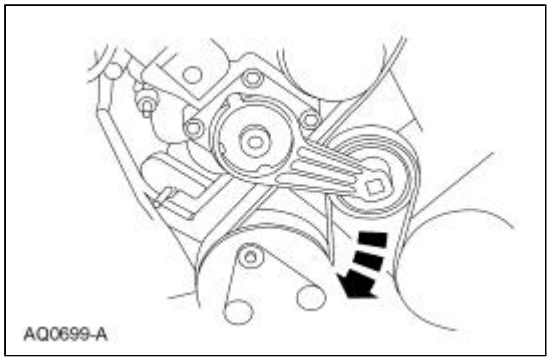
29	N808102	LH lower accessory drive belt idler pulley bolt
30	6C348	LH lower accessory drive belt idler pulley



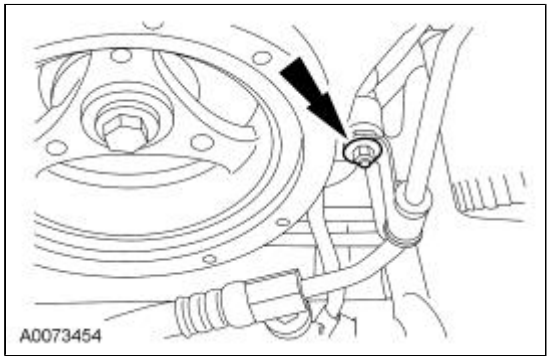
Item	Part Number	Description
31	6D081	Engine front cover gasket (3 required)
32	N806155	CKP sensor bolt
33	6C315	CKP sensor
34	6C086	Engine front cover
35	N808529	Engine front cover lower studs (2 required)
36	N806177	Engine front cover bolt (9 required)
37	W706605	Engine front cover bolt
38	W709573	Engine front cover upper stud (3 required)

Removal

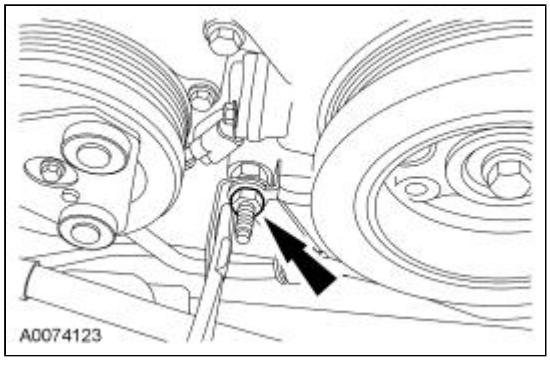
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Drain the engine oil.
3. Remove the engine cooling fan. For additional information, refer to Section 303-03 .
4. Remove the cooling fan shroud. For additional information, refer to Section 303-03 .
5. Remove the RH valve cover. For additional information, refer to Valve Cover — RH in this section.
6. Remove the LH valve cover. For additional information, refer to Valve Cover — LH in this section.
7. Rotate the tensioner clockwise and remove the accessory drive belt.



8. Remove the nut and the power steering pressure hose support bracket.

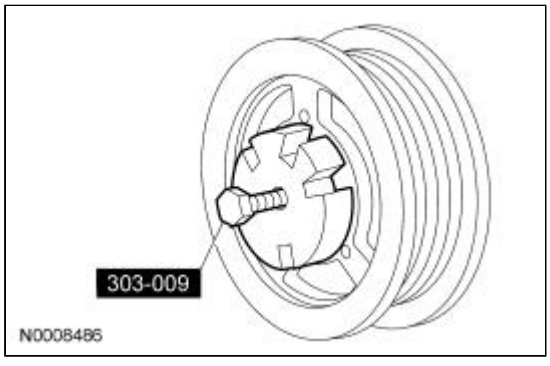


9. Remove the nut and the battery wiring harness and transmission cooler tube support brackets.

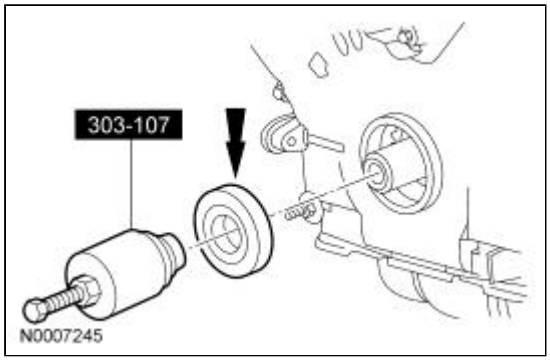


10. Remove the crankshaft pulley bolt and washer.
    - Discard the crankshaft pulley bolt.

11. Using the special tool, remove the crankshaft pulley.



12. Using the special tool, remove and discard the crankshaft front seal.



13. Remove the 3 bolts and the 3 accessory drive idler pulleys.

14. Remove the 4 bolts and the coolant pump pulley.

15. Remove the 3 bolts and the accessory drive belt tensioner.

16. Disconnect the RH camshaft position (CMP) sensor wiring harness retainer from the cylinder head.

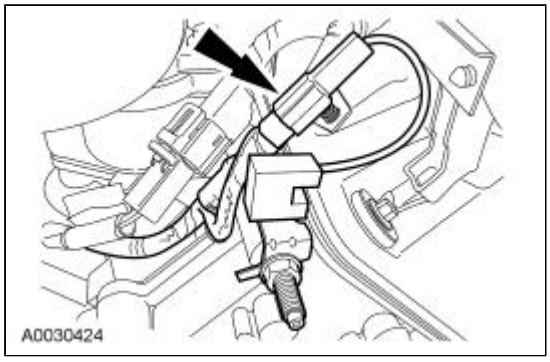
17. Disconnect the A/C compressor electrical connector.

18. Disconnect the crankshaft position (CKP) sensor electrical connector.

19. Remove the bolt and the RH CMP sensor.

20. **NOTE:** LH shown, RH similar.

    Disconnect the radio ignition interference capacitor electrical connectors.

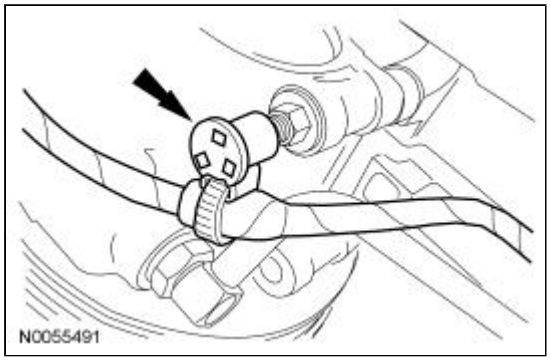


21. Remove the nut and the RH radio ignition interference capacitor.

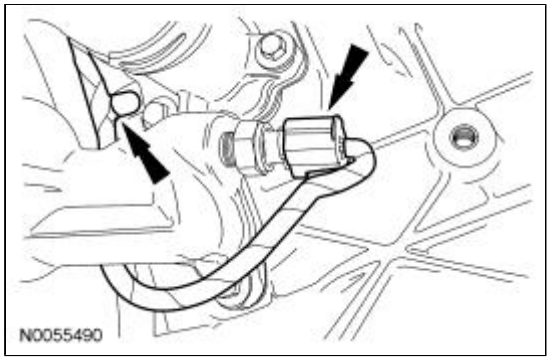
22. Remove the nut and the LH radio ignition interference capacitor.

23. Remove the bolt and the LH CMP sensor.
    - Discard the O-ring seal.

24. Disconnect the wiring harness position retainer from the power steering pump stud bolt.



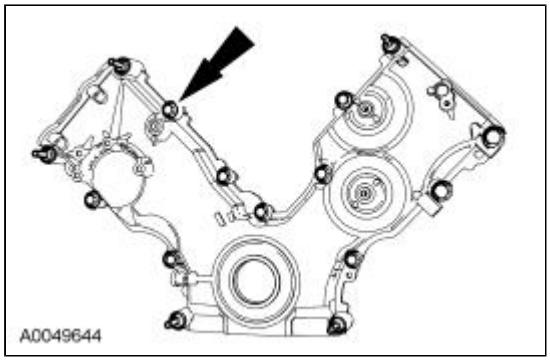
25. Disconnect the wiring harness position retainer and the engine oil pressure (EOP) switch electrical connector and position the wiring harness aside.



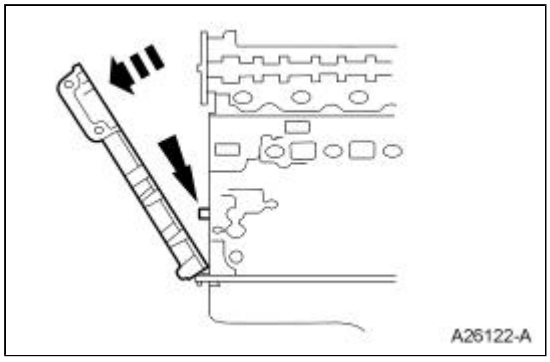
26. Remove the 2 bolts, the stud bolt and position the power steering pump assembly aside.

27. Remove the 4 front oil pan bolts.

28. Remove the bolts and the studs.



29. Remove the engine front cover from the front cover to cylinder block dowel.



30. Remove the bolt and the CKP sensor.
    - Discard the O-ring seal.

31. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    Remove and discard the engine front cover gaskets.
    - Clean the mating surfaces with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
    - Inspect the mating surfaces.

Installation

1. **NOTE:** Lubricate the O-ring with clean engine oil prior to installation.

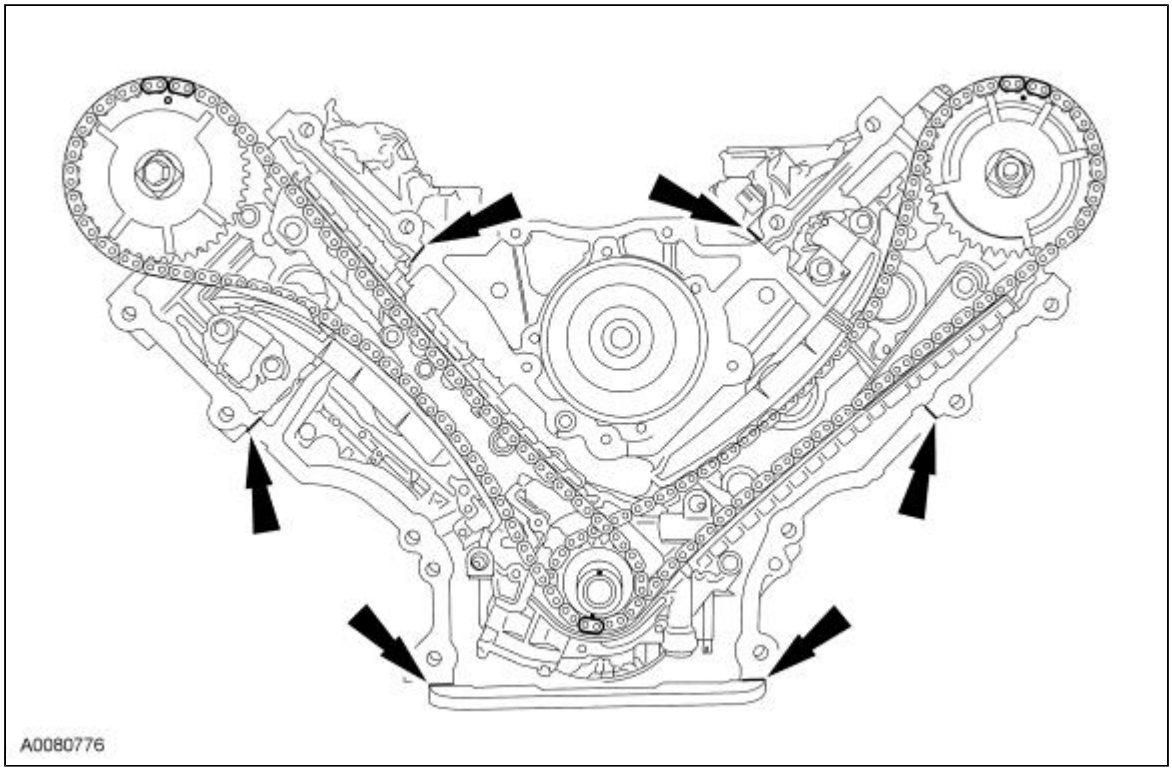
   Install the CKP sensor and the bolt.
   - Tighten to 10 Nm (89 lb-in).

2. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

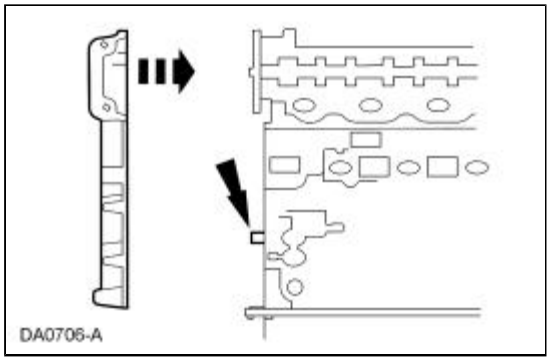
   NOTE: If the engine front cover is not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

   NOTE: Make sure that the engine front cover gasket is in place on the engine front cover before installation.

   Apply a bead of silicone gasket and sealant along the cylinder head-to-cylinder block surface and the oil pan-to-cylinder block surface, at the locations shown.



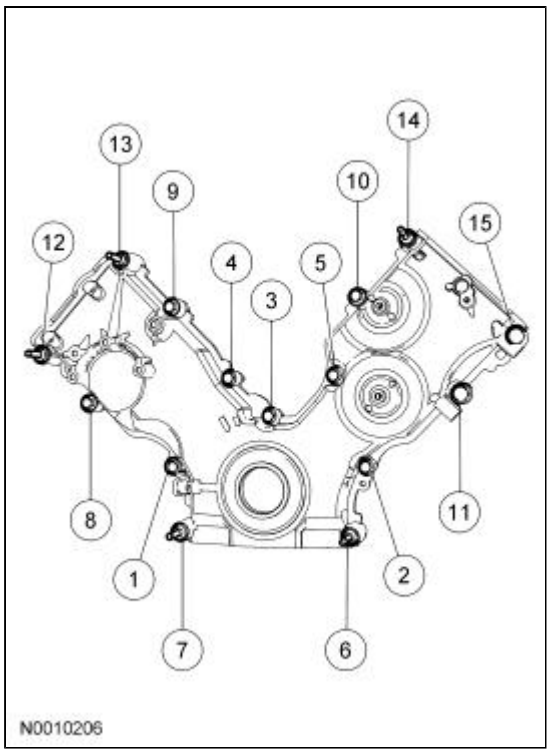
3. Install new engine front cover gaskets on the engine front cover. Position the engine front cover onto the dowels. Install the fasteners finger tight.



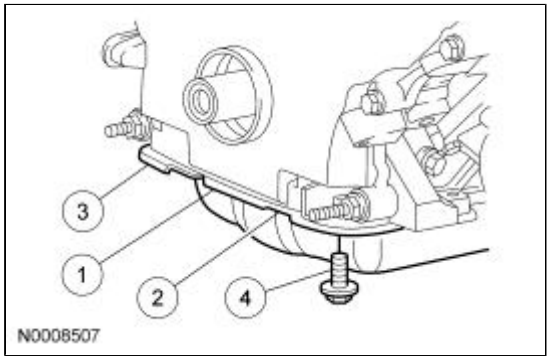
4. Tighten the engine front cover fasteners in 2 stages, in the sequence shown.
   Stage 1: Tighten fasteners 1 through 15 to 25 Nm (18 lb-ft).
   Stage 2: Tighten fasteners 6 and 7 to 48 Nm (35 lb-ft).

Item	Part Number	Description
1	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
2	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
3	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
4	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
5	N806177	Bolts, Hex Flange Head Pilot, M8 x 1.25 x 50
6	N808529	Stud, Hex Head Pilot, M10 x 1.5 x 1.5 x 103
7	N808529	Stud, Hex Head Pilot, M10 x 1.5 x 1.5 x 103
8	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
9	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
10	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50

11	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
12	W709573	Stud and Washer, Hex Head Pilot, M8 x 1.25 x 1.25 x 94
13	W709573	Stud and Washer, Hex Head Pilot, M8 x 1.25 x 1.25 x 94
14	W709573	Stud and Washer, Hex Head Pilot, M8 x 1.25 x 1.25 x 94
15	W706605	Bolt, Hex Head Pilot, M8 x 1.25 x 56

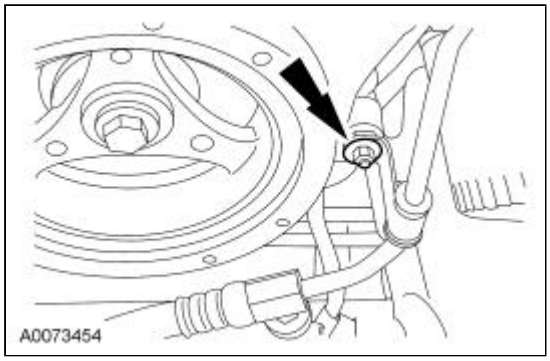


5. Loosely install the bolts, then tighten the bolts in 2 stages, in the sequence shown.
    - Stage 1: Tighten to 20 Nm (15 lb-ft).
    - Stage 2: Tighten an additional 60 degrees.

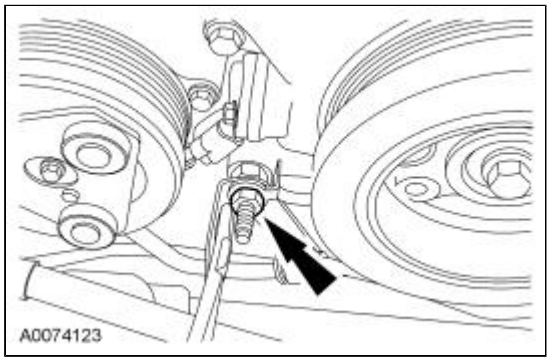


6. Position the power steering pump assembly and install the bolts.
    - Tighten to 25 Nm (18 lb-ft).

7. Position the power steering pressure hose support bracket and install the nut.
    - Tighten to 10 Nm (89 lb-in).



8. Position the transmission cooler tube support bracket and install the nut.
    - Tighten to 10 Nm (89 lb-in).



9. **NOTE:** Lubricate the O-ring seal with clean engine oil prior to installation.

    Install the RH CMP sensor and the bolt.
    - Tighten to 10 Nm (89 lb-in).

10. Connect the RH CMP sensor electrical connector.

11. Connect the wiring harness retainer from the cylinder head.

12. Connect the A/C compressor electrical connector.

13. Connect the CKP sensor electrical connector.

14. Install the LH radio ignition interference capacitor and the nut.
    - Tighten to 25 Nm (18 lb-ft).

15. **NOTE:** Lubricate the O-ring seal with clean engine oil prior to installation.

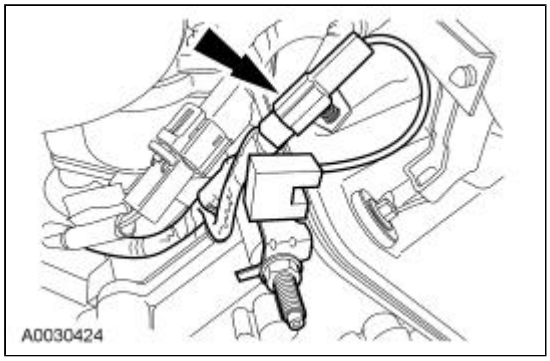
    Install the LH CMP sensor and the bolt.
    - Tighten to 10 Nm (89 lb-in).

16. Connect the LH CMP sensor electrical connector.

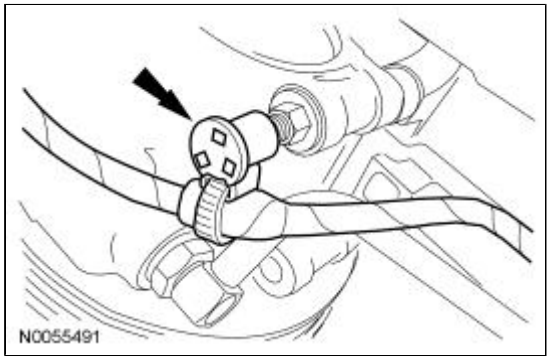
17. Install the RH radio ignition interference capacitor and the nut.
    - Tighten to 25 Nm (18 lb-ft).

18. **NOTE:** LH shown, RH similar.

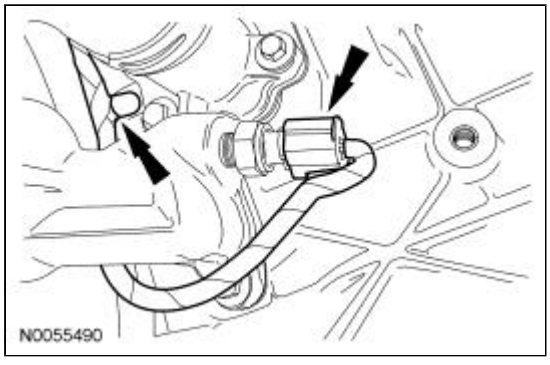
    Connect the radio ignition interference capacitor electrical connectors.



19. Connect the wiring harness position retainer to the power steering pump stud bolt.



20. Connect the wiring harness position retainer and the EOP switch electrical connector.

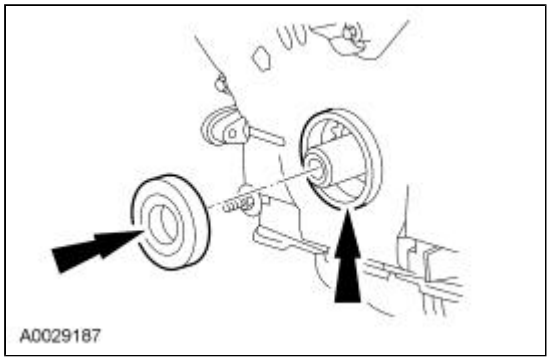


21. Install the accessory drive belt tensioner and the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).

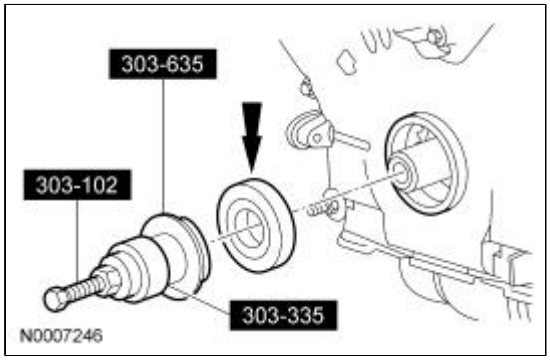
22. Install the coolant pump pulley and the 4 bolts.
    - Tighten to 25 Nm (18 lb-ft).

23. Install the 3 accessory drive idler pulleys and the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).

24. Lubricate the engine front cover and the crankshaft front seal inner lip with clean engine oil.

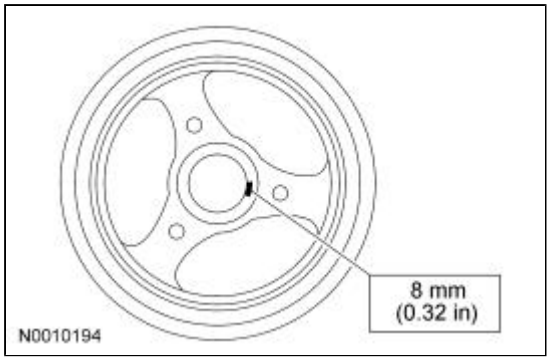


25. Using the special tools, install the crankshaft front seal into the engine front cover.

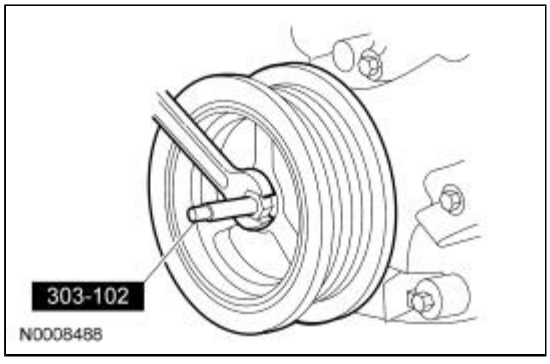


26. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

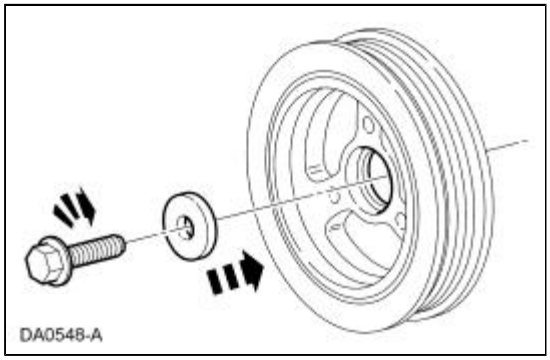
    Apply silicone gasket and sealant to the Woodruff key slot on the crankshaft pulley.



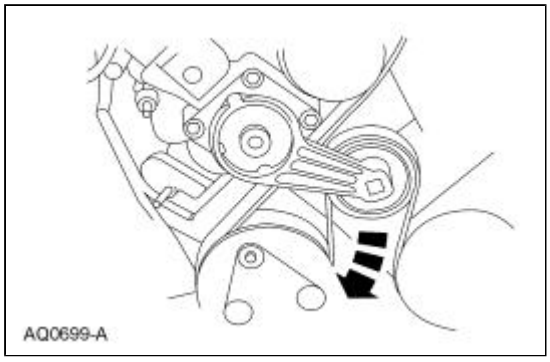
27. Use the special tool to install the crankshaft pulley.



28. Tighten the new crankshaft pulley bolt in 4 stages.
    - Stage 1: Tighten to 90 Nm (66 lb-ft).
    - Stage 2: Loosen 360 degrees.
    - Stage 3: Tighten to 50 Nm (37 lb-ft).
    - Stage 4: Tighten an additional 90 degrees.



29. Rotate the tensioner clockwise and install the accessory drive belt.



30. Install the RH valve cover. For additional information, refer to Valve Cover — RH in this section.
31. Install the LH valve cover. For additional information, refer to Valve Cover — LH in this section.
32. Install the cooling fan shroud. For additional information, refer to Section 303-03 .
33. Install the engine cooling fan. For additional information, refer to Section 303-03 .
34. Fill the crankcase with clean engine oil.

Timing Drive Components

Special Tool(s)

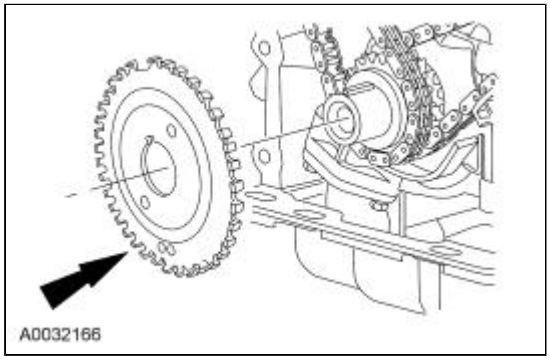
ST2804-A	Compressor, Valve Spring 303-1039
 ST2807-A	Locking Tool, Camshaft Phaser Sprocket 303-1046

Material

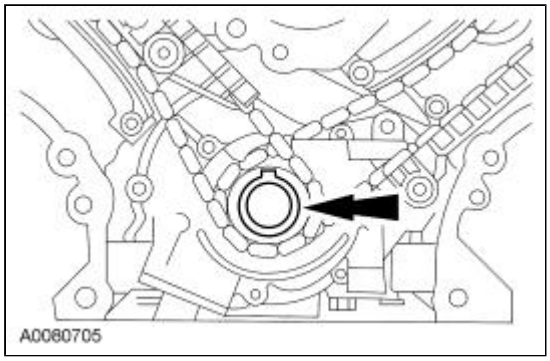
Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A
Hydraulic Chain Tensioner Retaining Clip 1L3Z-6P250-AA	—

Removal

1. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.
2. Remove the crankshaft sensor ring from the crankshaft.

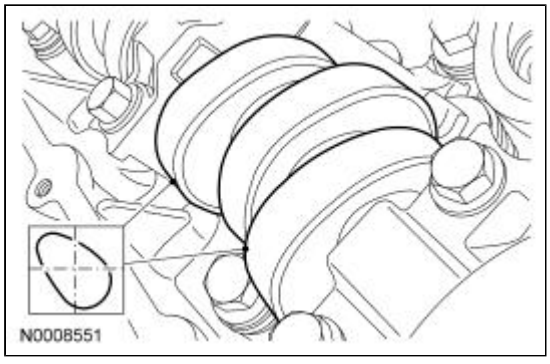


3. Position the crankshaft keyway at the 12 o'clock position.



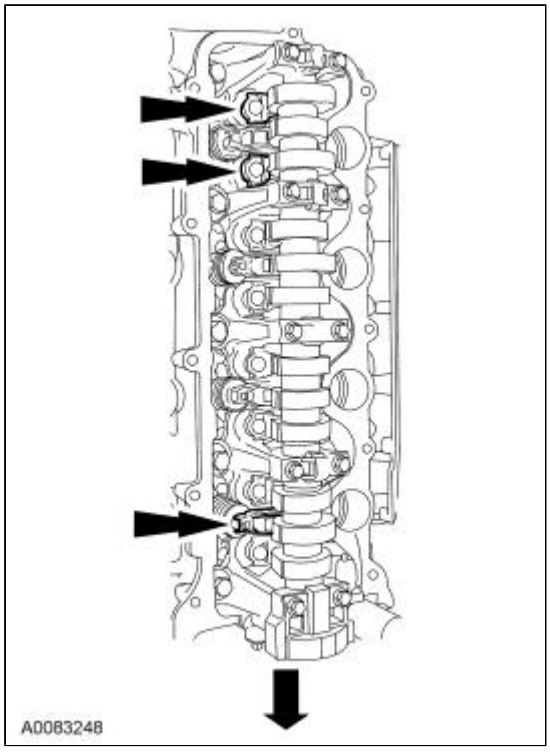
4. **NOTE:** If the camshaft lobes are not exactly positioned as shown, the crankshaft will require one full additional rotation to 12 o'clock.

   The No. 1 cylinder camshaft exhaust lobe must be coming up on the exhaust stroke. Verify by noting the position of the 2 intake camshaft lobes and the exhaust lobe on the No. 1 cylinder.



5. **CAUTION: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into the original locations.**

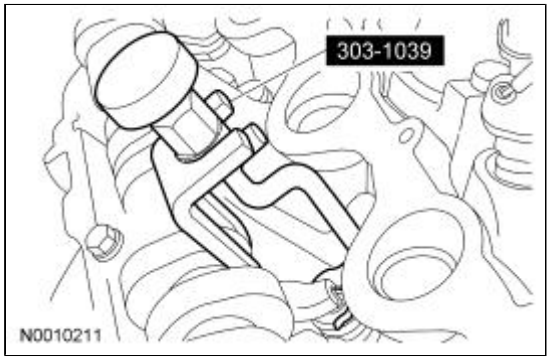
   Remove only the 3 camshaft roller followers shown in the illustration from the RH cylinder head.



6. **CAUTION: Do not allow the valve keepers to fall off the valve or the valve may drop into the cylinder.**

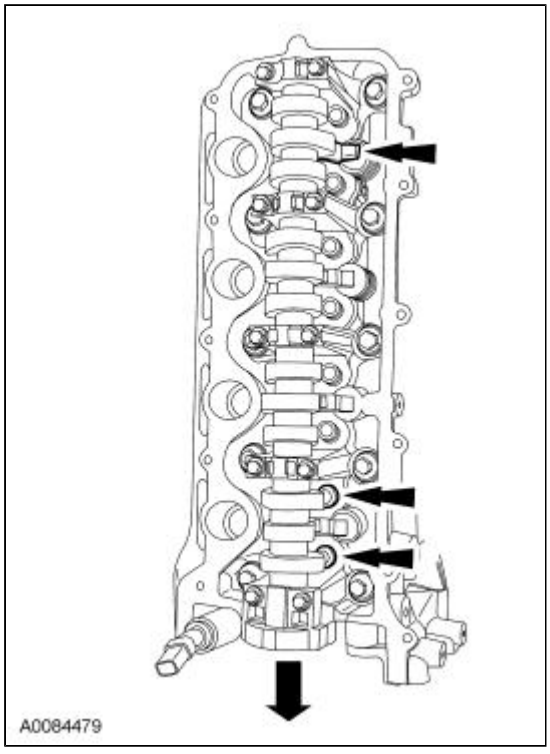
   NOTE: It may be necessary to push the valve down while compressing the spring.

   Using the special tool, remove the 3 designated camshaft roller followers in the previous step from the RH cylinder head.



7. **CAUTION: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into the original locations.**

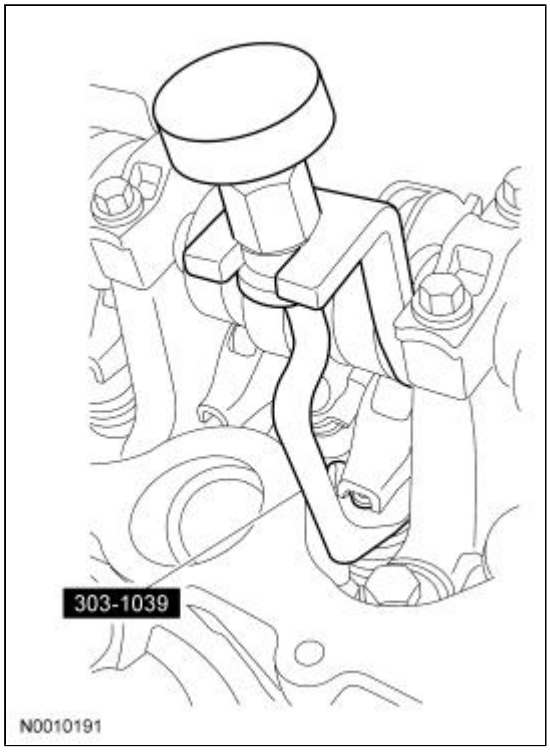
   Remove only the 3 camshaft roller followers shown in the illustration from the LH cylinder head.



8. **CAUTION: Do not allow the valve keepers to fall off the valve or the valve may drop into the cylinder.**

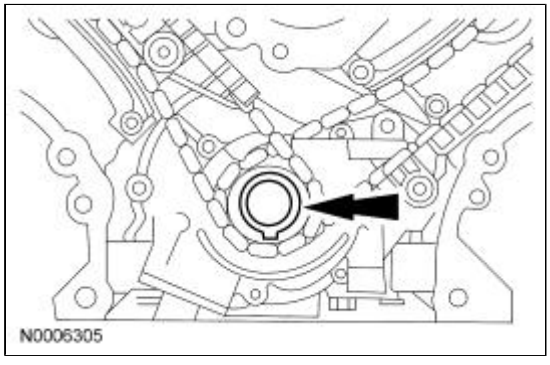
   NOTE: It may be necessary to push the valve down while compressing the spring.

   Using the special tool, remove the 3 designated camshaft roller followers in the previous step from the LH cylinder head.



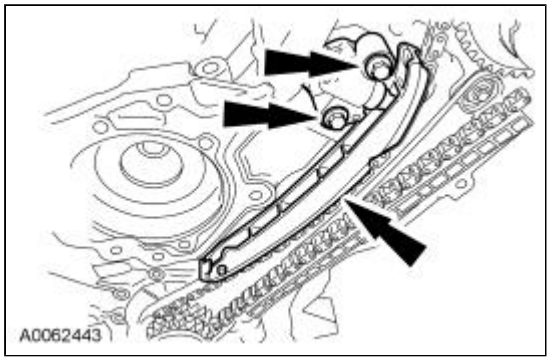
9. **CAUTION: The crankshaft cannot be moved past the 6 o'clock position once set.**

   Rotate the crankshaft clockwise and position the crankshaft keyway at the 6 o'clock position.



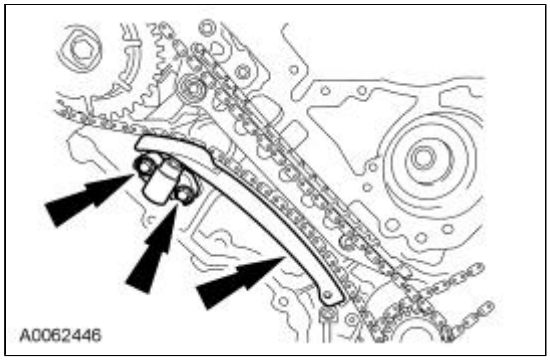
10. **CAUTION: If one or both of the tensioner mounting bolts are loosened or removed, the tensioner-sealing bead must be inspected for seal integrity. If cracks, tears, separation from the tensioner body or permanent compression of the seal bead is observed, install a new tensioner.**

    Remove the bolts, the LH timing chain tensioner and tensioner arm.

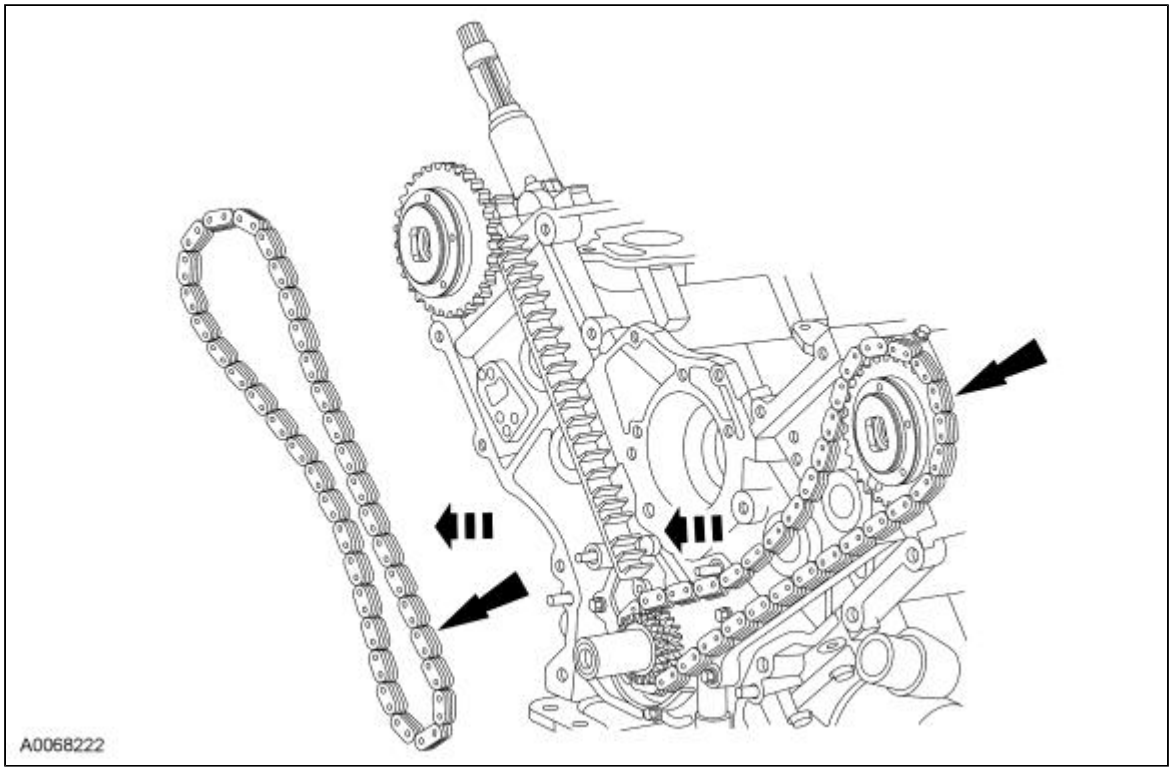


11. **CAUTION: If one or both of the tensioner mounting bolts are loosened or removed, the tensioner-sealing bead must be inspected for seal integrity. If cracks, tears, separation from the tensioner body or permanent compression of the seal bead is observed, install a new tensioner.**

    Remove the bolts, the RH timing chain tensioner and tensioner arm.



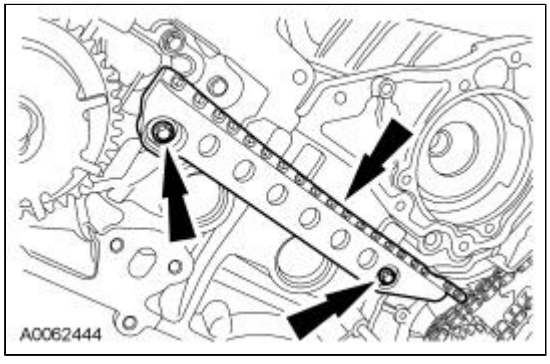
12. Remove the RH and LH timing chains and the crankshaft sprocket.
    - Remove the RH timing chain from the camshaft sprocket.
    - Remove the RH timing chain from the crankshaft sprocket.
    - Remove the LH timing chain from the camshaft sprocket.
    - Remove the LH timing chain and crankshaft sprocket.



13. **NOTE:** RH shown, LH similar.

Remove the LH and RH timing chain guides.

- Remove the bolts.
- Remove both timing chain guides.

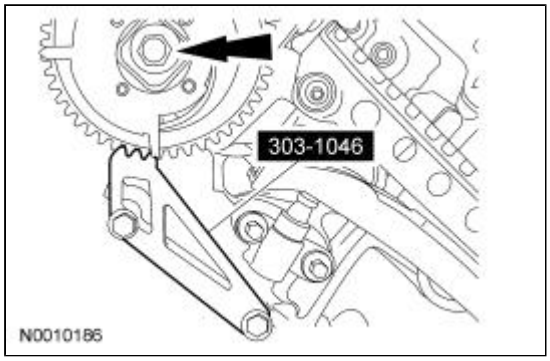


14. **CAUTION: Damage to the variable camshaft timing (VCT) phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

CAUTION: Only use hand tools to remove the VCT phaser sprocket assembly or damage may occur to the camshaft or VCT phaser sprocket.

Using the special tool, remove the bolt and the RH VCT phaser sprocket assembly.

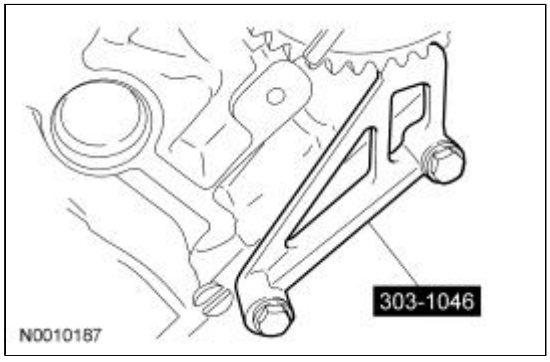
- Discard the VCT phaser sprocket bolt.



15. **CAUTION: Damage to the VCT phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    CAUTION: Only use hand tools to remove the VCT phaser sprocket assembly or damage may occur to the camshaft or VCT phaser sprocket.

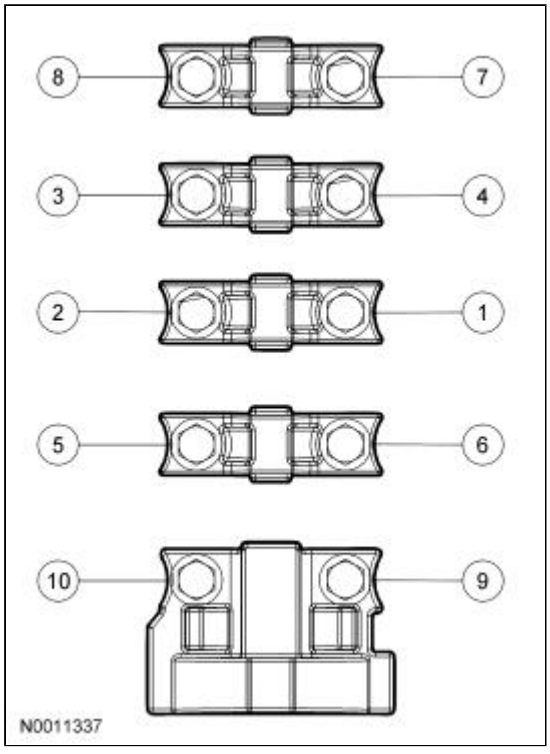
    Using the special tool, remove the bolt and the LH VCT phaser sprocket assembly.
    - Discard the VCT phaser sprocket bolt.



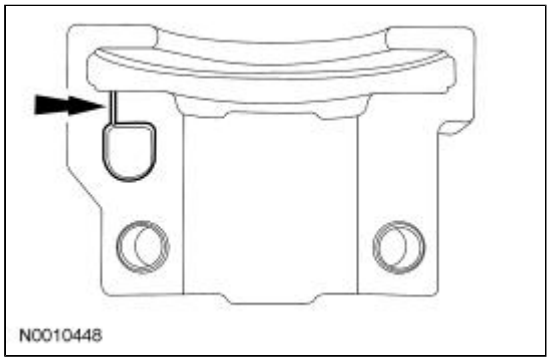
16. **CAUTION: When removing the front thrust camshaft bearing cap, use care as the cap may be damaged from sideloading when removing the cam unequally in height from the bearing towers.**

    NOTE: The camshaft bearing caps must be installed in their original locations. Record camshaft bearing cap locations.

    Remove the bolts in the sequence shown and remove the RH cylinder head front camshaft bearing cap and then the remaining bearing caps.



17. Clean and inspect the RH camshaft bearing caps.
    - The camshaft front thrust bearing cap contains an oil metering groove. Make sure the groove is free of foreign material.

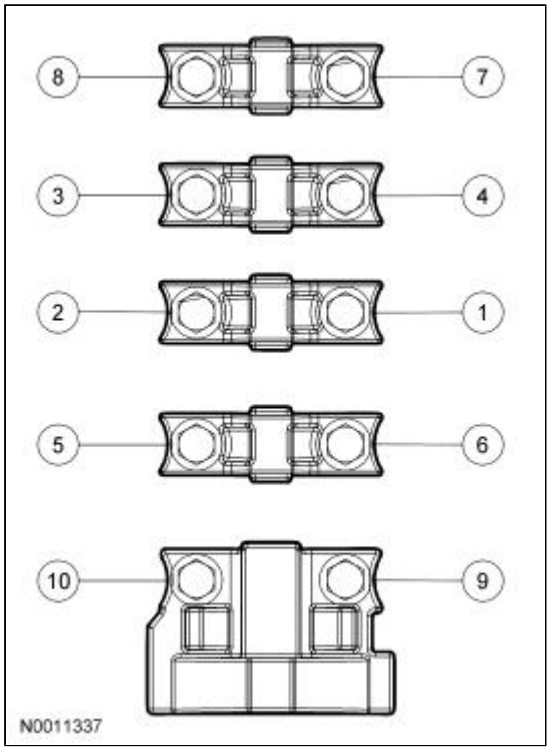


18. Remove the RH camshaft.

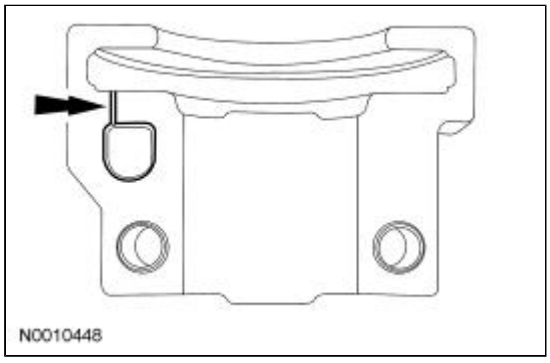
19. **CAUTION: When removing the front thrust camshaft bearing cap, use care as the cap may be damaged from sideloading when removing the cam unequally in height from the bearing towers.**

    NOTE: The camshaft bearing caps must be installed in their original locations. Record camshaft bearing cap locations.

    Remove the bolts in the sequence shown and remove the LH cylinder head front camshaft bearing cap and then the remaining bearing caps.



20. Clean and inspect the LH camshaft bearing caps.
    - The camshaft front thrust bearing cap contains an oil metering groove. Make sure the groove is free of foreign material.



21. Remove the LH camshaft.

22. **CAUTION: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into the original locations.**

    Remove all of the remaining camshaft roller followers from the cylinder heads.

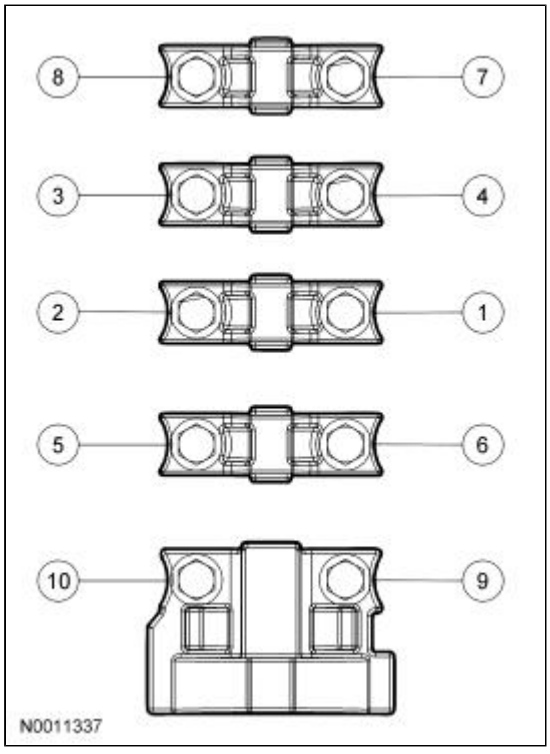
Installation

1. Install the LH and RH camshafts.
    - Lubricate the camshaft and camshaft journals with clean engine oil prior to installation.

2. **NOTE:** LH shown, RH similar.

    Install the LH and RH camshaft bearing caps in their original locations.
    - Lubricate the camshaft bearing caps with clean engine oil.
    - Position the front camshaft bearing cap.

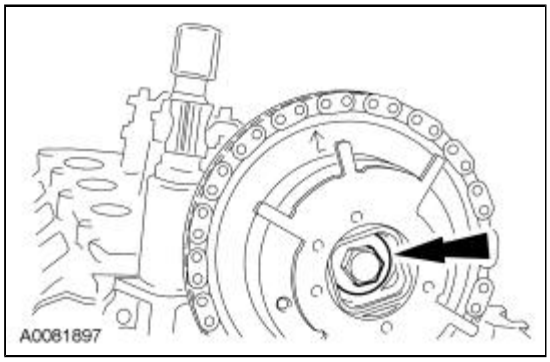
- Position the remaining camshaft bearing caps.
- Install the bolts loosely.
- Tighten to 10 Nm (89 lb-in) in the sequence shown.



3. **CAUTION: Damage to the VCT phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

   NOTE: LH shown, RH similar.

   Install the VCT phaser sprockets and new VCT phaser sprocket bolts finger tight.



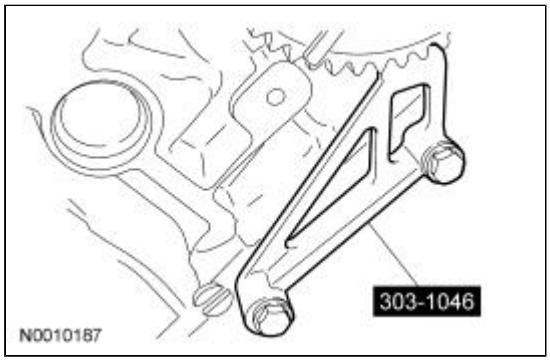
4. **CAUTION: Damage to the VCT phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

   CAUTION: Only use hand tools to remove the VCT phaser sprocket assembly or damage may occur to the camshaft or VCT phaser sprocket.

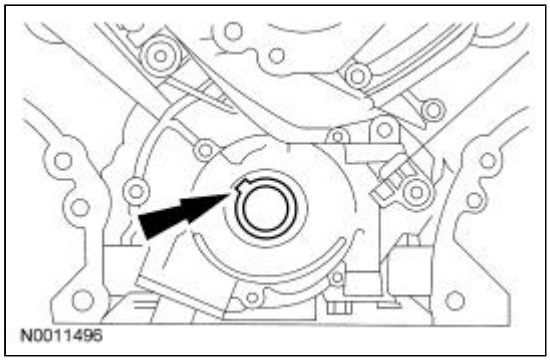
   NOTE: LH shown, RH similar.

   Using the special tool, tighten the LH and RH VCT phaser sprocket bolts in 2 stages.

- Stage 1: Tighten to 40 Nm (30 lb-ft).
- Stage 2: Tighten an additional 90 degrees.



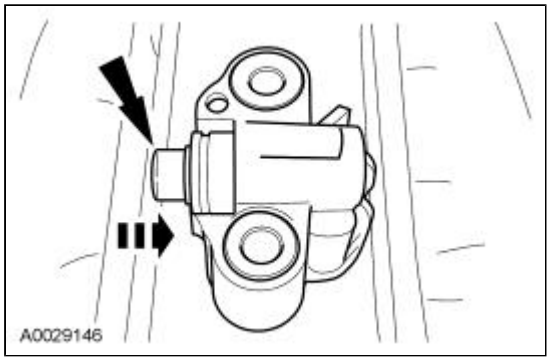
5. Position the crankshaft keyway at the 11 o'clock position.



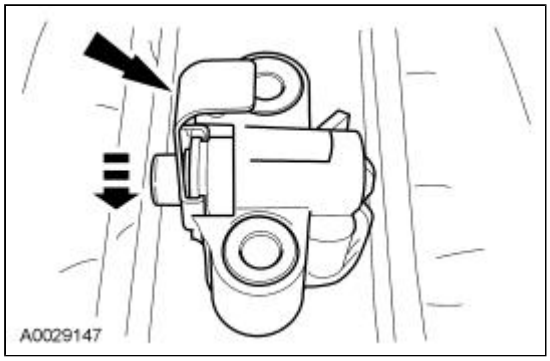
6. **CAUTION: Timing chain procedures must be followed exactly or damage to valves and pistons will result.**

   CAUTION: Prior to installation, inspect the tensioner-sealing bead for seal integrity. If cracks, tears, separation from the tensioner body or permanent compression of the seal bead is observed, install a new tensioner.

   Compress the tensioner plunger, using a vise.

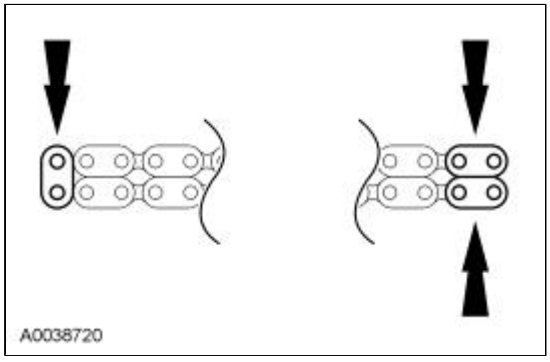


7. Install a retaining clip on the tensioner to hold the plunger in during installation.

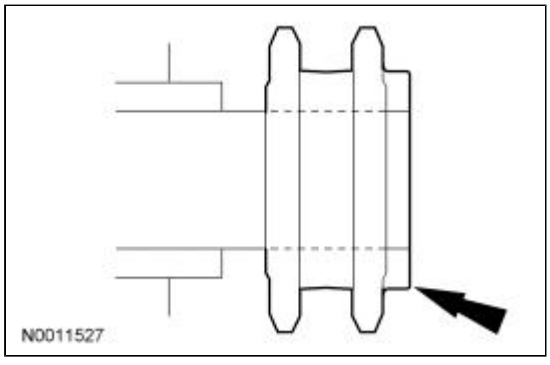


8. Remove the tensioner from the vise.

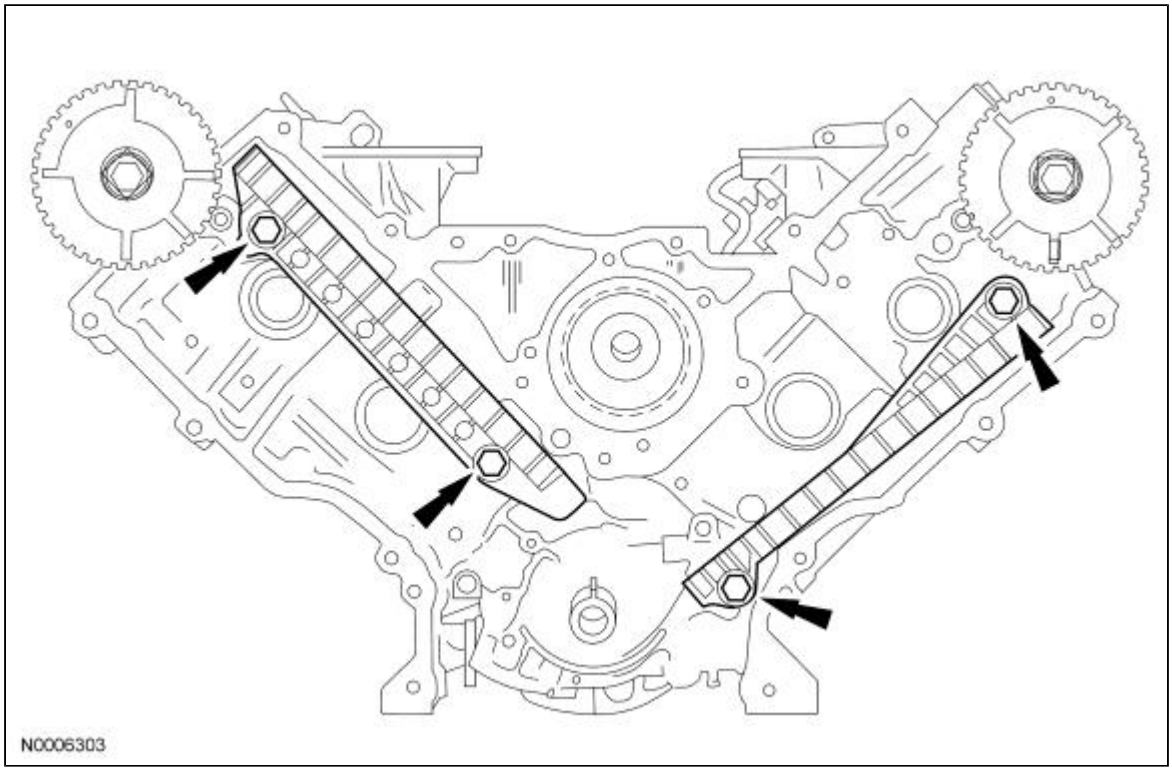
9. If the copper links are not visible, mark 2 links on one end and 1 link on the other end, and use as timing marks.



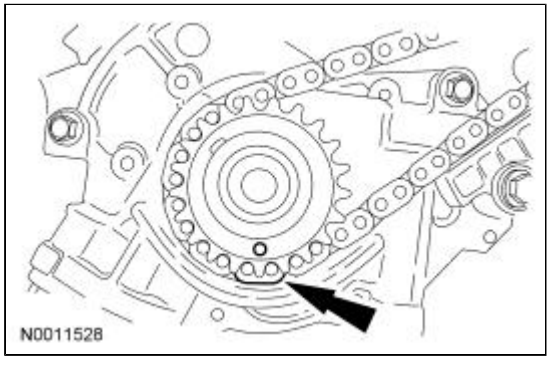
10. Install the crankshaft sprocket, making sure the flange faces forward.



11. Install the 4 bolts and the LH and RH timing chain guides.
    - Tighten to 10 Nm (89 lb-in).

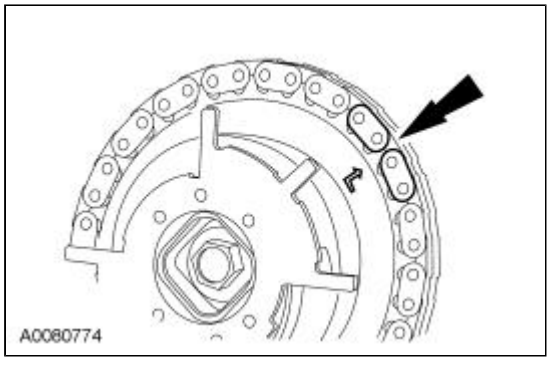


12. Position the lower end of the LH (inner) timing chain on the crankshaft sprocket, aligning the timing mark on the outer flange of the crankshaft sprocket with the single copper (marked) link on the chain.



13. **NOTE:** Make sure the upper half of the timing chain is below the tensioner arm dowel.

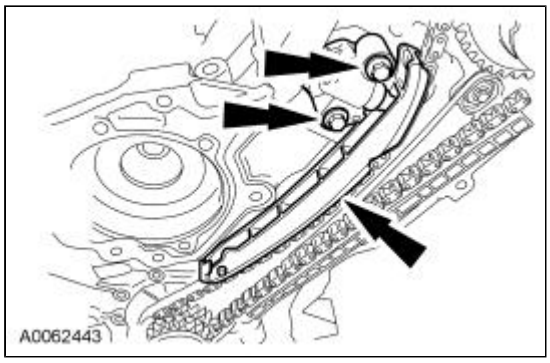
    Position the timing chain on the VCT phaser sprocket with the timing mark positioned between the 2 copper (marked) chain links.



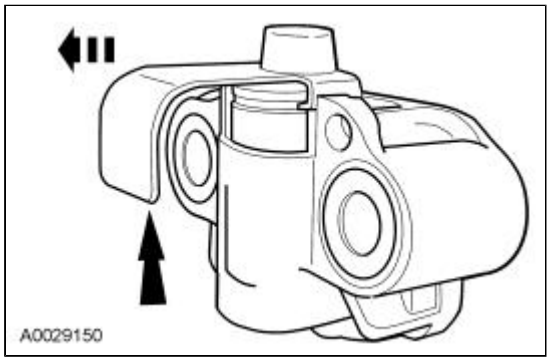
14. **NOTE:** The LH timing chain tensioner arm has a bump near the dowel hole for identification.

Position the LH timing chain tensioner arm on the dowel pin and install the LH timing chain tensioner and bolts.

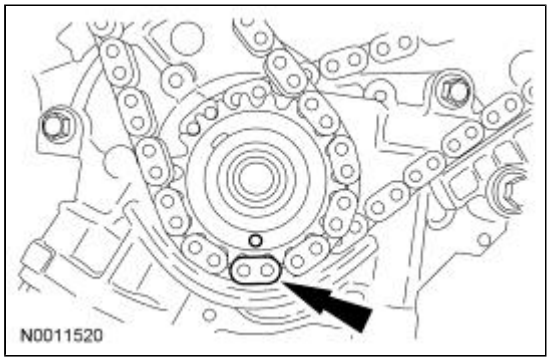
- Tighten to 25 Nm (18 lb-ft).



15. Remove the retaining clip from the LH timing chain tensioner.

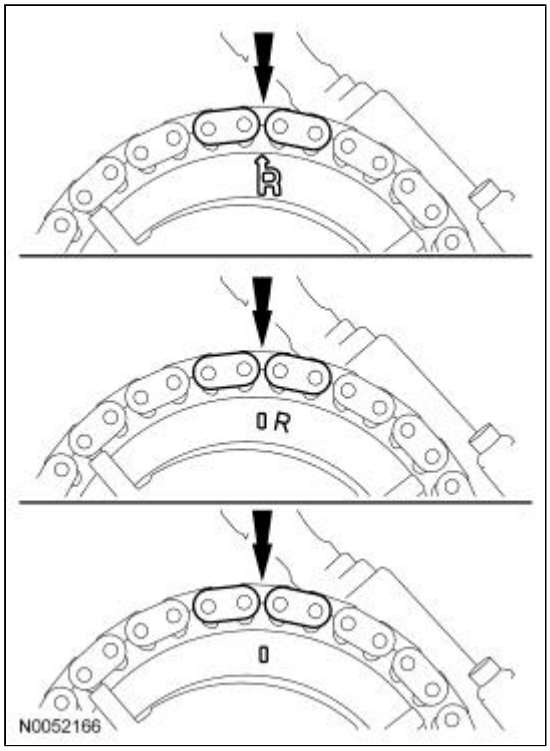


16. Position the lower end of the RH (outer) timing chain on the crankshaft sprocket, aligning the timing mark on the sprocket with the single copper (marked) chain link.

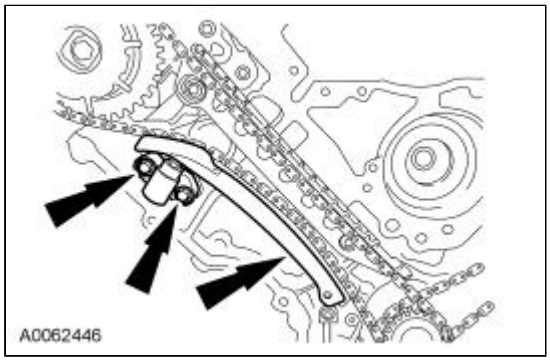


17. **NOTE:** The camshaft phaser and sprocket will be stamped with one of the illustrated timing marks for the RH camshaft.

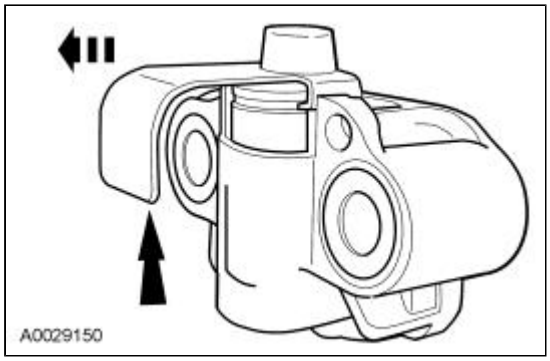
    Position the RH timing chain on the VCT phaser sprocket with the timing mark positioned between the 2 copper (marked) chain links.



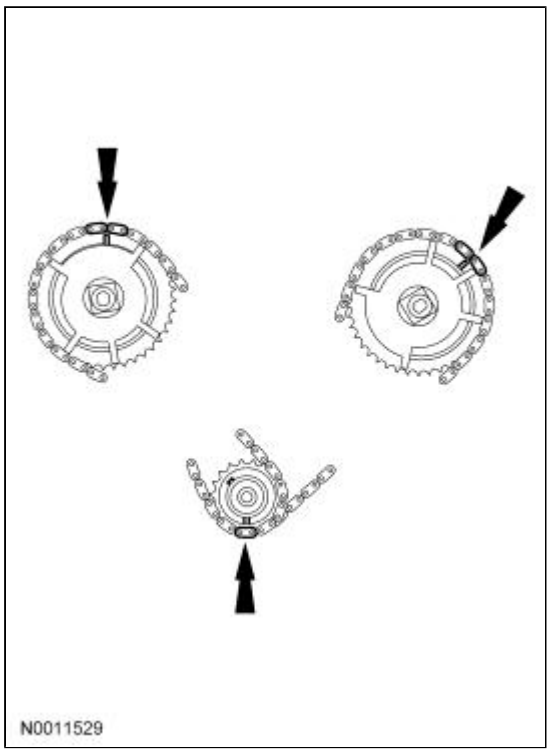
18. Position the RH timing chain tensioner arm on the dowel pin and install the RH timing chain tensioner and bolts.
    - Tighten to 25 Nm (18 lb-ft).



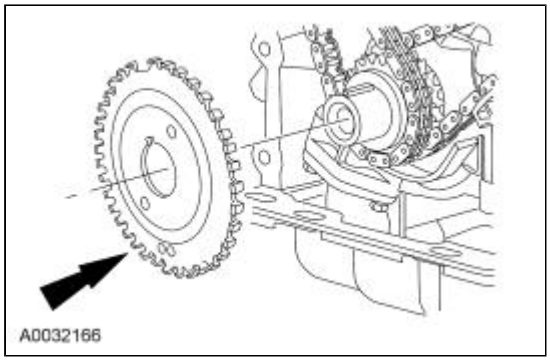
19. Remove the retaining clip from the RH timing chain tensioner.



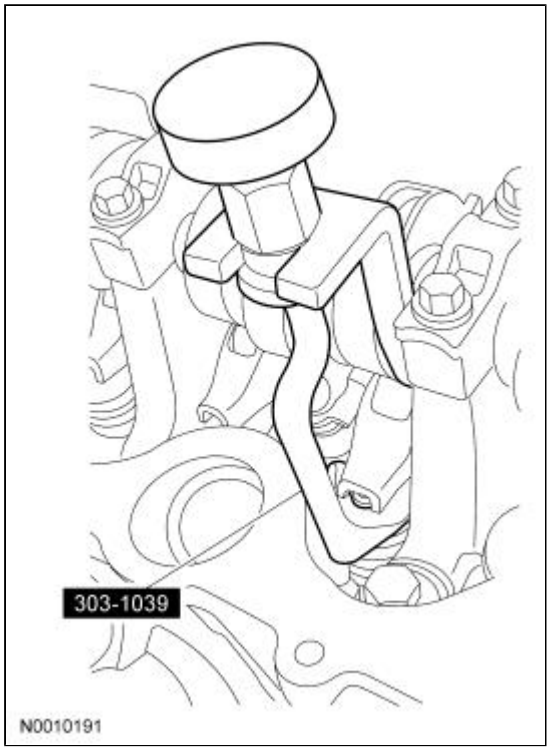
20. As a post-check, verify correct alignment of all timing marks.



21. Install the crankshaft sensor ring on the crankshaft.



22. Using the special tool, install all of the camshaft roller followers.
    - Lubricate the camshaft roller followers with clean engine oil prior to installation.

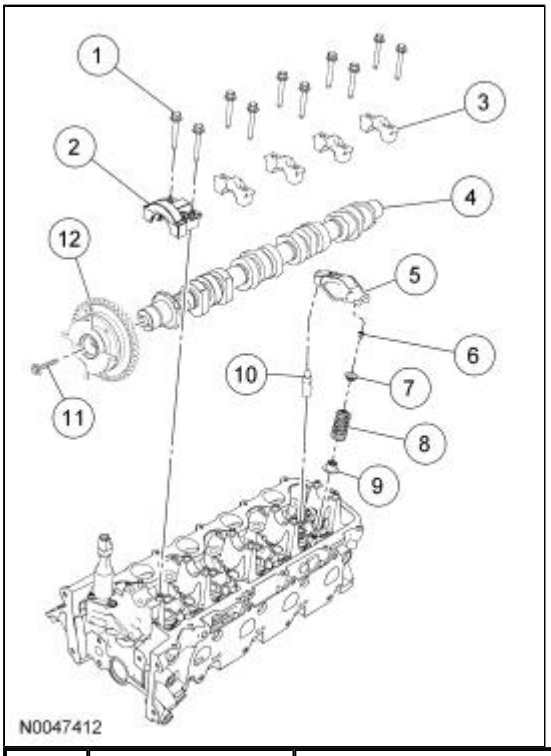


23. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

Valve Train Components — Exploded View

Printable View (135 KB)

NOTE: LH shown, RH similar.



Item	Part Number	Description
1	N807834	Camshaft bearing cap bolt (10 required)
2	6B284	Camshaft front bearing cap
3	6B280	Camshaft bearing cap (4 required)
4	6C255	Camshaft
5	6529	Camshaft roller follower (12 required)
6	6518	Valve spring retainer key (24 required)
7	6514	Valve spring retainer (12 required)
8	6513	Valve spring (12 required)
9	6A517	Valve seal (12 required)
10	6C501	Hydraulic lash adjuster (12 required)
11	6279	Camshaft phaser and sprocket bolt
12	6C524	Camshaft phaser and sprocket

Special Tool(s)

ST2804-A	Compressor, Valve Spring 303-1039
ST2969-A	Wedge, Timing Chain 303-1175

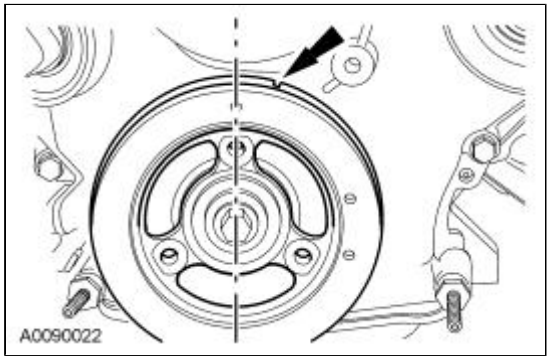
Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Removal

CAUTION: The camshaft procedure must be followed exactly or damage to the valves and pistons will result.

1. Position the crankshaft damper spoke at the 12 o'clock position and the timing mark indentation at the 1 o'clock position.



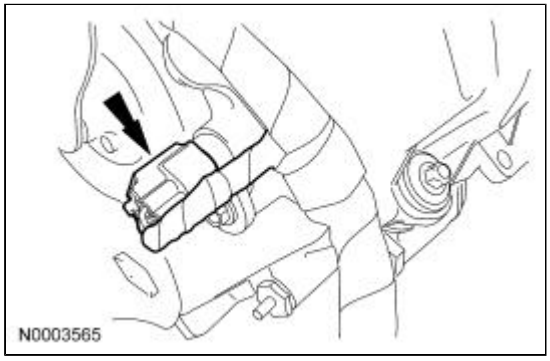
2. Remove the LH valve cover. For additional information, refer to Valve Cover — LH in this section.

3. **CAUTION: Damage to the camshaft phaser and sprocket assembly will occur if**

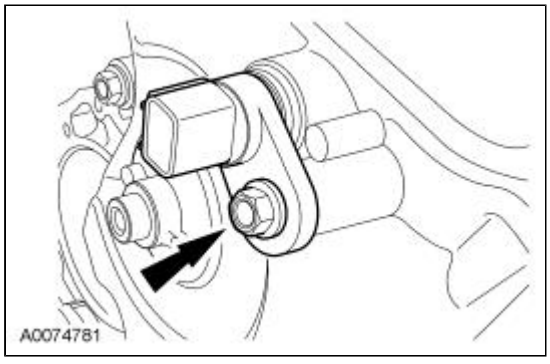
mishandled or used as a lifting or leveraging device.

Loosen and back off the LH camshaft phaser and sprocket bolt one full turn.

4. Disconnect the LH camshaft position (CMP) sensor electrical connector.

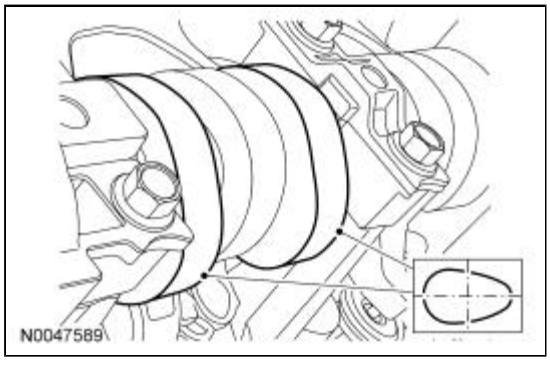


5. Remove the LH CMP sensor and the bolt.

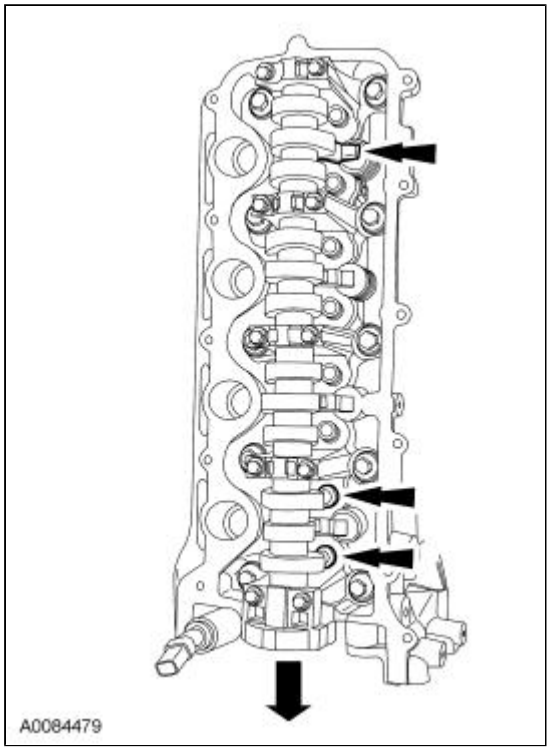


6. **NOTE:** If the camshaft lobes are not exactly positioned as shown, the crankshaft keyway will require one full additional rotation to 12 o'clock.

   The No. 5 cylinder camshaft lobe must be coming up on the exhaust stroke. Verify by noting the position of the 2 intake camshaft lobes and the exhaust lobe on the No. 5 cylinder.



7. Remove only the 3 camshaft roller followers shown in the illustration.

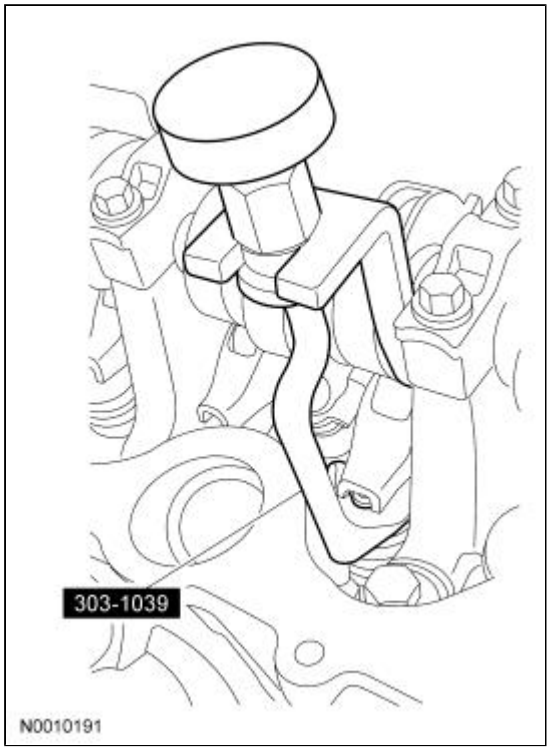


8. **CAUTION: Do not allow the valve keepers to fall off the valve or the valve may drop into the cylinder.**

   NOTE: The camshaft roller followers must be installed in their original locations. Record camshaft roller follower locations.

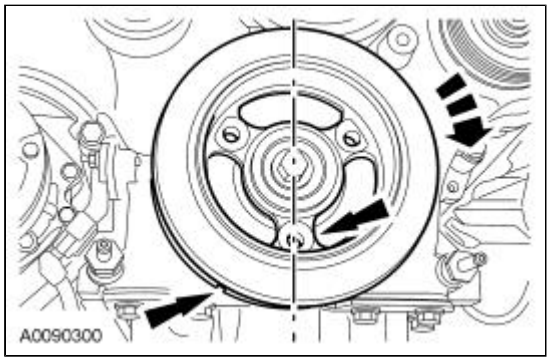
   NOTE: It may be necessary to push the valve down while compressing the spring.

   Using the special tool, remove only the 3 designated camshaft roller followers from the previous step.



9. **CAUTION: The crankshaft cannot be moved past the 6 o'clock position once set.**

   Rotate the crankshaft clockwise, as viewed from the front, positioning the crankshaft damper spoke at the 6 o'clock position and the timing mark indentation at the 7 o'clock position.

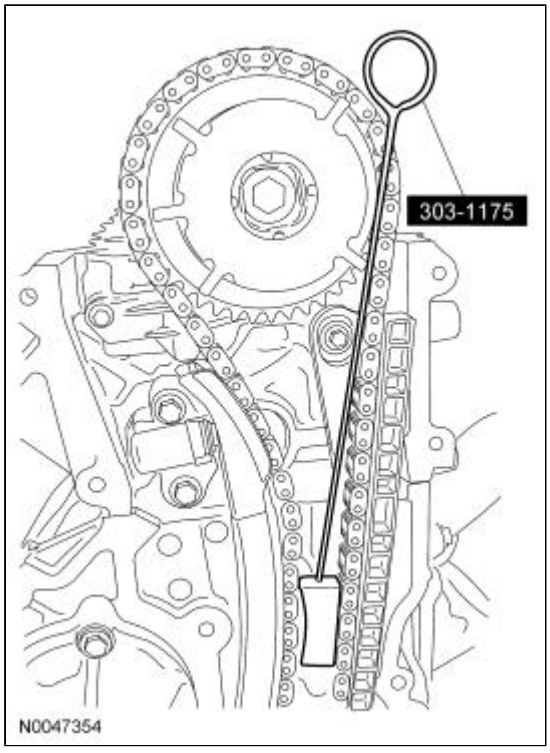


10. **CAUTION: Engine is not freewheeling. Camshaft procedure must be followed exactly or damage to valves and pistons will result.**

    CAUTION: The Timing Chain Wedge tool must be installed square to the timing chain and the engine block.

    NOTE: Engine front cover removed for clarity.

    Install the special tool in the LH timing chain as shown.

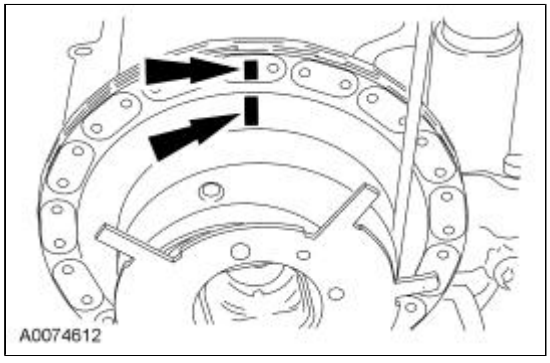


11. **CAUTION: Do not remove the Timing Chain Wedge tool at any time during assembly. If the special tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section.**

CAUTION: The timing chain must be installed in its original position onto the camshaft phaser and sprocket using the scribed marks, or damage to valves and pistons will result.

NOTE: RH shown, LH similar.

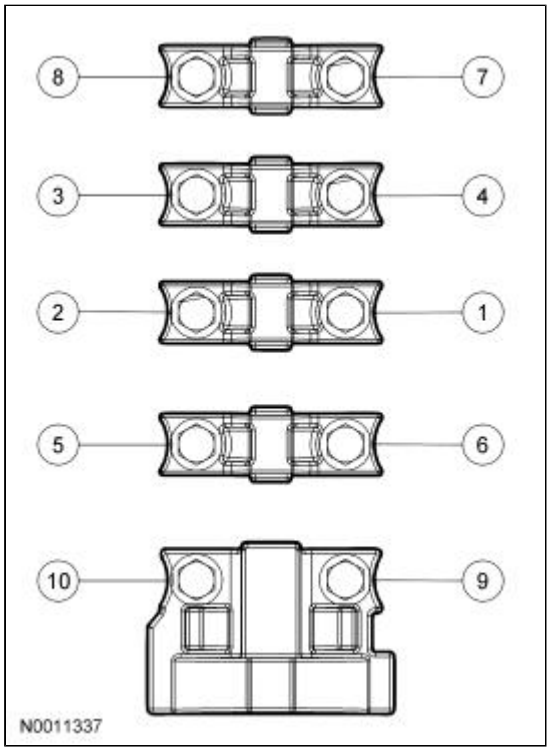
Scribe a location mark on the timing chain and the camshaft phaser and sprocket assembly.



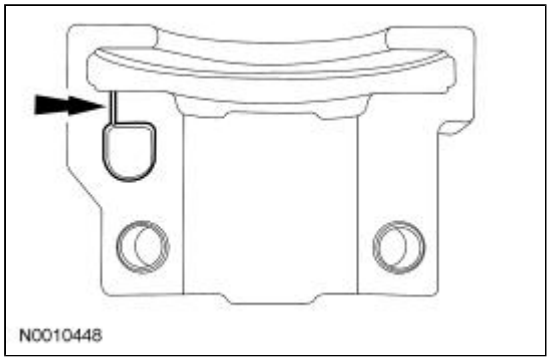
12. **CAUTION: When removing the front thrust camshaft bearing cap, use care as the cap may be damaged from side loading when removing the cam unequally in height from the bearing towers.**

    NOTE: The camshaft bearing caps must be installed in their original locations. Record camshaft bearing cap locations.

    Remove the bolts in the sequence shown and remove the front camshaft bearing cap and then the remaining bearing caps.



13. Clean and inspect the LH camshaft bearing caps.
    - The camshaft front thrust bearing cap contains an oil metering groove. Make sure the groove is free of foreign material.

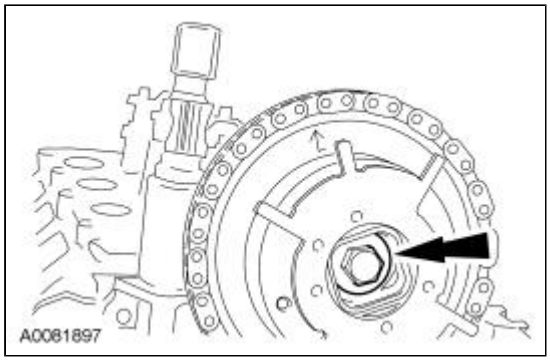


14. **CAUTION: Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    CAUTION: Only use hand tools to remove the camshaft phaser and sprocket bolt or damage may occur to the camshaft or camshaft phaser and sprocket.

    CAUTION: Do not remove the Timing Chain Wedge tool at any time during assembly. If the special tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section.

    Remove the bolt and withdraw the camshaft from the camshaft phaser and sprocket assembly, leaving the camshaft phaser and sprocket assembly in place.
    - Discard the bolt and washer.



15. Inspect the camshaft phaser and sprocket for damage. For additional information, refer to Camshaft Phaser and Sprocket in this section.

Installation

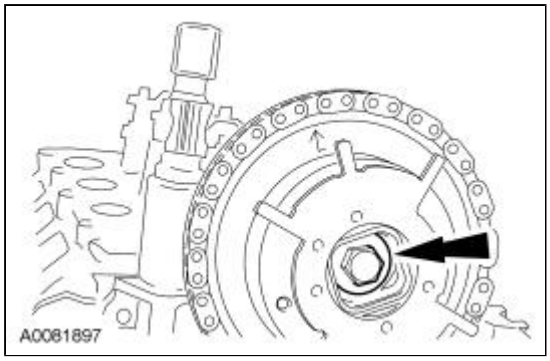
1. Lubricate the camshaft and camshaft journals with clean engine oil.

2. **CAUTION: Do not remove the Timing Chain Wedge tool at any time during assembly. If the special tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section.**

   CAUTION: Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.

CAUTION: Do not allow the camshaft roller followers to move out of position when installing the camshaft.

Install the camshaft into the camshaft phaser and sprocket assembly and onto the head. Install a new camshaft phaser and sprocket bolt finger tight.

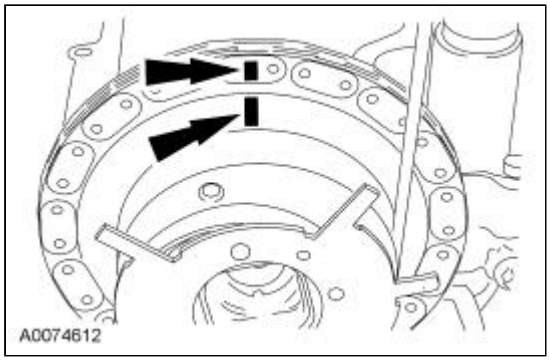


3. **CAUTION: Do not remove the Timing Chain Wedge tool at any time during assembly. If the special tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section.**

CAUTION: The timing chain must be installed in its original position onto the camshaft phaser and sprocket using the scribed marks, or damage to valves and pistons will result.

NOTE: RH shown, LH similar.

Verify the camshaft phaser and sprocket and timing chain scribe marks are still in alignment.

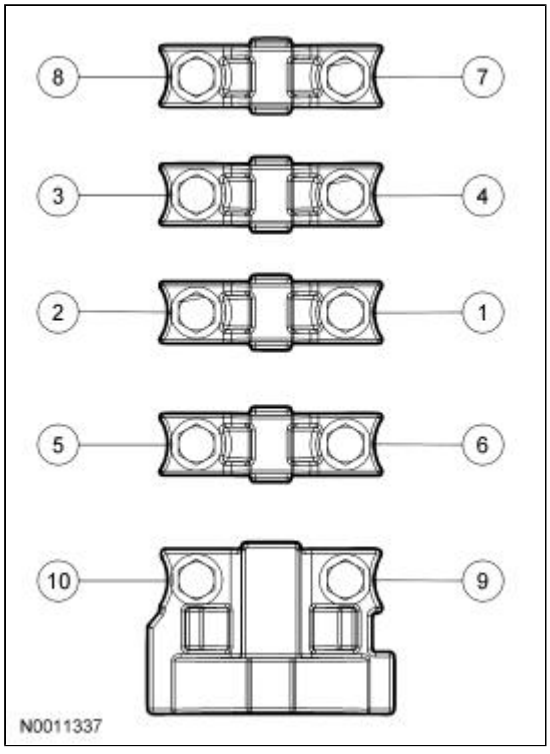


4. **CAUTION: Do not allow the camshaft roller followers to move out of position when installing the camshaft.**

Install the camshaft bearing caps in their original locations.

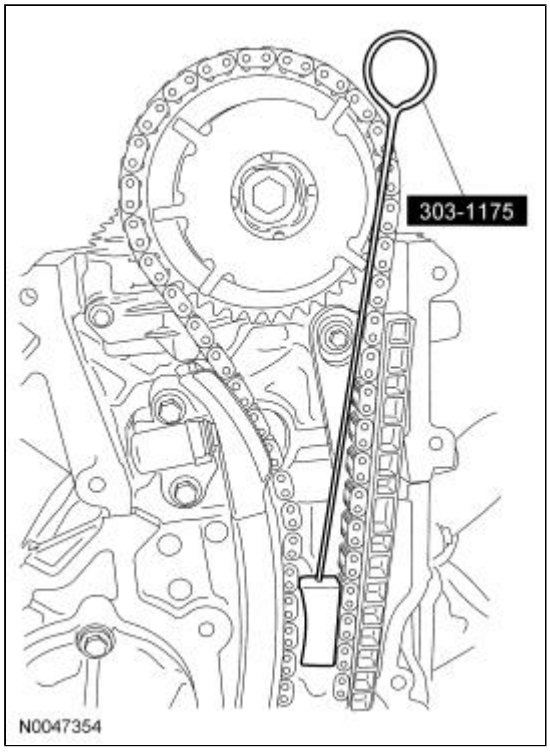
- Lubricate the camshaft bearing caps with clean engine oil.
- Position the front camshaft bearing cap.
- Position the remaining camshaft bearing caps.
- Install the bolts loosely.

5. Tighten the bolts in the sequence shown.
   - Tighten to 10 Nm (89 lb-in).

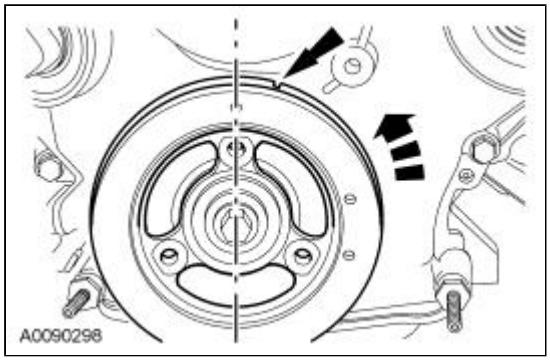


6. **NOTE:** Engine front cover removed for clarity.

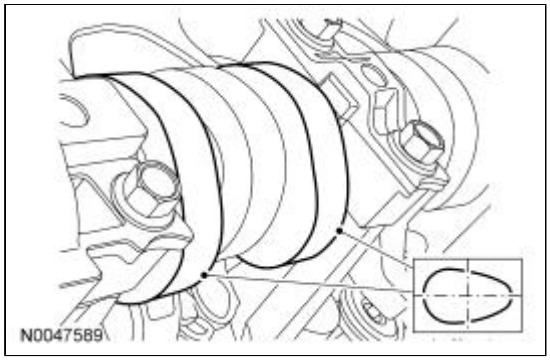
   Remove the special tools.



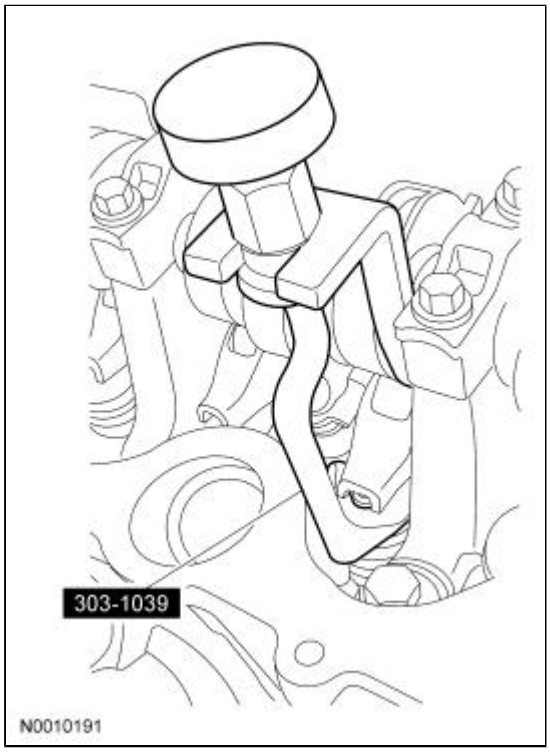
7. Rotate the crankshaft a half turn counterclockwise and position the crankshaft damper spoke at the 12 o'clock position and the timing mark indentation at the 1 o'clock position.



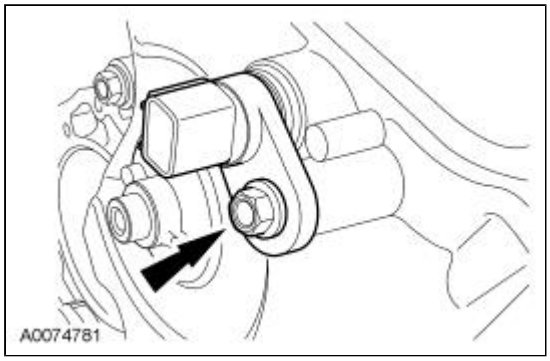
8. Verify correct camshaft position by noting the position of the No. 5 cylinder intake and exhaust camshaft lobes.



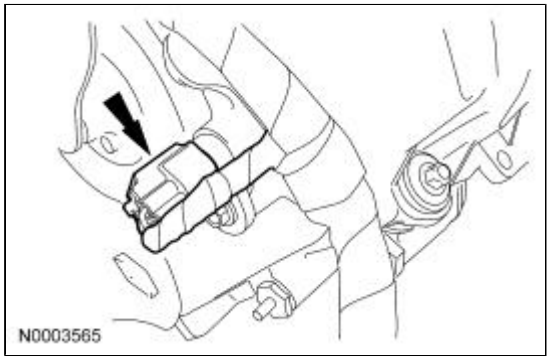
9. Using the special tool, install the 3 originally removed camshaft roller followers.



10. Install the CMP sensor and the bolt.



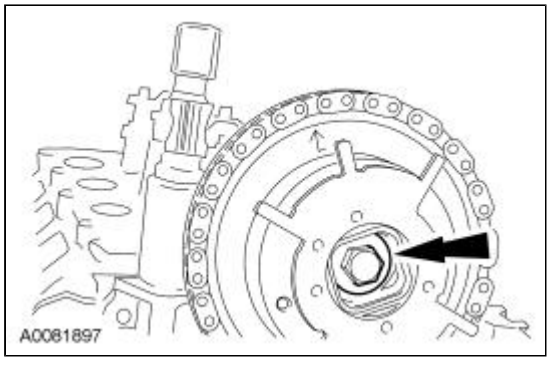
11. Connect the CMP electrical connector.



12. **CAUTION: Only use hand tools to install the camshaft phaser and sprocket assembly or damage may occur to the camshaft or camshaft phaser and sprocket.**

    CAUTION: Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.

    Tighten the camshaft phaser and sprocket bolt in 2 stages:
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.



13. Install the LH valve cover. For additional information, refer to Valve Cover — LH in this section.

Camshaft — RH

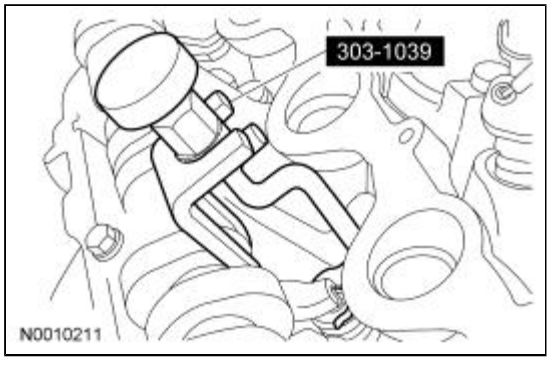
   NOTE: The camshaft roller followers must be installed in their original locations. Record camshaft roller follower locations.

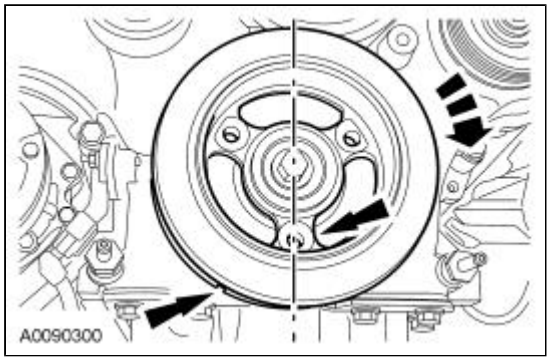
   NOTE: It may be necessary to push the valve down while compressing the spring.

   Using the special tool, remove only the 3 designated camshaft roller followers from the previous step.



9. **CAUTION: The crankshaft cannot be moved past the 6 o'clock position once set.**

   Rotate the crankshaft clockwise, as viewed from the front, positioning the crankshaft damper spoke at the 6 o'clock position and the timing mark indentation at the 7 o'clock position.

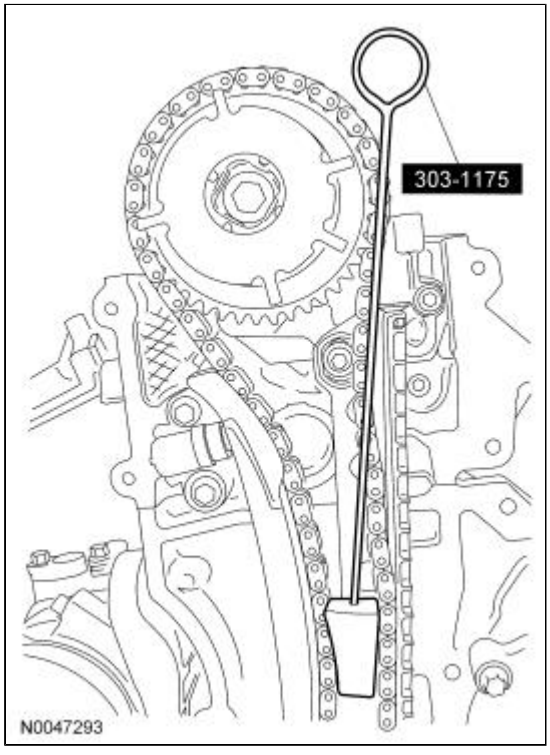


10. **CAUTION: Engine is not freewheeling. Camshaft procedure must be followed exactly or damage to valves and pistons will result.**

    CAUTION: The Timing Chain Wedge tool must be installed square to the timing chain and the engine block.

    NOTE: Engine front cover removed for clarity.

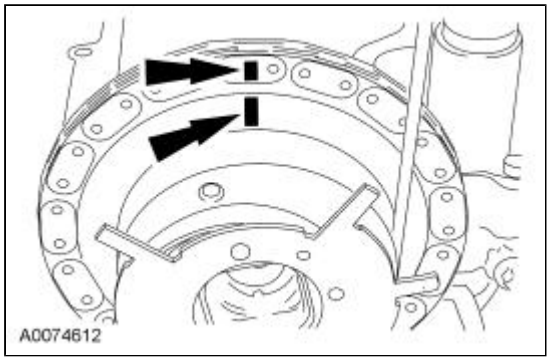
    Install the special tool in the RH timing chain as shown.



11. **CAUTION: Do not remove the Timing Chain Wedge tool at any time during assembly. If the special tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section.**

    CAUTION: The timing chain must be installed in its original position onto the camshaft phaser and sprocket using the scribed marks, or damage to valves and pistons will result.

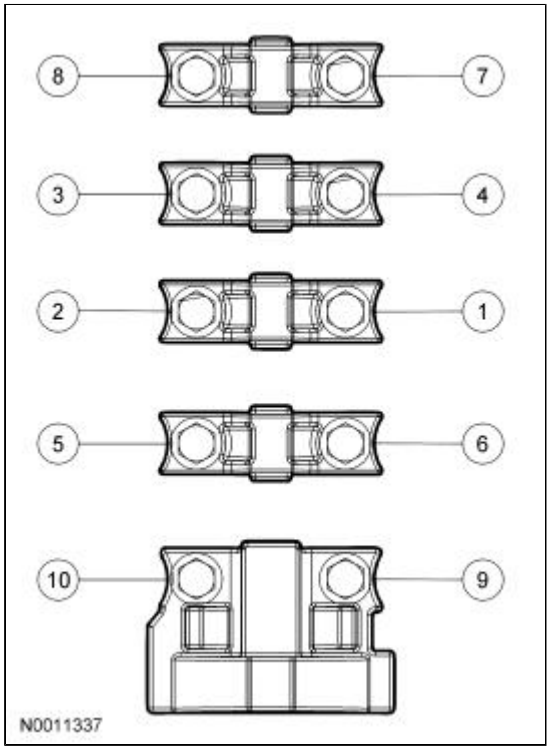
    Scribe a location mark on the timing chain and the camshaft phaser and sprocket assembly.



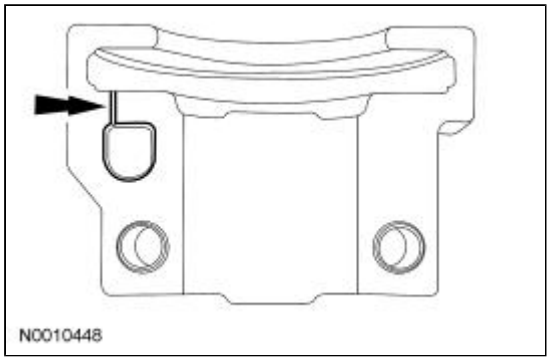
12. **CAUTION: When removing the front thrust camshaft bearing cap, use care as the cap may be damaged from sideloading when removing the cam unequally in height from the bearing towers.**

    NOTE: The camshaft bearing caps must be installed in their original locations. Record camshaft bearing cap locations.

    Remove the bolts in the sequence shown and remove the front camshaft bearing cap and then the remaining bearing caps.



13. Clean and inspect the RH camshaft bearing caps.
    - The camshaft front thrust bearing cap contains an oil metering groove. Make sure the groove is free of foreign material.

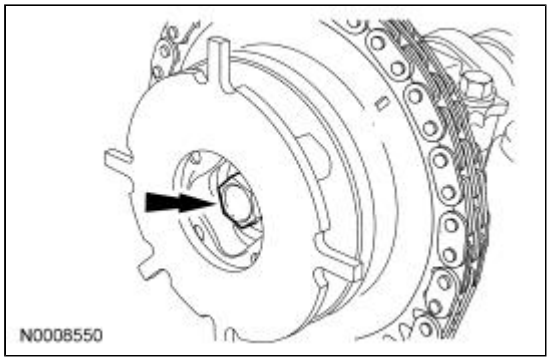


14. **CAUTION: Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    CAUTION: Only use hand tools to remove the camshaft phaser and sprocket bolt or damage may occur to the camshaft or camshaft phaser and sprocket.

    CAUTION: Do not remove the Timing Chain Wedge tool at any time during assembly. If the special tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section.

    Remove the bolt and withdraw the camshaft from the camshaft phaser and sprocket assembly, leaving the camshaft phaser and sprocket assembly in place.
    - Discard the bolt and washer.



15. Inspect the camshaft phaser and sprocket for damage. For additional information, refer to Camshaft Phaser and Sprocket in this section.

Installation

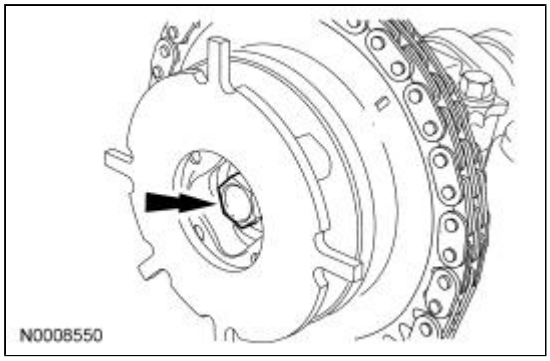
1. Lubricate the camshaft and camshaft journals with clean engine oil.

2. **CAUTION: Do not remove the Timing Chain Wedge tool at any time during assembly. If the special tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section.**

   CAUTION: Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.

CAUTION: Do not allow the camshaft roller followers to move out of position when installing the camshaft.

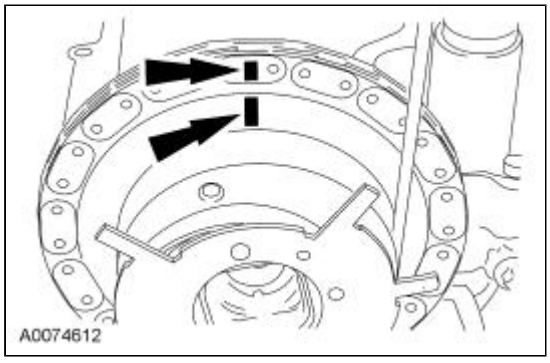
Install the camshaft into the camshaft phaser and sprocket assembly and onto the head. Install a new camshaft phaser and sprocket bolt finger tight.



3. **CAUTION: Do not remove the Timing Chain Wedge tool at any time during assembly. If the special tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section.**

   CAUTION: The timing chain must be installed in its original position onto the camshaft phaser and sprocket using the scribed marks, or damage to valves and pistons will result.

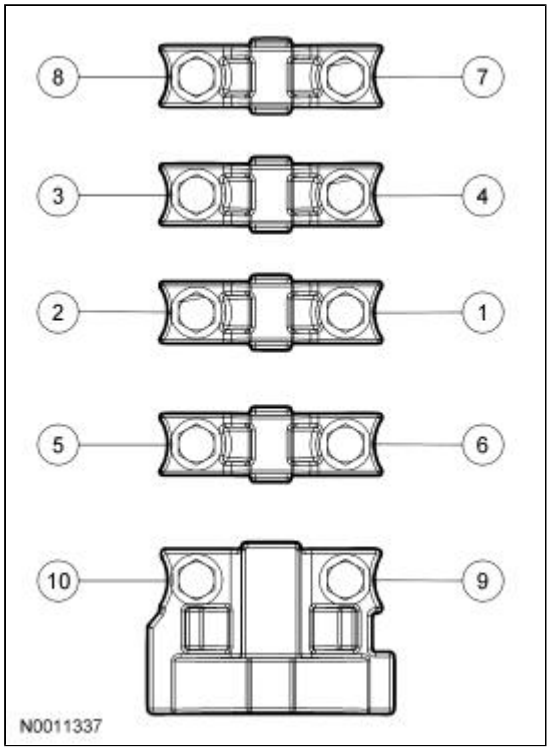
   Verify the camshaft phaser and sprocket and timing chain scribe marks are still in alignment.



4. **CAUTION: Do not allow the camshaft roller followers to move out of position when installing the camshaft.**

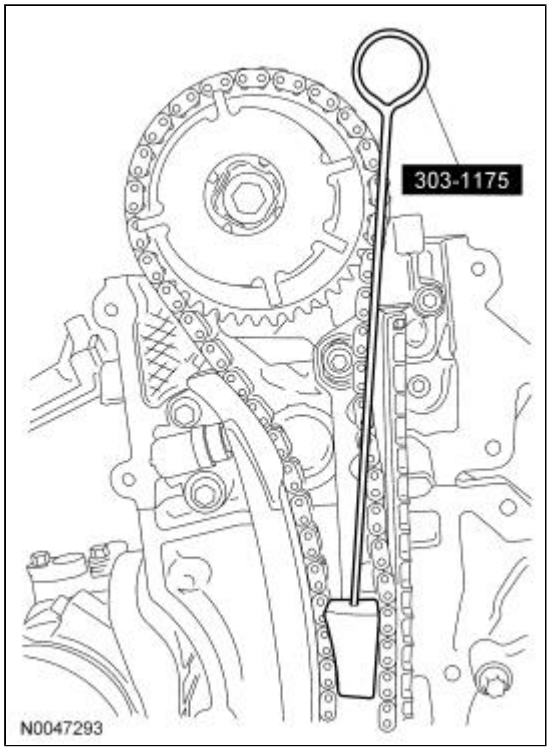
   Install the camshaft bearing caps in their original locations.
   - Lubricate the camshaft bearing caps with clean engine oil.
   - Position the front camshaft bearing cap.
   - Position the remaining camshaft bearing caps.
   - Install the bolts loosely.

5. Tighten the bolts in the sequence shown.
   - Tighten to 10 Nm (89 lb-in).

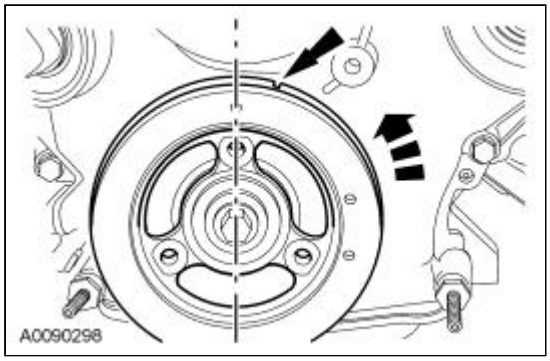


6. **NOTE:** Engine front cover removed for clarity.

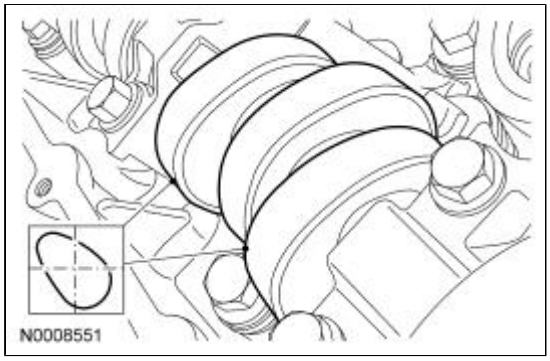
   Remove the special tool.



7. Rotate the crankshaft a half turn counterclockwise and position the crankshaft damper spoke at the 12 o'clock position and the timing mark indentation at the 1 o'clock position.

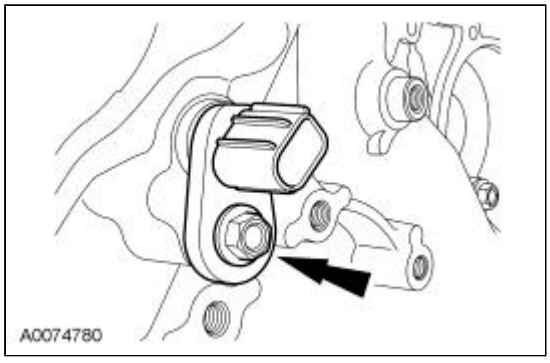


8. Verify correct camshaft position by noting the position of the No. 1 cylinder intake and exhaust camshaft lobes.

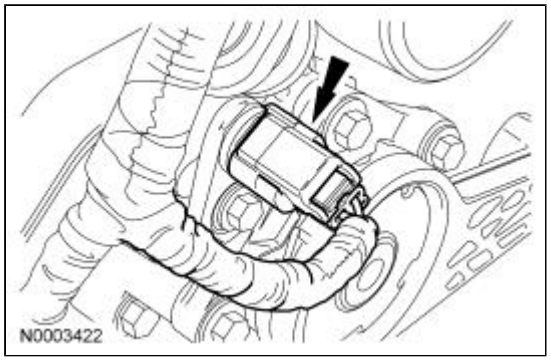


9. Using the special tool, install the 3 originally removed camshaft roller followers.

10. Install the CMP sensor and the bolt.
    - Tighten to 10 Nm (89 lb-in).



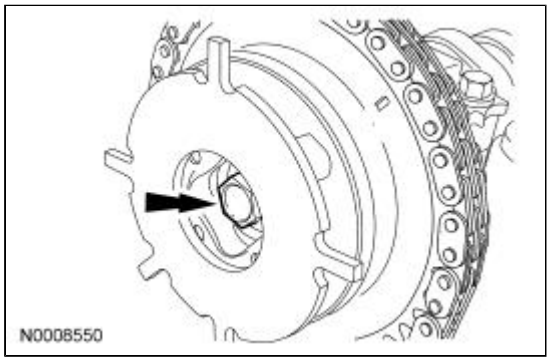
11. Connect the CMP electrical connector.



12. **CAUTION: Only use hand tools to install the camshaft phaser and sprocket assembly or damage may occur to the camshaft or camshaft phaser and sprocket.**

    CAUTION: Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.

    Tighten the new camshaft phaser and sprocket bolt in 2 stages:
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.



13. Install the RH valve cover. For additional information, refer to Valve Cover — RH in this section.

Camshaft Phaser and Sprocket

Printable View (184 KB)

Special Tool(s)

ST2969-A	Wedge, Timing Chain 303-1175

Removal

1. If servicing the RH camshaft phaser and sprocket, remove the RH camshaft. For additional information, refer to Camshaft — RH in this section.

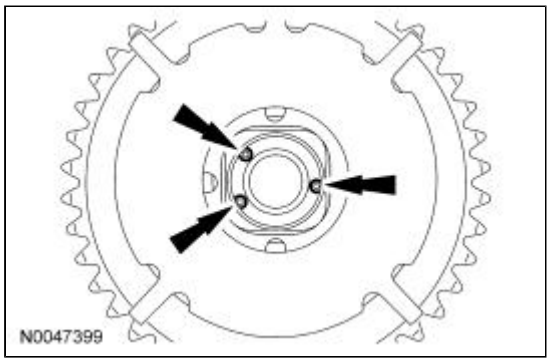
2. If servicing the LH camshaft phaser and sprocket, remove the LH camshaft. For additional information, refer to Camshaft — LH in this section.

3. **CAUTION: Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

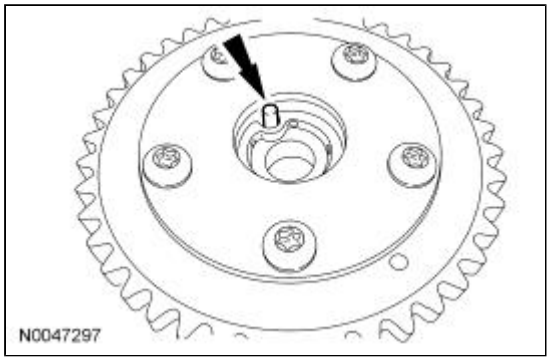
   CAUTION: Do not remove the Timing Chain Wedge tool at any time during assembly. If the special tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section.

   Remove the camshaft phaser and sprocket from the timing chain.

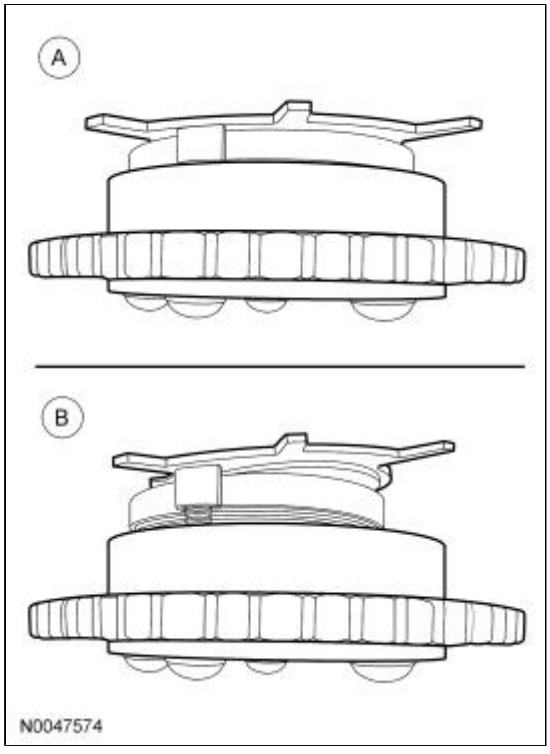
4. Inspect the front of the camshaft phaser and sprocket for missing or damaged roll pins.
   - If the roll pins are missing or damaged, a new camshaft phaser and sprocket must be installed.



5. Inspect the rear of the camshaft phaser and sprocket for a deformed or damaged location pin.
   - If the location pin is deformed or damaged a new camshaft phaser and sprocket must be installed.



6. Visually inspect the camshaft phaser and sprocket for squareness (A). If the trigger wheel or spring is deformed or damaged (B), install a new camshaft phaser and sprocket.



Installation

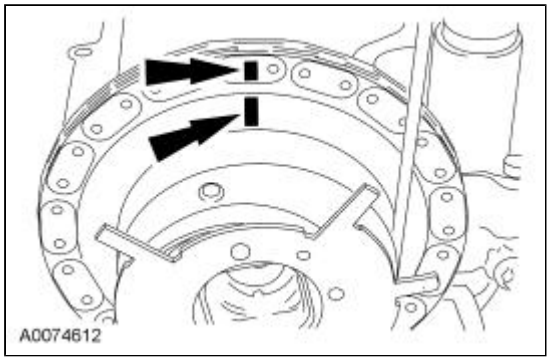
1. **CAUTION: Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

   If installing a new camshaft phaser and sprocket, transfer the original scribe mark to the new camshaft phaser and sprocket.

2. **CAUTION: The timing chain must be installed in its original position onto the camshaft phaser and sprocket using the scribed marks, or damage to valves and pistons will result.**

   CAUTION: Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.

   Align the scribe marks and position the camshaft phaser and sprocket into the timing chain.



3. If servicing the RH camshaft phaser and sprocket, install the RH camshaft. For additional information, refer to Camshaft — RH in this section.

4. If servicing the LH camshaft phaser and sprocket, install the LH camshaft. For additional information, refer to Camshaft — LH in this section.

Camshaft Roller Follower

Printable View (119 KB)

Special Tool(s)

ST2804-A	Compressor, Valve Spring 303-1039

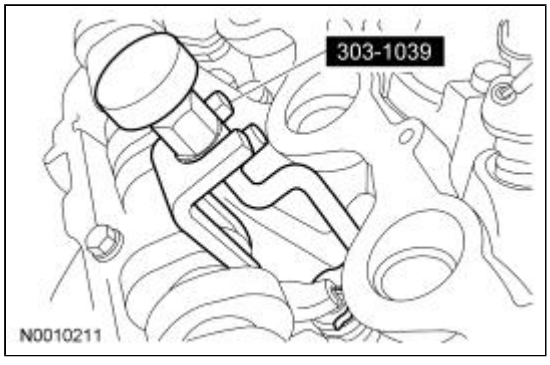
Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Removal

1. Depending on the camshaft roller follower being serviced, remove the LH or RH valve cover. For additional information, refer to Valve Cover — LH or Valve Cover — RH in this section.
2. Rotate the crankshaft until the piston for the valve being serviced is at the top of its stroke with the intake valve and the exhaust valves closed.
3. **CAUTION: If the components are to be reinstalled, they must be installed in the same position. Mark the components for installation into the original location.**

   Using the special tool, compress the valve spring and remove the camshaft roller follower.



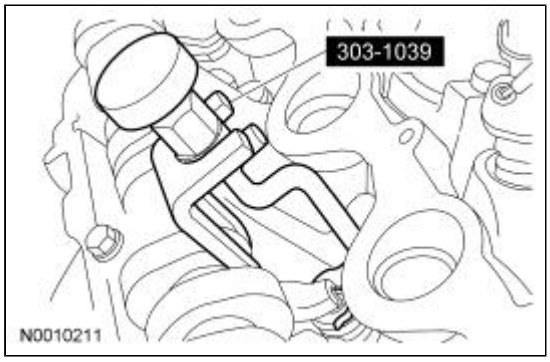
4. Repeat the previous 2 steps for each camshaft roller follower being serviced.
5. Inspect the camshaft roller follower. For additional information, refer to Section 303-00 .

Installation

1. **CAUTION: If the components are to be reinstalled, they must be installed in the same position. Mark the components for installation into the original locations.**

   NOTE: Lubricate the camshaft roller followers with clean engine oil prior to installation.

   Using the special tool, compress the valve spring and install the camshaft roller follower.



2. Repeat the previous step for each camshaft roller follower being serviced.

3. Depending on the camshaft roller follower being serviced, install the LH or RH valve cover. For additional information, refer to Valve Cover — LH or Valve Cover — RH in this section.

Valve Springs

Printable View (154 KB)

Special Tool(s)

ST2804-A	Compressor, Valve Spring 303-1039

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Removal

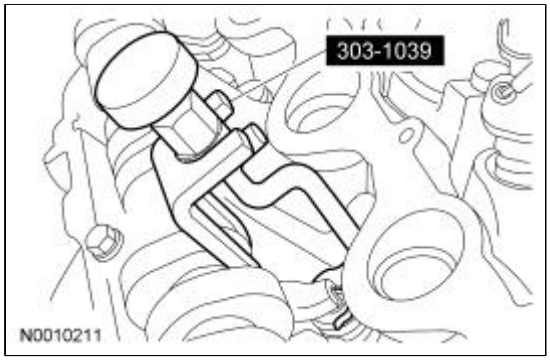
1. Depending on the valve spring being serviced, remove the LH or RH valve cover. For additional information, refer to Valve Cover — LH or Valve Cover — RH in this section.

2. Remove the spark plug. For additional information, refer to Section 303-07 .

3. Rotate the crankshaft until the piston for the valve being serviced is at the top of its stroke with the intake valve and the exhaust valves closed.

4. **CAUTION: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into the original locations.**

   Using the special tool, compress the valve spring and remove the camshaft roller follower.



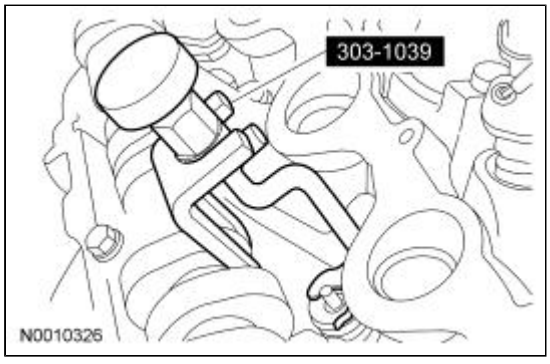
5. Use compressed air in the cylinder to hold both valves in position.
   - Apply a minimum of 965 kPa (140 psi) of compressed air into the cylinder.

6. **CAUTION: If air pressure has forced the piston to the bottom of the cylinder, any loss of air pressure will allow the valve to fall into the cylinder. If air pressure must be removed, support the valve prior to removal.**

   CAUTION: If the components are to be reinstalled, they must be installed in the same position. Mark the components for location.

   NOTE: If a valve drops into the cylinder, remove the cylinder head. For additional information, refer to Cylinder Head in this section.

   Using the special tool, compress the valve spring and remove the valve spring retainer keys.

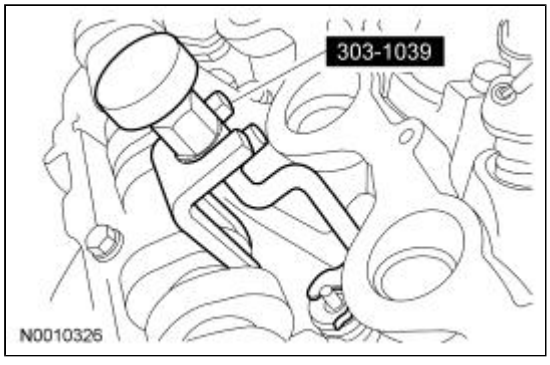


7. Remove the valve spring retainer and the valve spring.

8. Inspect the valve spring. For additional information, refer to Section 303-00 .

Installation

1. Using the special tool, install the valve spring, the valve spring retainer and the valve spring retainer keys.

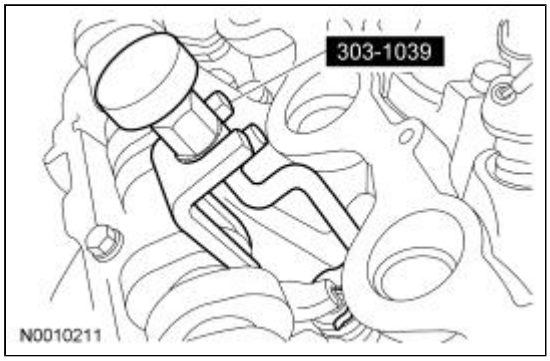


2. Relieve the air pressure from the cylinder.

3. **CAUTION: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into the original locations.**

   NOTE: Lubricate the camshaft roller follower with clean engine oil prior to installation.

   Using the special tool, compress the valve spring and install the camshaft roller follower.



4. Install the spark plug. For additional information, refer to Section 303-07 .

5. Depending on the valve spring being serviced, install the LH or RH valve cover. For additional information, refer to Valve Cover — LH or Valve Cover — RH in this section.

Valve Seals

Printable View (190 KB)

Special Tool(s)

ST2804-A	Compressor, Valve Spring 303-1039
 ST1332-A	Installer, Valve Stem Oil Seal 303-383 (T91P-6571-A)

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Removal

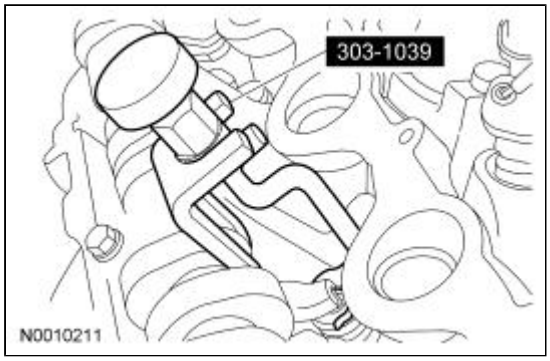
1. Depending on the valve being serviced, remove the LH or RH valve cover. For additional information, refer to Valve Cover — LH or Valve Cover — RH in this section.

2. Remove the spark plug. For additional information, refer to Section 303-07 .

3. Rotate the crankshaft until the piston for the valve being serviced is at the top of its stroke with the intake valve and the exhaust valves closed.

4. **CAUTION: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into the original locations.**

   Using the special tool, compress the valve spring and remove the camshaft roller follower.



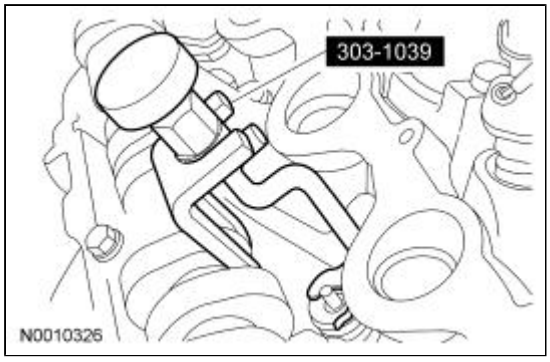
5. Use compressed air in the cylinder to hold both valves in position.
   - Apply a minimum of 965 kPa (140 psi) of compressed air into the cylinder.

6. **CAUTION: If air pressure has forced the piston to the bottom of the cylinder, any loss of air pressure will allow the valve to fall into the cylinder. If air pressure must be removed, support the valve prior to removal.**

   CAUTION: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for locations.

   NOTE: If a valve drops into the cylinder, remove the cylinder head. For additional information, refer to Cylinder Head in this section.

   Using the special tool, compress the valve spring and remove the valve spring retainer keys.



7. Remove the valve spring retainer, the valve spring and the valve seal.
   - Discard the valve seal.

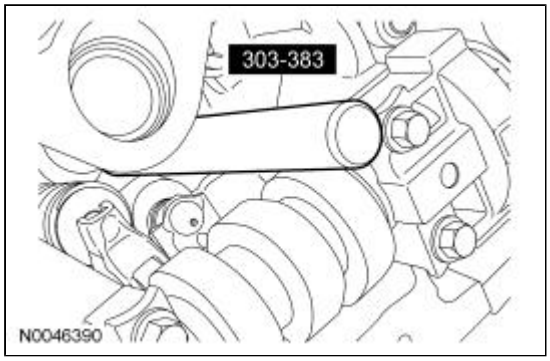
8. Inspect the components. For additional information, refer to Section 303-00 .

Installation

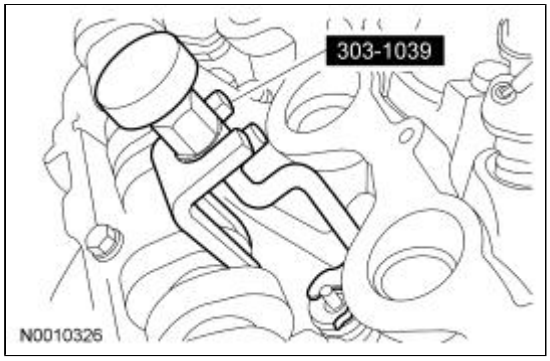
1. **NOTE:** Lubricate the valve seal and valve stem with clean engine oil prior to installation.

   Position a new valve seal onto the valve stem.

2. Using the special tool, install the new valve seal.



3. Using the special tool, install the valve spring, the valve spring retainer and the valve spring retainer keys.



4. Relieve the air pressure from the cylinder.

5. **CAUTION: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into the original locations.**

   NOTE: Lubricate the camshaft roller follower with clean engine oil prior to installation.

   Using the special tool, compress the valve spring and install the camshaft roller follower.

6. Install the spark plug. For additional information, refer to Section 303-07 .

7. Depending on the valve being serviced, install the LH or RH valve cover. For additional information, refer to Valve Cover — LH or Valve Cover — RH in this section.

Hydraulic Lash Adjuster

Printable View (80 KB)

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Removal and Installation

1. Remove the camshafts. For additional information, refer to Camshaft — LH or Camshaft — RH in this section.

2. Remove the remaining camshaft roller followers from the cylinder head being serviced.

3. **CAUTION: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into the original locations.**

   Remove the hydraulic lash adjusters that are being serviced.

4. Inspect the hydraulic lash adjusters. For additional information, refer to Section 303-00 .

5. **NOTE:** Lubricate each of the hydraulic lash adjusters with clean engine oil prior to installation.

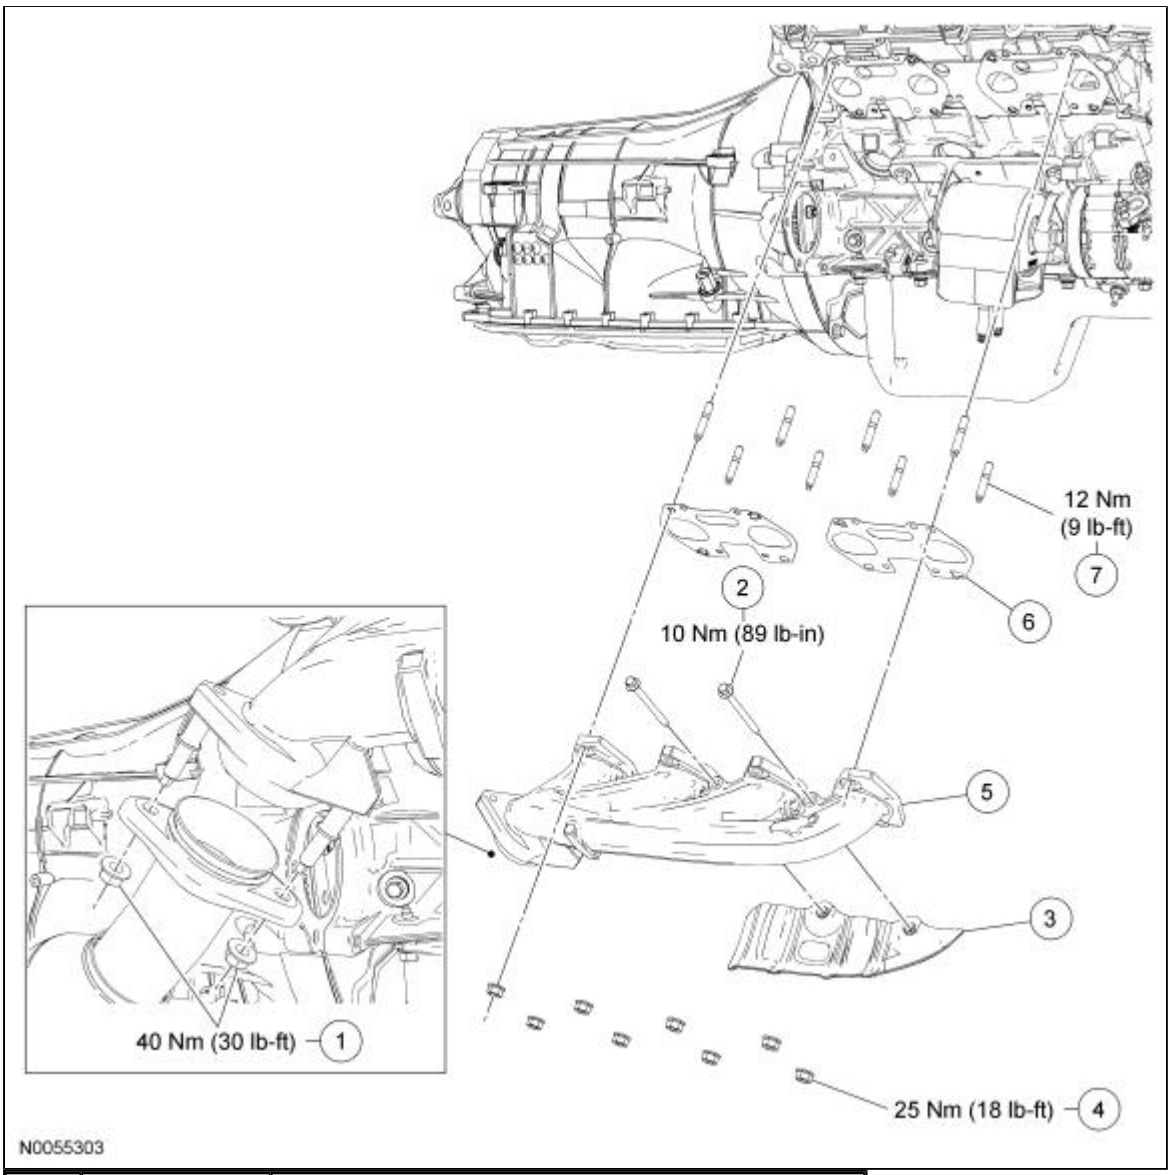
   To install, reverse the removal procedure.

Exhaust Manifold — RH

Printable View (256 KB)

Material

Item	Specification
Motorcraft Metal Surface Prep ZC-31	—



Item	Part Number	Description
1	W705443	Exhaust Y-pipe flange nuts (2 required)
2	—	Exhaust manifold heat shield bolt (2 required)
3	—	Exhaust manifold heat shield
4	W701706	Exhaust manifold nut (8 required)
5	9430	Exhaust manifold

6	9Y431	Exhaust manifold gasket (2 required)
7	W707747	Exhaust manifold stud (8 required)

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the RH inner fenderwell. For additional information, refer to Section 501-02 .

3. Remove the RH engine support insulator. For additional information, refer to Engine Support Insulators .

4. Remove the 2 bolts and the exhaust manifold heat shield.

5. Remove the 8 exhaust manifold nuts, studs and the exhaust manifold.
   - Discard the exhaust manifold nuts and studs.

6. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These may cause scratches and gouges resulting in leak paths. Use a plastic scraper to clean the sealing surfaces.**

   NOTE: Clean the sealing surfaces with metal surface prep. Follow the directions on the packaging.

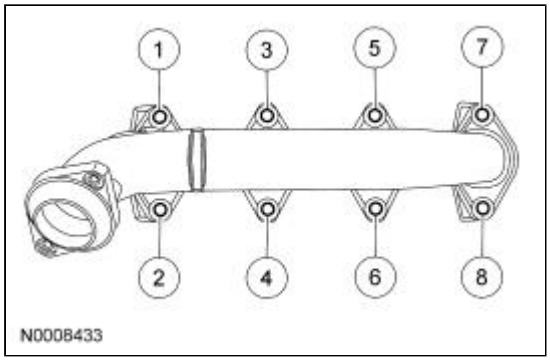
   Remove and discard the exhaust manifold gaskets. Clean the sealing surfaces with metal surface prep.

7. Inspect the exhaust manifold. For additional information, refer to Section 303-00 .

Installation

1. Using new exhaust manifold gaskets and studs, position the 2 gaskets and exhaust manifold and install the 8 studs.
   - Tighten to 12 Nm (9 lb-ft).

2. Using new exhaust manifold nuts, install the 8 nuts.
   - Tighten to 25 Nm (18 lb-ft) in the sequence shown.



3. Position the exhaust manifold heat shield and install the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).

4. Install the RH engine support insulator. For additional information, refer to Engine Support Insulators .

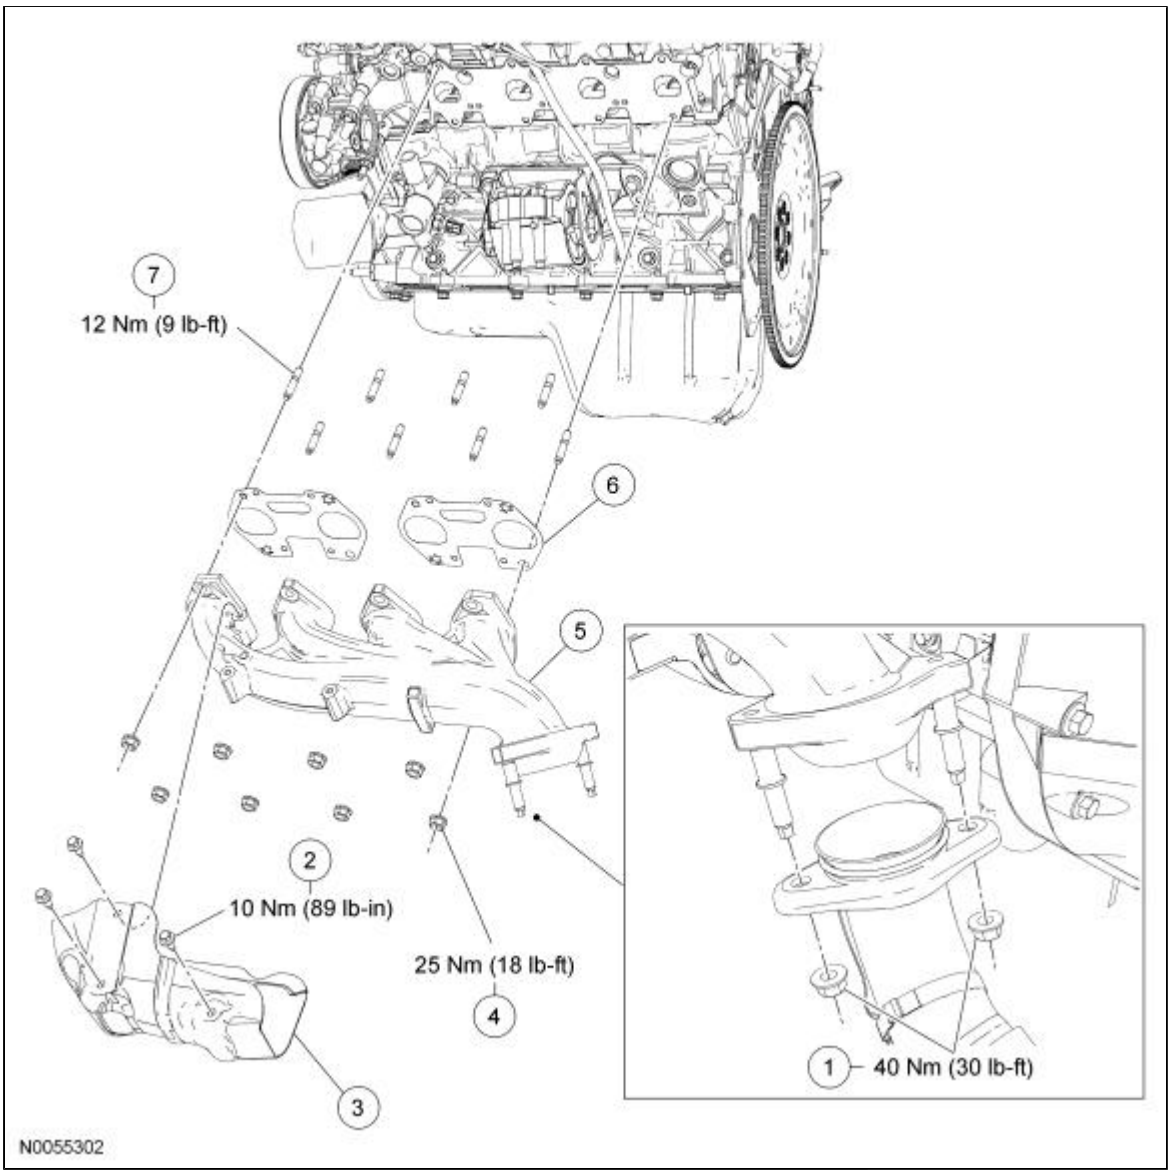
5. Install the RH inner fenderwell. For additional information, refer to Section 501-02 .

Exhaust Manifold — LH

Printable View (314 KB)

Material

Item	Specification
Motorcraft Metal Surface Prep ZC31	—



Item	Part Number	Description
1	W705443	Exhaust Y-pipe flange nuts (2 required)
2	W707130	Exhaust manifold heat shield bolt (3 required)
3	9Y427	Exhaust manifold heat shield
4	W701706	Exhaust manifold nut (8 required)
5	9431	Exhaust manifold

6	9Y431	Exhaust manifold gasket (2 required)
7	W707747	Exhaust manifold stud (8 required)

Removal

All vehicles

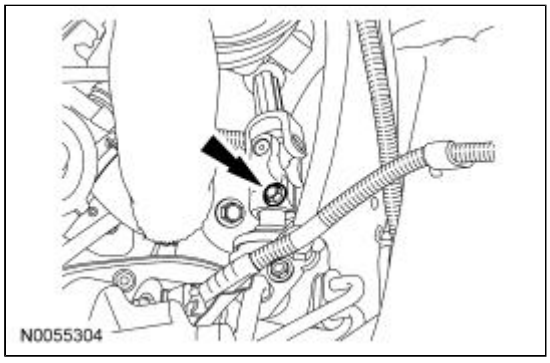
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the air cleaner outlet tube. For additional information, refer to Section 303-12 .

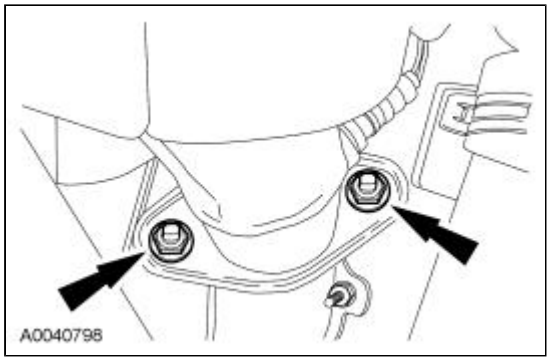
3. Remove the degas bottle. For additional information, refer to Section 303-03 .

4. **CAUTION: Do not allow the steering column shaft to rotate while the intermediate shaft is disconnected or damage to the clockspring can result. If there is evidence that the shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

   Remove the bolt and disconnect the steering shaft and position aside.



5. Remove the 4 (2 LH and 2 RH) exhaust manifold-to-catalytic converter nuts.



6. Remove the 3 bolts and the exhaust manifold heat shield.

Four wheel drive (4WD) vehicles

7. Remove the front driveshaft. For additional information, refer to Section 205-01 .

All vehicles

8. Remove the 8 exhaust manifold nuts, studs and the exhaust manifold.

- Discard the exhaust manifold nuts and studs.

9. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These may cause scratches and gouges resulting in leak paths. Use a plastic scraper to clean the sealing surfaces.**

   NOTE: Clean the sealing surfaces with metal surface prep. Follow the directions on the packaging.

   Remove and discard the exhaust manifold gaskets. Clean the sealing surfaces with metal surface prep.

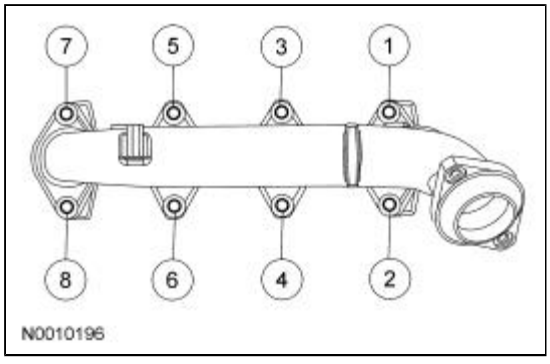
10. Inspect the exhaust manifold. For additional information, refer to Section 303-00 .

Installation

All vehicles

1. Using new exhaust manifold gaskets and studs, position the 2 gaskets and exhaust manifold and install the 8 studs.
   - Tighten to 12 Nm (9 lb-ft).

2. Using new exhaust manifold nuts, install the 8 nuts.
   - Tighten to 25 Nm (18 lb-ft) in the sequence shown.



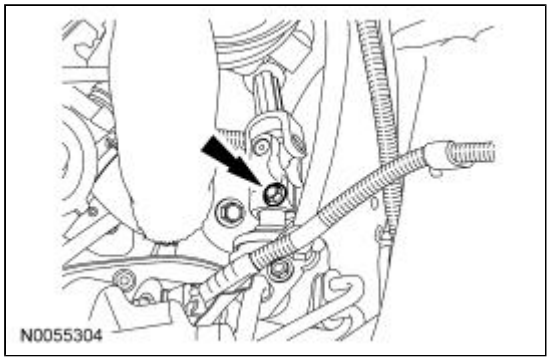
4WD vehicles

3. Install the front driveshaft. For additional information, refer to Section 205-01 .

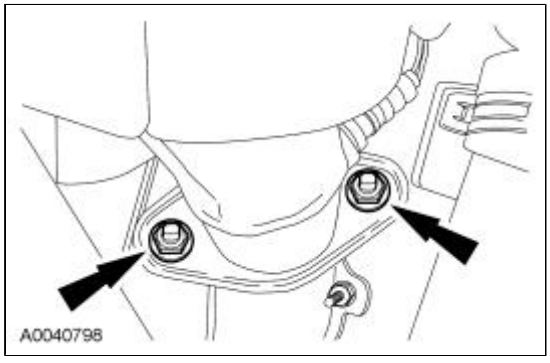
All vehicles

4. **CAUTION: Do not allow the steering column shaft to rotate while the intermediate shaft is disconnected or damage to the clockspring can result. If there is evidence that the shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

   Connect the steering shaft and install the bolt.
   - To install, tighten to 30 Nm (22 lb-ft).



5. Install the 4 exhaust manifold-to-catalytic converter nuts.



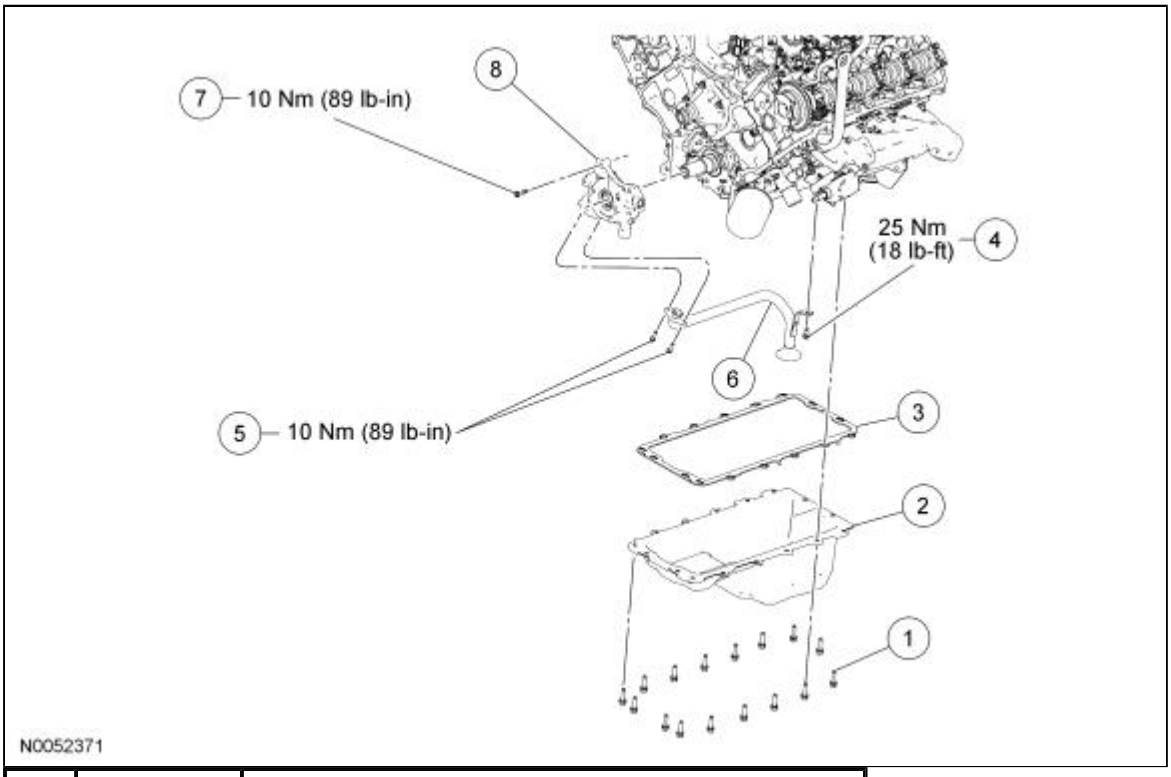
6. Position the exhaust manifold heat shield and install the 3 bolts.
    - To install, tighten to 10 Nm (89 lb-in).

7. Install the degas bottle. For additional information, refer to Section 303-03 .

8. Install the air cleaner outlet tube. For additional information, refer to Section 303-12 .

Engine Lubrication Components — Exploded View

Printable View (125 KB)



Item	Part Number	Description
1	W701605	Oil pan bolt (16 required)
2	6675	Oil pan
3	6710	Oil pan gasket
4	N605904	Oil pump screen and pickup tube-to-spacer bolt
5	N806155	Oil pump screen and pickup tube-to-oil pump bolts (2 required)
6	6622	Oil pump screen and pickup tube
7	N806183	Oil pump bolt (3 required)
8	6621	Oil pump

1. For additional information, refer to the procedures in this section.

Oil Pan

Printable View (429 KB)

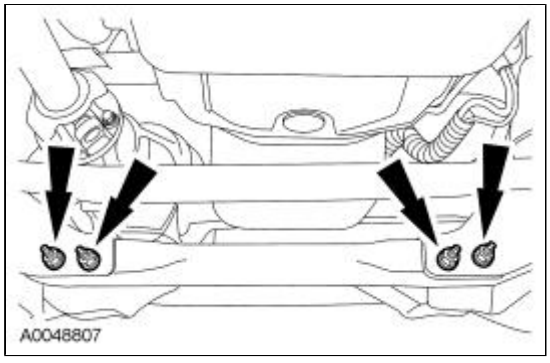
Material

Item	Specification
Motorcraft Metal Surface Prep ZC-31	—
Silicone Gasket Remover ZC-30	—
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

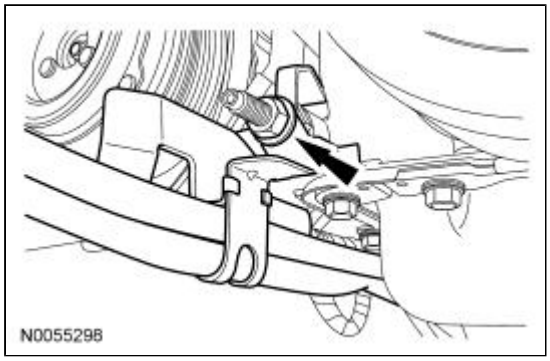
Removal

All vehicles

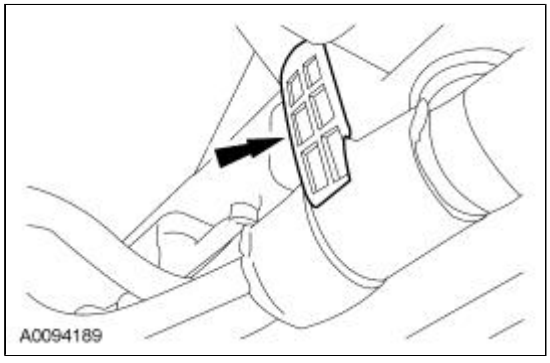
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Drain the engine oil.
3. Remove the 4 bolts and the frame crossmember.



4. Remove the nut and remove the starter wiring harness and transmission fluid cooler tube support brackets from the stud bolt.

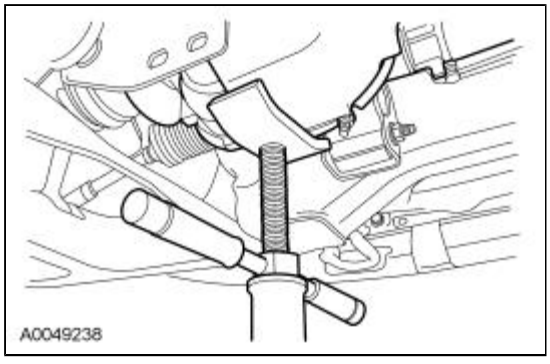


5. Disconnect the starter wiring harness retainer.



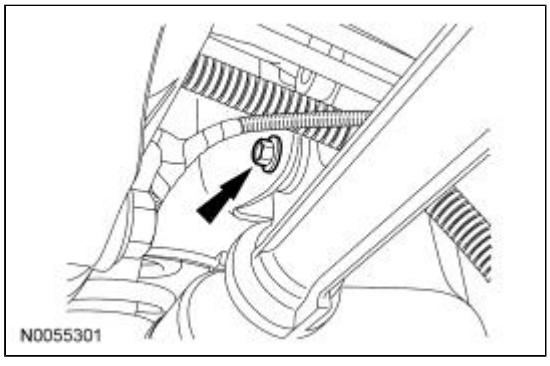
Four wheel drive (4WD) vehicles

6. Support the front axle housing with a jack stand.



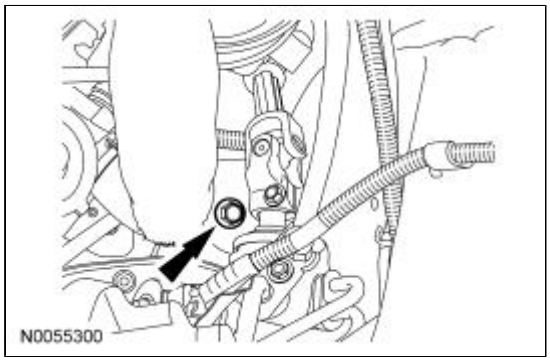
7. **NOTE:** Mark the bolt and bracket so that alignment can be maintained on installation.

   Remove the front axle housing RH mounting bolt.



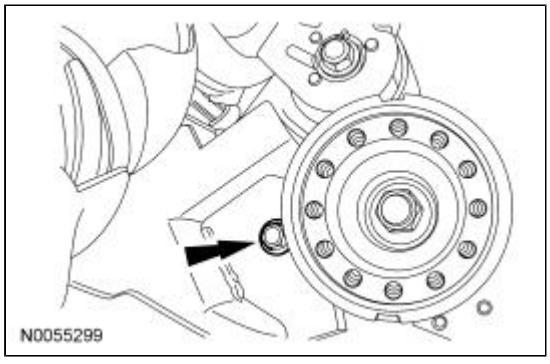
8. **NOTE:** Mark the bolt and bracket so that alignment can be maintained on installation.

   Remove the front axle housing LH front mounting bolt.



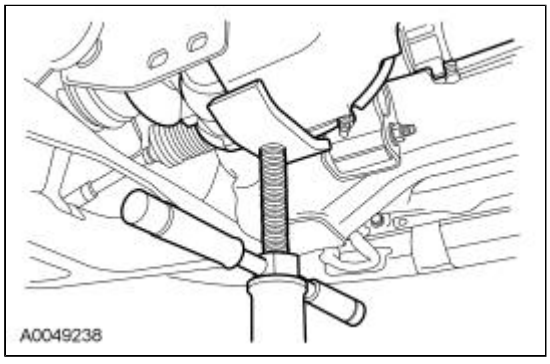
9. **NOTE:** Mark the bolt and bracket so that alignment can be maintained on installation.

   Remove the front axle housing LH rear mounting bolt.



10. **CAUTION: Use care when lowering the front axle housing, or the vacuum lines to the axle solenoid may become disconnected or damaged.**

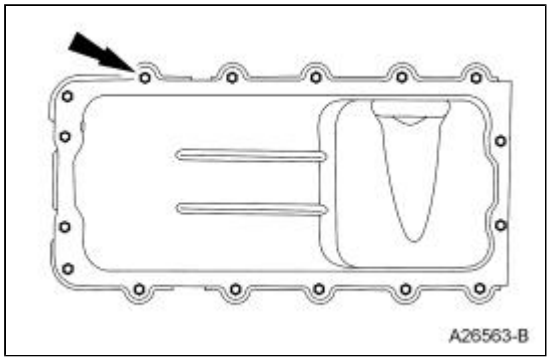
    Lower the axle to allow clearance for the oil pan to be removed.



All vehicles

11. **NOTE:** Be careful when removing the oil pan gasket. It is reusable.

    Remove the 16 bolts, the oil pan and the gaskets.
    - Inspect the oil pan gasket for damage.
    - If damaged, discard the oil pan gasket and the oil pan-to-oil pump gaskets.



Installation

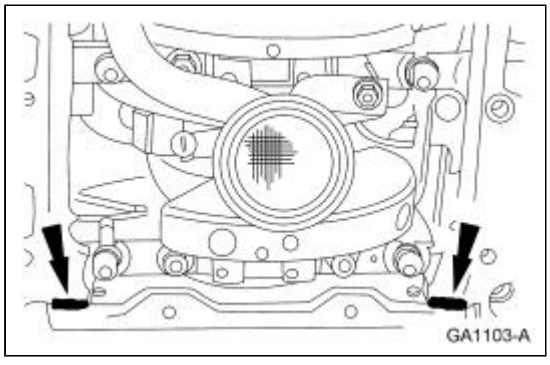
All vehicles

1. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

   Inspect the oil pan. Clean the mating surface for the oil pan with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

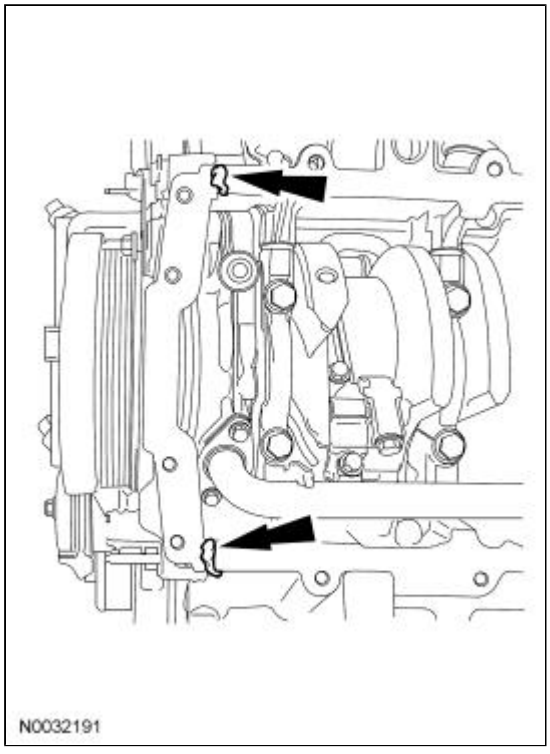
2. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

   Apply silicone gasket and sealant at the crankshaft rear seal retainer plate-to-cylinder block sealing surface.

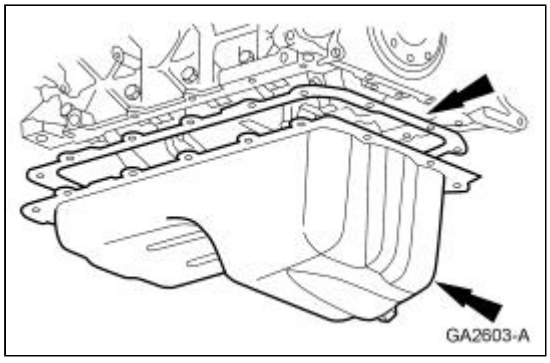


3. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

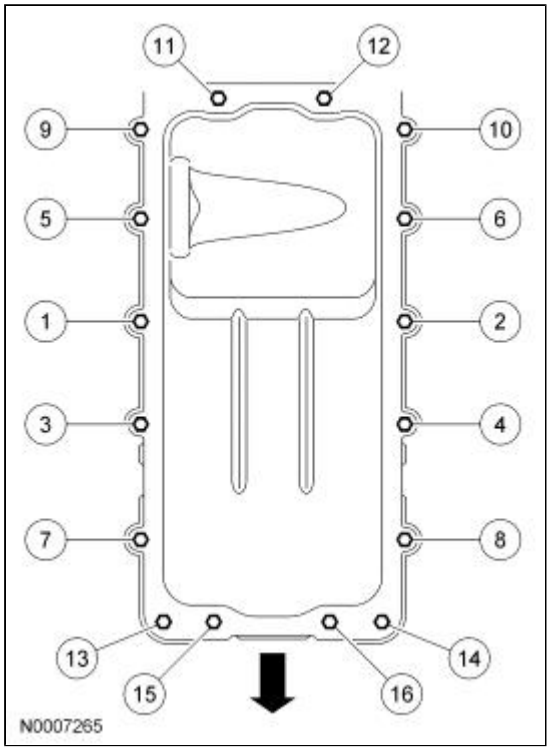
   Apply silicone gasket and sealant at the engine front cover-to-cylinder block sealing surface.



4. Install the oil pan gasket and the oil pan and loosely install the 16 bolts.



5. Tighten the bolts in 3 stages, in the sequence shown.
    - Stage 1: Tighten to 2 Nm (18 lb-in).
    - Stage 2: Tighten to 20 Nm (15 lb-ft).
    - Stage 3: Tighten an additional 60 degrees.

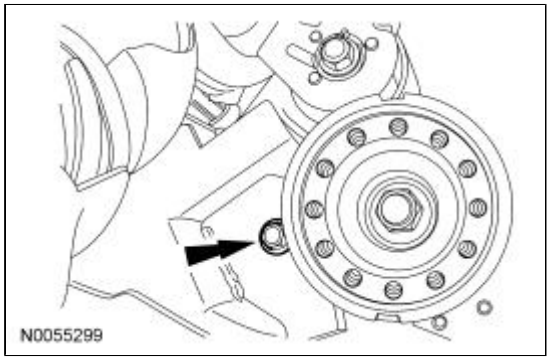


4WD vehicles

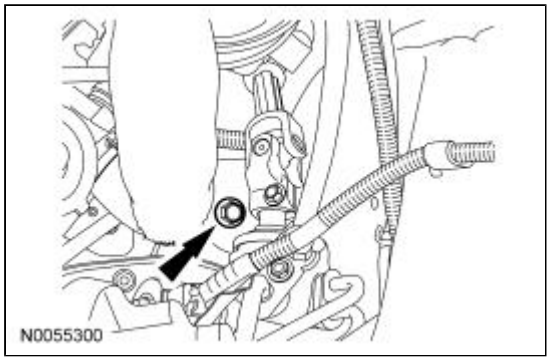
6. **CAUTION: Use care when positioning the front axle housing, or the vacuum lines to the axle solenoid may become disconnected or damaged.**

   Position the front axle housing and loosely install the 3 bolts, aligning the bolt location marks made during removal.

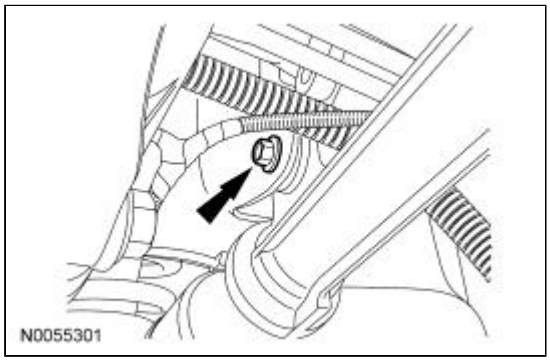
7. Install the front axle housing RH mounting bolt.
   - Tighten to 89 Nm (66 lb-ft).



8. Install the front axle housing LH front mounting bolt.
   - Tighten to 89 Nm (66 lb-ft).

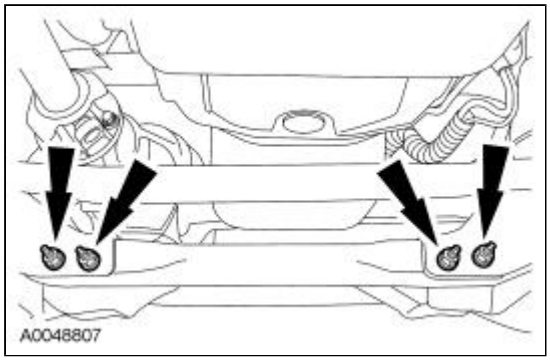


9. Install the front axle housing LH rear mounting bolt.
    - Tighten to 89 Nm (66 lb-ft).

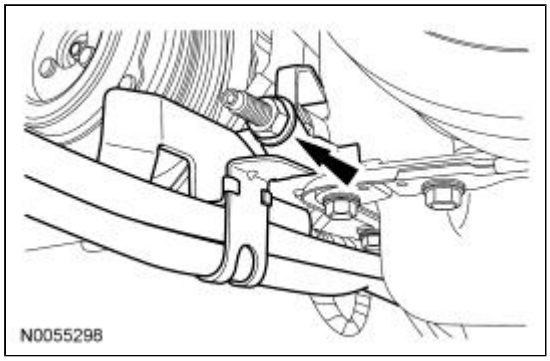


All vehicles

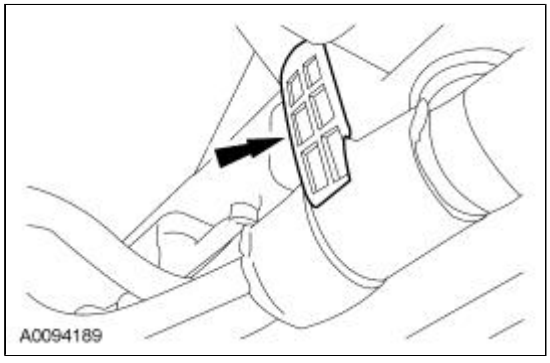
10. Position the frame crossmember and the 4 bolts.
    - Tighten to 102 Nm (75 lb-ft).



11. Position the starter wiring harness and transmission fluid cooler tube support brackets and install the nut.
    - Tighten to 10 Nm (89 lb-in).



12. Connect the starter wiring harness retainer to the cylinder block.



13. Fill the crankcase with clean engine oil.

Oil Pump

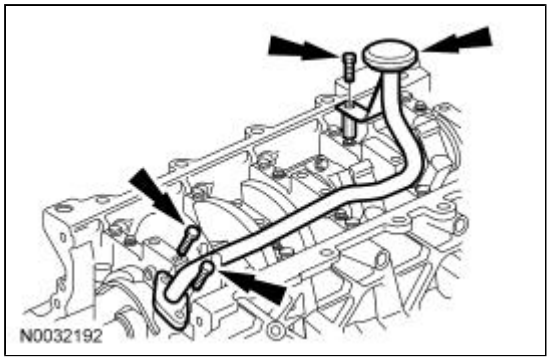
Printable View (141 KB)

Material

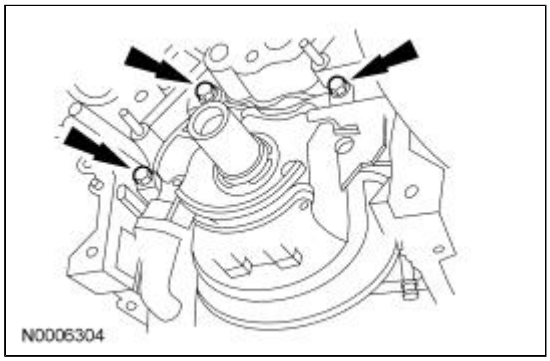
Item	Specification
Motorcraft Metal Surface Prep ZC-31	—
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Removal

1. Remove the timing drive components. For additional information, refer to Timing Drive Components in this section.
2. Remove the oil pan. For additional information, refer to Oil Pan in this section.
3. Remove the 3 bolts and the oil pump screen and pickup tube.



4. Remove the 3 bolts and the oil pump.

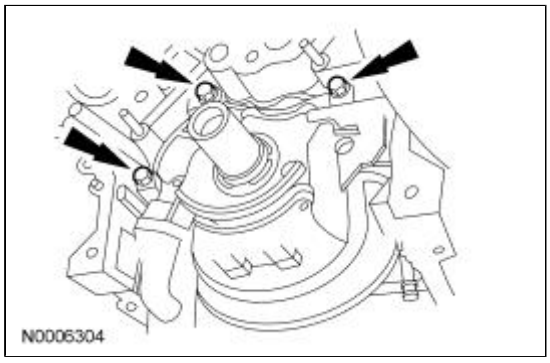


Installation

1. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

   Clean the sealing surfaces with metal surface prep. Follow the directions on the packaging. Inspect the mating surfaces.

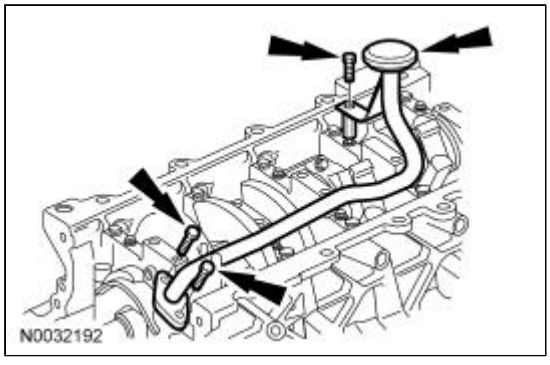
2. Position the oil pump and install the bolts.
   - Tighten to 10 Nm (89 lb-in).



3. **CAUTION: Make sure the O-ring is in place and not damaged. A missing or damaged O-ring can cause foam in the lubrication system, low oil pressure and severe engine damage.**

   NOTE: Clean and inspect the mating surfaces and install a new O-ring. Lubricate the O-ring with clean engine oil prior to installation.

   Position the oil pump screen and pickup tube and install the 3 bolts.
   - Tighten the oil pump screen and pickup tube-to-oil pump bolts to 10 Nm (89 lb-in).
   - Tighten the oil pump screen and pickup tube-to-spacer bolt to 25 Nm (18 lb-ft).



4. Install the oil pan. For additional information, refer to Oil Pan in this section.

5. Install the timing drive components. For additional information, refer to Timing Drive Components in this section.

Oil Pump Screen and Pickup Tube

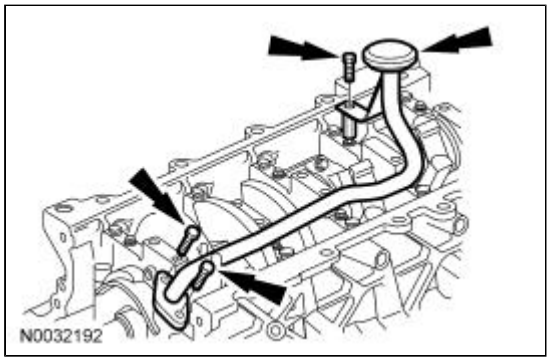
Printable View (112 KB)

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Removal

1. Remove the oil pan. For additional information, refer to Oil Pan in this section.
2. Remove the 3 bolts and the oil pump screen and pickup tube.

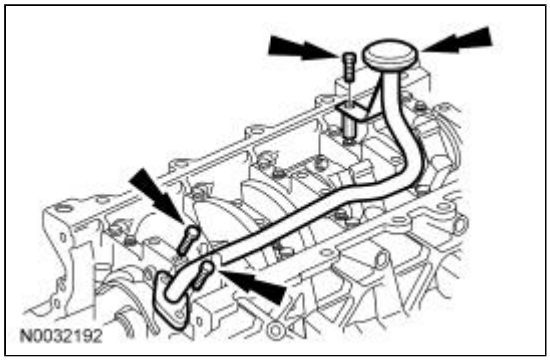


Installation

1. **CAUTION: Make sure the O-ring is in place and not damaged. A missing or damaged O-ring can cause foam in the lubrication system, low oil pressure and severe engine damage.**

   NOTE: Clean and inspect the mating surfaces and install a new O-ring. Lubricate the O-ring with clean engine oil prior to installation.

   Position the oil pump screen and pickup tube and install the bolts.
   - Tighten the oil pump screen and pickup tube-to-oil pump bolts to 10 Nm (89 lb-in).
   - Tighten the oil pump screen and pickup tube-to-spacer bolt to 25 Nm (18 lb-ft).



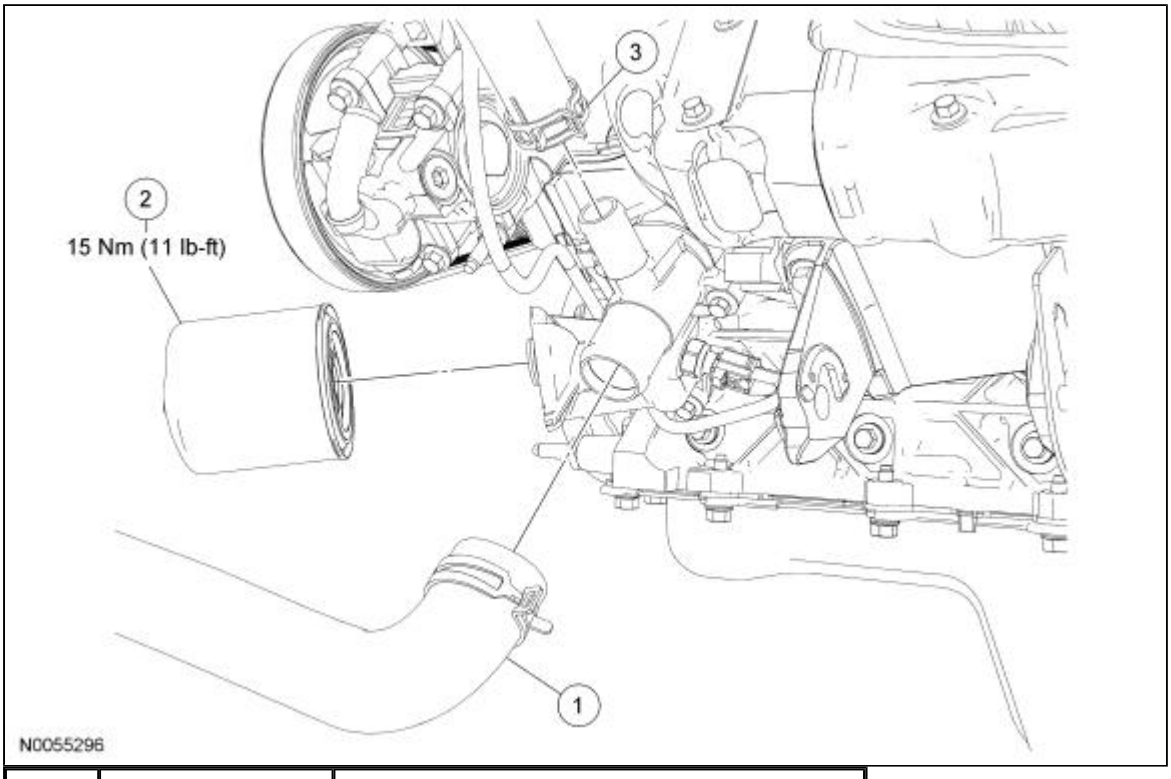
2. Install the oil pan. For additional information, refer to Oil Pan in this section.

Oil Filter Adapter

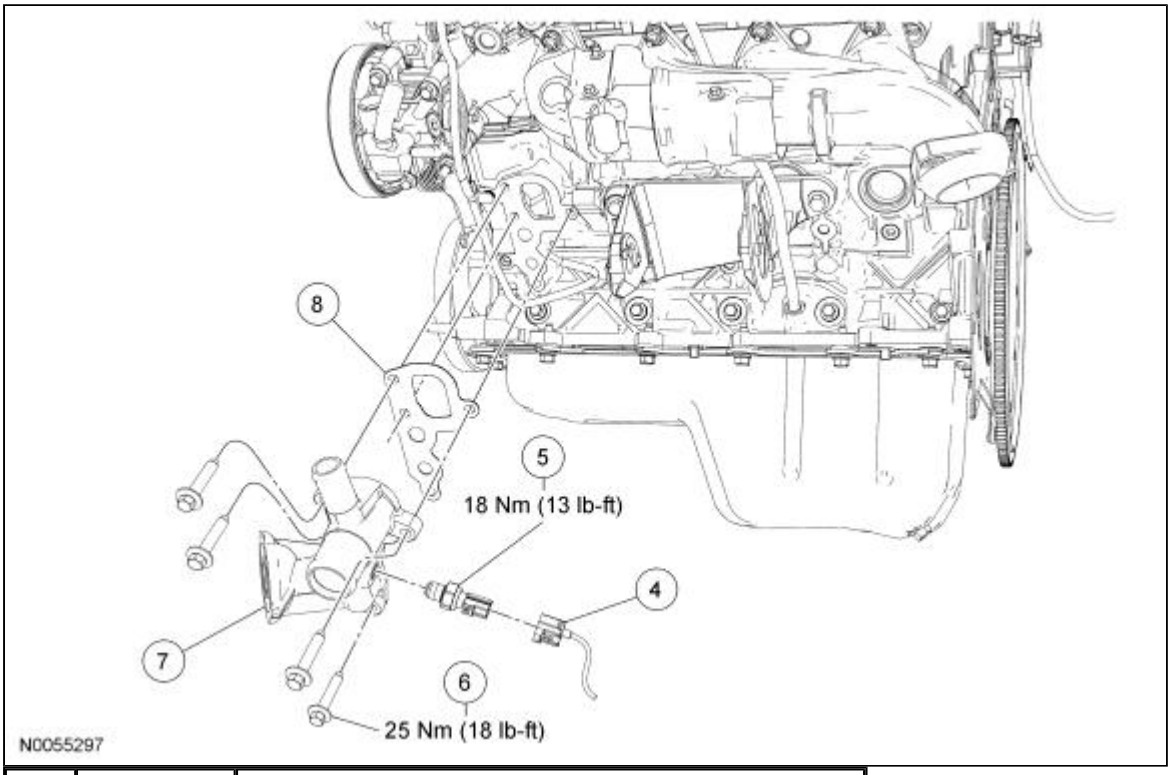
Printable View (309 KB)

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A
Motorcraft Metal Surface Prep ZC-31	—
Silicone Gasket Remover ZC-30	—



Item	Part Number	Description
1	8B273	Lower radiator hose
2	6714	Oil filter
3	8C351	Lower degas bottle coolant hose



Item	Part Number	Description
4	—	Engine oil pressure (EOP) switch electrical connector (part of 12B637)
5	9278	EOP switch
6	N806156	Oil filter adapter bolt (4 required)
7	6881	Oil filter adapter
8	6A636	Oil filter adapter gasket

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Drain the engine cooling system. For additional information, refer to Section 303-03 .

3. Disconnect the lower radiator hose from the oil filter adapter and position it aside.

4. Disconnect the degas bottle coolant hose from the oil filter adapter and position it aside.

5. Remove and discard the engine oil filter.
   - To install, tighten to 15 Nm (11 lb-ft).

6. Disconnect the engine oil pressure (EOP) switch electrical connector.

7. Remove the EOP switch.
   - To install, tighten to 18 Nm (13 lb-ft).

8. Remove the 4 bolts and the oil filter adapter.
   - To install, tighten to 25 Nm (18 lb-ft).

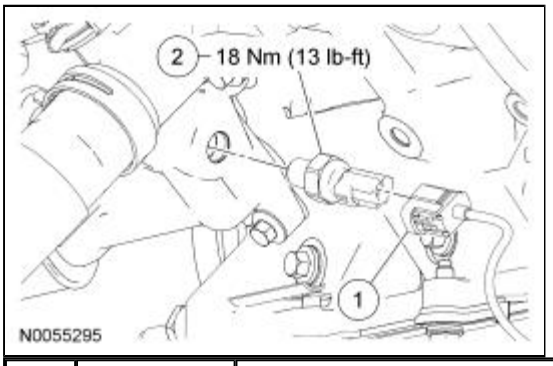
9. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These may cause scratches and gouges resulting in leak paths. Use a plastic scraper to clean the sealing surfaces.**

   Remove and discard the oil filter adapter gasket. Clean the sealing surfaces with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Inspect the mating surfaces.

10. To install, reverse the removal procedure.
    - Install a new oil filter.
    - Check the engine oil level and fill as necessary with clean engine oil.

Engine Oil Pressure (EOP) Switch

Printable View (94 KB)



Item	Part Number	Description
1	—	Engine oil pressure (EOP) switch electrical connector (part 12B637)
2	9278	EOP switch

Removal and Installation

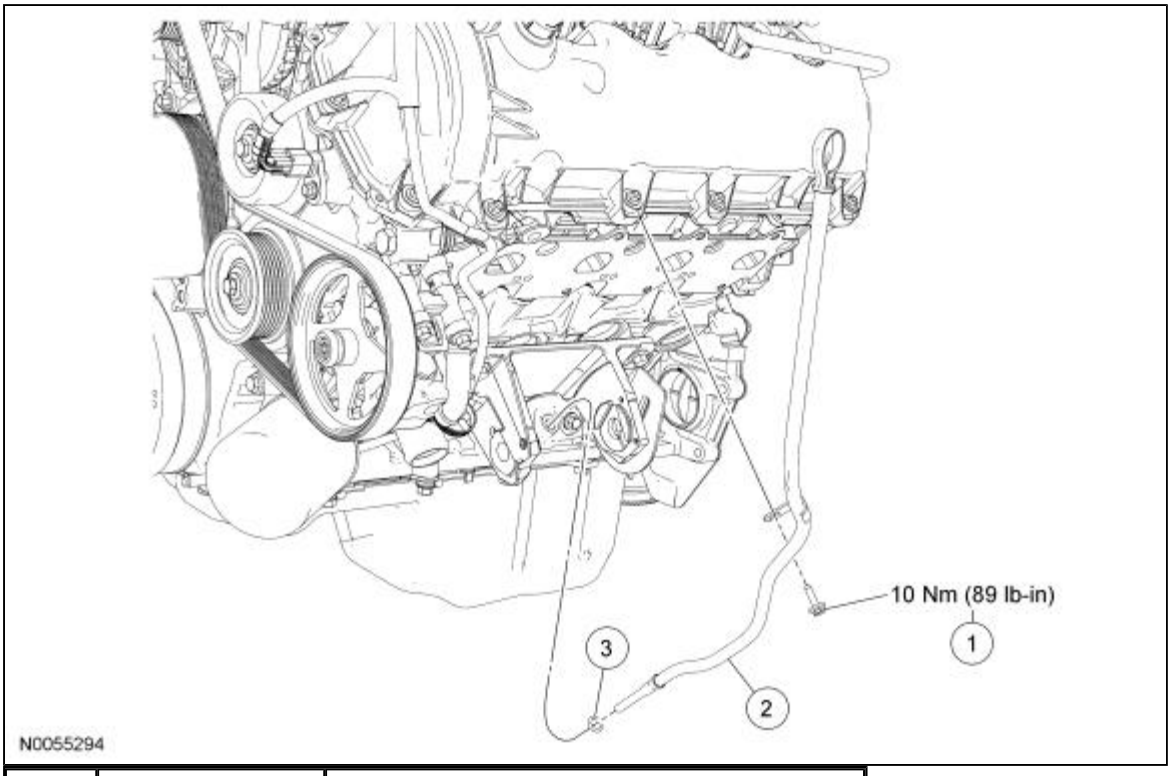
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the engine oil pressure (EOP) switch electrical connector.
   - To install, tighten to 18 Nm (13 lb-ft).
3. Remove the EOP switch.
   - To install, tighten to 18 Nm (13 lb-ft).
4. To install, reverse the removal procedure.

Oil Level Indicator and Tube

Printable View (205 KB)

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A



Item	Part Number	Description
1	N605892	Oil level indicator and tube bolt
2	6K873	Oil level indicator and tube
3	—	Oil level indicator tube O-ring seal

Removal and Installation

1. Remove the LH exhaust manifold. For additional information, refer to Exhaust Manifold — LH in this section.

2. Remove the oil level indicator and tube bolt.
   - To install, tighten to 10 Nm (89 lb-in).

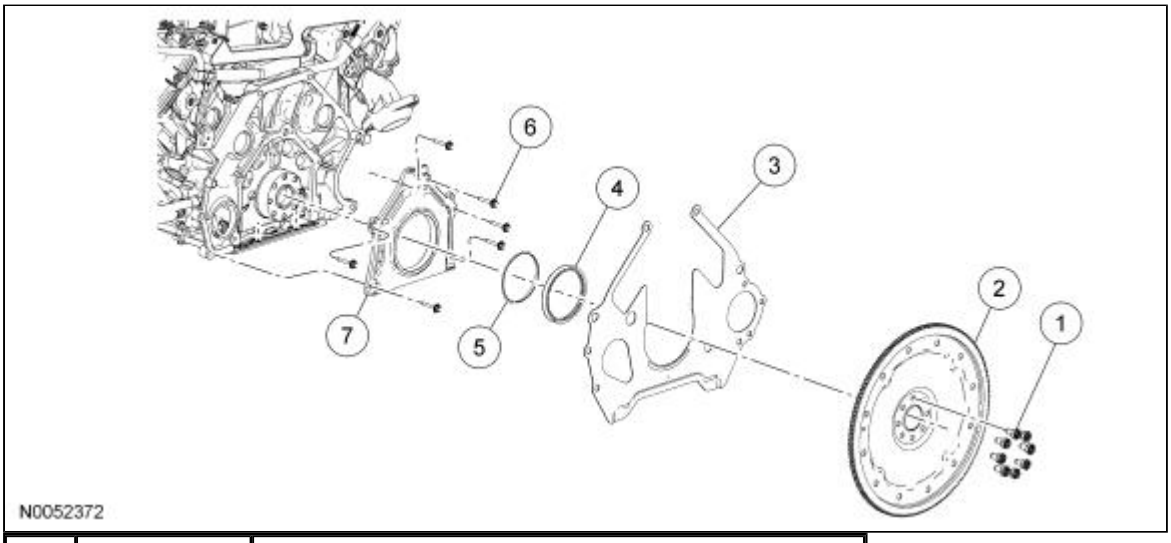
3. Remove the oil level indicator and tube from the cylinder block.
   - Discard the O-ring seal.

4. **NOTE:** Lubricate the new oil level indicator tube O-ring seal with clean engine oil prior to installation.

   To install, reverse the removal procedure.
   - Install a new O-ring seal.

Flexplate or Flywheel and Crankshaft Rear Seal — Exploded View

Printable
View (128 KB)



Item	Part Number	Description
1	N806168	Flexplate bolt (8 required)
2	6375	Flexplate
3	6A373	Rear cover plate
4	6310	Crankshaft oil slinger
5	6701	Crankshaft rear seal
6	N806155	Crankshaft rear seal retainer plate bolt (6 required)
7	6K318	Crankshaft rear seal retainer plate

1. For additional information, refer to the procedures in this section.

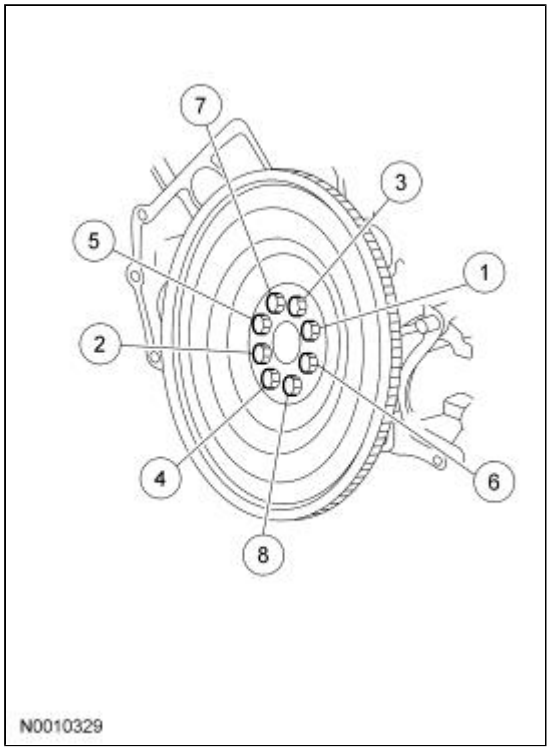
Flexplate

Printable View (97 KB)

Removal and Installation

1. Remove the transmission. For additional information, refer to Section 307-01A or Section 307-01B .

2. Remove the 8 bolts and the flexplate.
   - To install, tighten to 80 Nm (59 lb-ft) in the sequence shown.



3. To install, reverse the removal procedure.

Crankshaft Rear Seal

Printable View (208 KB)

Special Tool(s)

ST1480-A	Installer, Crankshaft Rear Seal 303-518 (T95P-6701-DH)
 ST1382-A	Remover, Crankshaft Rear Seal 303-519 (T95P-6701-EH)
 ST1479-A	Installer, Crankshaft Rear Seal 303-516 (T95P-6701-BH)
ST1481-A	Remover, Crankshaft Rear Oil Slinger 303-514 (T95P-6701-AH)
ST1482-A	Installer, Crankshaft Rear Oil Slinger 303-517 (T95P-6701-CH)
ST1185-A	Impact Slide Hammer 100-001 (T50T-100-A)

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada);	WSS-M2C930-A

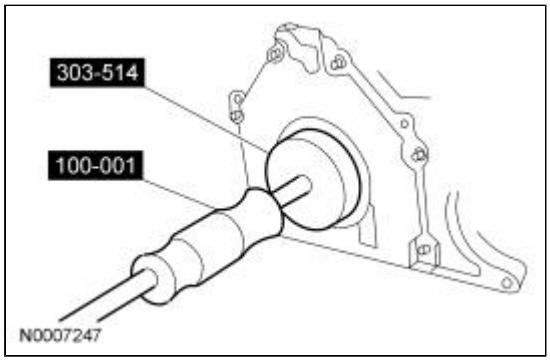
or equivalent	

Removal

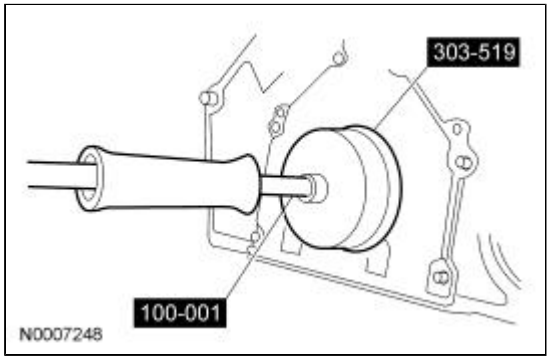
1. Remove the transmission. For additional information, refer to Section 307-01A or Section 307-01B .

2. Remove the 8 bolts and the flexplate.

3. Using the special tools, remove the crankshaft oil slinger.
   - Discard the crankshaft oil slinger.



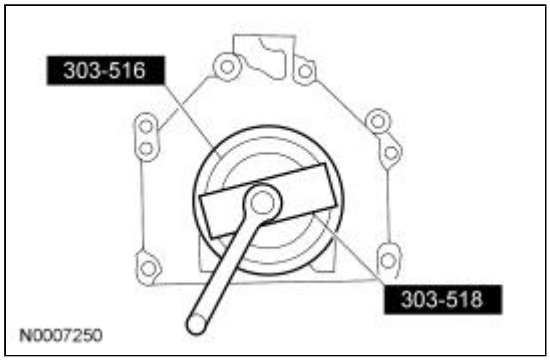
4. Using the special tools, remove the crankshaft rear seal.
   - Discard the crankshaft rear seal.



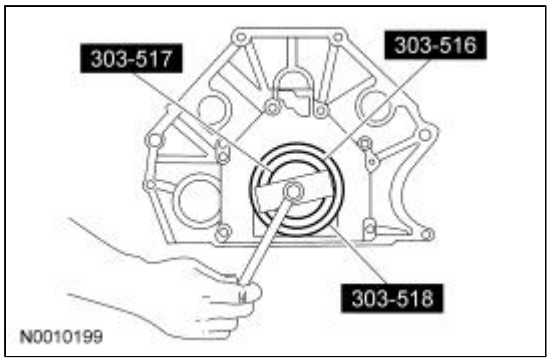
Installation

1. **NOTE:** Lubricate the inner lip of the crankshaft rear seal with clean engine oil.

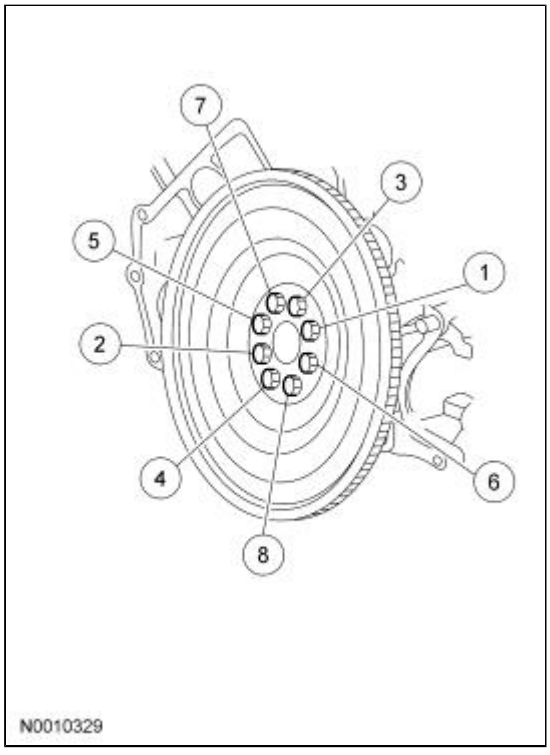
   Using the special tools, install a new crankshaft rear seal.



2. Using the special tools, install a new crankshaft rear oil slinger.



3. Install the flexplate and tighten the 8 bolts in the sequence shown.
    - Tighten to 80 Nm (59 lb-ft).



4. Install the transmission. For additional information, refer to Section 307-01A or Section 307-01B .

Crankshaft Rear Seal with Retainer Plate

Printable View (253 KB)

Special Tool(s)

ST1480-A	Installer, Crankshaft Rear Seal 303-518 (T95P-6701-DH)
 ST1382-A	Remover, Crankshaft Rear Seal 303-519 (T95P-6701-EH)
 ST1479-A	Installer, Crankshaft Rear Seal 303-516 (T95P-6701-BH)
ST1481-A	Remover, Crankshaft Rear Oil Slinger 303-514 (T95P-6701-AH)
ST1482-A	Installer, Crankshaft Rear Oil Slinger 303-517 (T95P-6701-CH)
ST1185-A	Impact Slide Hammer 100-001 (T50T-100-A)

Material

Item	Specification
Motorcraft Metal Surface Prep ZC-31	—
Silicone Gasket Remover ZC-30	—

Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

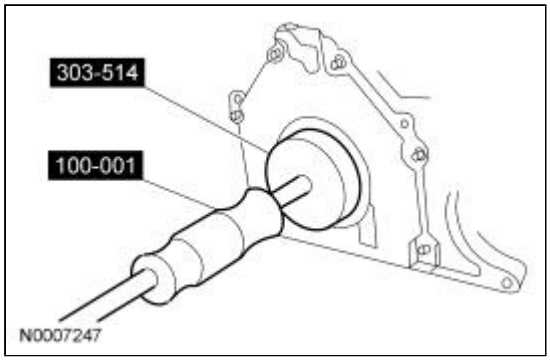
Removal

1. Remove the transmission. For additional information, refer to Section 307-01A or Section 307-01B .

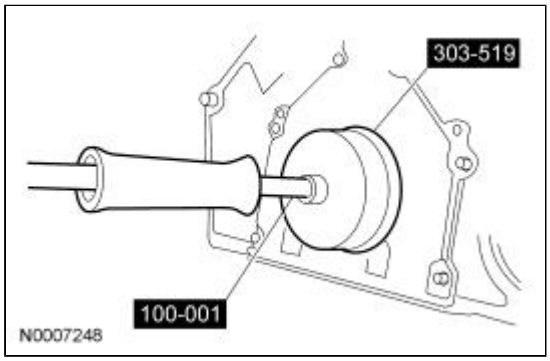
2. Remove the oil pan. For additional information, refer to Oil Pan in this section.

3. Remove the 8 bolts and the flexplate.

4. Using the special tools, remove the crankshaft oil slinger.
   - Discard the crankshaft oil slinger.



5. Using the special tools, remove the crankshaft rear seal.
   - Discard the crankshaft rear seal.



6. Remove the 6 bolts and the crankshaft rear seal retainer plate.

Installation

1. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

   NOTE: Clean the sealing surfaces with silicone gasket remover and metal surface prep. Follow

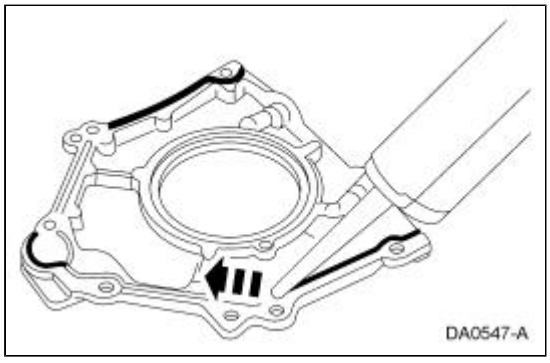
the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

Clean and inspect the mating surface.

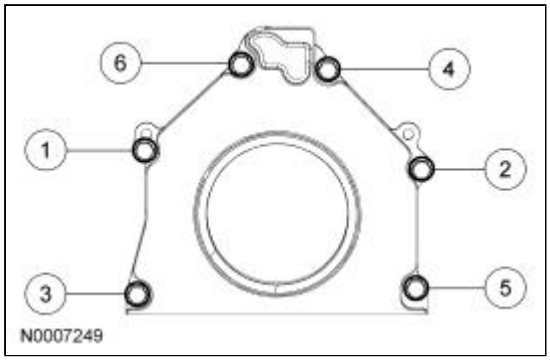
2. **NOTE:** If the rear crankshaft seal retaining plate is not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leaks.

   NOTE: The silicone must be applied on the groove along the retainer plate.

   Apply a 4.06 mm (0.16 in) bead of silicone gasket and sealant around the crankshaft rear seal retainer plate sealing surface.

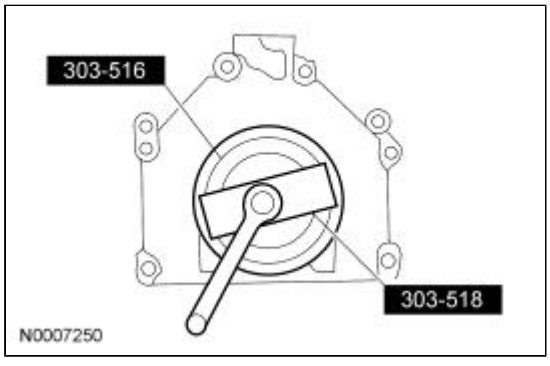


3. Install the crankshaft rear seal retainer plate and the 6 bolts in the sequence shown.
   - Tighten to 10 Nm (89 lb-in).

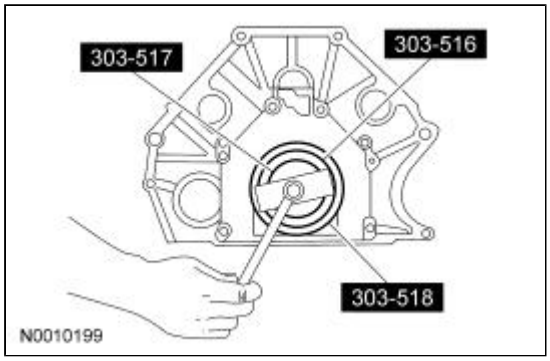


4. **NOTE:** Lubricate the inner lip of the crankshaft rear seal with clean engine oil.

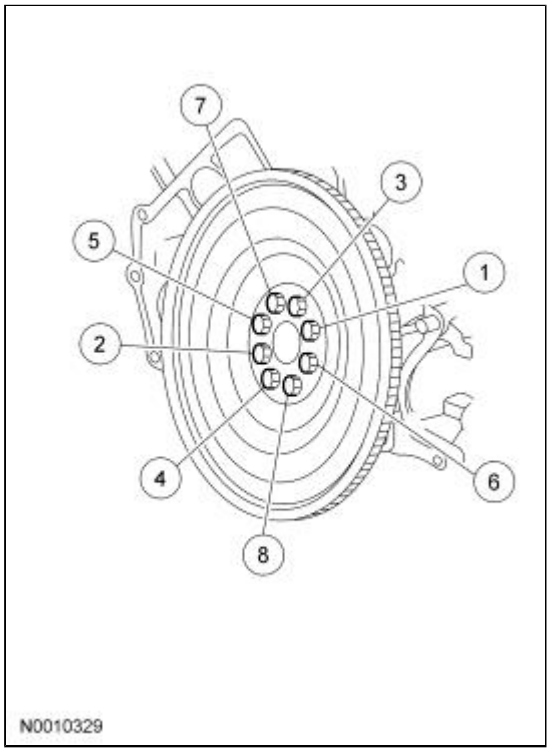
   Using the special tools, install a new crankshaft rear seal.



5. Using the special tools, install a new crankshaft rear oil slinger.



6. Install the flexplate and tighten the 8 bolts in the sequence shown.
    - Tighten to 80 Nm (59 lb-ft).



7. Install the oil pan. For additional information, refer to Oil Pan in this section.

8. Install the transmission. For additional information, refer to Section 307-01A or Section 307-01B .

Engine Support Insulators

Printable View (543 KB)

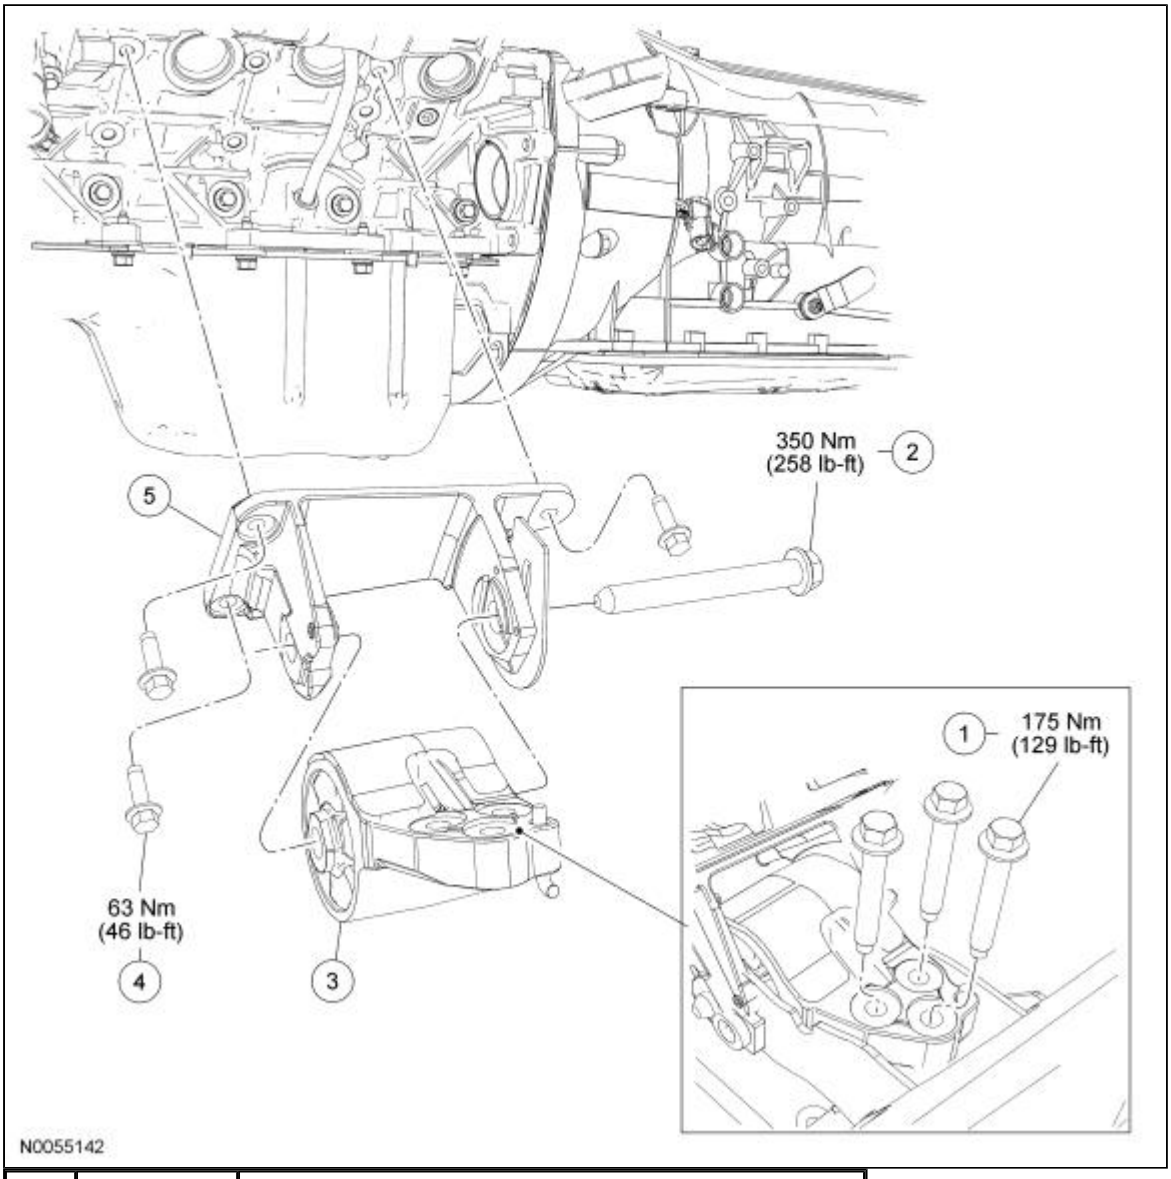
Special Tool(s)

ST2176-B	Engine Support Bar, Heavy Duty 303-F070
ST2970-A	Support Hook 303-F071
ST2592-A	Engine Support Bracket 303-639

Material

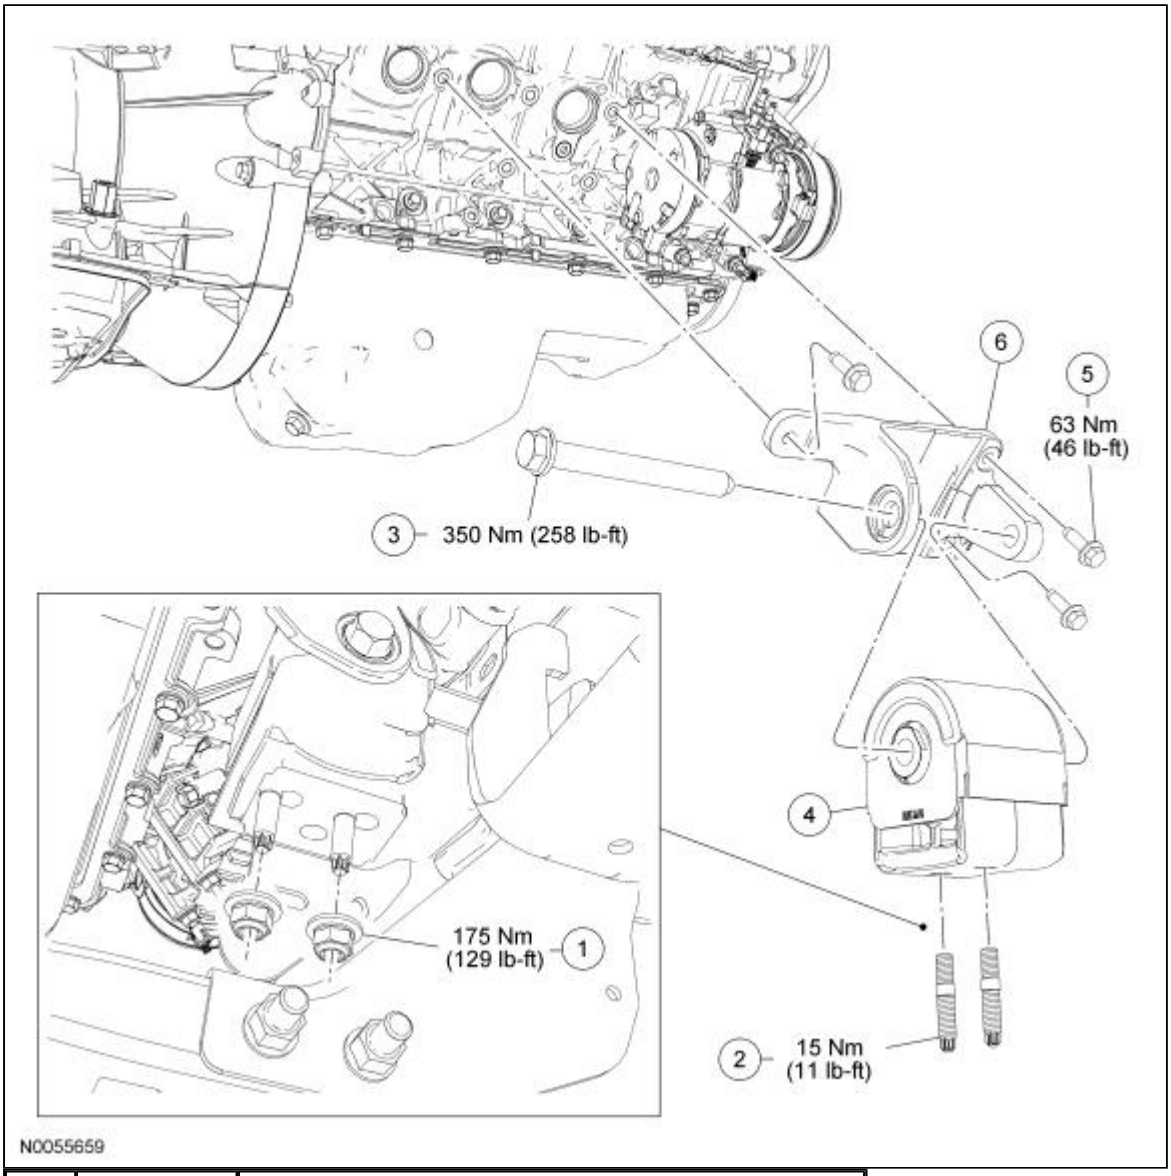
Item	Specification
Threadlock 262 TA-26	WSK-M2G351-A6

LH Engine Support Insulator



Item	Part Number	Description
1	W712805	LH engine support insulator-to-frame bolt (3 required)
2	W711142	LH engine support insulator through bolt
3	6B032	LH engine support insulator
4	W711141	LH engine support insulator-to-cylinder block bracket bolt (3 required)
5	6061	LH engine support insulator-to-cylinder block bracket

RH Engine Support Insulator



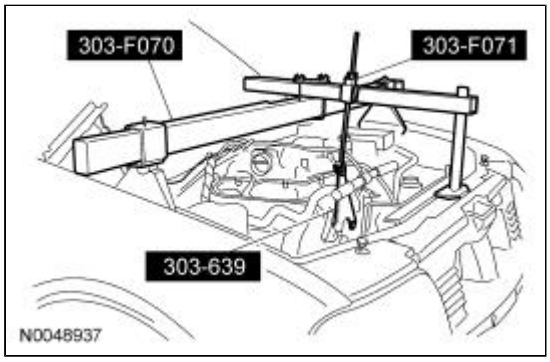
Item	Part Number	Description
1	W707251	RH engine support insulator-to-frame nut (2 required)
2	W711144	RH engine support insulator-to-frame stud bolt (2 required)
3	W711142	RH engine support insulator through bolt
4	6H028	RH engine support insulator
5	W711141	RH engine support insulator-to-cylinder block bracket bolt (3 required)
6	—	RH engine support insulator-to-cylinder block bracket

Removal

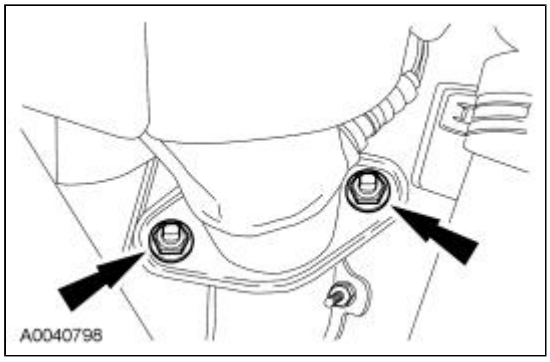
All engine support insulators

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Remove the throttle body (TB). For additional information, refer to Section 303-04 .
4. Remove the cooling fan. For additional information, refer to Section 303-03 .
5. Remove the generator. For additional information, refer to Section 414-02 .
6. Remove the starter. For additional information, refer to Section 303-06 .
7. If servicing the engine support insulators on a four wheel drive (4WD) vehicle, remove the front drive shaft. For additional information, refer to Section 205-01 .
8. Install the special tools.

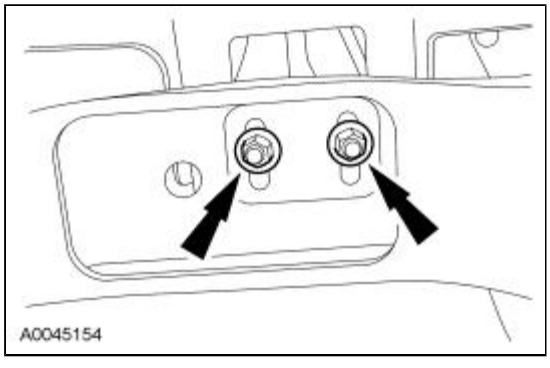


9. Remove the 4 exhaust manifold-to-catalytic converter nuts.



10. **CAUTION: Only use hand tools when removing the transmission mount-to-crossmember nuts or damage to the transmission mount can occur.**

    Loosen the transmission mount-to-crossmember nuts.



RH engine support insulator

11. **CAUTION: Only use hand tools when loosening the engine support insulator through bolts or damage to the engine support insulator-to-cylinder block bracket can occur.**

    Loosen the LH engine support insulator through bolt.

12. **CAUTION: Only use hand tools when removing the engine support insulator through bolts or damage to the engine support insulator-to-cylinder block bracket can occur.**

    Remove the RH engine support insulator through bolt.

13. **CAUTION: Only use hand tools when removing the engine support insulator nuts or damage to the engine support insulator can occur.**

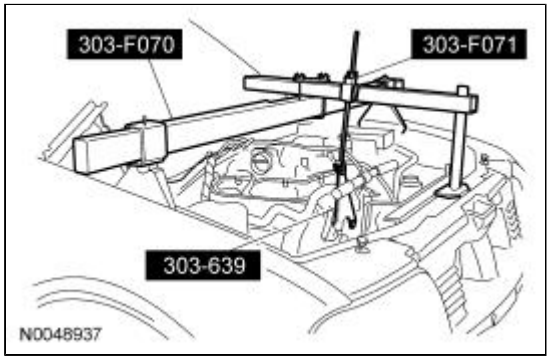
    NOTE: If during nut removal the stud bolt is extracted from the engine support insulator, separate the nut from the stud bolt prior to stud bolt installation.

    Remove the 2 RH engine support insulator nuts.

14. **CAUTION: Only use hand tools when removing the engine support insulator stud bolts or damage to the engine support insulator can occur.**

    Remove the 2 RH engine support insulator stud bolts.

15. Using the special tools, raise the engine.



16. Remove the 3 bolts and the RH engine support insulator-to-cylinder block bracket.

17. Remove the RH engine support insulator.

LH engine support insulator

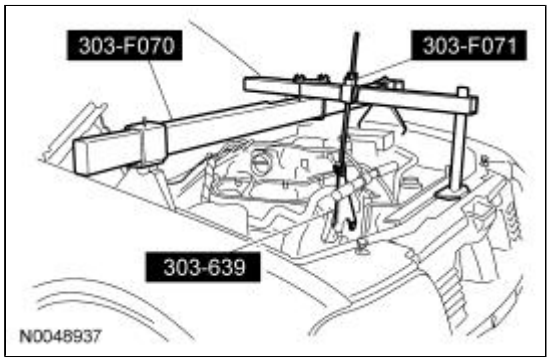
18. **CAUTION: Only use hand tools when loosening the engine support insulator through bolts or damage to the engine support insulator-to-cylinder block bracket can occur.**

    Loosen the RH engine support insulator through bolt.

19. **CAUTION: Only use hand tools when removing the engine support insulator through bolts or damage to the engine support insulator-to-cylinder block bracket can occur.**

Remove the LH engine support insulator through bolt.

20. Using the special tools, raise the engine.



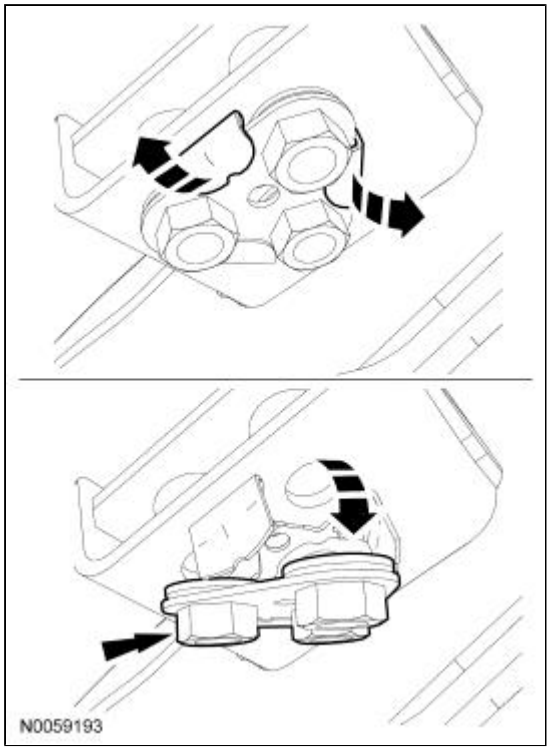
21. **CAUTION: Only use hand tools when removing the engine support insulator-to-frame bolts or damage to the engine support insulator-to-frame nut plate can occur.**

Remove the 3 engine support insulator-to-frame bolts.
- Discard the 3 bolts.

22. Remove the 3 bolts and the LH engine support insulator-to-cylinder block bracket.

23. Remove the LH engine support insulator.

24. Inspect the engine support insulator-to-frame nut plate for thread damage. If the nut plate is damaged, bend 2 tabs back and remove the nut plate. Replace the nut plate with service part number 56190 and bend the 2 tabs back to the original position.



Installation

RH engine support insulator

1. Clean the engine support insulator-to-cylinder block and engine support insulator-to-frame mating surfaces of any dirt or foreign material prior to installation.

2. **CAUTION: Only use hand tools when installing the engine support insulator stud bolts or damage to the engine support insulator can occur.**

   Position the RH engine support insulator into the vehicle and install the 2 stud bolts.
   - Tighten to 15 Nm (11 lb-ft).

3. Position the RH engine support insulator-to-cylinder block bracket and install the 3 bolts.
   - Tighten to 63 Nm (46 lb-ft).

4. **CAUTION: Only use hand tools when installing the RH engine support insulator nuts or damage to the engine support insulator can occur.**

   Install the 2 RH engine support insulator nuts.
   - Tighten to 175 Nm (129 lb-ft).

LH engine support insulator

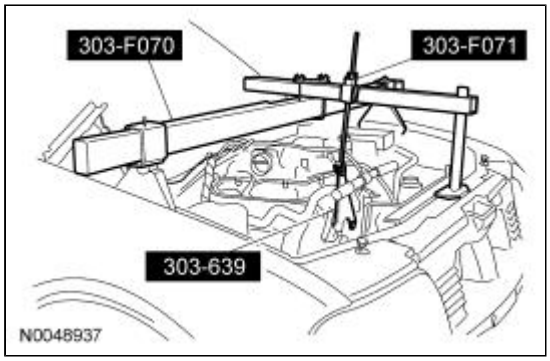
5. Clean the engine support insulator-to-cylinder block and engine support insulator-to-frame mating surfaces of any dirt or foreign material prior to installation.

6. Position the LH engine support insulator and hand start the 3 new engine support insulator-to-frame bolts.
   - Tighten to 175 Nm (129 lb-ft).

7. Position the LH engine support insulator-to-cylinder block bracket and install the 3 bolts.
   - Tighten to 63 Nm (46 lb-ft).

All engine support insulator

8. Using the special tools, lower the engine into position.



9. **CAUTION: Only use hand tools when installing the engine support insulator through bolt or damage to the engine support insulator-to-cylinder block bracket can occur.**

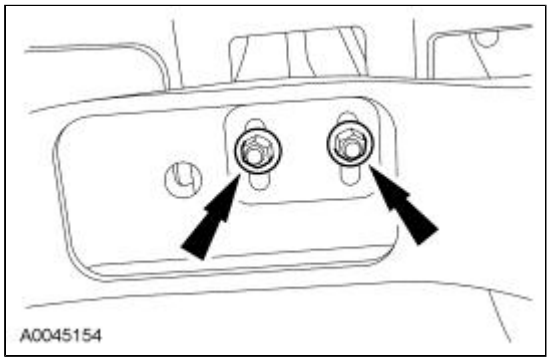
   Install the LH and RH engine support insulator bolts.
   - Apply Threadlock 262 to the bolt threads prior to installation.
   - Tighten to 350 Nm (258 lb-ft).

10. **CAUTION: Only use hand tools when installing the transmission mount-to-**

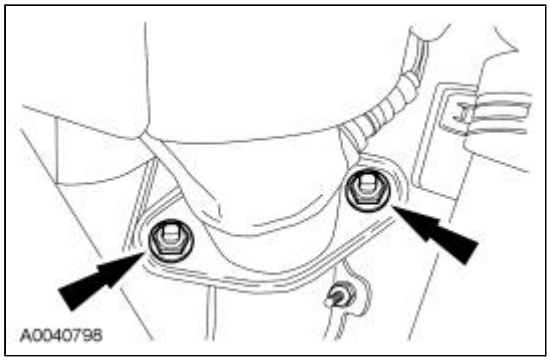
crossmember nuts or damage to the transmission mount can occur.

Install the transmission mount-to-crossmember nuts.

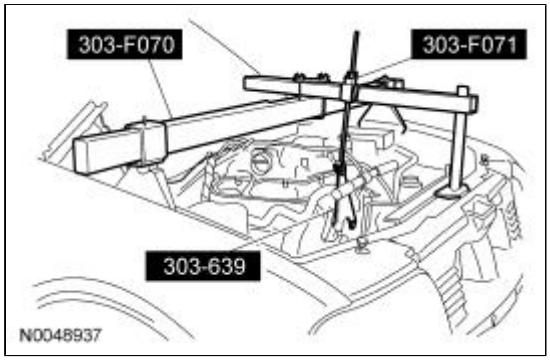
- Tighten to 103 Nm (76 lb-ft).



11. Position the Y-pipe and install the 4 nuts.
    - Tighten to 40 Nm (30 lb-ft).



12. Remove the special tools.



13. Install the starter. For additional information, refer to Section 303-06 .
14. If servicing the engine support insulator on a 4WD vehicle, install the front driveshaft. For additional information, refer to Section 205-01 .
15. Install the generator. For additional information, refer to Section 414-02 .
16. Install the cooling fan. For additional information, refer to Section 303-03 .
17. Install the TB. For additional information, refer to Section 303-04 .
18. Connect the battery ground cable. For additional information, refer to Section 414-01 .

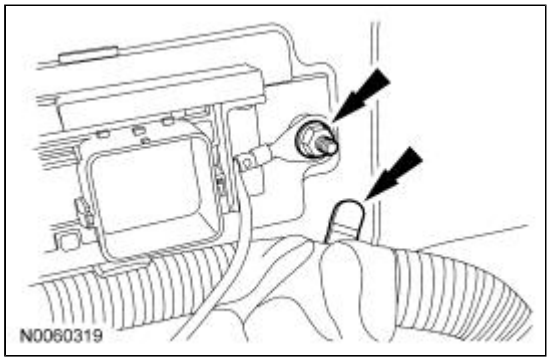
Engine

Printable View (837 KB)

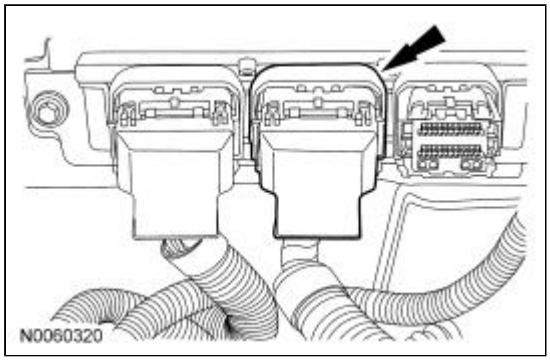
Special Tool(s)

ST1377-A	Modular Engine Lift Bracket 303-F047 (014-00073)

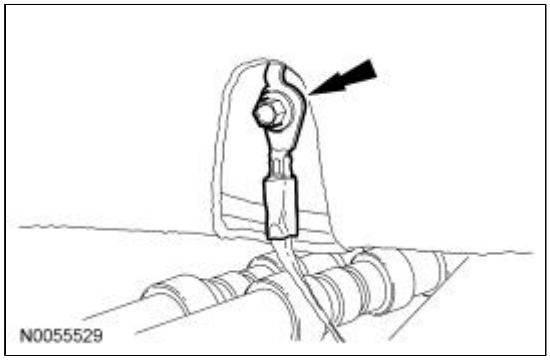
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the hood.
3. Remove the cooling module. For additional information, refer to Section 303-03 .
4. Remove the bypass tube. For additional information, refer to Section 303-03 .
5. If servicing the engine on a four wheel drive (4WD) vehicle, remove the front drive shaft. For additional information, refer to Section 205-01 .
6. Remove the starter. For additional information, refer to Section 303-06 .
7. Remove the accessory drive belt.
8. Remove the nut and the ground cable and disconnect the wiring harness retainer.



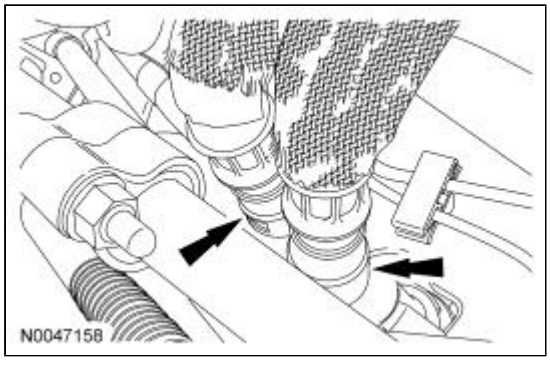
9. Disconnect the powertrain control module (PCM) electrical connector.



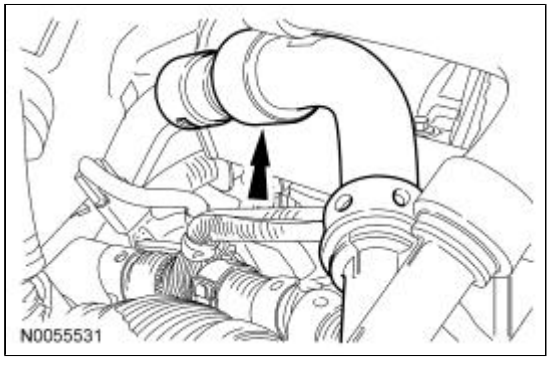
10. Remove the bolt and the ground cable.



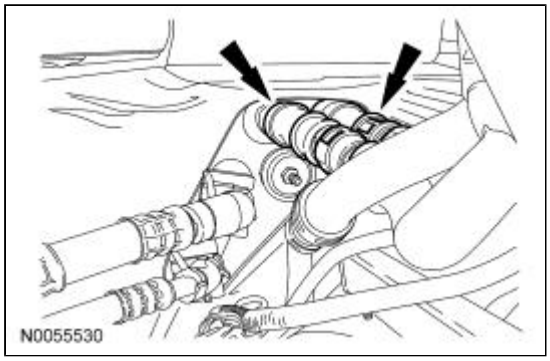
11. If equipped, disconnect the 2 auxiliary heat coolant hose quick connect couplings.



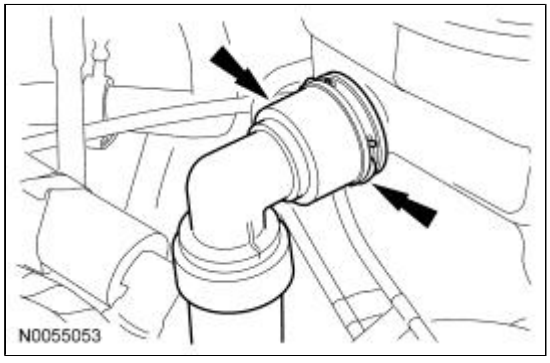
12. Disconnect the heater coolant hose quick connect coupling.



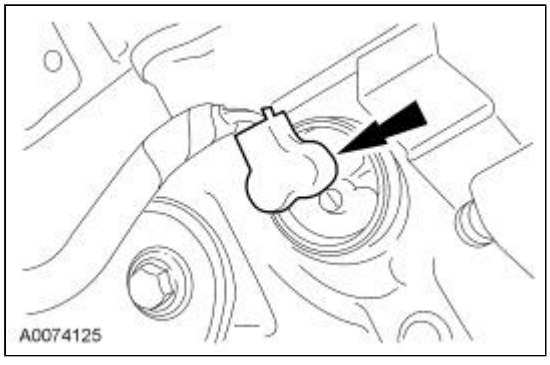
13. Disconnect and remove the 2 heater coolant hose quick connect couplings.



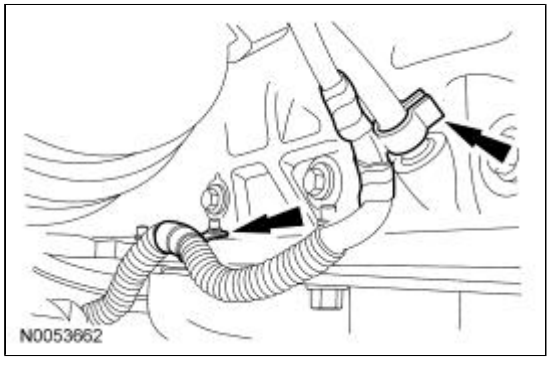
14. Remove the clip and disconnect the degas bottle coolant outlet hose quick connect coupling.



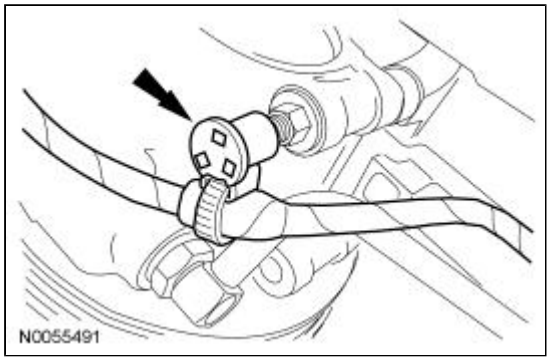
15. If equipped, disconnect the block heater electrical connector.



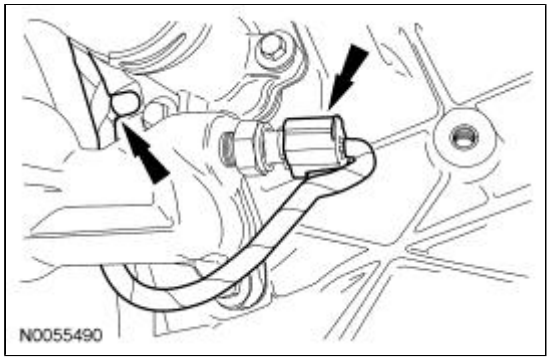
16. If equipped, disconnect the block heater wiring harness retainers.



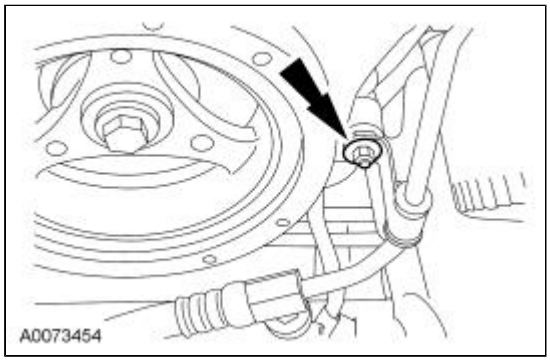
17. Disconnect the wiring harness position retainer from the power steering pump stud bolt.



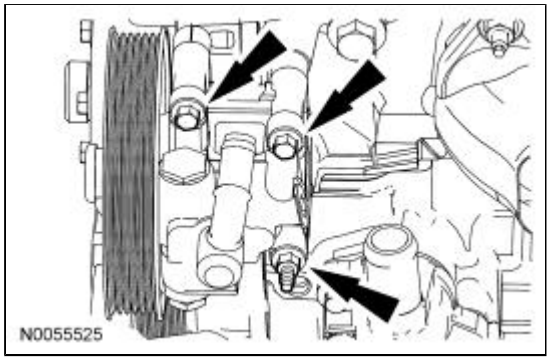
18. Disconnect the wiring harness position retainer and the engine oil pressure (EOP) switch electrical connector and position the wiring harness aside.



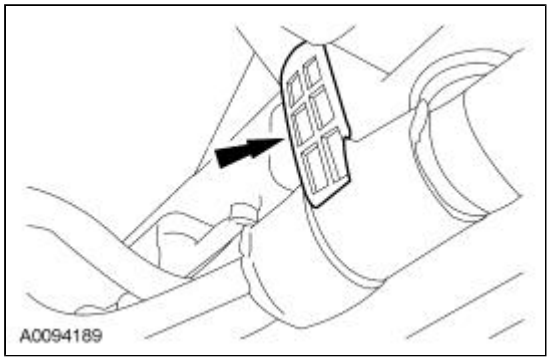
19. Remove the nut and the power steering pressure tube support bracket.



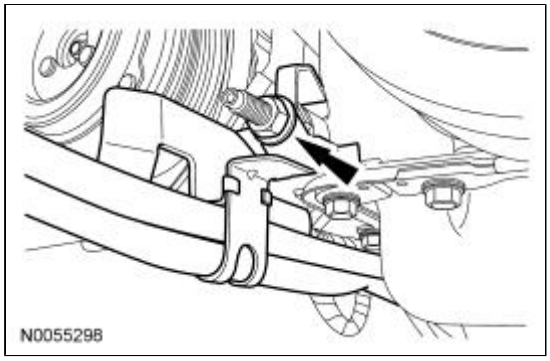
20. Remove the 2 bolts, the stud bolt and position the power steering pump aside.



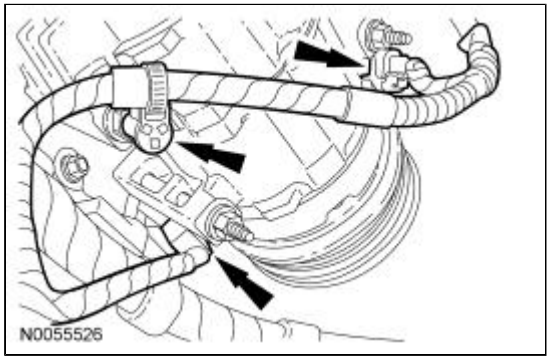
21. Disconnect the starter wiring harness retainer.



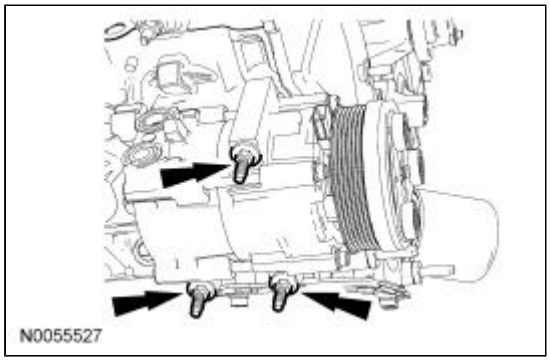
22. Remove the nut and remove the starter wiring harness and transmission fluid cooler tube support brackets from the nut.



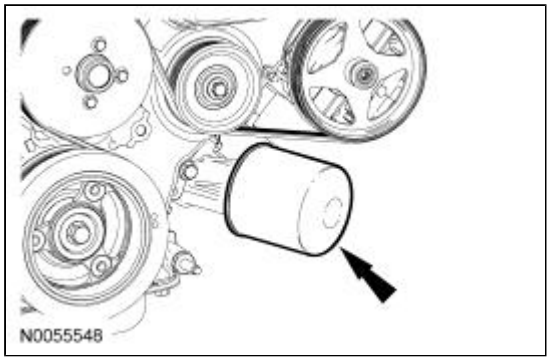
23. Disconnect the wiring harness position retainer and the crankshaft position (CKP) sensor and A/C compressor electrical connectors.



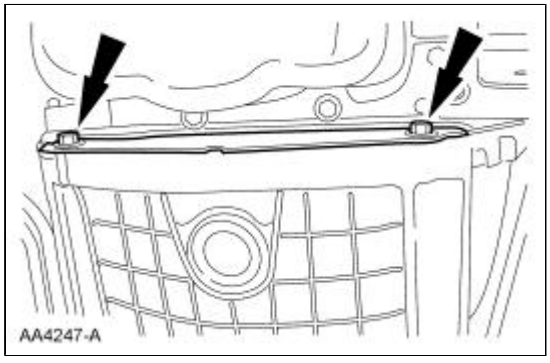
24. Remove the 3 stud bolts and position the A/C compressor aside.



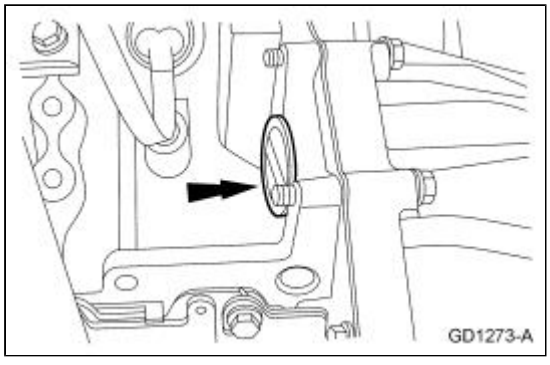
25. Remove and discard the oil filter.



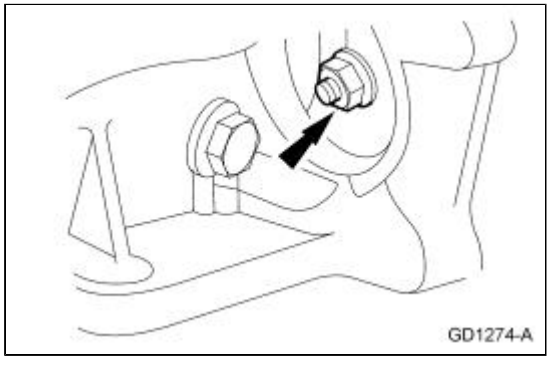
26. Remove the bolts and the flexplate inspection cover.



27. Remove the cylinder block opening cover.

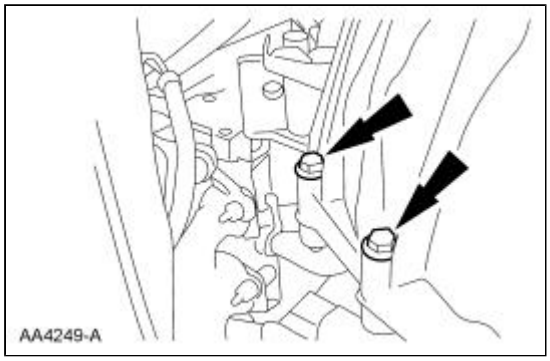


28. Remove the torque converter-to-flexplate nuts.
    - Discard the nuts.

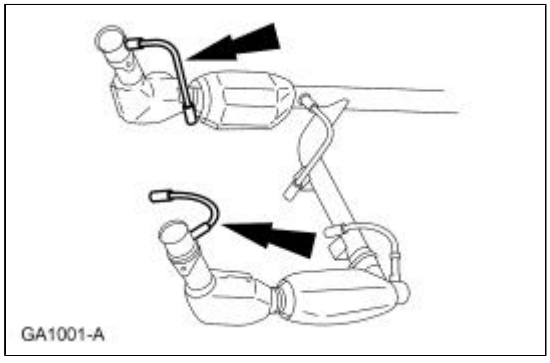


29. **NOTE:** The upper 2 transmission-to-engine bolts will be removed later.

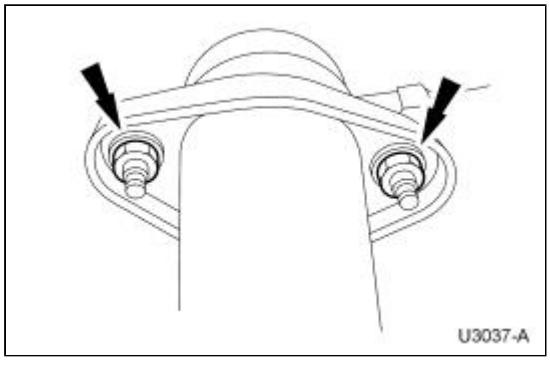
    Remove the lower 5 transmission-to-engine bolts.



30. Disconnect the heated exhaust gas oxygen sensor (HO2S) electrical connectors.



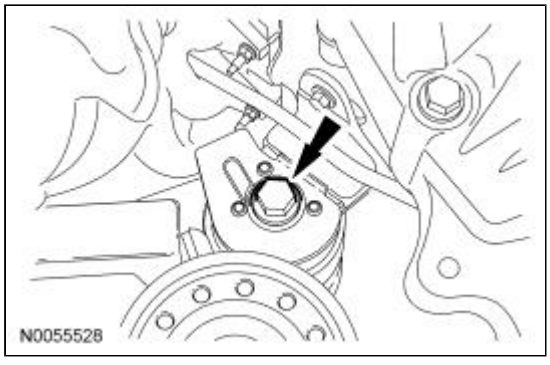
31. Remove the 4 exhaust manifold flange nuts.



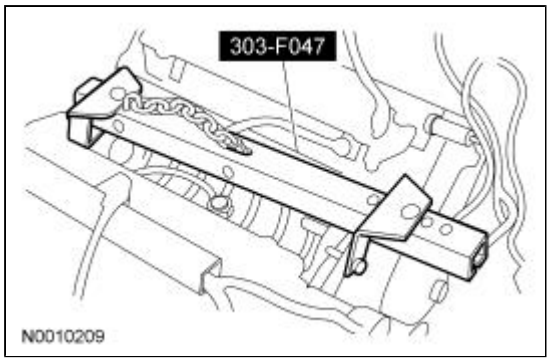
32. **CAUTION: Only use hand tools when removing the engine support insulator through bolts or damage to the engine support insulator-to-cylinder block bracket can occur.**

NOTE: LH shown, RH similar.

Remove the RH and LH engine support insulator through bolts.



33. Remove the upper 2 transmission-to-engine bolts and install the special tool.



34. Using a suitable floor crane, remove the engine assembly from the vehicle.

Cylinder Head

Printable View (1780 KB)

Special Tool(s)

 ST1668-A	Remover/Installer, Cylinder Head 303-572 (T97T-6000-A)
 ST2807-A	Locking Tool, Camshaft Phaser Sprocket 303-1046
ST2804-A	Compressor, Valve Spring 303-1039
ST1286-A	Remover, Crankshaft Vibration Damper 303-009 (T58P-6316-D)
ST1730-A	Remover, Crankshaft Front Seal 303-107 (T74P-6700-A)
ST1377-A	Modular Engine Lift Bracket 303-F047 (014-00073) or equivalent

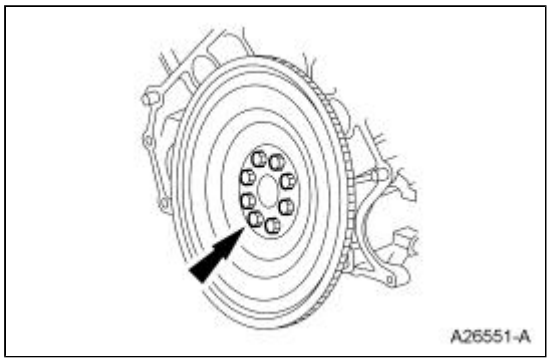
Material

Item	Specification
Motorcraft Metal Surface Prep ZC-31	—
Silicone Gasket Remover ZC-30	—

All cylinder heads

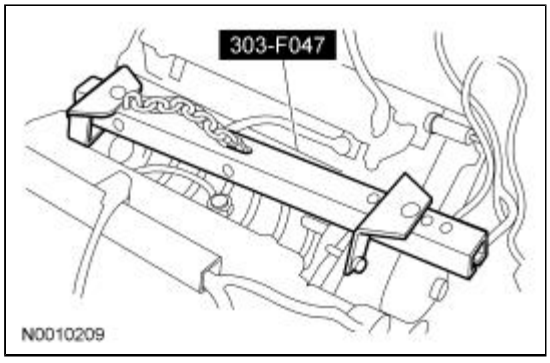
1. Remove the engine. For additional information, refer to Engine in the Removal portion of this section.

2. Remove the bolts and the flexplate.

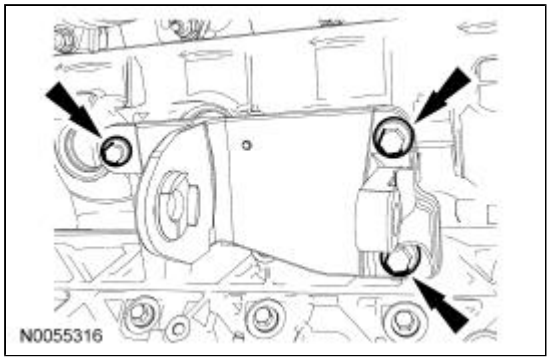


3. Install the engine onto a suitable engine stand.

4. Remove the special tool.

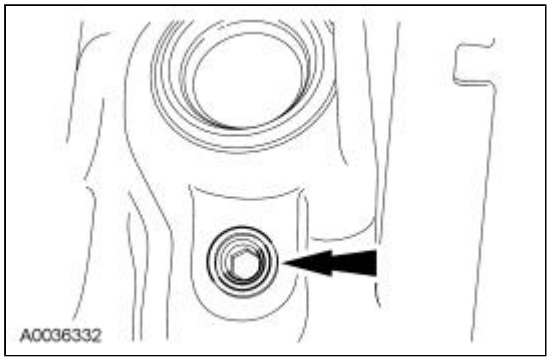


5. Remove the 3 bolts and the RH engine support insulator bracket.



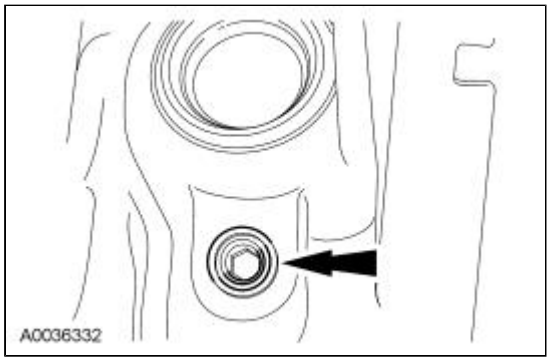
6. **NOTE:** LH shown, RH similar.

   Remove the cylinder block drain plugs and drain the coolant into a suitable container.



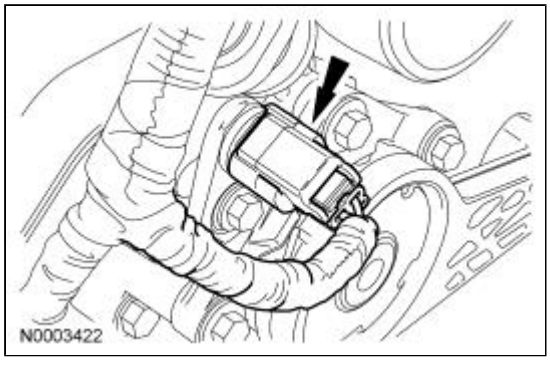
7. **NOTE:** LH shown, RH similar.

   Install the cylinder block drain plugs.
   - Tighten to 24 Nm (18 lb-ft).

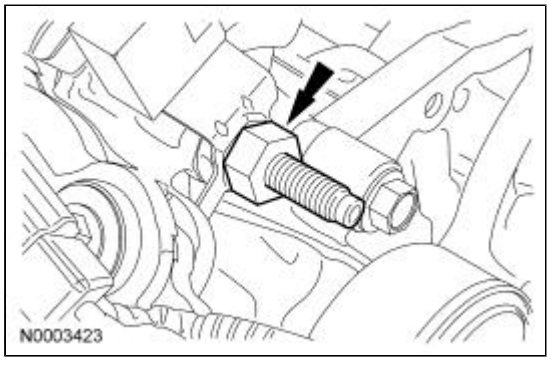


8. **NOTE:** RH shown, LH similar.

   Disconnect the RH and LH camshaft position (CMP) sensor electrical connectors.

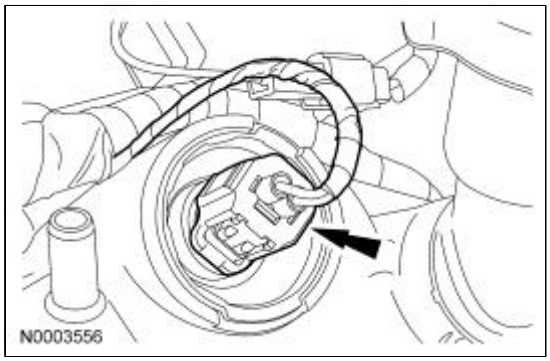


9. Remove the nut and the RH radio ignition interference capacitor.

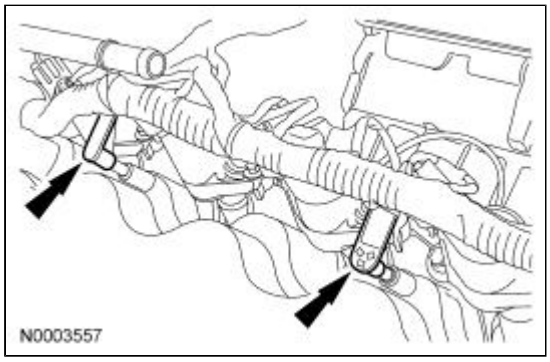


10. **NOTE:** RH shown, LH similar.

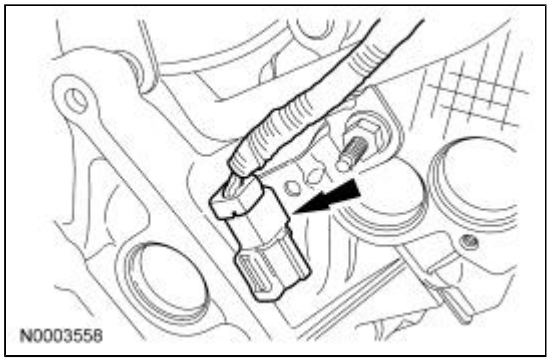
    Disconnect the RH and LH variable camshaft timing (VCT) solenoid electrical connector.



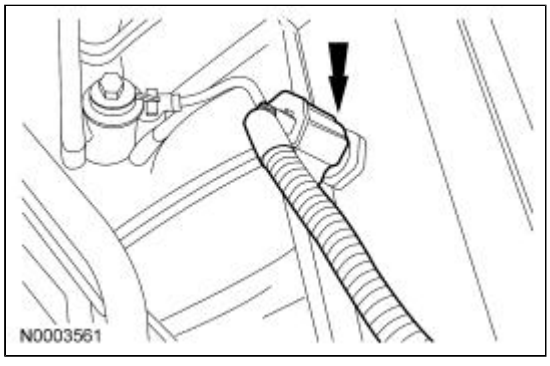
11. Disconnect the 2 engine wiring harness retainers from the RH valve cover studs.



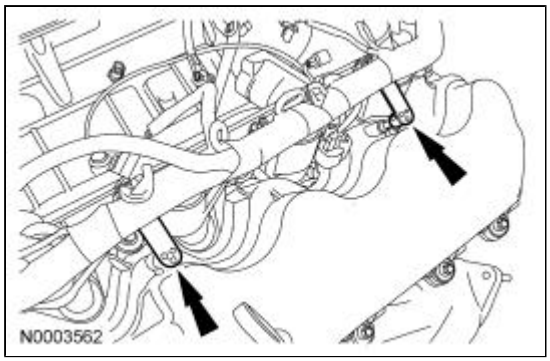
12. Disconnect the electrical connector retainer from the coolant tube.



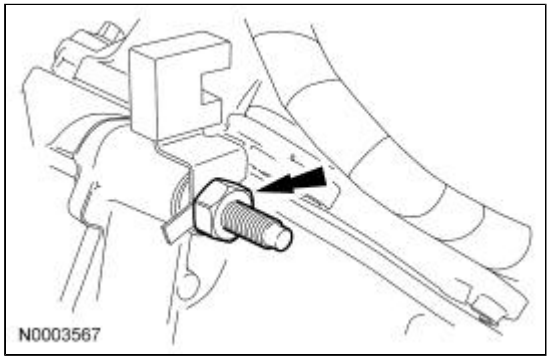
13. Disconnect the cylinder head temperature (CHT) sensor electrical connector.



14. Disconnect the 2 engine wiring harness retainers from the LH valve cover studs.

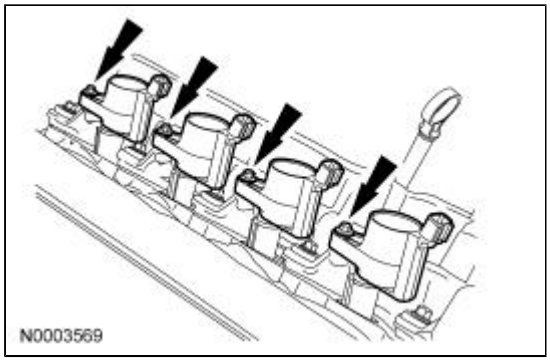


15. Remove the nut and the LH radio ignition interference capacitor.



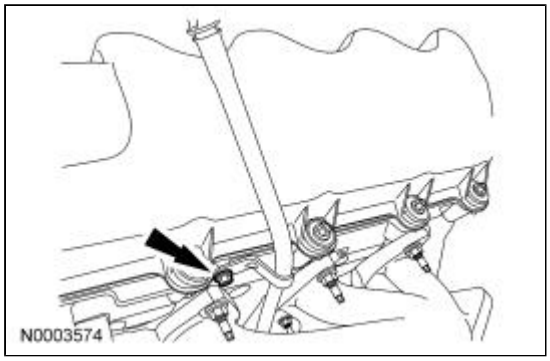
16. **NOTE:** LH shown, RH similar.

    Remove the 8 bolts and the 8 ignition coils.

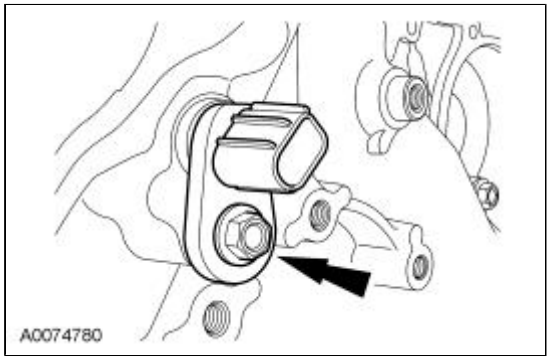


17. Remove the engine wiring harness from the engine assembly.

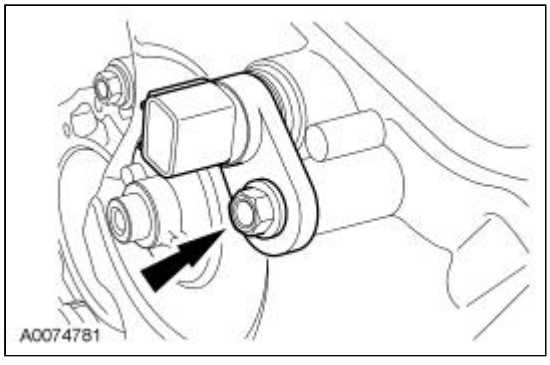
18. Remove the bolt and the oil level indicator tube.
    - Discard the O-ring seal.



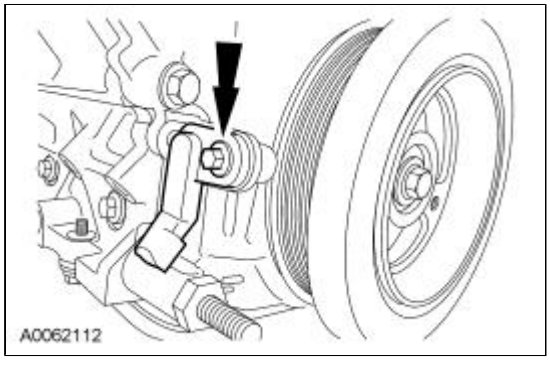
19. Remove the bolt and the RH CMP sensor.



20. Remove the bolt and the LH CMP sensor.



21. Remove the bolt and the CKP sensor.



22. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

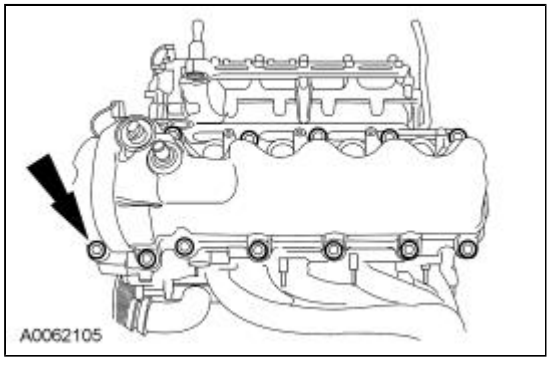
CAUTION: When removing the valve cover, make sure to avoid damaging the VCT solenoid.

NOTE: The fasteners are part of the valve cover and should not be removed.

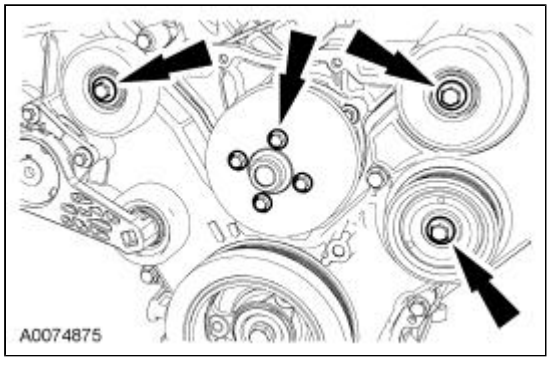
NOTE: LH shown, RH similar.

Loosen the fasteners and remove the valve covers.

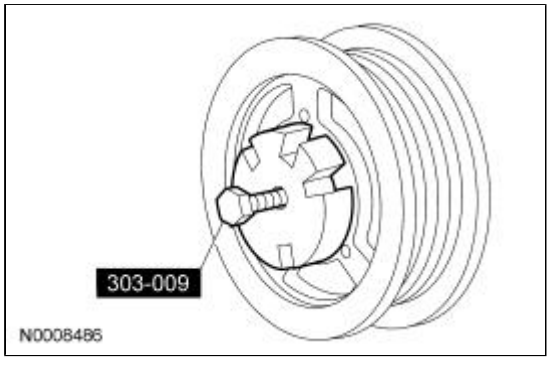
- Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
- Inspect the valve cover gasket. If the gasket is damaged, remove and discard the gasket. Clean the valve cover gasket groove with soap and water or a suitable solvent.



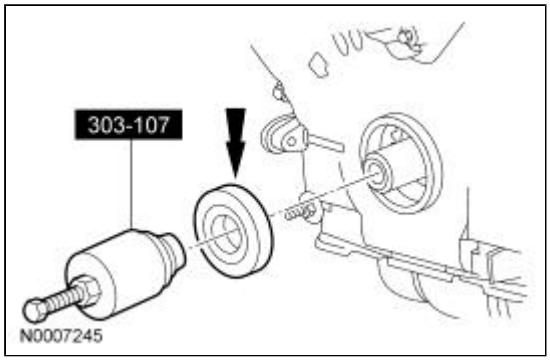
23. Remove the bolts, the coolant pump pulley and the 3 accessory drive belt idler pulleys.



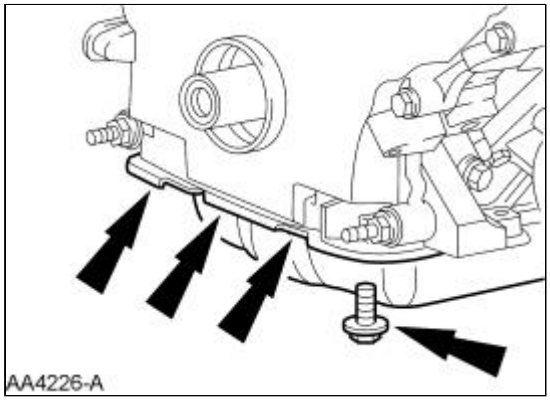
24. Remove and discard the crankshaft pulley bolt. Using the special tool, remove the crankshaft pulley.



25. Using the special tool, remove and discard the crankshaft front seal.

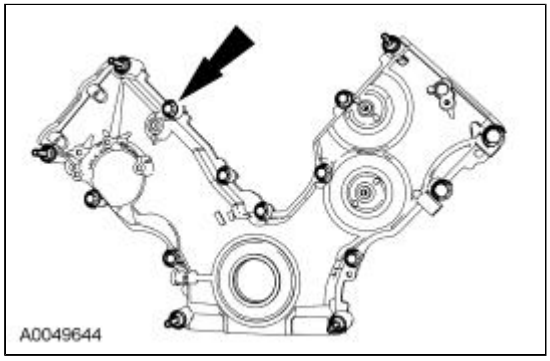


26. Remove the front 4 oil pan bolts.

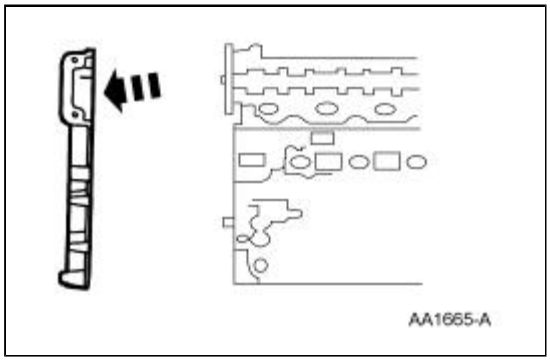


27. **NOTE:** Correct fastener location is essential for assembly procedure. Record fastener location.

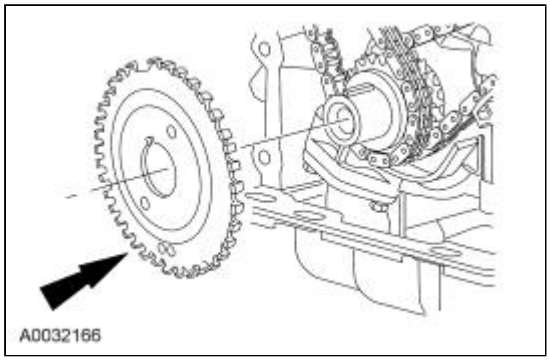
    Remove the fasteners.



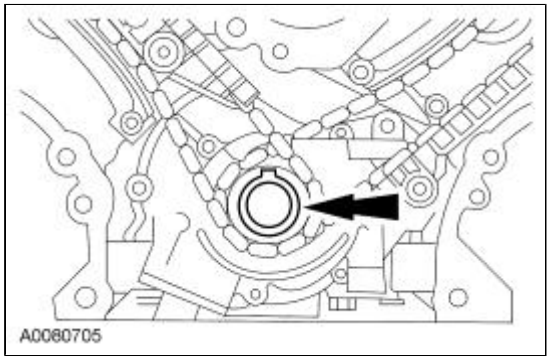
28. Remove the engine front cover from the cylinder block.



29. Remove the crankshaft sensor ring from the crankshaft.

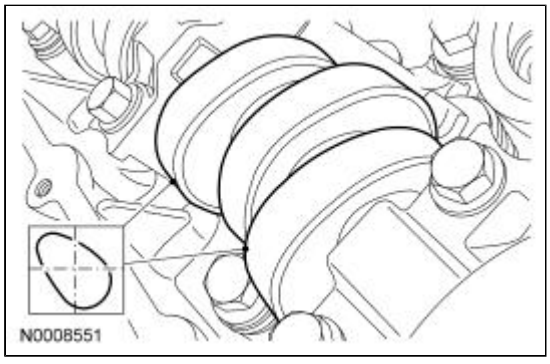


30. Position the crankshaft keyway at the 12 o'clock position.



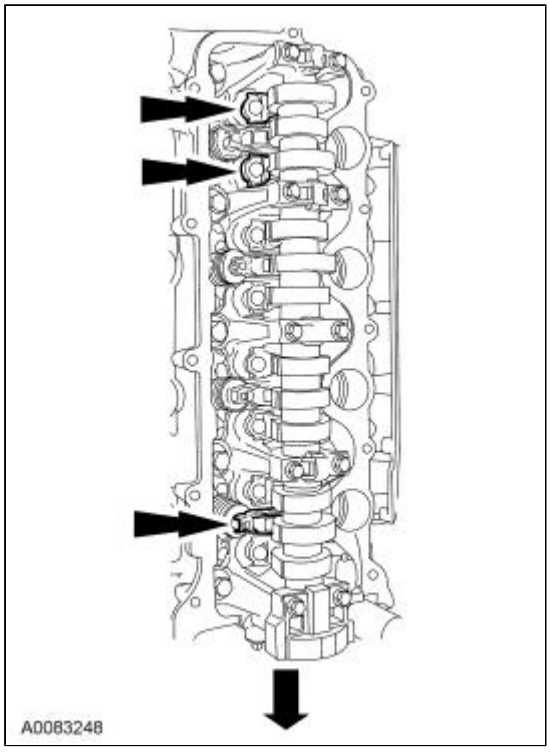
31. **NOTE:** If the camshaft lobes are not exactly positioned as shown, the crankshaft will require one full additional rotation to 12 o'clock.

    The No. 1 cylinder camshaft exhaust lobe must be coming up on the exhaust stroke. Verify by noting the position of the 2 intake camshaft lobes and the exhaust lobe on the No. 1 cylinder.



32. **CAUTION: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into the original locations.**

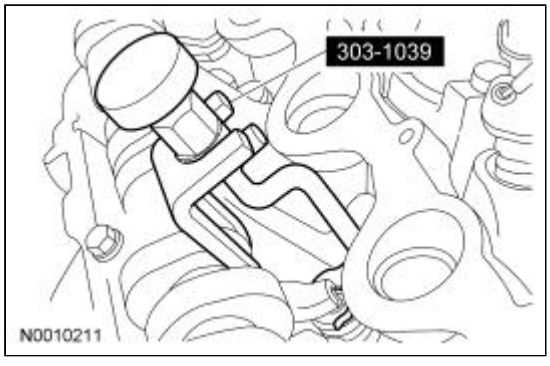
    Remove only the 3 camshaft roller followers shown in the illustration from the RH cylinder head.



33. **CAUTION: Do not allow the valve keepers to fall off the valve or the valve may drop into the cylinder.**

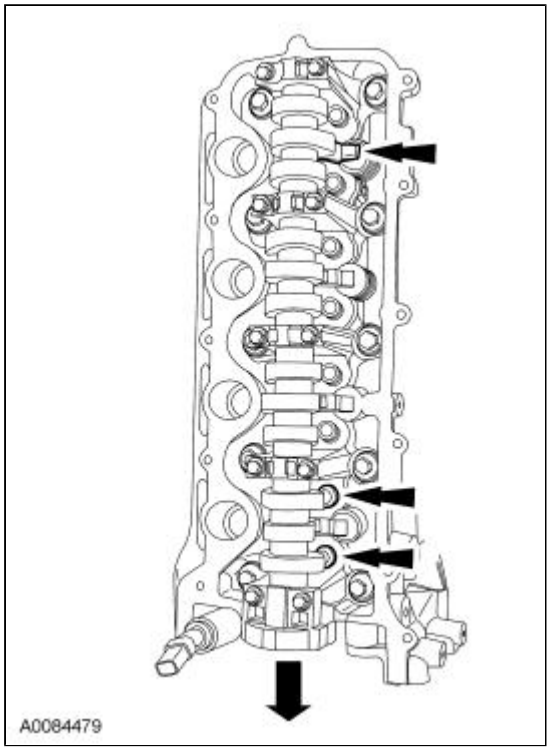
    NOTE: It may be necessary to push the valve down while compressing the spring.

    Using the special tool, remove the 3 designated camshaft roller followers in the previous step from the RH cylinder head.



34. **CAUTION: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into the original locations.**

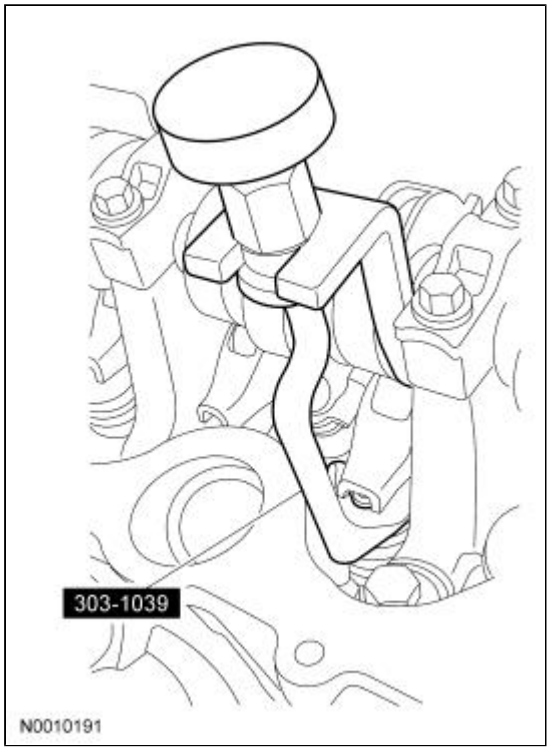
    Remove only the 3 camshaft roller followers shown in the illustration from the LH cylinder head.



35. **CAUTION: Do not allow the valve keepers to fall off the valve or the valve may drop into the cylinder.**

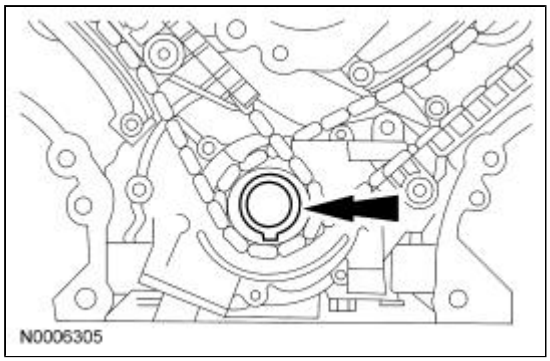
    NOTE: It may be necessary to push the valve down while compressing the spring.

    Using the special tool, remove the 3 designated camshaft roller followers in the previous step from the LH cylinder head.



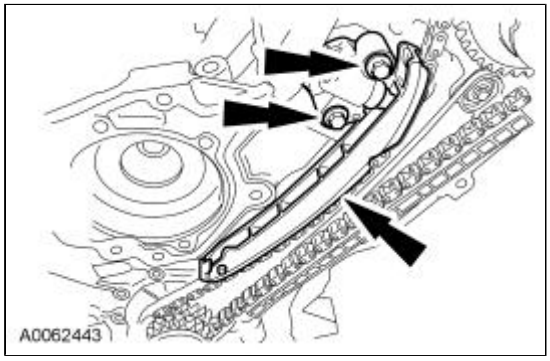
36. **CAUTION: The crankshaft cannot be moved past the 6 o'clock position once set.**

Rotate the crankshaft clockwise and position the crankshaft keyway at the 6 o'clock position.



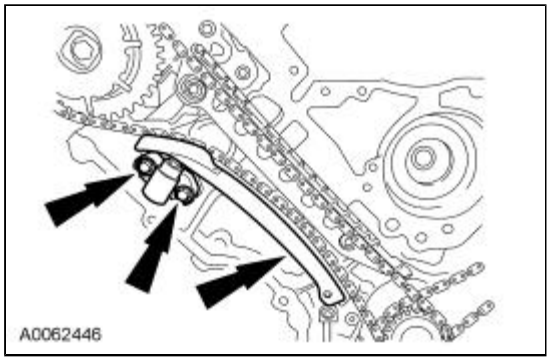
37. **CAUTION: If one or both of the tensioner mounting bolts are loosened or removed, the tensioner-sealing bead must be inspected for seal integrity. If cracks, tears, separation from the tensioner body or permanent compression of the seal bead is observed, install a new tensioner.**

    Remove the bolts, the LH timing chain tensioner and tensioner arm.

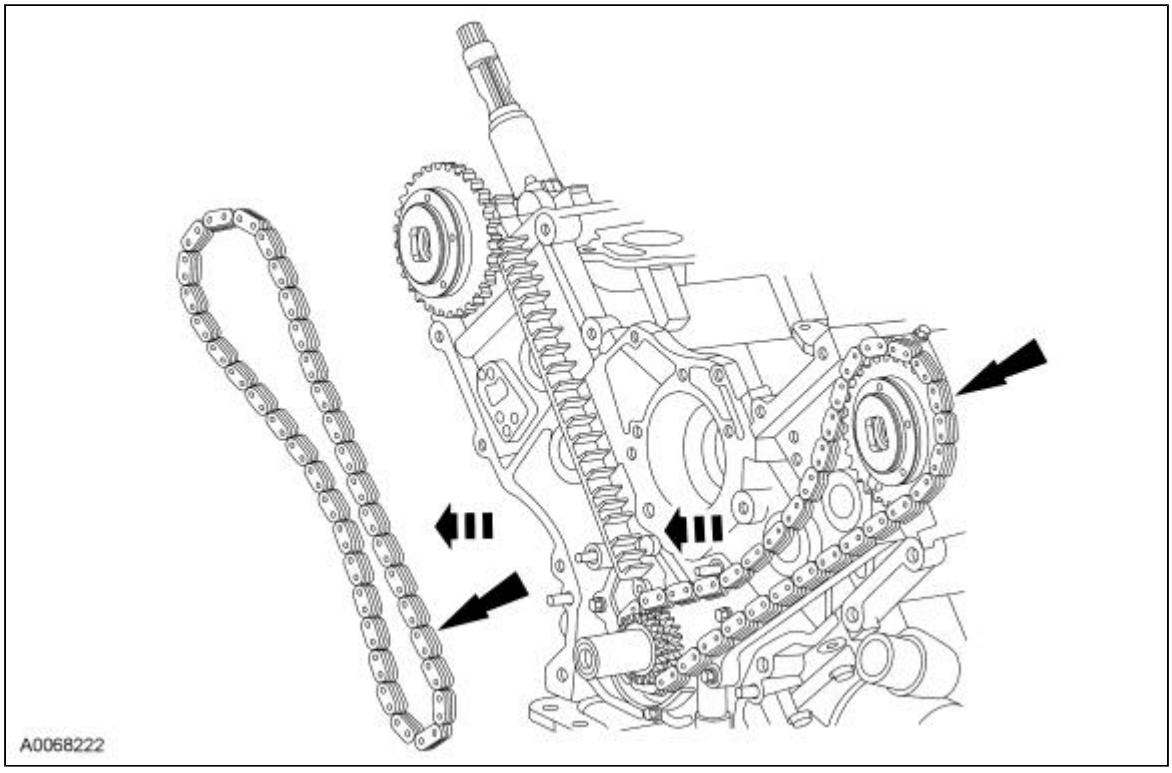


38. **CAUTION: If one or both of the tensioner mounting bolts are loosened or removed, the tensioner-sealing bead must be inspected for seal integrity. If cracks, tears, separation from the tensioner body or permanent compression of the seal bead is observed, install a new tensioner.**

    Remove the bolts, the RH timing chain tensioner and tensioner arm.



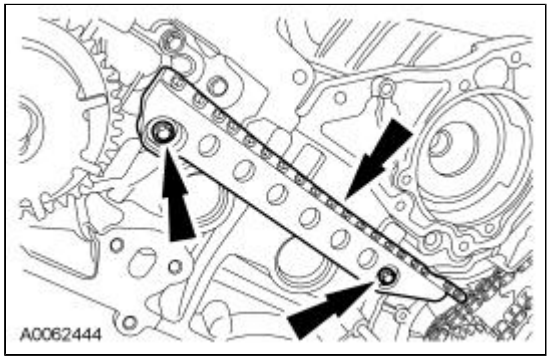
39. Remove the RH and LH timing chains and the crankshaft sprocket.
    - Remove the RH timing chain from the camshaft sprocket.
    - Remove the RH timing chain from the crankshaft sprocket.
    - Remove the LH timing chain from the camshaft sprocket.
    - Remove the LH timing chain and crankshaft sprocket.



40. **NOTE:** RH shown, LH similar.

Remove the LH and RH timing chain guides.

- Remove the bolts.
- Remove both timing chain guides.

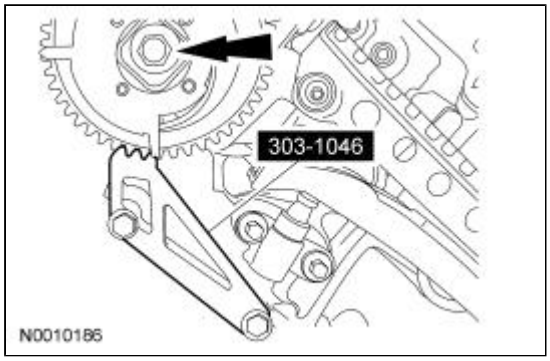


41. **CAUTION: Damage to the VCT phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

CAUTION: Only use hand tools to remove the VCT phaser sprocket assembly or damage may occur to the camshaft or VCT phaser sprocket.

Using the special tool, remove the bolt and the RH VCT phaser sprocket assembly.

- Discard the camshaft phaser sprocket bolt.

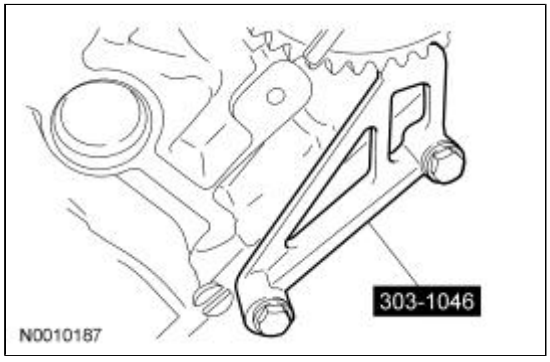


42. **CAUTION: Damage to the VCT phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

CAUTION: Only use hand tools to remove the VCT phaser sprocket assembly or damage may occur to the camshaft or VCT phaser sprocket.

Using the special tool, remove the bolt and the LH VCT phaser sprocket assembly.

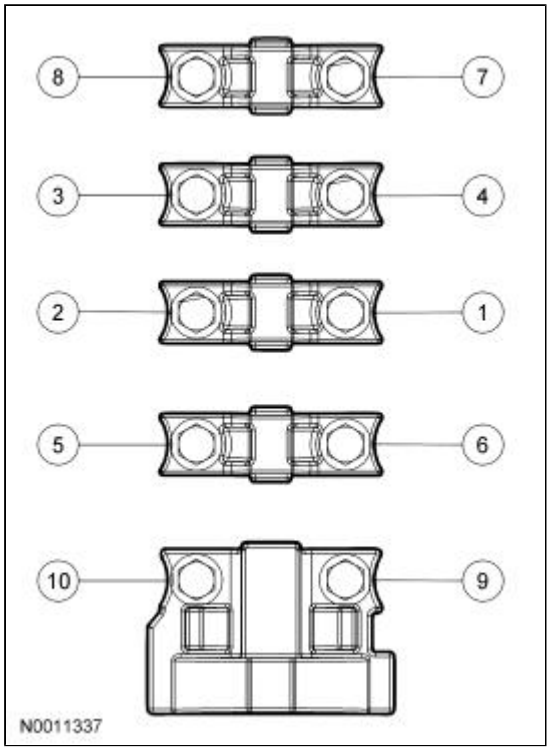
- Discard the camshaft phaser sprocket bolt.



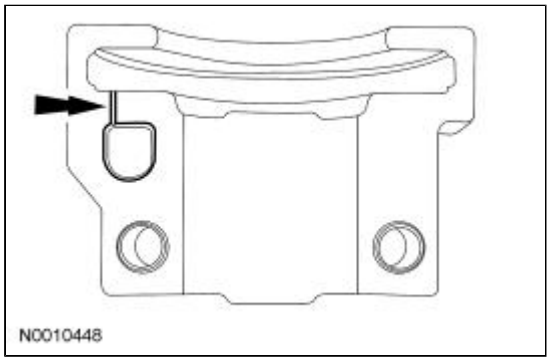
43. **CAUTION: When removing the front thrust camshaft bearing cap, use care as the cap may be damaged from sideloading when removing the cam unequally in height from the bearing towers.**

NOTE: The camshaft bearing caps must be installed in their original locations. Record camshaft bearing cap locations.

Remove the bolts in the sequence shown and remove the RH cylinder head front camshaft bearing cap and then the remaining bearing caps.



44. Clean and inspect the RH camshaft bearing caps.
    - The camshaft front thrust bearing cap contains an oil metering groove. Make sure the groove is free of foreign material.

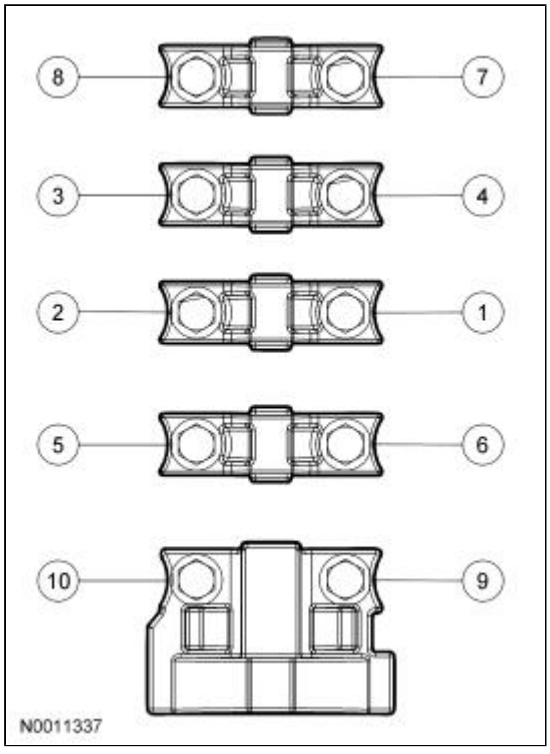


45. Remove the RH camshaft.

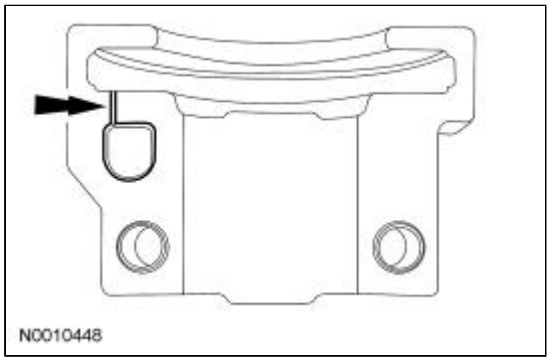
46. **CAUTION: When removing the front thrust camshaft bearing cap, use care as the cap may be damaged from sideloading when removing the cam unequally in height from the bearing towers.**

    NOTE: The camshaft bearing caps must be installed in their original locations. Record camshaft bearing cap locations.

    Remove the bolts in the sequence shown and remove the LH cylinder head front camshaft bearing cap and then the remaining bearing caps.



47. Clean and inspect the LH camshaft bearing caps.
    - The camshaft front thrust bearing cap contains an oil metering groove. Make sure the groove is free of foreign material.



48. Remove the LH camshaft.

49. **CAUTION: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into the original locations.**

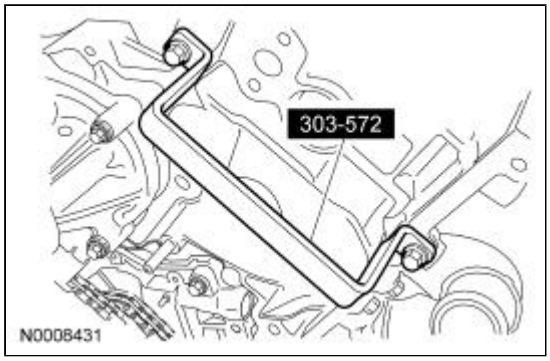
    Remove all of the remaining camshaft roller followers from the cylinder heads.

LH cylinder head

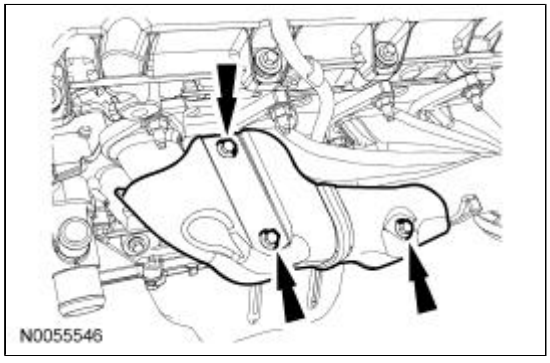
50. **CAUTION: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into the original locations.**

    Remove the hydraulic lash adjusters from the LH cylinder head.

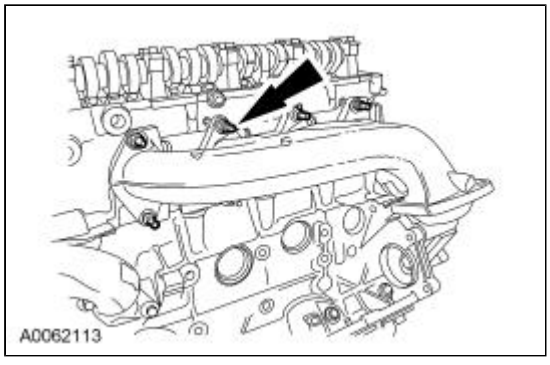
51. Install the special tool onto the LH cylinder head.



52. Remove the 3 bolts and the exhaust manifold heat shield.



53. Remove the 8 nuts, the 8 studs and the LH exhaust manifold.
    - Discard the gaskets, nuts and studs.
    - Inspect the exhaust manifold. For additional information, refer to Section 303-00 .

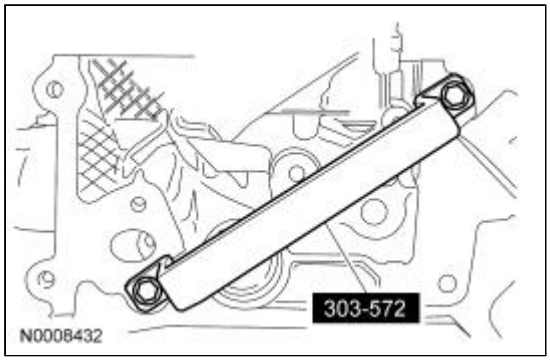


RH cylinder head

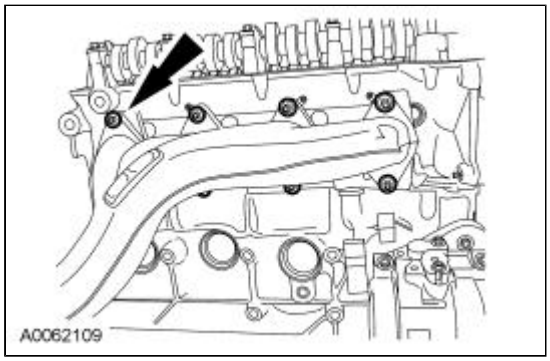
54. **CAUTION: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into the original locations.**

    Remove the hydraulic lash adjusters from the RH cylinder heads.

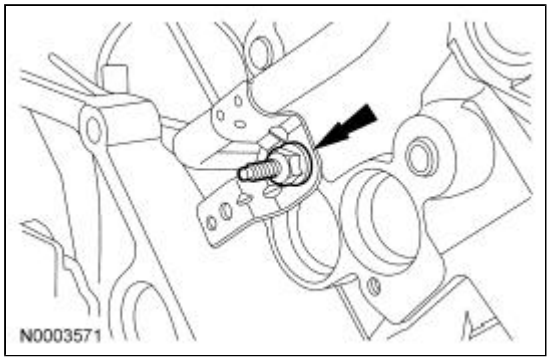
55. Install the special tool onto the RH cylinder head.



56. Remove the 8 nuts, the 8 studs and the RH exhaust manifold.
    - Discard the gasket, nuts and studs.
    - Inspect the exhaust manifold. For additional information, refer to Section 303-00 .



57. Remove the stud bolt and the coolant tube.
    - Discard the O-ring seals.



All cylinder heads

58. **CAUTION: The cylinder head must be cool before removing it from the engine. Cylinder head warpage can result if a warm or hot cylinder head is removed.**

    CAUTION: Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine.

    CAUTION: The cylinder head bolts must be discarded and new bolts must be installed. They are tighten-to-yield designed and cannot be reused.

    CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other

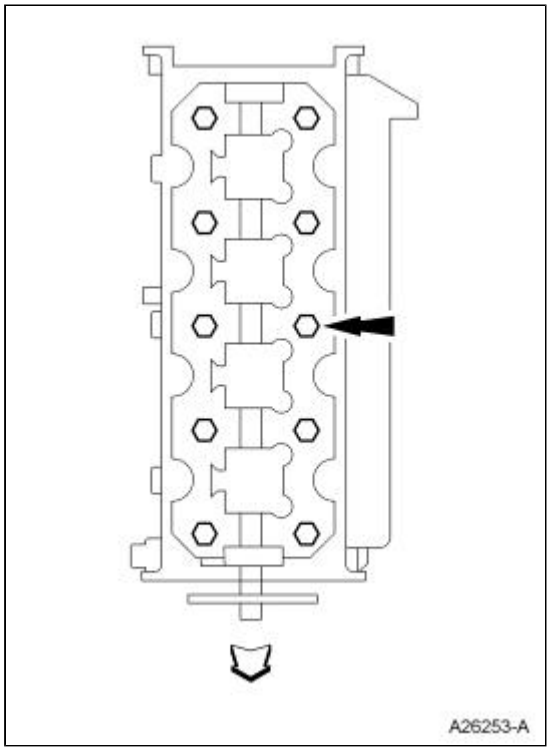
abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.

CAUTION: Aluminum surfaces are soft and can be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.

NOTE: RH shown, LH similar.

Remove the bolts and the cylinder head.

- Discard the cylinder head gasket.
- Discard the cylinder head bolts.



59. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

CAUTION: Observe all warnings or cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

Clean the cylinder head-to-cylinder block mating surfaces of both the cylinder head and the cylinder block.

1. Remove any large deposits of silicone or gasket material with a plastic scraper.
2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.
3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant, and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

60. **NOTE:** Make sure all cylinder head surfaces are clear of any gasket material, RTV, oil and coolant. The cylinder head surface must be clean and dry before running a flatness check.

NOTE: Use a straightedge that is calibrated by the manufacturer to be flat within 0.005 mm (0.0002 in) per running foot length. For example, if the straightedge is 61 cm (24 in) long, the machined edge must be flat within 0.010 mm (0.0004 in) from end to end.

NOTE: LH shown, RH similar.

Support the cylinder head on a bench with the head gasket side up. Inspect all areas of the deck face with a straightedge, paying particular attention to the oil pressure feed area. The cylinder head must not have depressions deeper than 0.0254 mm (0.001 in) across a 38.1 mm (1.5 in) square area, or scratches longer than 0.0254 mm (0.001 in).

Material

Item	Specification
Motorcraft Metal Surface Prep ZC-31	—
Silicone Gasket Remover ZC-30	—

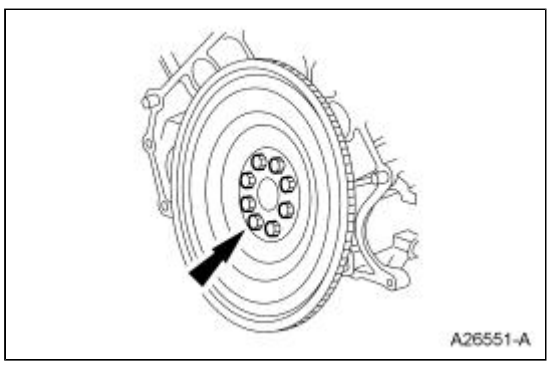
CAUTION: Remove the cylinder heads before removing the crankshaft. Failure to do so can result in engine damage.

CAUTION: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

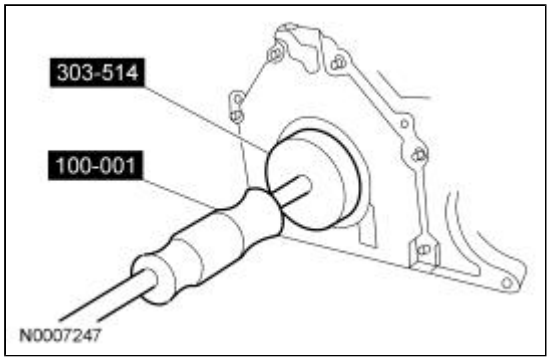
NOTE: The flexplate, crankshaft rear seal and the crankshaft rear oil slinger must be removed before mounting the engine on the engine stand.

NOTE: For additional information, refer to the exploded view under the assembly procedure in this section.

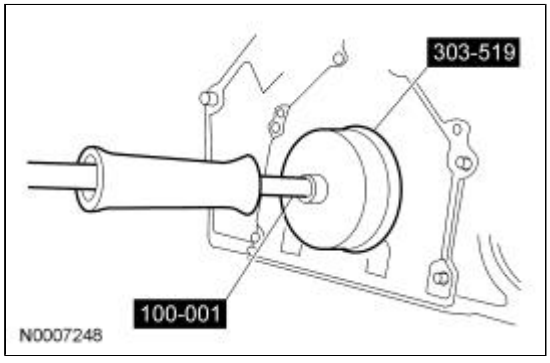
1. Remove the bolts and the flexplate.



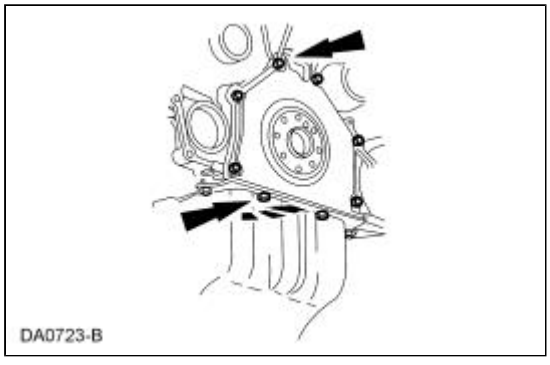
2. Using the special tools, remove and discard the crankshaft rear oil slinger.



3. Using the special tools, remove and discard the crankshaft rear seal.

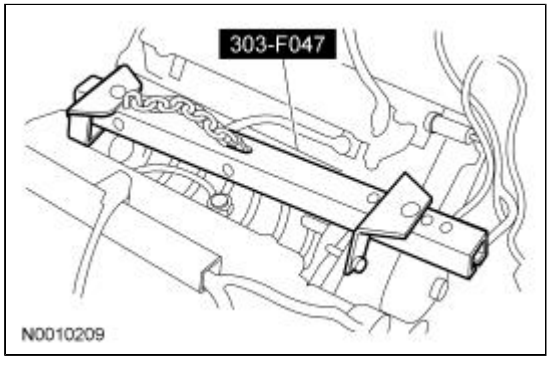


4. Remove the 8 bolts and the crankshaft rear seal retainer plate.

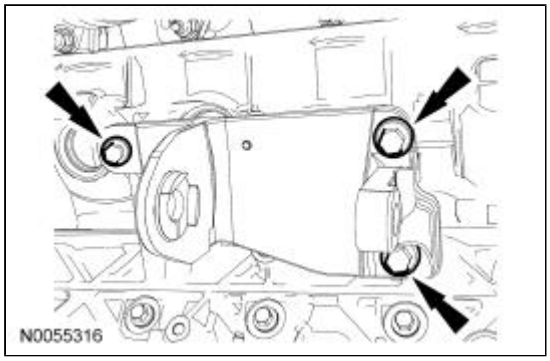


5. Mount the engine on a suitable work stand.

6. Remove the special tool.

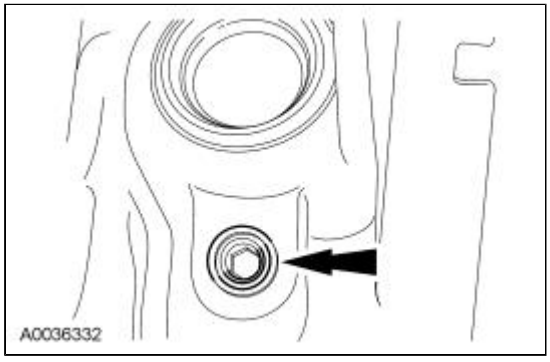


7. Remove the 3 bolts and the RH engine support insulator bracket.



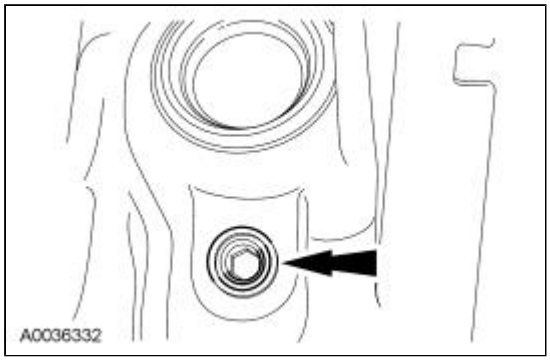
8. **NOTE:** LH shown, RH similar.

   Remove the cylinder block drain plugs and drain the coolant into a suitable container.

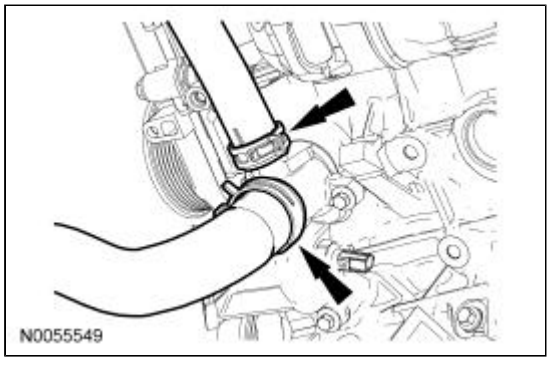


9. **NOTE:** LH shown, RH similar.

   Install the cylinder block drain plugs.
   - Tighten to 24 Nm (18 lb-ft).

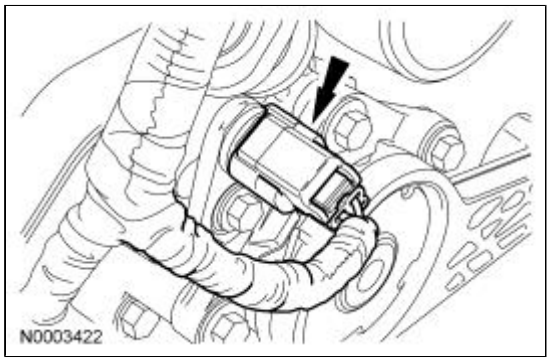


10. Disconnect the 2 coolant hoses from the oil filter adapter.

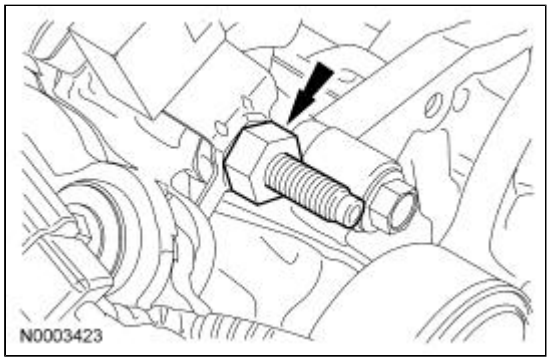


11. **NOTE:** RH shown, LH similar.

    Disconnect the RH and LH camshaft position (CMP) sensor electrical connectors.

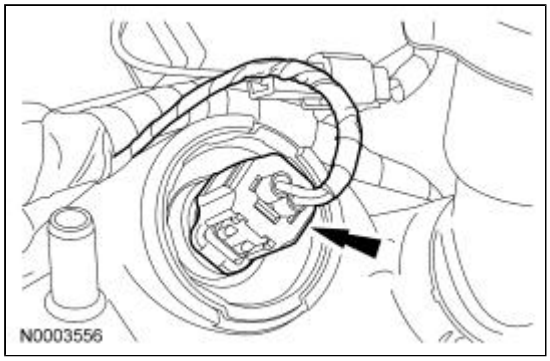


12. Remove the nut and the RH radio ignition interference capacitor.

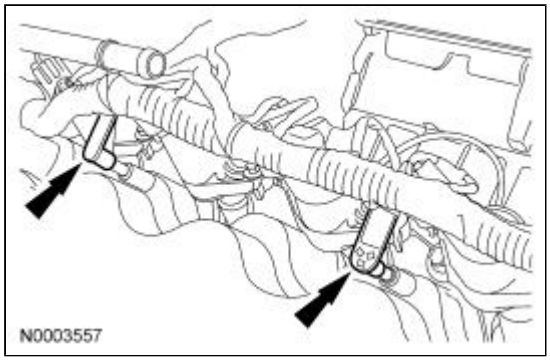


13. **NOTE:** RH shown, LH similar.

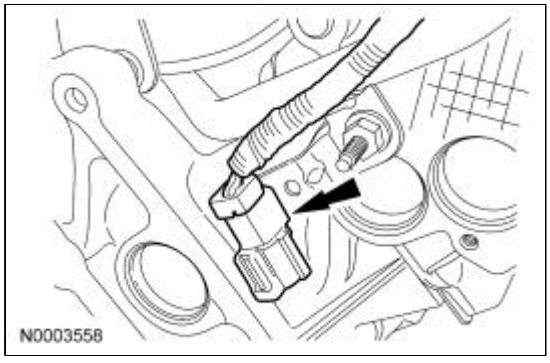
    Disconnect the RH and LH variable camshaft timing (VCT) solenoid electrical connector.



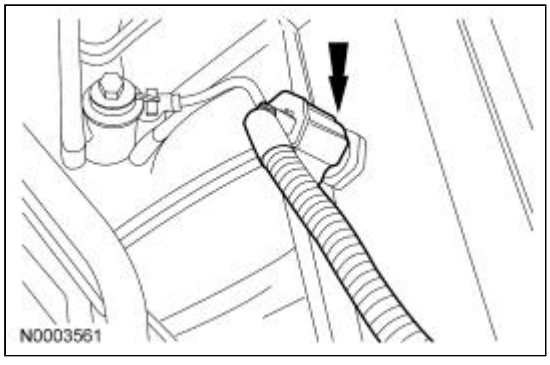
14. Disconnect the 2 engine wiring harness retainers from the RH valve cover studs.



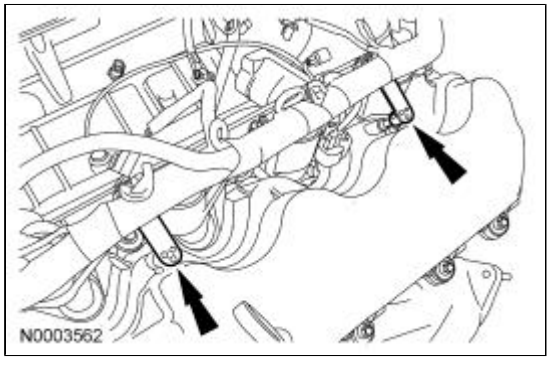
15. Disconnect the electrical connector retainer from the coolant tube.



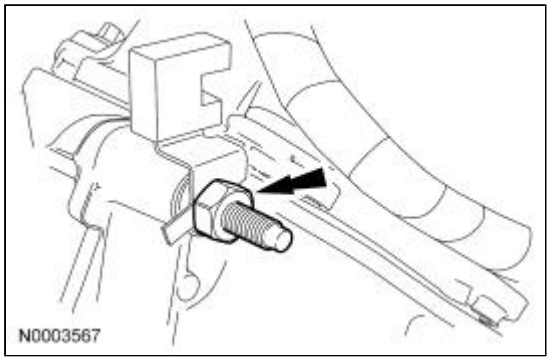
16. Disconnect the cylinder head temperature (CHT) sensor electrical connector.



17. Disconnect the 2 engine wiring harness retainers from the LH valve cover studs.

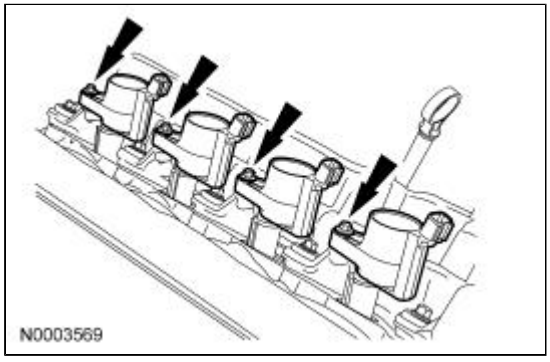


18. Remove the nut and the LH radio ignition interference capacitor.



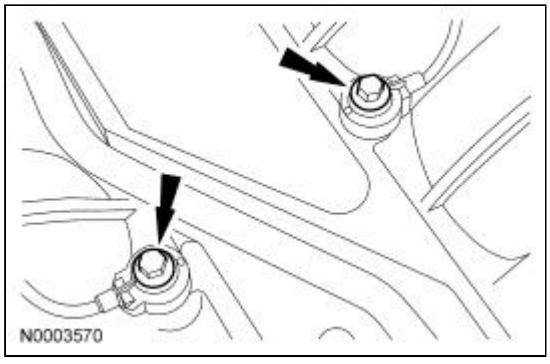
19. **NOTE:** LH shown, RH similar.

    Remove the 8 bolts and the 8 ignition coils.

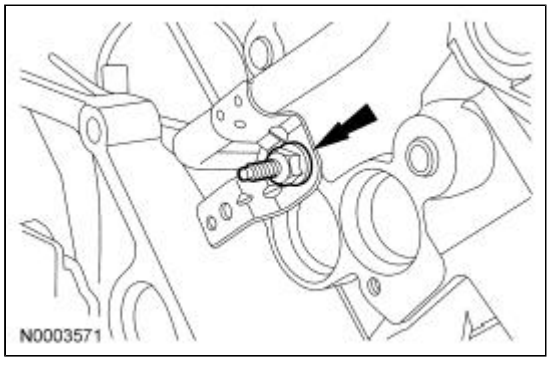


20. Remove the engine wiring harness from the engine assembly.

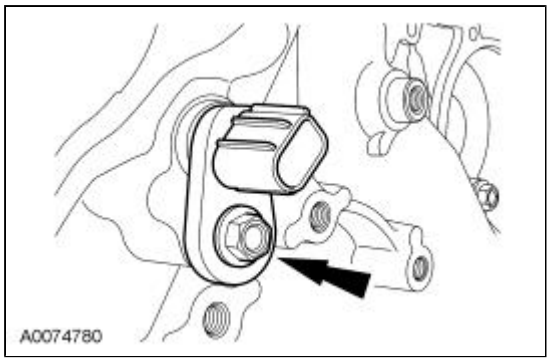
21. Remove the 2 bolts and the 2 knock sensors (KS).



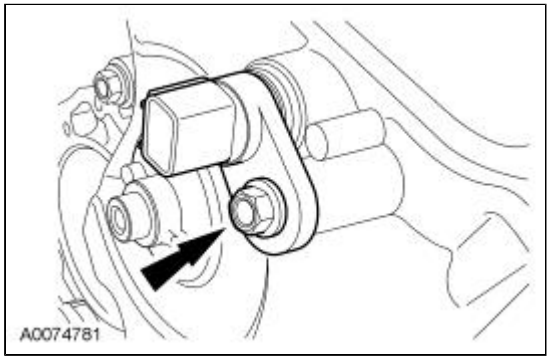
22. Remove the stud bolt and the coolant tube.
    - Discard the O-ring seal.



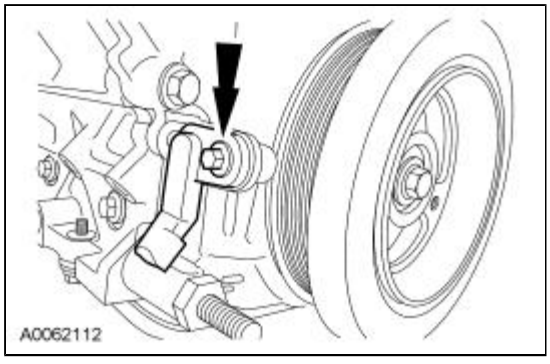
23. Remove the bolt and the RH CMP sensor.



24. Remove the bolt and the LH CMP sensor.



25. Remove the bolt and the crankshaft position (CKP) sensor.



26. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

CAUTION: When removing the valve cover, make sure to avoid damaging the VCT solenoid.

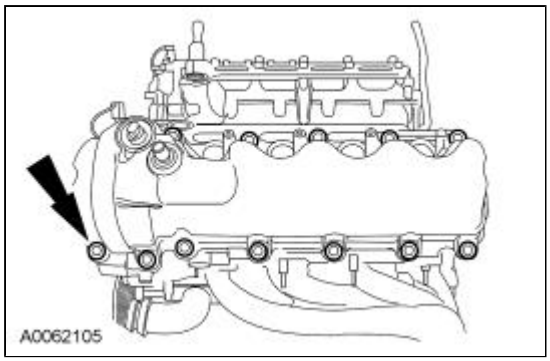
NOTE: The fasteners are part of the valve cover and should not be removed.

NOTE: LH shown, RH similar.

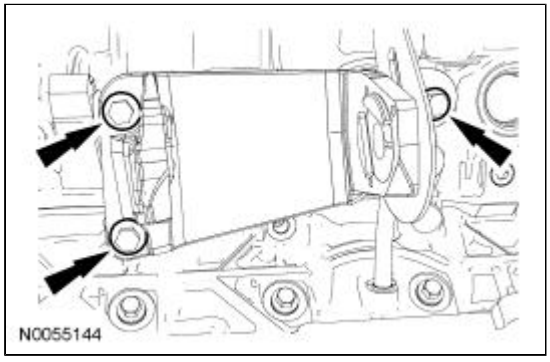
Loosen the fasteners and remove the valve covers.

- Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
- Inspect the valve cover gasket. If the gasket is damaged, remove and discard the gasket.

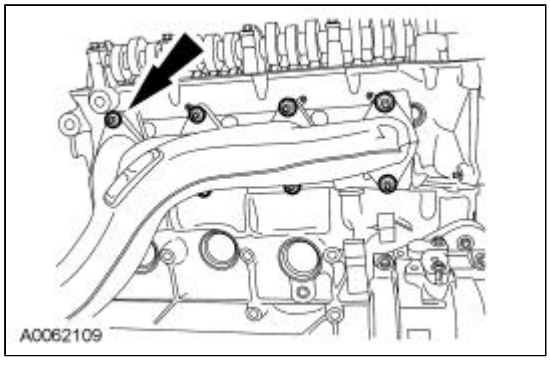
Clean the valve cover gasket groove with soap and water or a suitable solvent.



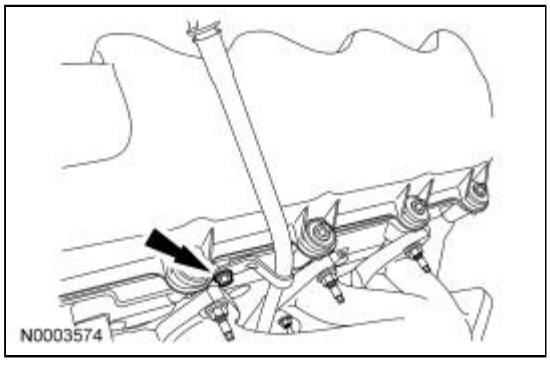
27. Remove the bolts and the LH engine support insulator-to-cylinder block bracket.



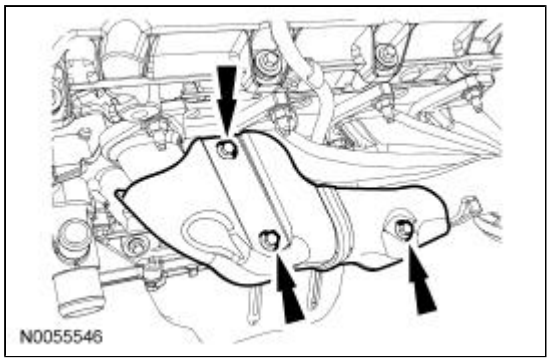
28. Remove the 8 nuts, the 8 studs and the RH exhaust manifold.
    - Discard the gaskets, nuts and studs.
    - Inspect the exhaust manifold. For additional information, refer to Section 303-00 .



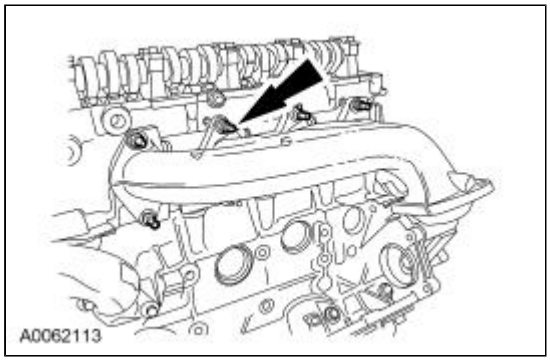
29. Remove the bolt and the oil level indicator tube.
    - Discard the O-ring seal.



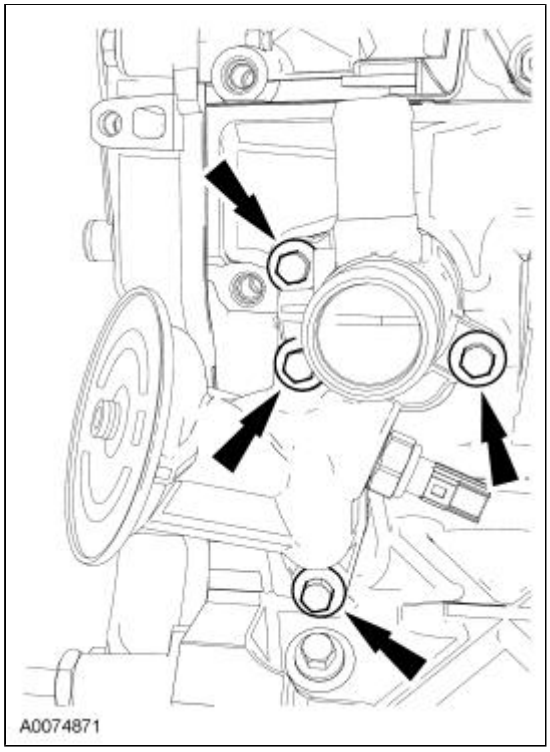
30. Remove the 3 bolts and the LH exhaust manifold heat shield.



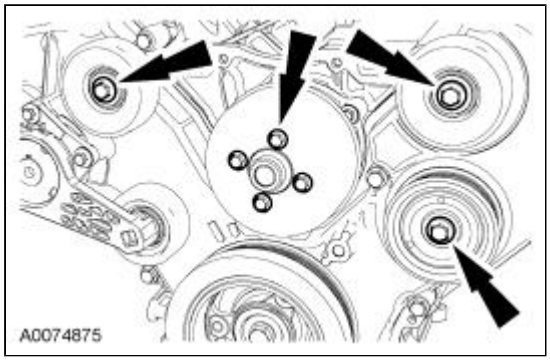
31. Remove the 8 nuts, the 8 studs and the LH exhaust manifold.
    - Discard the gaskets, nuts and studs.
    - Inspect the exhaust manifold. For additional information, refer to Section 303-00 .



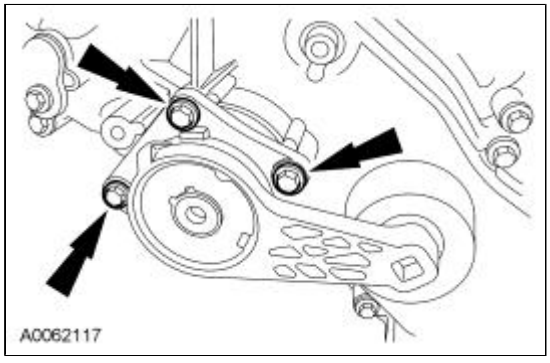
32. Remove the bolts and the oil filter adapter.
    - Discard the gasket.



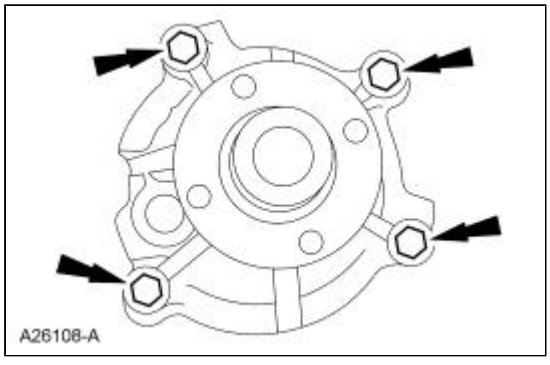
33. Remove the bolts, the coolant pump pulley and the 3 accessory drive belt idler pulleys.



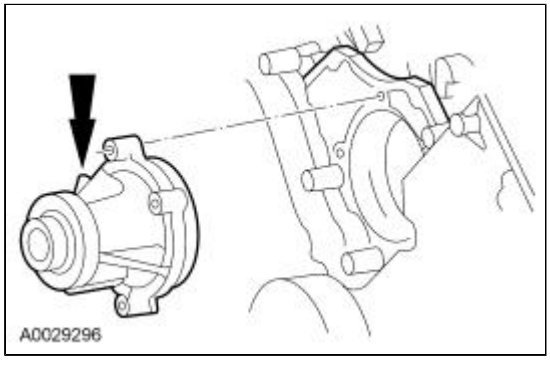
34. Remove the bolts and the accessory drive belt tensioner.



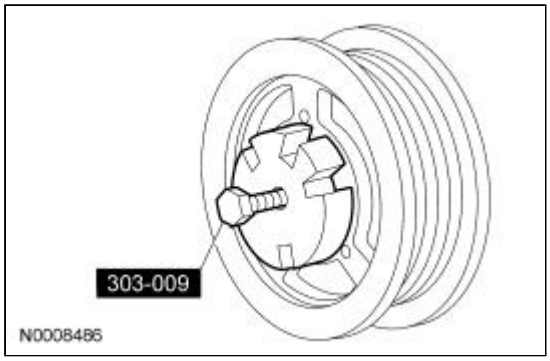
35. Remove the coolant pump bolts.



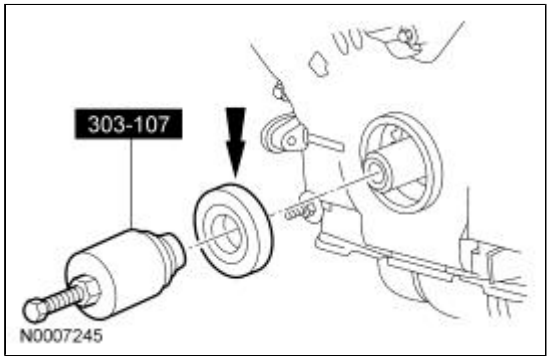
36. Remove the coolant pump from the cylinder block.
    - Discard the O-ring seal.



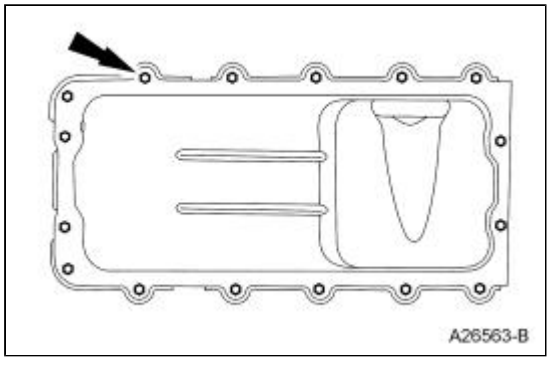
37. Remove and discard the crankshaft pulley bolt. Using the special tool, remove the crankshaft pulley.



38. Using the special tool, remove and discard the crankshaft front seal.

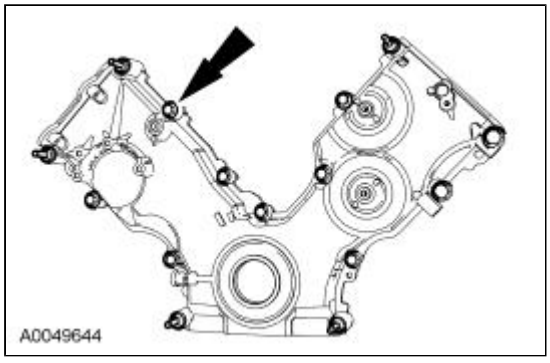


39. Remove the bolts, oil pan and discard the oil pan gasket.

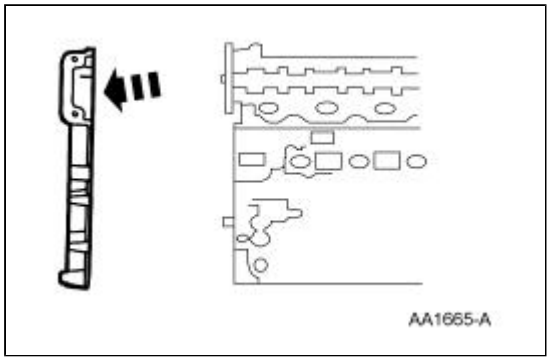


40. **NOTE:** Correct fastener location is essential for the assembly procedure. Record fastener location.

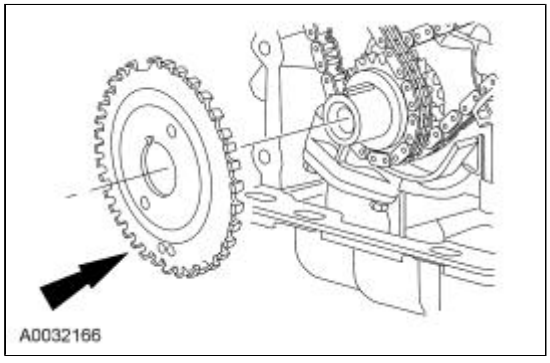
    Remove the fasteners.



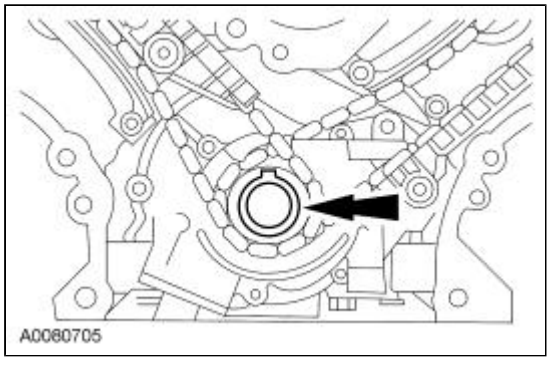
41. Remove the engine front cover from the cylinder block.



42. Remove the crankshaft sensor ring from the crankshaft.

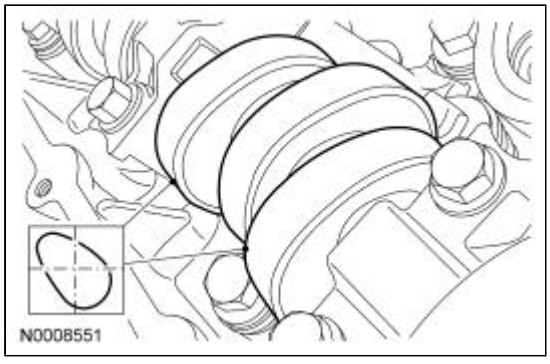


43. Position the crankshaft keyway at the 12 o'clock position.



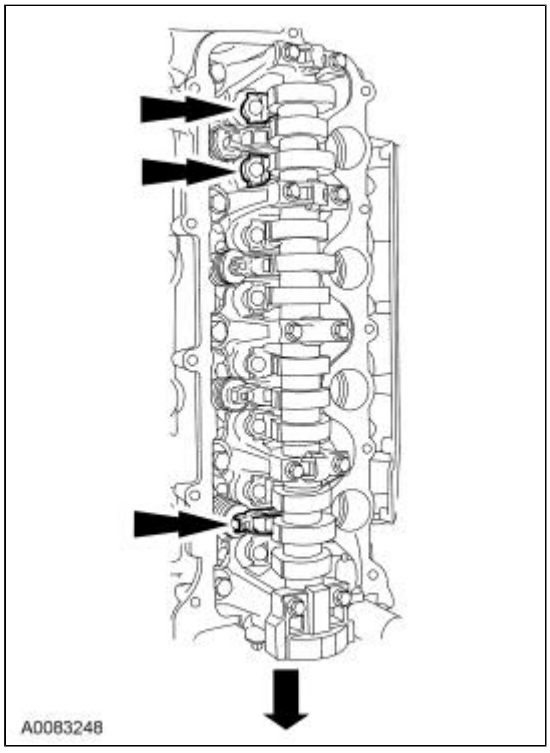
44. **NOTE:** If the camshaft lobes are not exactly positioned as shown, the crankshaft will require one full additional rotation to 12 o'clock.

    The No. 1 cylinder camshaft exhaust lobe must be coming up on the exhaust stroke. Verify by noting the position of the 2 intake camshaft lobes and the exhaust lobe on the No. 1 cylinder.



45. **CAUTION: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into the original locations.**

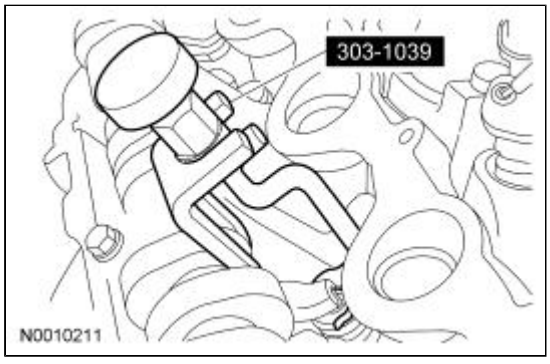
Remove only the 3 camshaft roller followers shown in the illustration from the RH cylinder head.



46. **CAUTION: Do not allow the valve keepers to fall off the valve or the valve may drop into the cylinder.**

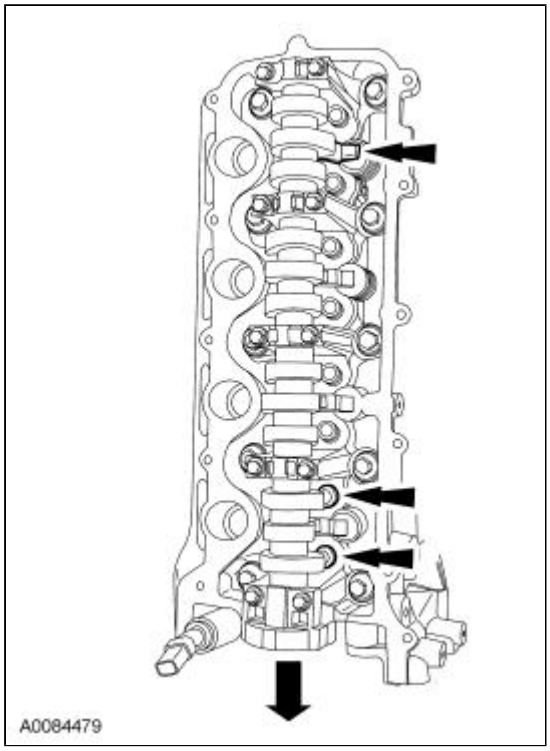
NOTE: It may be necessary to push the valve down while compressing the spring.

Using the special tool, remove the 3 designated camshaft roller followers in the previous step from the RH cylinder head.



47. **CAUTION: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into the original locations.**

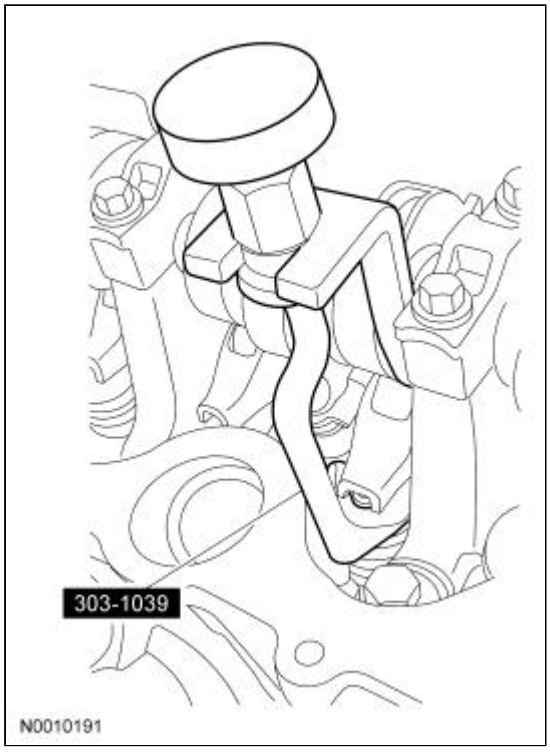
Remove only the 3 camshaft roller followers shown in the illustration from the LH cylinder head.



48. **CAUTION: Do not allow the valve keepers to fall off the valve or the valve may drop into the cylinder.**

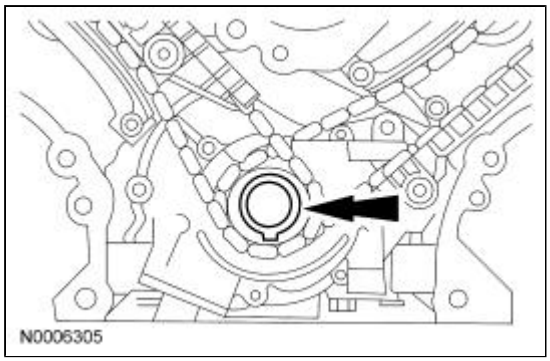
    NOTE: It may be necessary to push the valve down while compressing the spring.

    Using the special tool, remove the 3 designated camshaft roller followers in the previous step from the LH cylinder head.



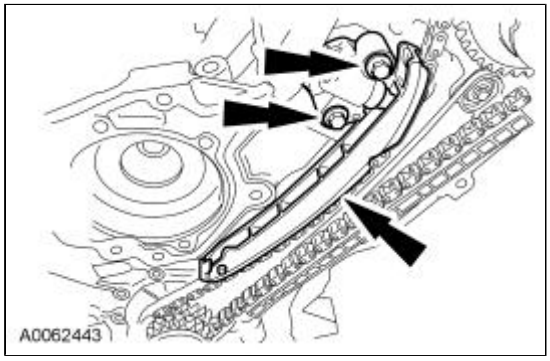
49. **CAUTION: The crankshaft cannot be moved past the 6 o'clock position once set.**

Rotate the crankshaft clockwise and position the crankshaft keyway at the 6 o'clock position.



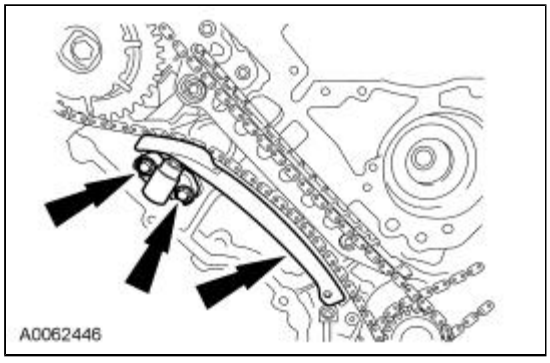
50. **CAUTION: If one or both of the tensioner mounting bolts are loosened or removed, the tensioner-sealing bead must be inspected for seal integrity. If cracks, tears, separation from the tensioner body or permanent compression of the seal bead is observed, install a new tensioner.**

    Remove the bolts, the LH timing chain tensioner and tensioner arm.

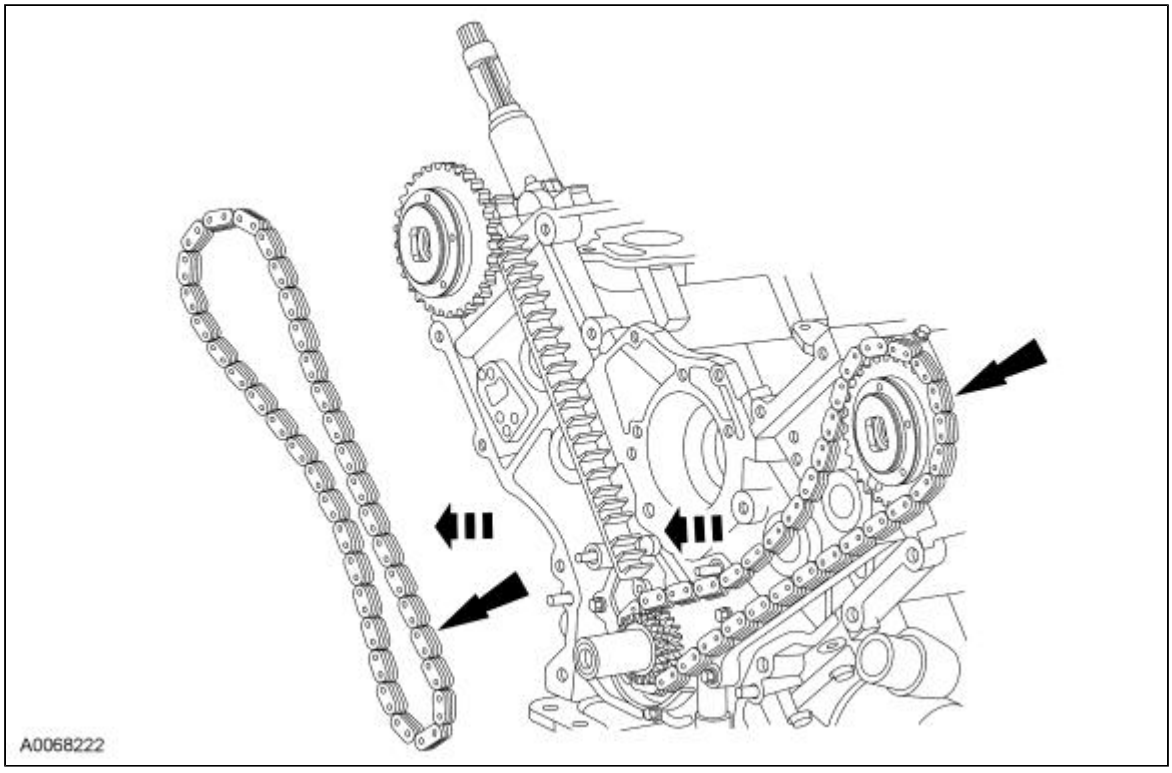


51. **CAUTION: If one or both of the tensioner mounting bolts are loosened or removed, the tensioner-sealing bead must be inspected for seal integrity. If cracks, tears, separation from the tensioner body or permanent compression of the seal bead is observed, install a new tensioner.**

    Remove the bolts, the RH timing chain tensioner and tensioner arm.



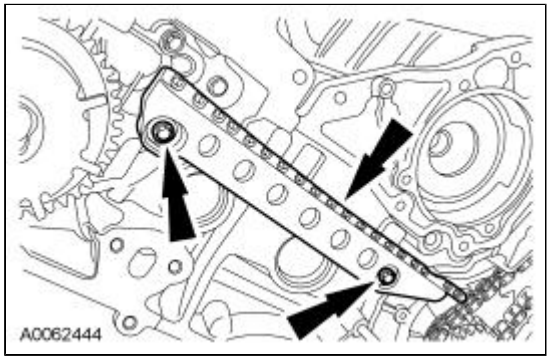
52. Remove the RH and LH timing chains and the crankshaft sprocket.
    - Remove the RH timing chain from the camshaft sprocket.
    - Remove the RH timing chain from the crankshaft sprocket.
    - Remove the LH timing chain from the camshaft sprocket.
    - Remove the LH timing chain and crankshaft sprocket.



53. **NOTE:** RH shown, LH similar.

Remove the LH and RH timing chain guides.

- Remove the bolts.
- Remove both timing chain guides.

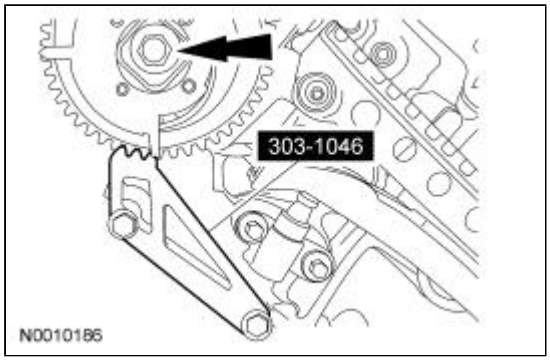


54. **CAUTION: Damage to the VCT phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

CAUTION: Only use hand tools to remove the VCT phaser sprocket assembly or damage may occur to the camshaft or VCT phaser sprocket.

Using the special tool, remove the bolt and the RH VCT phaser sprocket assembly.

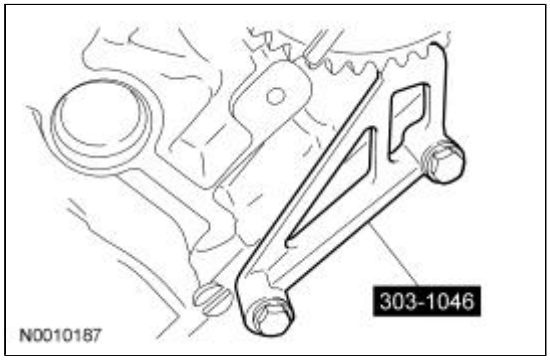
- Discard the VCT phaser sprocket bolt.



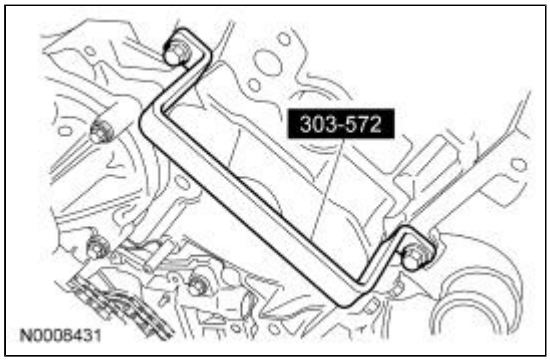
55. **CAUTION: Damage to the VCT phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    CAUTION: Only use hand tools to remove the VCT phaser sprocket assembly or damage may occur to the camshaft or VCT phaser sprocket.

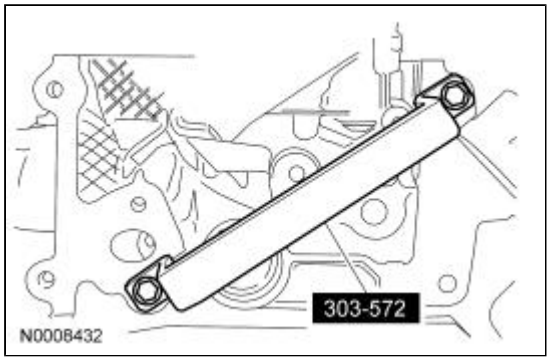
    Using the special tool, remove the bolt and the LH VCT phaser sprocket assembly.
    - Discard the VCT phaser sprocket bolt.



56. Install the special tool onto the LH cylinder head.



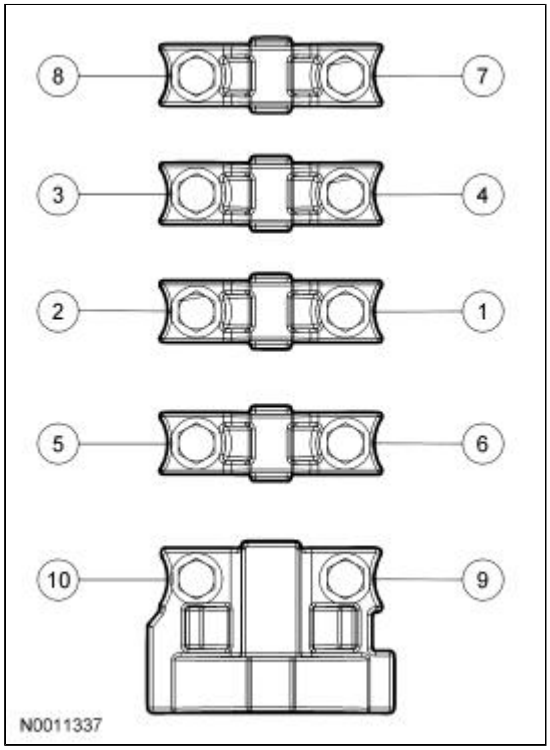
57. Install the special tool onto the RH cylinder head.



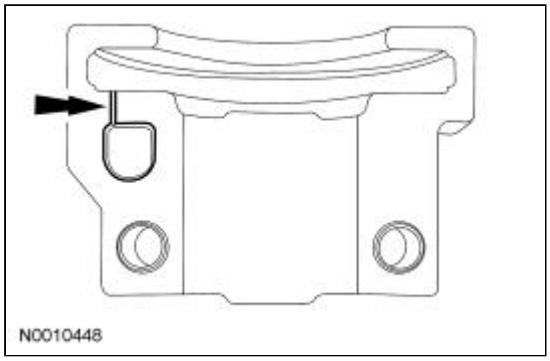
58. **CAUTION: When removing the front thrust camshaft bearing cap, use care as the cap may be damaged from sideloading when removing the cam unequally in height from the bearing towers.**

    NOTE: The camshaft bearing caps must be installed in their original locations. Record camshaft bearing cap locations.

    Remove the bolts in the sequence shown and remove the RH cylinder head front camshaft bearing cap and then the remaining bearing caps.



59. Clean and inspect the RH camshaft bearing caps.
    - The camshaft front thrust bearing cap contains an oil metering groove. Make sure the groove is free of foreign material.



60. Remove the RH camshaft.

61. **CAUTION: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into the original locations.**

    Remove the remaining camshaft roller followers from the RH cylinder head.

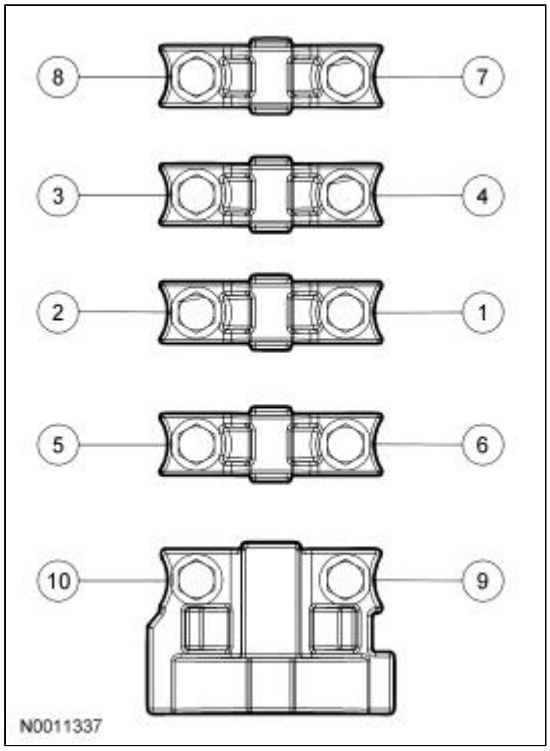
62. **CAUTION: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into the original locations.**

    Remove the hydraulic lash adjusters from the RH cylinder head.

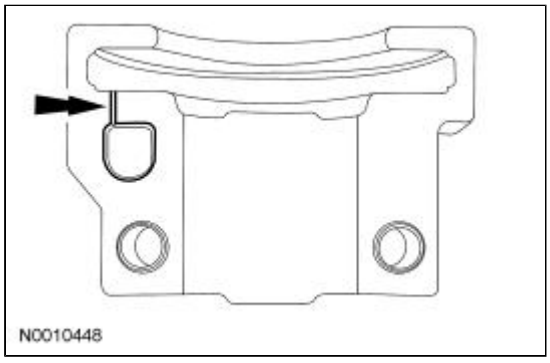
63. **CAUTION: When removing the front thrust camshaft bearing cap, use care as the cap may be damaged from sideloading when removing the cam unequally in height from the bearing towers.**

    NOTE: The camshaft bearing caps must be installed in their original locations. Record camshaft bearing cap locations.

    Remove the bolts in the sequence shown and remove the LH cylinder head front camshaft bearing cap and then the remaining bearing caps.



64. Clean and inspect the LH camshaft bearing caps.
    - The camshaft front thrust bearing cap contains an oil metering groove. Make sure the groove is free of foreign material.



65. Remove the LH camshaft.

66. **CAUTION: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into the original locations.**

    Remove the remaining camshaft roller followers from the LH cylinder head.

67. **CAUTION: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into the original locations.**

    Remove the hydraulic lash adjusters from the LH cylinder head.

68. **CAUTION: The cylinder head must be cool before removing it from the engine. Cylinder head warpage can result if a warm or hot cylinder head is removed.**

CAUTION: Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine.

CAUTION: The cylinder head bolts must be discarded and new bolts must be installed. They are tighten-to-yield designed and cannot be reused.

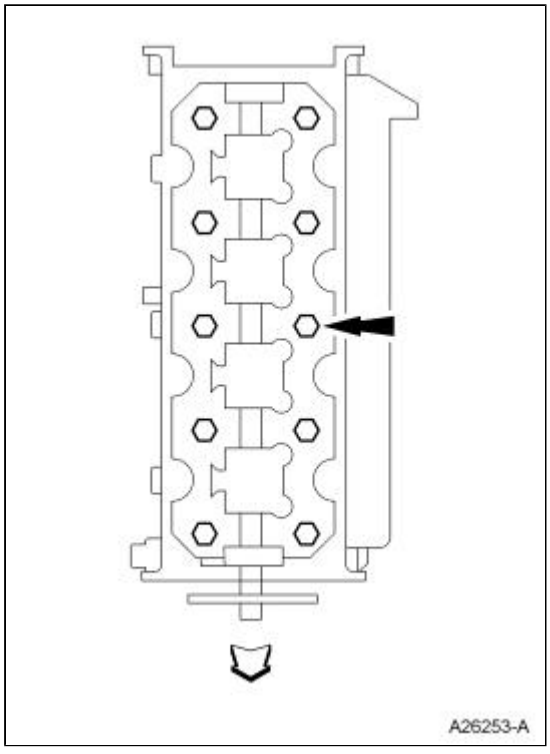
CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.

CAUTION: Aluminum surfaces are soft and can be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.

NOTE: RH shown, LH similar.

Remove the bolts and the cylinder head.

- Discard the cylinder head gasket.
- Discard the cylinder head bolts.



69. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

CAUTION: Observe all warnings or cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

Clean the cylinder head-to-cylinder block mating surfaces of both the cylinder head and the

cylinder block.

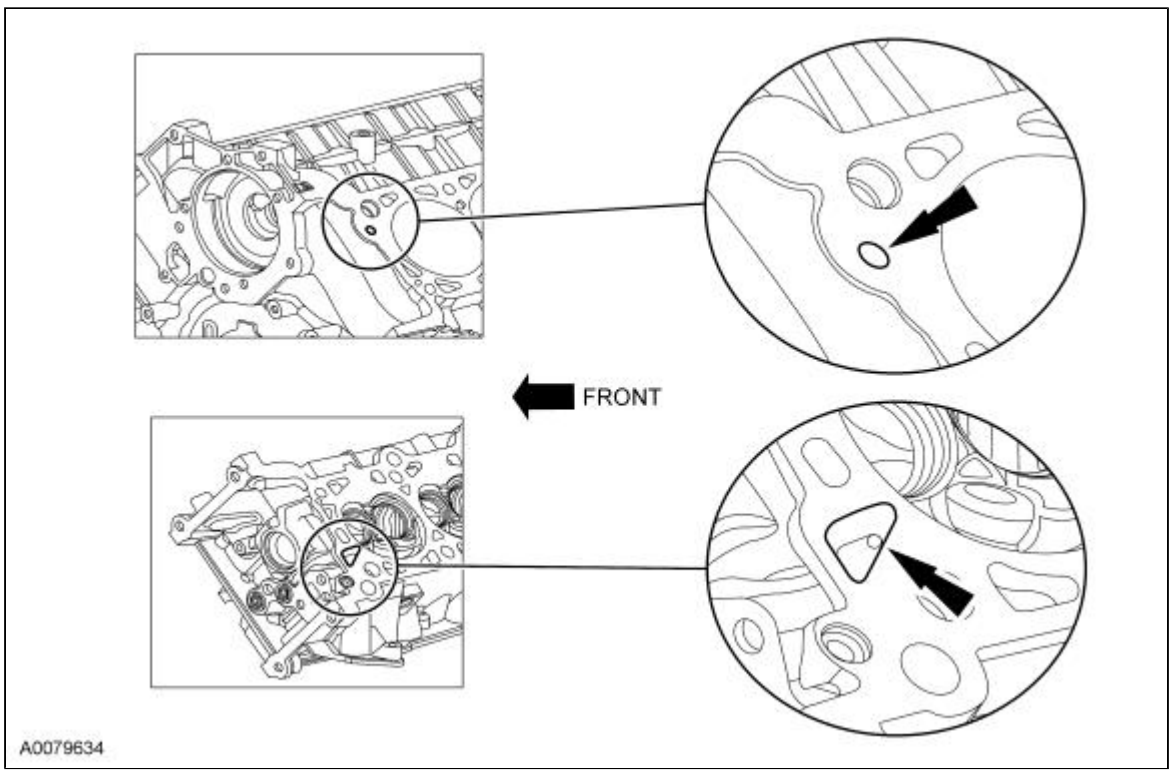
1. Remove any large deposits of silicone or gasket material with a plastic scraper.
2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.
3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant, and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

70. **NOTE:** Make sure all cylinder head surfaces are clear of any gasket material, RTV, oil and coolant. The cylinder head surface must be clean and dry before running a flatness check.

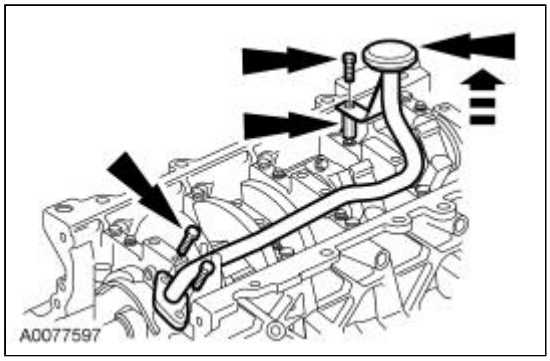
    NOTE: Use a straightedge that is calibrated by the manufacturer to be flat within 0.005 mm (0.0002 in) per running foot length. For example, if the straightedge is 61 cm (24 in) long, the machined edge must be flat within 0.010 mm (0.0004 in) from end to end.

    NOTE: LH shown, RH similar.

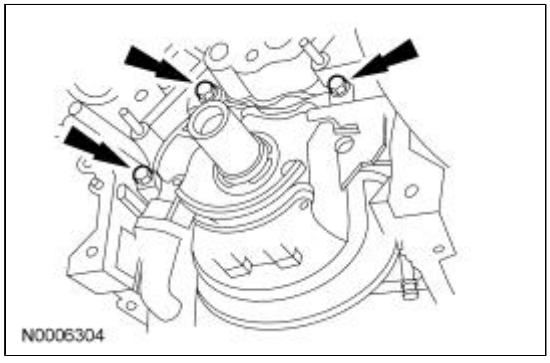
    Support the cylinder head on a bench with the head gasket side up. Inspect all areas of the deck face with a straightedge, paying particular attention to the oil pressure feed area. The cylinder head must not have depressions deeper than 0.0254 mm (0.001 in) across a 38.1 mm (1.5 in) square area, or scratches longer than 0.0254 mm (0.001 in).



71. Remove the bolts, the oil pump screen and pickup tube and the spacer.



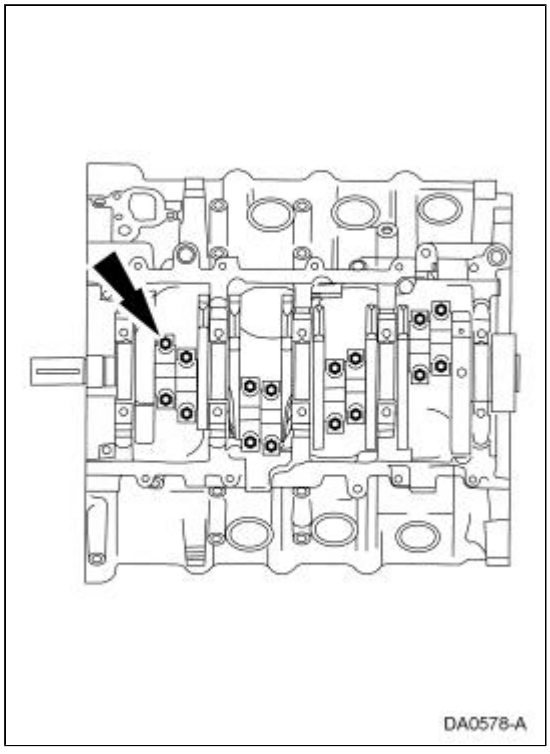
72. Remove the 3 bolts and the oil pump.



73. Before removing the pistons, inspect the top of the cylinder bores. If necessary, remove the ridge or carbon deposits from each cylinder using an abrasive pad or equivalent, following the manufacturer instructions.

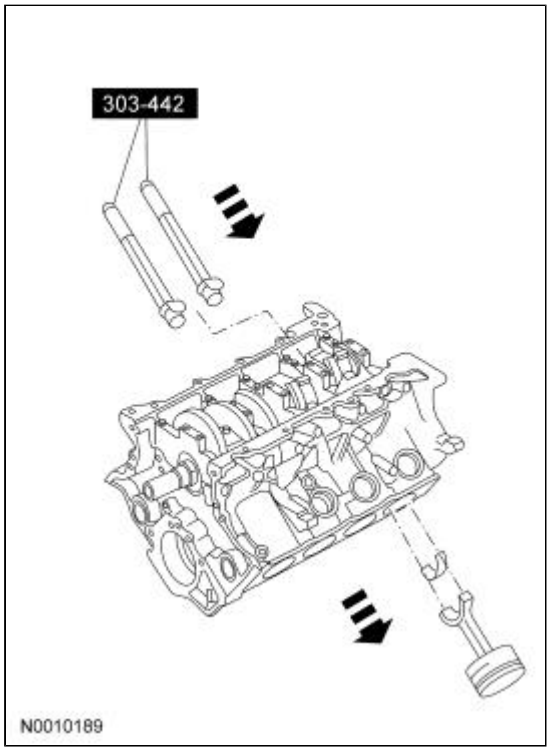
74. **CAUTION: Verify that the connecting rods and rod caps have orientation numbers cast into them. If not, number the connecting rods and rod caps for correct orientation.**

Remove the bolts and the connecting rod caps. Discard the bolts.



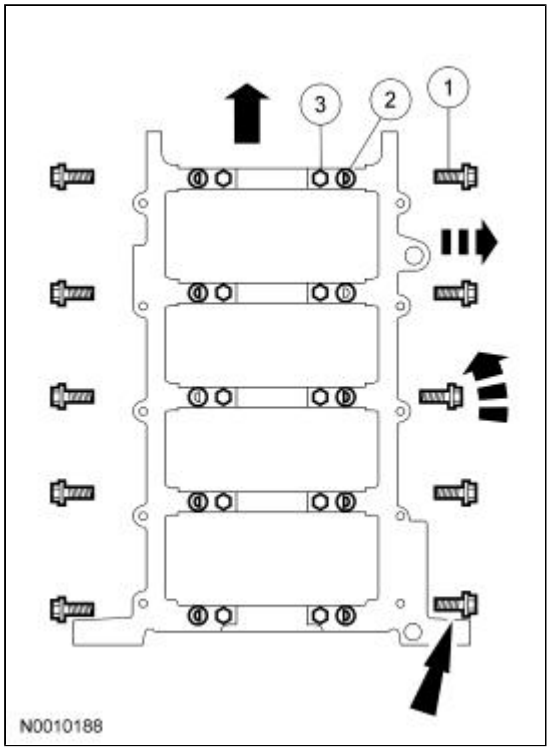
75. **CAUTION: Do not scratch the cylinder walls or crankshaft journals with the connecting rod.**

Use the special tool to push the piston through the top of the cylinder block.

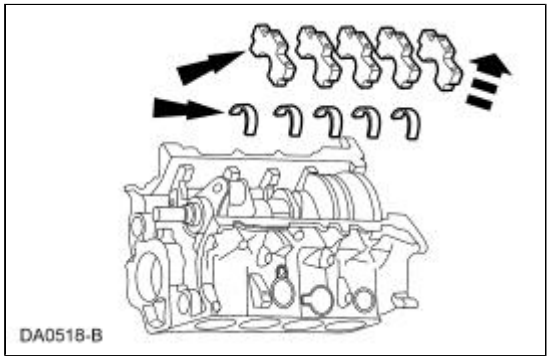


76. Disassemble the 8 pistons. For additional information, refer to Piston in this section.

77. Remove the fasteners.
    1. Remove and discard the cross-mounted main cap bolts.
    2. Remove the dowels.
    3. Remove and discard the main bearing cap bolts.



78. Remove the 5 main bearing caps, the lower crankshaft main bearings and the lower thrust washer.



79. Remove the crankshaft, the upper crankshaft main bearings and the upper thrust washers from the cylinder block.

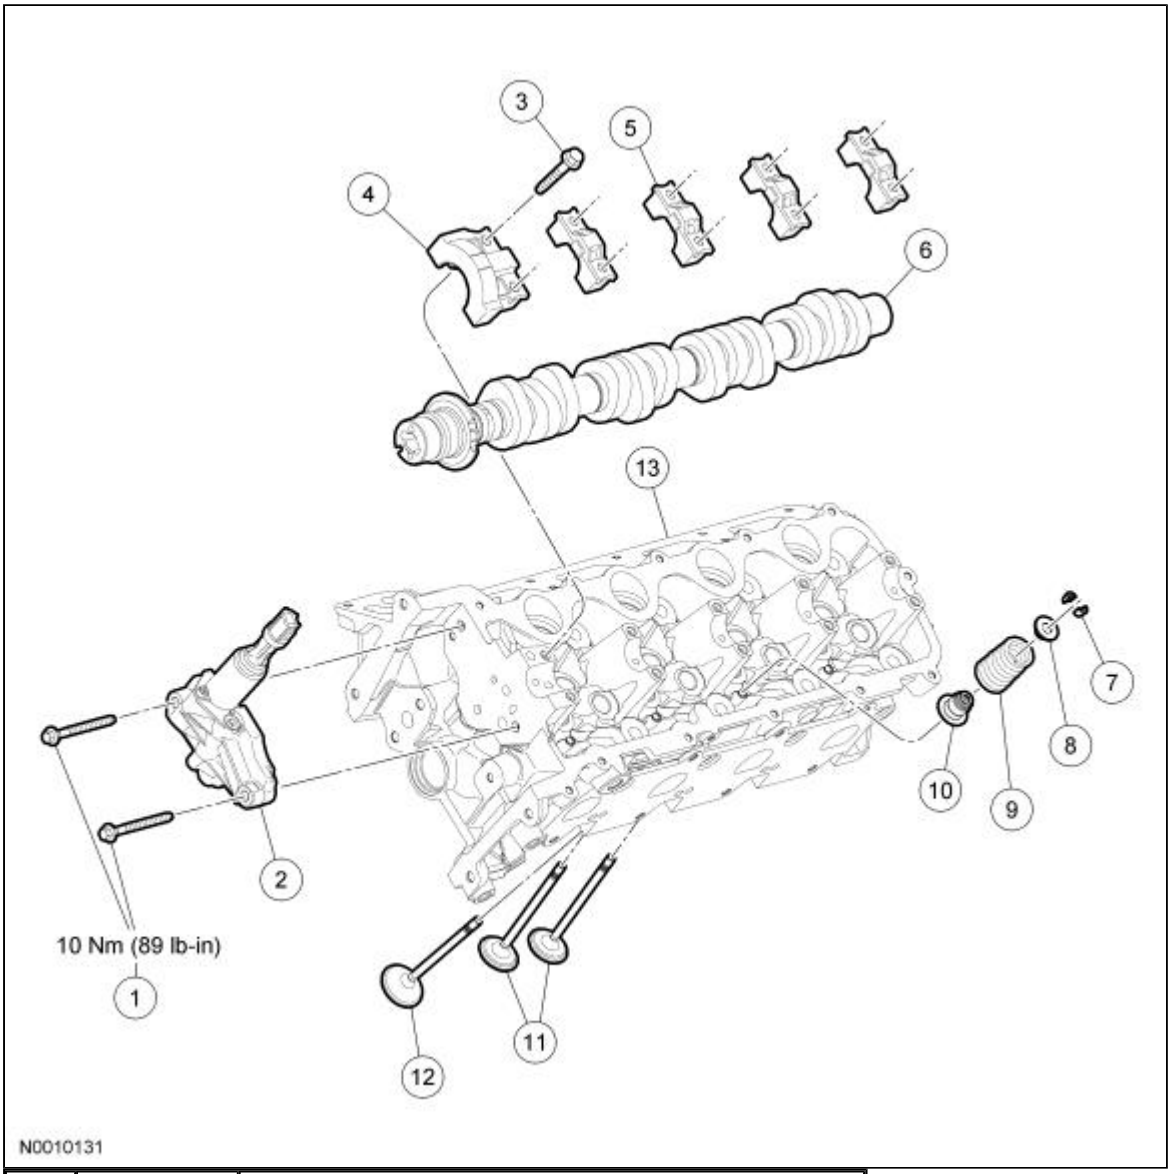
ST2804-A	Compressor, Valve Spring 303-1039
 ST1332-A	Installer, Valve Stem Oil Seal 303-383 (T91T-6571-A)

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A



Item	Part Number	Description
1	W701520	Variable camshaft timing (VCT) housing assembly bolts (2 required)
2	6C261	VCT housing assembly
3	N807834	Camshaft bearing cap bolt (10 required)
4	6B284	Camshaft front bearing cap
5	6B280	Camshaft bearing cap (4 required)
6	6C255	Camshaft
7	6518	Valve spring retainer key (24 required)
8	6514	Valve spring retainer (12 required)
9	6513	Valve spring (12 required)
10	6A517	Valve seal (12 required)
11	6507	Intake valves (8 required)
12	6505	Exhaust valve (4 required)
13	6050	Cylinder head

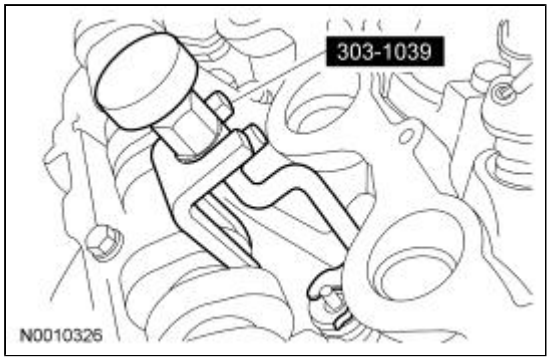
Disassembly

1. Remove the bolts and the variable camshaft timing (VCT) housing.
    - Discard the gasket.

2. Lubricate the camshaft and camshaft journals with clean engine oil and install the camshaft.

3. Install the camshaft bearing caps in their original locations.
    - Lubricate the camshaft bearing caps with clean engine oil.
    - Position the front camshaft bearing cap.
    - Position the remaining camshaft bearing caps.
    - Install the bolts finger tight.

4. Using the special tool, compress the valve spring and remove the valve spring retainer keys.



5. Remove the valve spring retainer, the valve spring and the valve seal.
    - Discard the valve seal.

6. Remove the valve from the cylinder head

7. Repeat the previous 3 steps for each valve.

8. Inspect the components. For additional information, refer to Section 303-00 .

9. **CAUTION: When removing the front thrust camshaft bearing cap, use care as the cap may be damaged from sideloading when removing the cam unequally in height from the bearing towers.**

    Remove the bolts the front camshaft bearing cap and then the remaining bearing caps.

10. Remove the camshaft.

11. Check the cylinder head for distortion. For additional information, refer to Section 303-00 .

Assembly

1. Lubricate the camshaft and camshaft journals with clean engine oil and install the camshaft.

2. Install the camshaft bearing caps in their original locations.
    - Lubricate the camshaft bearing caps with clean engine oil.
    - Position the front camshaft bearing cap.
    - Position the remaining camshaft bearing caps.
    - Install the bolts finger tight.

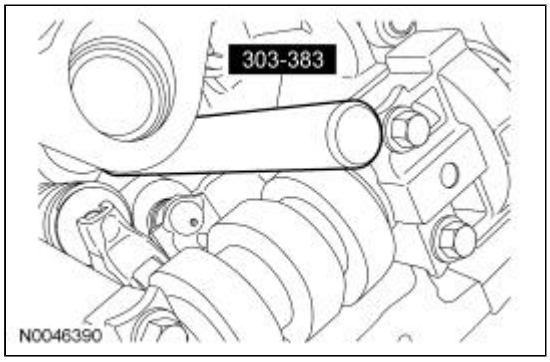
3. **NOTE:** Lubricate the valve stem with clean engine oil prior to installation.

   Install the valve into the cylinder head.

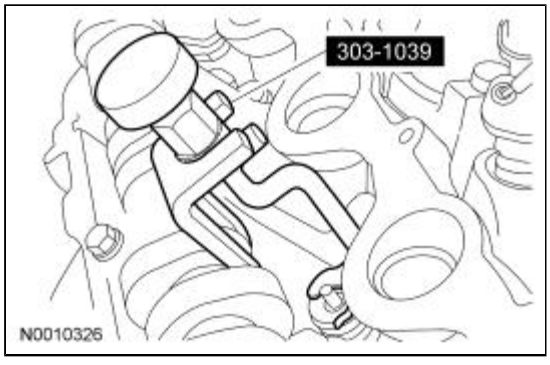
4. **NOTE:** Lubricate the valve seal and valve stem with clean engine oil prior to installation.

   Position a new valve seal onto the valve stem.

5. Using the special tool, install the new valve seal.



6. Using the special tool, install the valve spring, the valve spring retainer and the valve spring retainer keys.



7. Repeat the previous 2 steps for each valve.

8. Remove the bolts the front camshaft bearing cap and then the remaining bearing caps.

9. Remove the camshaft.

10. Install a new gasket, the VCT housing and the bolts.
    - Tighten to 10 Nm (89 lb-in).

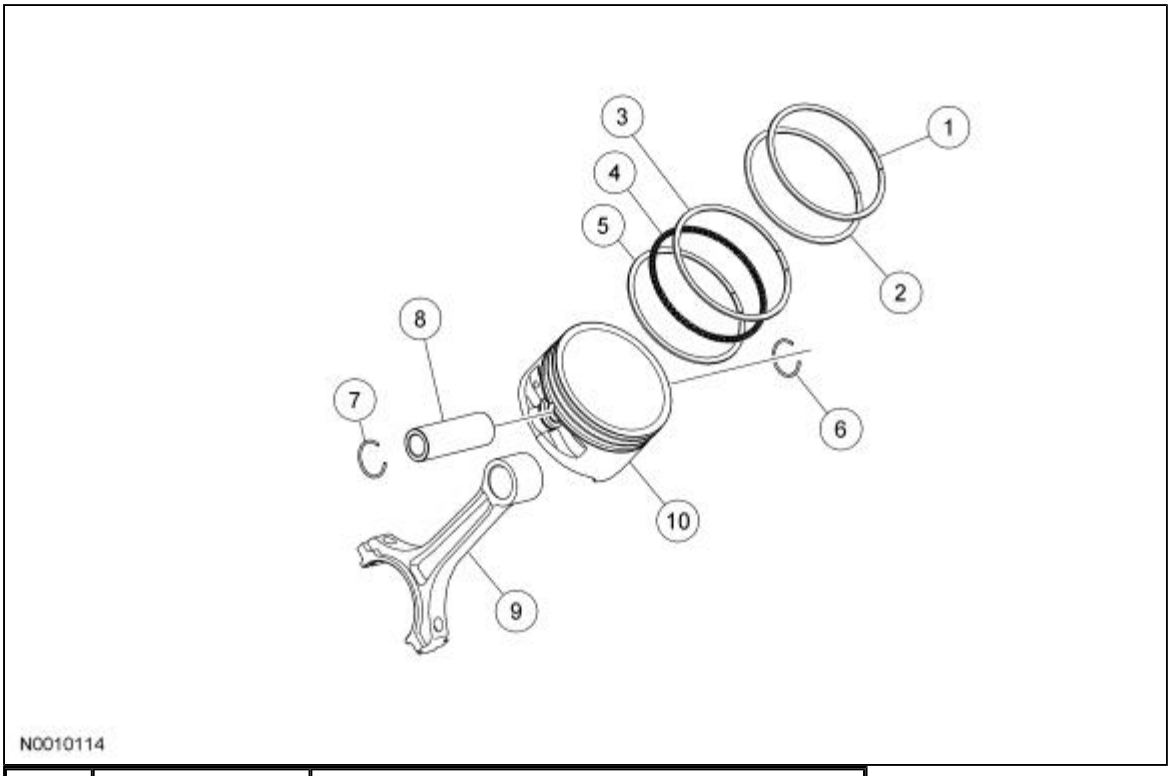
Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A



Item	Part Number	Description
1	6150	Piston compression upper ring
2	6152	Piston compression lower ring
3	6159	Piston oil control upper segment ring
4	6161	Piston oil control spacer
5	6159	Piston oil control lower segment ring
6	6140	Piston pin retainer
7	6140	Piston pin retainer
8	6135	Piston pin
9	6200	Connecting rod
10	6110	Piston

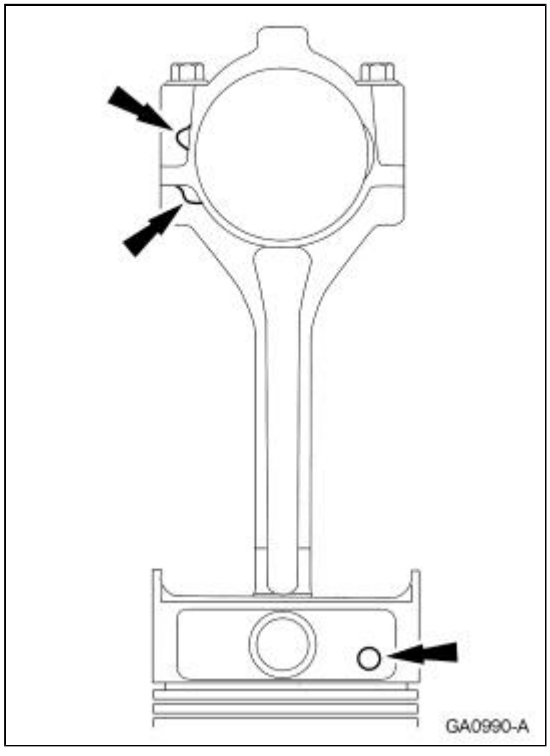
Disassembly

1. Remove the piston rings from the piston.
    - Discard the piston rings.
2. Remove the piston pin retainers and the piston pin.
3. Separate the piston from the connecting rod.
4. Clean and inspect the piston and connecting rod. For additional information, refer to Section 303-00 .

Assembly

1. **NOTE:** The connecting rod must be installed into the piston with identification markings toward the front.

   Position the connecting rod in the piston.



2. Lubricate the piston pin and pin bore with clean engine oil.
3. Install the piston pin in the piston and connecting rod assembly.
4. Install the piston pin retaining clips in the piston.
5. Lubricate the piston and the new piston rings with clean engine oil.
6. Install the piston rings onto the piston.

13	W719084	CMCV bolts (2 required)
14	9G730	CMCV
15	W500204	Positive crankcase ventilation (PCV) heater element bolts (2 required)
16	9F624	PCV heater element
17	—	PCV heater element O-ring seal
18	9Y451	Intake manifold assembly

Disassembly

1. Remove the 4 bolts, the vibration damper and the throttle body (TB).

2. Remove the 4 bolts and the fuel rail.

3. Remove the fuel injector-to-fuel rail locking clips and separate the fuel injectors from the fuel rail.
    - Discard the 2 O-ring seals from each fuel injector.

4. Remove the charge motion control valve (CMCV) rod locking clips.

5. Remove the stud bolt, the 2 bolts and the CMCV.

6. Remove the 2 bolts and the positive crankcase ventilation (PCV) heater element.
    - Discard the O-ring seal.

7. Remove the engine noise shield insulator from the intake manifold.

Assembly

1. Install the engine noise shield insulator onto the intake manifold.

2. **NOTE:** Lubricate the new O-ring seal with clean engine oil prior to installation.

   Using a new O-ring seal, install the PCV heater element and the 2 bolts.
    - Tighten to 6 Nm (53 lb-in).

3. Position the CMCV and install the stud bolt and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

4. Install the CMCV rod locking clips.

5. **NOTE:** Lubricate the new O-ring seal with clean engine oil prior to installation.

   Install new O-ring seals on each of the fuel injectors.

6. Assemble the fuel injectors onto the fuel rail and install the locking clips.

7. Install the fuel rail and fuel injector assembly onto the intake manifold.

8. Install the 4 fuel rail bolts.
    - Tighten to 10 Nm (89 lb-in).

9. **NOTE:** Lubricate the TB-to-intake manifold gasket with clean engine coolant prior to installation.

    Install the TB, the vibration damper and tighten the bolts in 2 stages.
    - Stage 1: Tighten to 9 Nm (80 lb-in).
    - Stage 2: Tighten an additional 90 degrees.

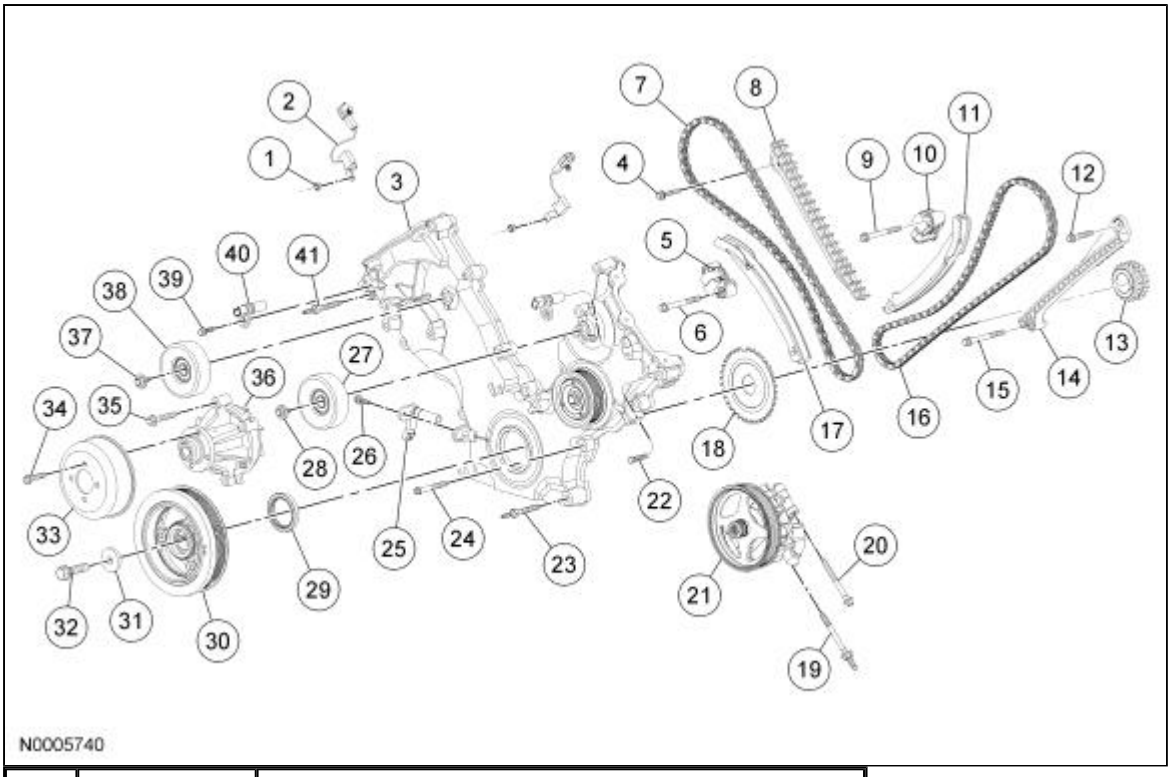
8	6C255	Camshaft — LH

9	6529	Roller follower (24 required)
10	6518	Valve spring retainer key (48 required)
11	6514	Valve spring retainer (24 required)
12	6513	Valve spring (24 required)
13	6A517	Valve stem seal (24 required)
14	6C501	Hydraulic lash adjuster (24 required)
15	6279	Camshaft phaser sprocket bolt — LH
16	6C524	Camshaft phaser sprocket — LH
17	6B284	Camshaft bearing cap
18	12405	Spark plug (4 required)
19	12A366	Ignition coil (4 required)
20	6065	Cylinder head bolt (20 required)
21	W707747	Exhaust manifold stud (8 required)
22	9Y431	Exhaust manifold gaskets (2 required)
23	9431	Exhaust manifold — LH
24	W701706	Exhaust manifold nut (8 required)
25	6507	Intake valve (16 required)
26	6505	Exhaust valve (8 required)
27	6083	Cylinder head gasket — LH
28	W701520	Variable camshaft timing (VCT) oil control solenoid assembly bolt (2 required)
29	6C261	VCT oil control solenoid assembly
30	6050	Cylinder head — LH
31	14B102	Cylinder head temperature (CHT) sensor jumper harness
32	W701571	Heater outlet tube stud bolt
33	18663	Heater outlet tube
34	6051	Cylinder head gasket — RH
35	6049	Cylinder head — RH
36	9Y431	Exhaust manifold gasket (2 required)
37	9430	Exhaust manifold — RH
38	W701706	Exhaust manifold nut (8 required)
39	W707747	Exhaust manifold stud (8 required)
40	6C260	VCT oil control solenoid assembly
41	W701520	VCT oil control solenoid assembly bolt (2 required)
42	6279	Camshaft phaser sprocket bolt — RH
43	6C524	Camshaft phaser sprocket — RH
44	6B284	Camshaft bearing cap
45	N807834	Camshaft bearing cap bolt (10 required)
46	6B280	Camshaft bearing cap (4 required)
47	6251	Camshaft — RH
48	12405	Spark plug (4 required)

49	12A366	Ignition coil (4 required)
50	W706175	Ignition coil bolt (8 required)
51	6582	Valve cover — RH
52	6765	Oil fill adapter
53	6766	Oil fill adapter cap
54	6758	Crankcase ventilation tube
55	W503282	Coolant crossover tube bolt (3 required)
56	W503279	Thermostat housing bolt (2 required)
57	8594	Thermostat housing
58	N806807	Thermostat O-ring seal
59	8575	Thermostat
60	8C369	Coolant crossover tube
61	9A474	Intake manifold vacuum tube and support bracket
62	W709775	Intake manifold bolt (10 required)
63	9Y451	Intake manifold assembly
64	6K817	Positive crankcase ventilation (PCV) tube
65	W500204	PCV heater element assembly bolt (2 required)
66	9F624	PCV heater element assembly

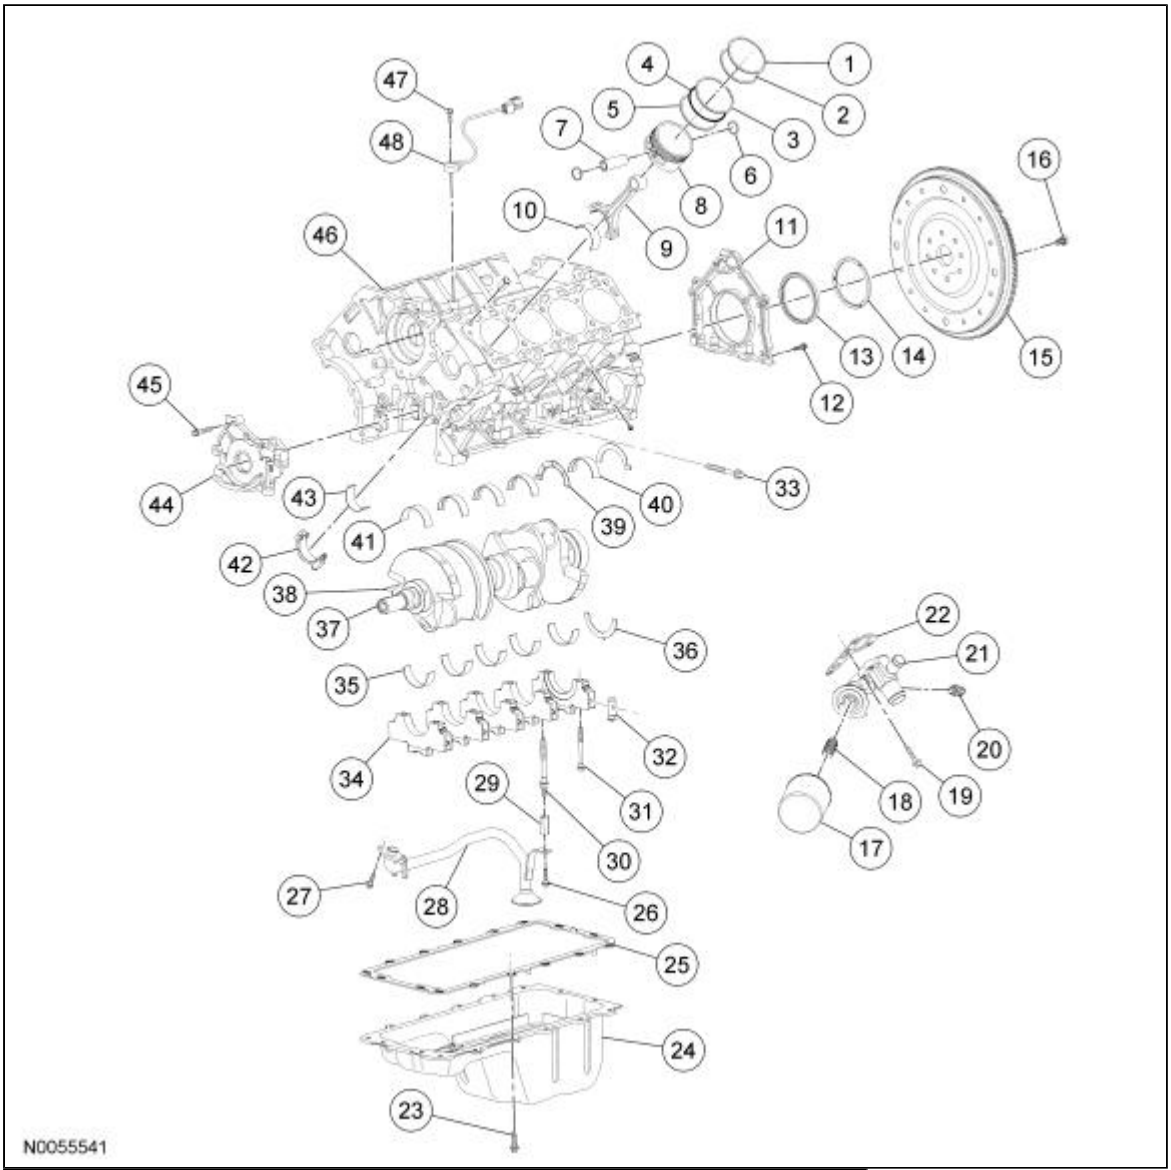
Engine — Front End



Item	Part Number	Description
1	N804758	Radio ignition interference capacitor nut
2	18801	Radio ignition interference capacitor
3	6C086	Engine front cover

4	W503282	Timing chain guide bolt— RH (2 required)
5	6L266	Timing chain tensioner — RH
6	N606543	Timing chain tensioner bolt — RH (2 required)
7	6268	Timing chain — RH
8	6M256	Timing chain guide — RH
9	N606543	Timing chain tensioner bolt — LH (2 required)
10	6M269	Timing chain tensioner — LH
11	6M274	Tensioner arm — LH
12	N605892	Timing chain guide upper bolt — LH
13	6306	Crankshaft sprocket
14	6B274	Timing chain guide — LH
15	N606527	Timing chain guide lower bolt — LH
16	6268	Timing Chain — LH
17	6K255	Tensioner arm — RH
18	12A227	Ignition pulse wheel
19	W707225	Power steering pump stud bolt
20	W706447	Power steering pump bolt (2 required)
21	3A696	Power steering pump assembly
22	W706605	Engine front cover bolt
23	N808529	Engine front cover stud bolt (2 required)
24	N806177	Engine front cover bolt (9 required)
25	6C315	Crankshaft position (CKP) sensor
26	N806155	CKP sensor bolt
27	19A216	Accessory drive belt idler pulley
28	N808102	Accessory drive belt idler pulley bolt
29	6700	Crankshaft front seal
30	6316	Crankshaft pulley
31	N806165	Crankshaft pulley washer
32	W701512	Crankshaft pulley bolt
33	8A528	Coolant pump pulley
34	N806282	Coolant pump pulley bolt (4 required)
35	N808794	Coolant pump bolt (4 required)
36	8501	Coolant pump
37	N808102	Accessory drive belt idler pulley bolt
38	19A216	Accessory drive belt idler pulley
39	N806155	Camshaft position (CMP) sensor bolt (2 required)
40	6B288	CMP sensor (2 required)
41	W709573	Engine front cover stud bolt (3 required)

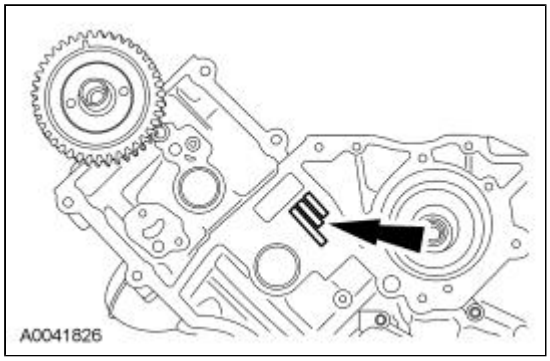
Engine — Lower End



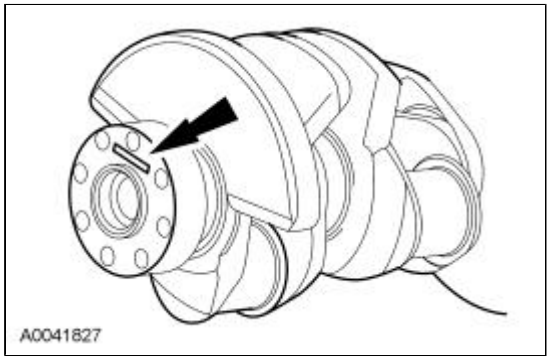
Item	Part Number	Description
1	6150	Upper compression ring (8 required)
2	6152	Lower compression ring (8 required)
3	6159	Outer oil control ring (8 required)
4	6161	Inner oil control ring (8 required)
5	6159	Outer oil control ring (8 required)
6	6140	Piston pin retainer (16 required)
7	6135	Piston pin (8 required)
8	6110	Piston (8 required)
9	6200	Connecting rod assembly (8 required)
10	6211	Connecting rod bearing (8 required)
11	6K318	Crankshaft rear seal retainer plate
12	N806155	Crankshaft rear seal retainer plate bolt (6 required)
13	6310	Crankshaft rear seal
14	6701	Crankshaft oil slinger

15	6375	Flexplate
16	N806168	Flexplate bolt (8 required)
17	6714	Oil filter
18	6890	Oil filter threaded adapter
19	N806156	Oil filter adapter bolt (4 required)
20	9278	Engine oil pressure (EOP) switch
21	6881	Oil filter adapter
22	6A636	Oil filter adapter gasket
23	W701605	Oil pan bolt (16 required)
24	6675	Oil pan
25	6710	Oil pan gasket
26	N605904	Oil pump screen and pickup tube bolt
27	N806155	Oil pump screen and pickup tube bolt (2 required)
28	6622	Oil pump screen and pickup tube
29	N806180	Oil pump screen and pickup tube spacer
30	6K258	Crankshaft main bearing cap stud
31	6345	Crankshaft main bearing cap bolt (9 required)
32	6A346	Crankshaft main bearing dowel (10 required)
33	6C357	Crankshaft main bearing cap bolt (10 required)
34	6325	Crankshaft main bearing cap (5 required)
35	6A338	Crankshaft bearing — lower (5 required)
36	6K302	Crankshaft thrust washer — lower
37	6303	Crankshaft
38	N806201	Crankshaft key
39	6A341	Crankshaft thrust washer — upper (2 required)
40	6333	Crankshaft bearing — upper (4 required)
41	6W337	Crankshaft bearing — upper
42	6210	Connecting rod cap (8 required)
43	6211	Connecting rod bearing (8 required)
44	6621	Oil pump
45	N806183	Oil pump bolt (3 required)
46	6010	Cylinder block
47	W500225	Knock sensor bolt (2 required)
48	12A699	Knock sensor (2 required)

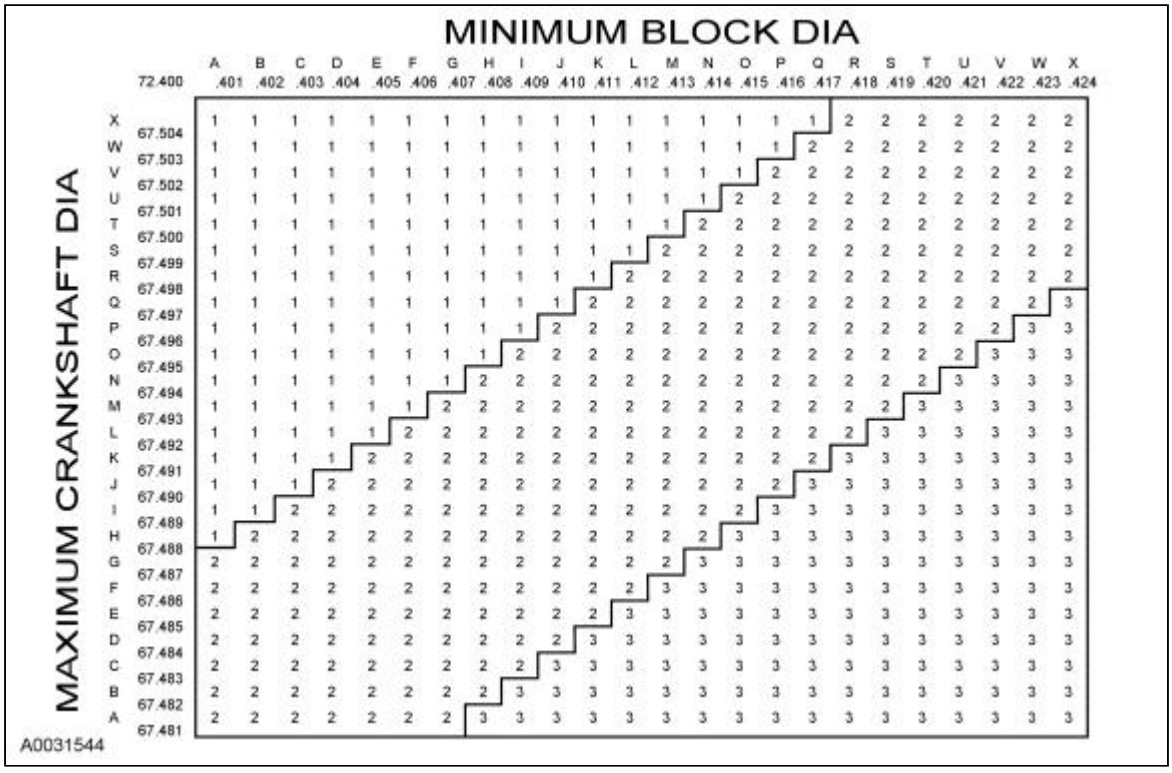
1. Record the main bearing code found on the front of the engine block.



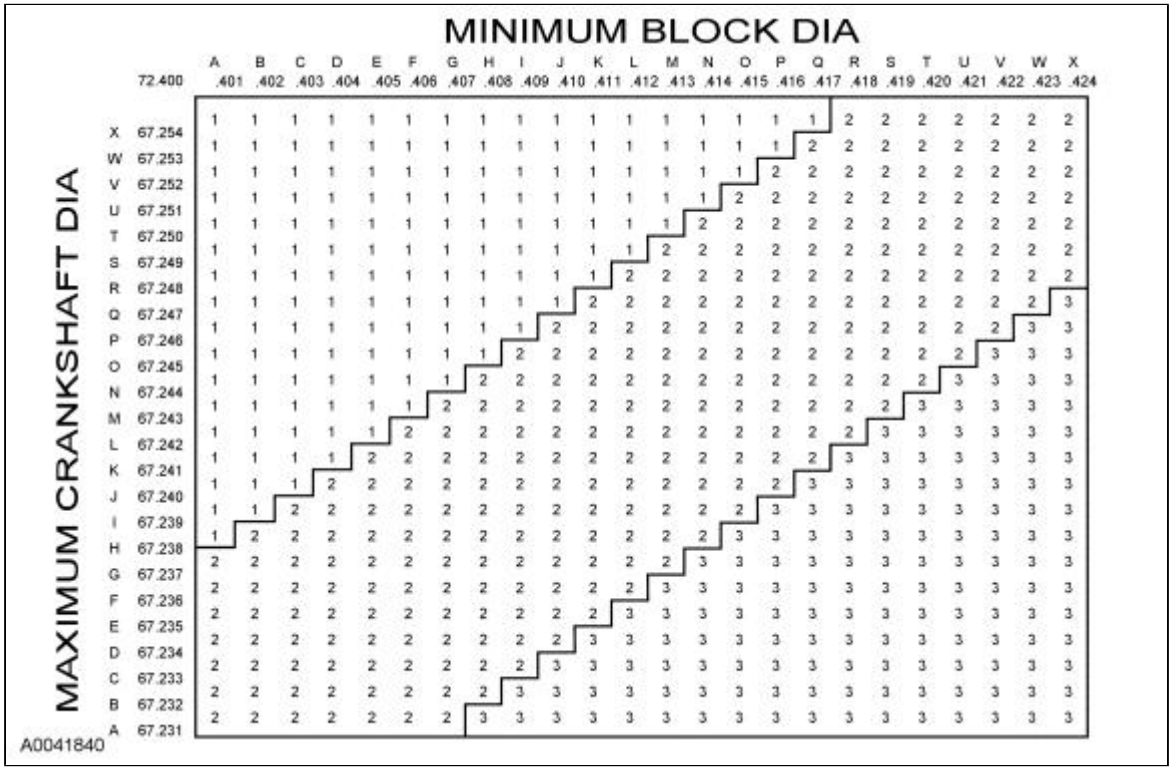
2. Record the main bearing code found on the back of the crankshaft.



3. Using the data recorded earlier and the Bearing Select Fit Chart, Standard Bearings, determine the required bearing grade for each main bearing.
    - Read the first letter of the engine block main bearing code and the first letter of the crankshaft main bearing code.
    - Read down the column below the engine block main bearing code letter, and across the row next to the crankshaft main bearing code letter, until the 2 intersect. This is the required bearing grade for the number one crankshaft main bearing.
    - As an example, if the engine block code letter is "F" and the crankshaft code letter is "D", the correct bearing grade for this main bearing is a "2".
    - Repeat this process for the remaining 4 main bearings.



4. If oversize bearings are being used, use the procedure in the previous step and the Bearing Select Fit Chart, Oversize Bearings to determine the required bearing grade for each main bearing.

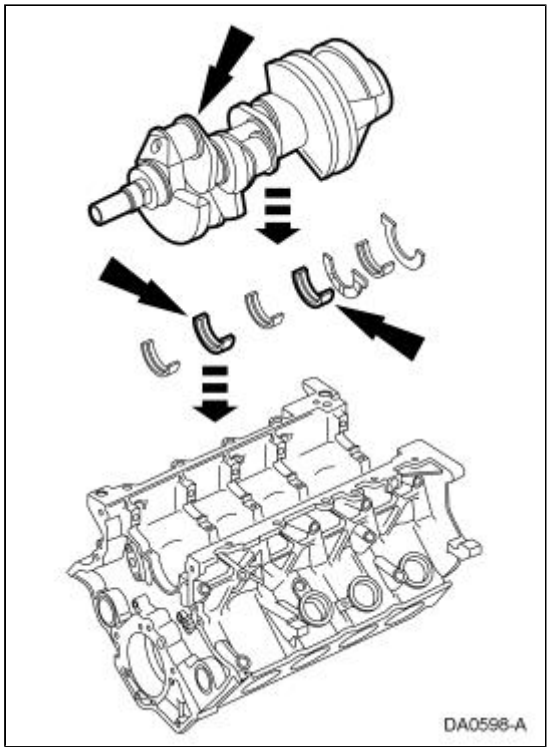


5. **NOTE:** Before assembling the cylinder block, all sealing surfaces must be free of chips, dirt, paint and foreign material. Also, make sure the coolant and oil passages are clear.

   Install the crankshaft upper main bearings into the cylinder block and lubricate them with clean engine oil.

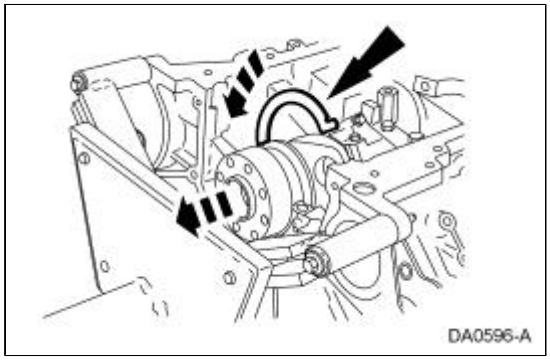
6. **NOTE:** The upper thrust washers are shown for location purposes only. Do not install the upper thrust washers until the crankshaft is installed. Refer to the following 2 steps.

   Install the crankshaft onto the upper crankshaft main bearings.



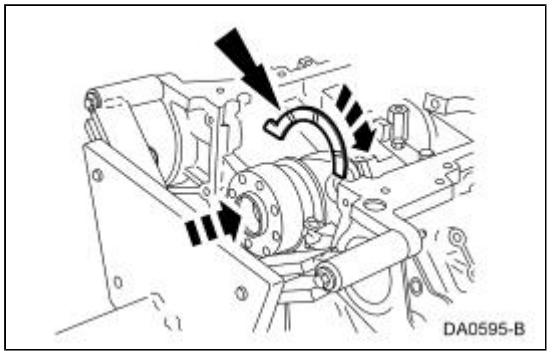
7. **NOTE:** The oil groove on the thrust washer must face toward the front of the engine (against the crankshaft thrust surface).

   Push the crankshaft rearward and install the rear crankshaft upper thrust washer at the back of the No. 5 main boss.



8. **NOTE:** The oil groove on the thrust washer must face toward the front of the engine (against the crankshaft surface).

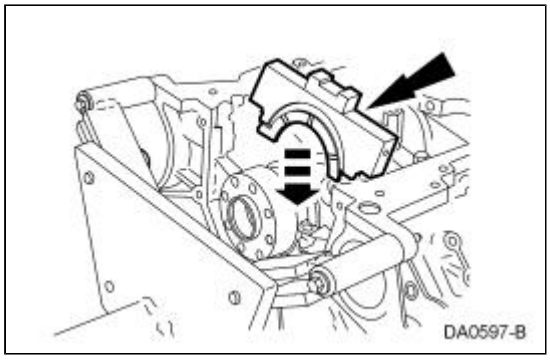
   Push the crankshaft forward and install the front crankshaft upper thrust washer at the front of the No. 5 main boss.



9. **NOTE:** To aid in assembly, apply petroleum jelly to the back of the crankshaft thrust washer.

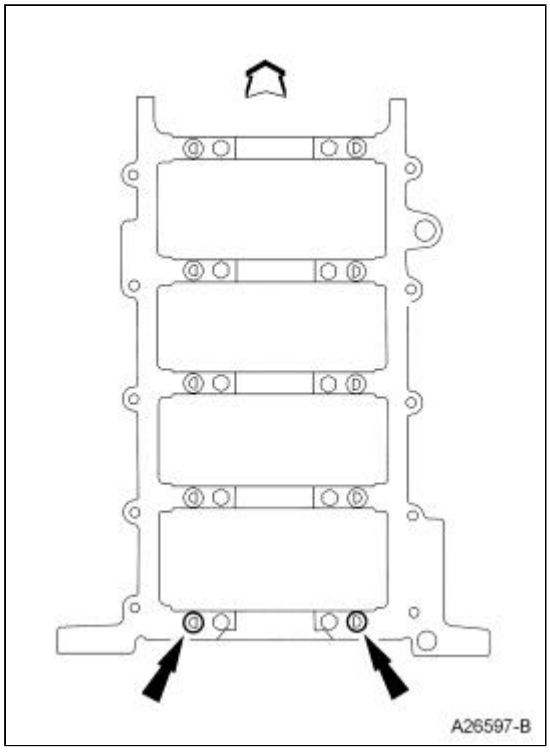
   NOTE: The oil groove on the thrust washer must face toward the rear of the engine (crankshaft surface).

   Install the lower crankshaft thrust washer to the back side of the No. 5 main bearing cap, with oil grooves facing the crankshaft surface.

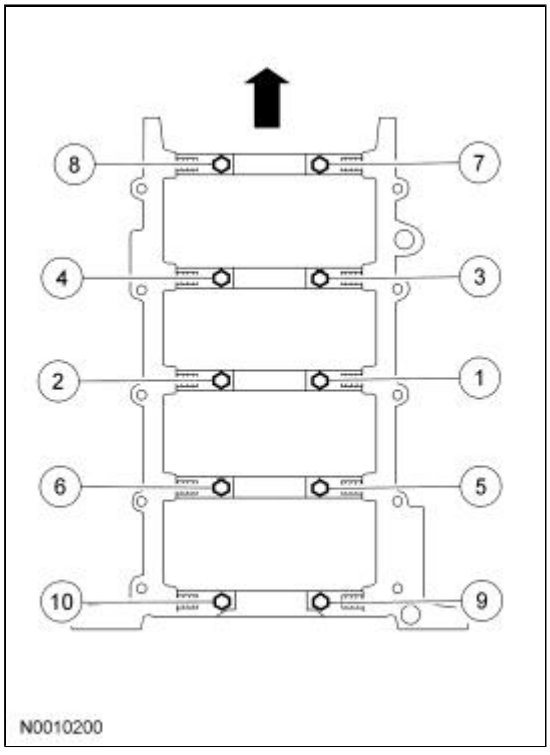


10. Install the crankshaft lower main bearings into the main bearing caps and lubricate them with clean engine oil. Locate the main bearing cap on the cylinder block and, keeping the cap as square as possible, alternately draw the cap down evenly using the cap fasteners.

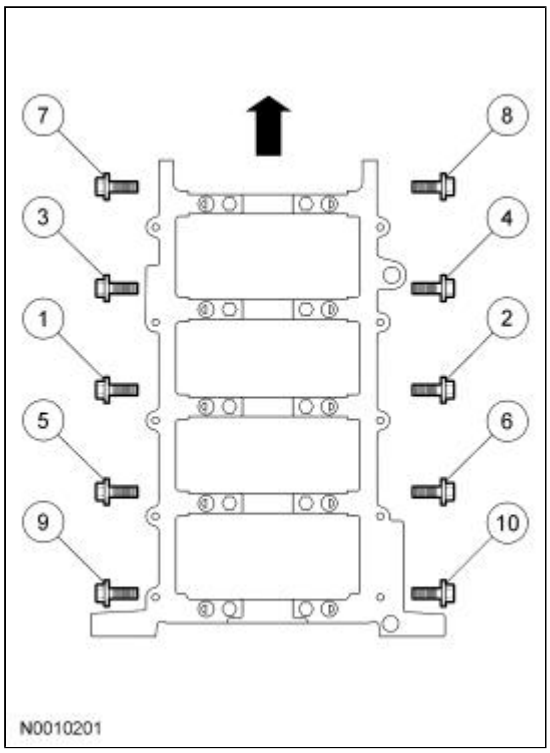
11. Install the dowel pins so the flat sides face the crankshaft.



12. Install the vertical main bearing cap fasteners and tighten in 2 stages, in the sequence shown.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.

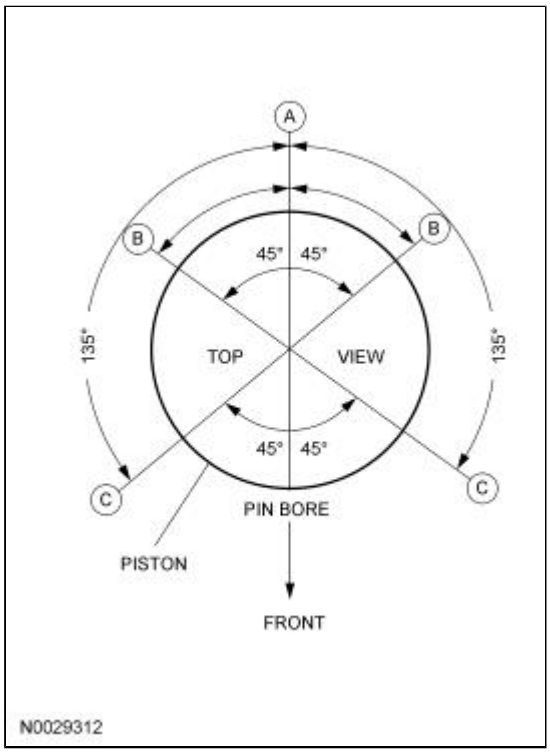


13. Install the side bolts and tighten them in 2 stages, in the sequence shown.
    - Stage 1: Tighten to 30 Nm (22 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.



14. Assemble the 8 pistons. For additional information, refer to Piston in this section.

15. Make sure the ring gaps (oil spacer-A, oil ring-B, compression ring-C) are correctly spaced around the circumference of the piston.



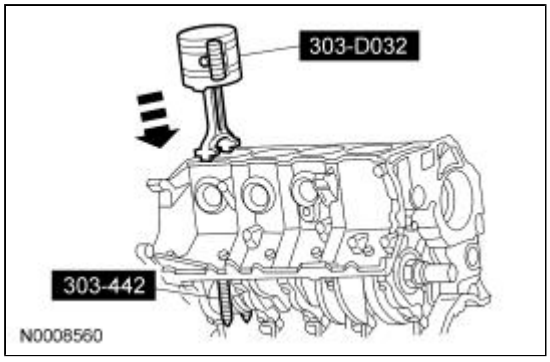
16. Check the piston-to-cylinder block and piston ring clearances. For additional information, refer to Section 303-00 .

17. **CAUTION: Do not scratch the cylinder walls or crankshaft journals with the connecting rod.**

NOTE: The following piston installation steps are for all 8 connecting rods, rod bearings and pistons. Only one connecting rod, rod bearing and piston is shown.

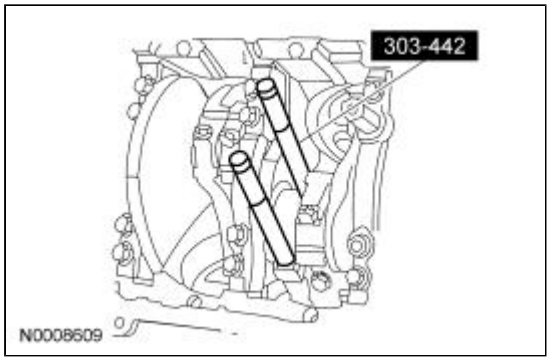
Use the special tools to install the connecting rod with the upper connecting rod bearing in place.

- Lubricate the piston and ring with clean engine oil
- Lubricate the rod bearings with clean engine oil.



18. **CAUTION: Do not scratch the cylinder walls or crankshaft journals with the connecting rod.**

Once the connecting rod is seated on the crankshaft journal, remove the special tools.



19. **CAUTION: The rod cap installation must keep the same orientation as marked during disassembly.**

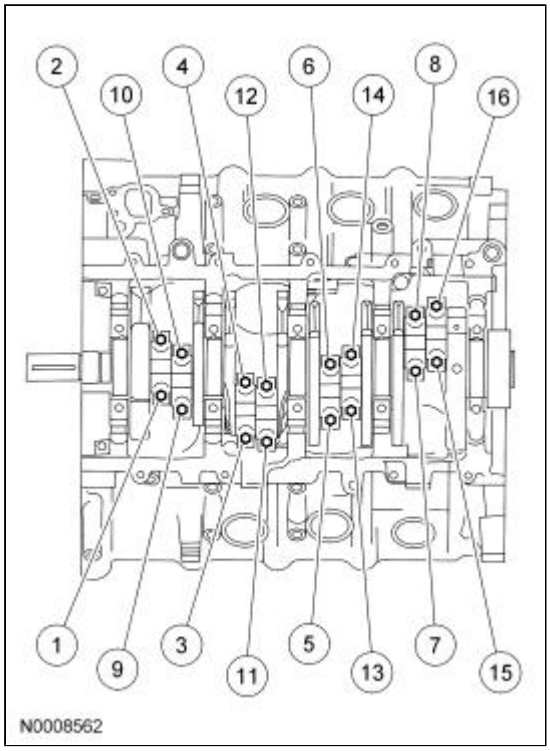
NOTE: The connecting rod caps are of the "cracked" design and must mate with the connecting rod ends. Excessive bearing clearance will result if not mated correctly.

Position the lower bearing and connecting rod, and install the new bolts loosely.

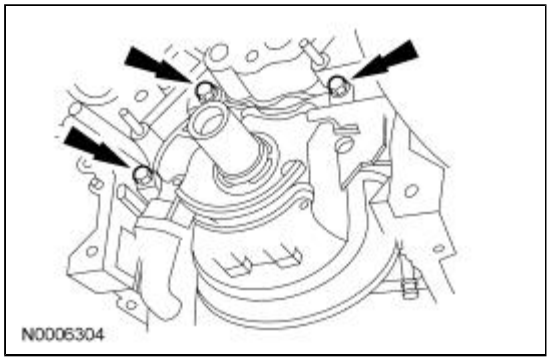
20. **NOTE:** Main bearing caps are removed for clarity.

Tighten the bolts in 2 stages, in the sequence shown.

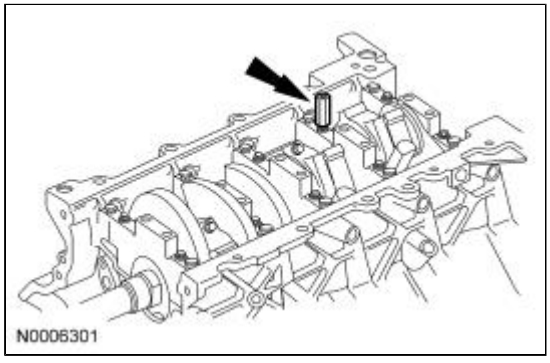
- Stage 1: Tighten to 43 Nm (32 lb-ft).
- Stage 2: Tighten an additional 105 degrees.



21. Position the oil pump and install the bolts.
    - Tighten to 10 Nm (89 lb-in).



22. Install the oil pump screen and pickup tube spacer.
    - Tighten to 25 Nm (18 lb-ft).

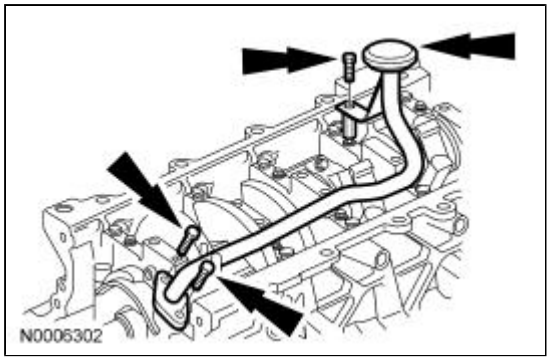


23. **CAUTION: Make sure the O-ring is in place and not damaged. A missing or damaged O-ring can cause foam in the lubrication system, low oil pressure and severe engine damage.**

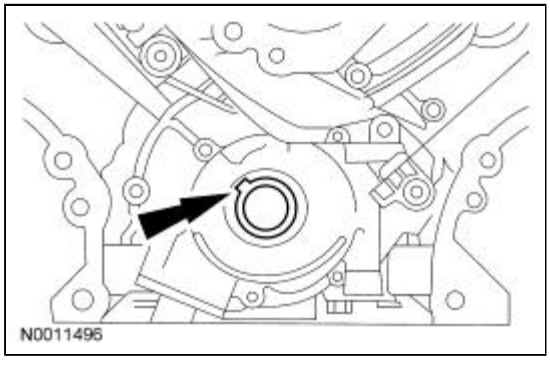
NOTE: Clean and inspect the mating surfaces and install a new O-ring. Lubricate the O-ring with clean engine oil prior to installation.

Position the oil pump screen and pickup tube and install the bolts.

- Tighten the oil pump screen and pickup tube-to-oil pump bolts to 10 Nm (89 lb-in).
- Tighten the oil pump screen and pickup tube-to-spacer bolt to 25 Nm (18 lb-ft).



24. Position the crankshaft keyway at the 11 o'clock position.



25. **CAUTION: Make sure all coolant residue and foreign material are cleaned from the block surface and cylinder bore.**

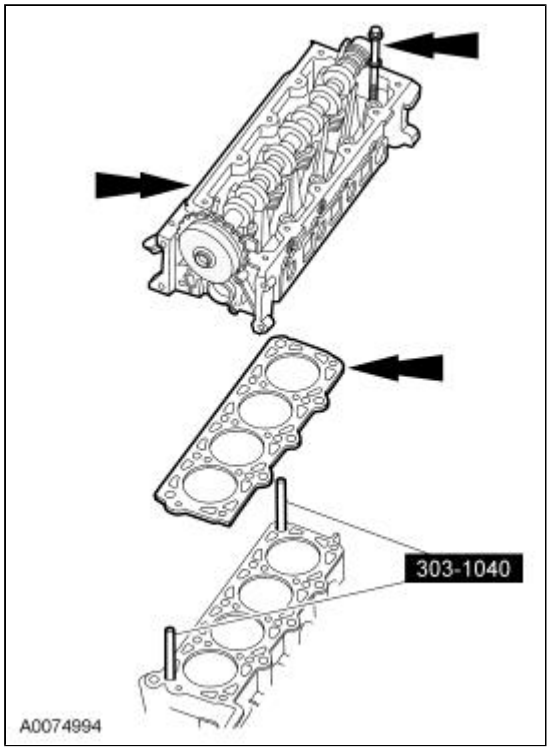
CAUTION: The use of sealing aids (aviation cement, copper spray, and glue) is not permitted. The gasket must be installed dry.

CAUTION: The cylinder head bolts must be discarded and new bolts installed. They are tighten-to-yield designed and cannot be reused.

NOTE: Do not turn the crankshaft until instructed to do so.

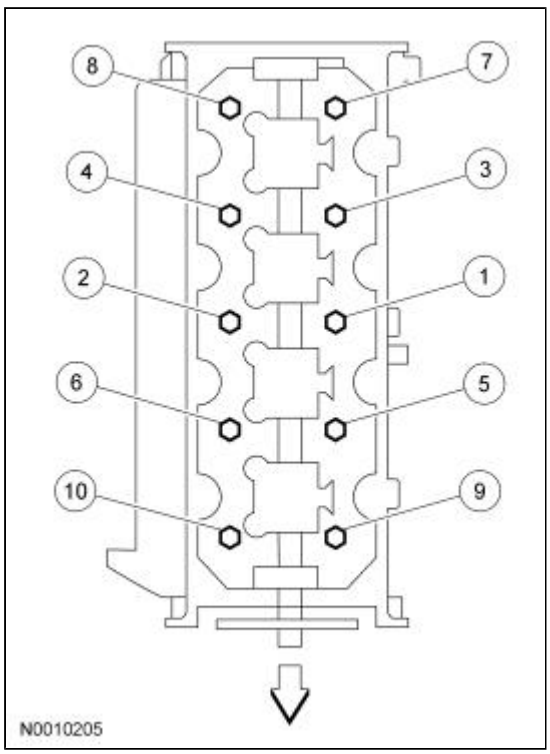
NOTE: LH shown, RH similar.

Using the special tools, position the cylinder head gaskets and cylinder heads over the dowels and install the cylinder head bolts loosely.

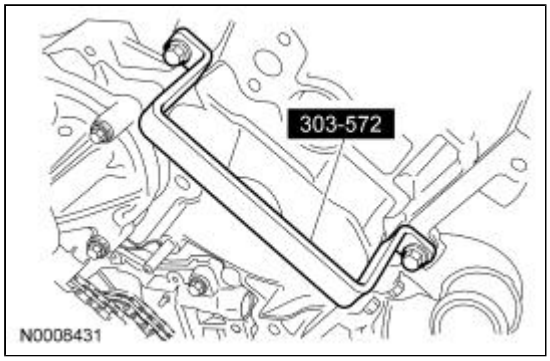


26. **NOTE:** RH shown, LH similar.

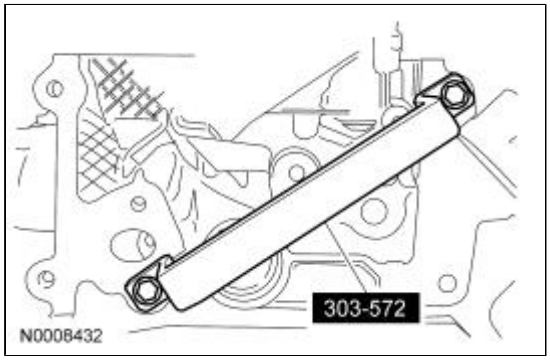
    Tighten the bolts in 3 stages, in the sequence shown.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.
    - Stage 3: Tighten an additional 90 degrees.



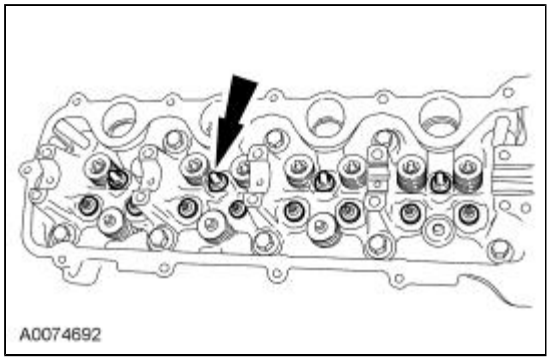
27. Remove the special tool from the LH cylinder head.



28. Remove the special tool from the RH cylinder head.



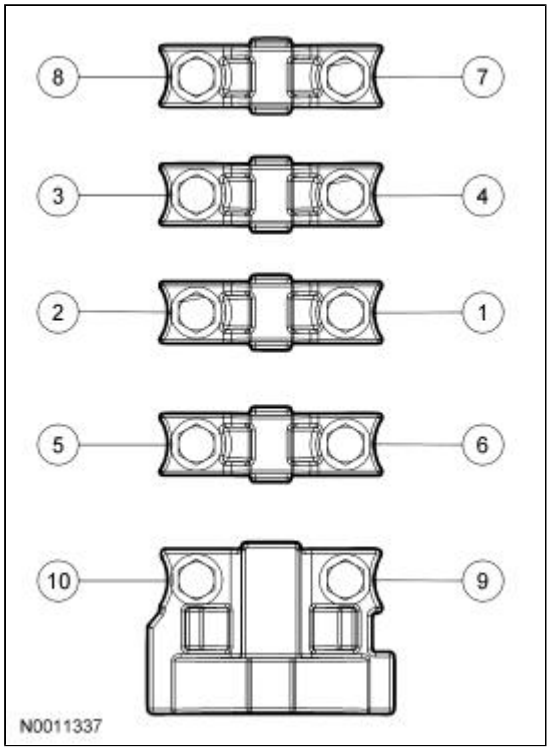
29. Install the hydraulic lash adjusters into the RH and LH cylinder heads.
    - Lubricate the hydraulic lash adjusters with clean engine oil prior to installation.



30. Install the LH and RH camshafts.
    - Lubricate the camshaft and camshaft journals with clean engine oil prior to installation.

31. **NOTE:** LH shown, RH similar.

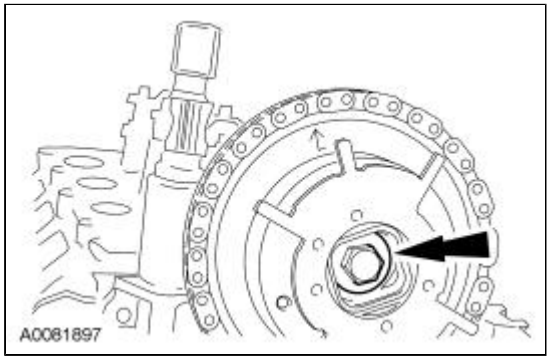
    Install the LH and RH camshaft bearing caps in their original locations.
    - Lubricate the camshaft bearing caps with clean engine oil.
    - Position the front camshaft bearing cap.
    - Position the remaining camshaft bearing caps.
    - Install the bolts loosely.
    - Tighten to 10 Nm (89 lb-in) in the sequence shown.



32. **CAUTION: Damage to the variable camshaft timing (VCT) phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    NOTE: LH shown, RH similar.

    Install the VCT phaser sprockets and new VCT phaser sprocket bolts finger tight.

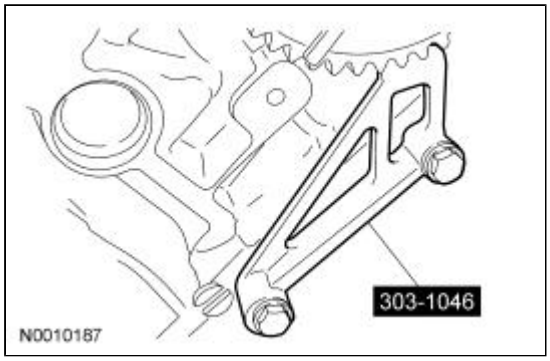


33. **CAUTION: Damage to the VCT phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    CAUTION: Only use hand tools to remove the VCT phaser sprocket assembly or damage may occur to the camshaft or VCT phaser sprocket.

    NOTE: LH shown, RH similar.

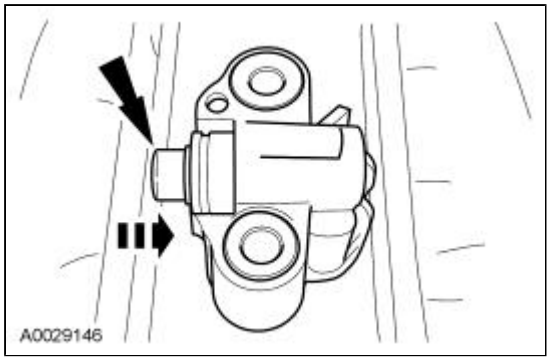
    Using the special tool, tighten the LH and RH VCT phaser sprocket bolts in 2 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.



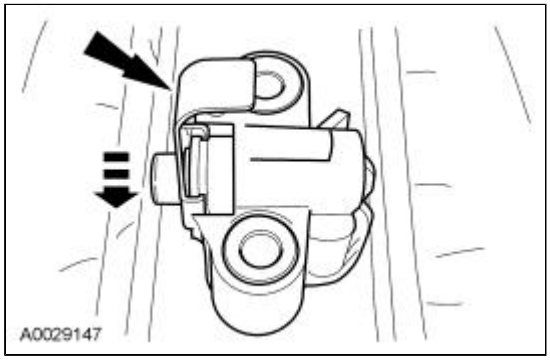
34. **CAUTION: Timing chain procedures must be followed exactly or damage to valves and pistons will result.**

    CAUTION: Prior to installation, inspect the tensioner-sealing bead for seal integrity. If cracks, tears, separation from the tensioner body or permanent compression of the seal bead is observed, install a new tensioner.

    Compress the tensioner plunger, using a vise.

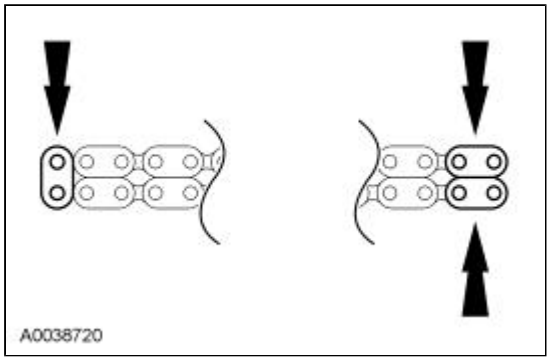


35. Install a retaining clip on the tensioner to hold the plunger in during installation.

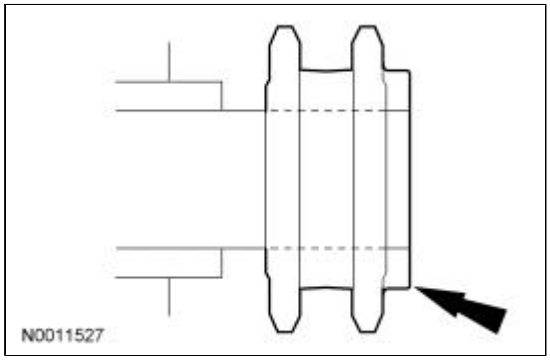


36. Remove the tensioner from the vise.

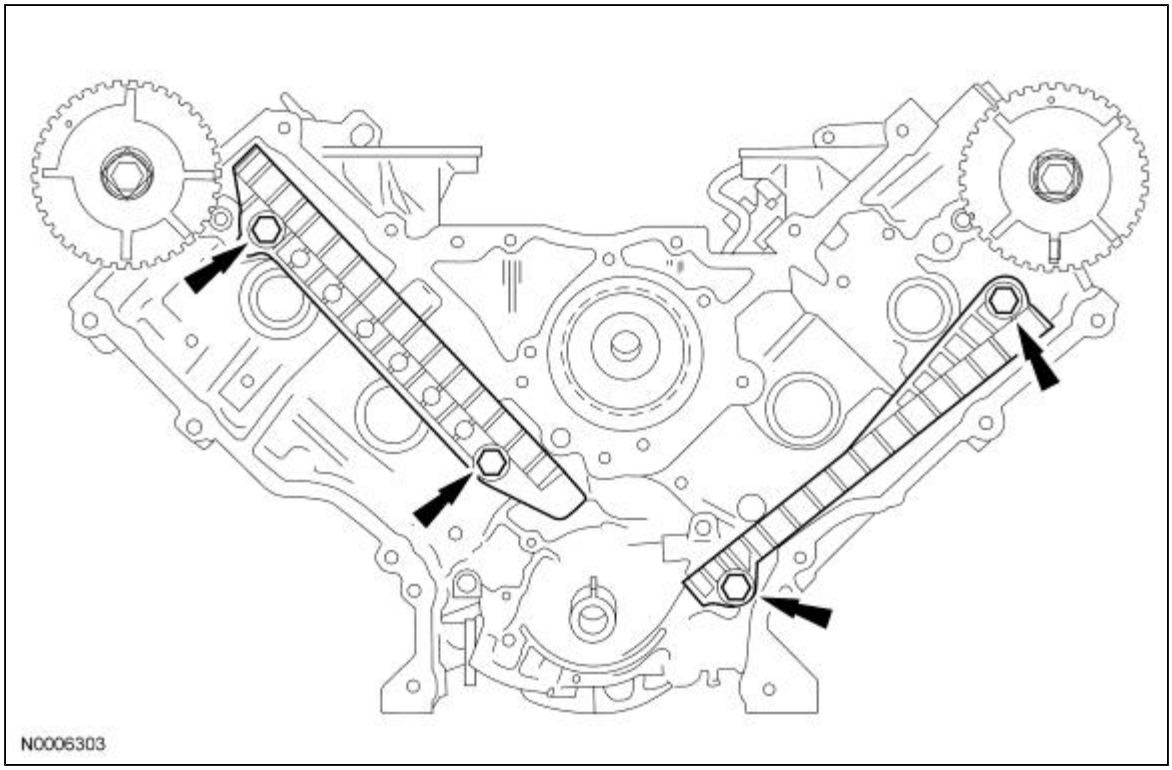
37. If the copper links are not visible, mark 2 links on one end and 1 link on the other end, and use as timing marks.



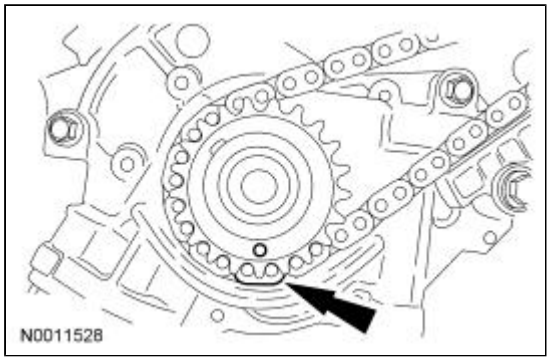
38. Install the crankshaft sprocket, making sure the flange faces forward.



39. Install the 4 bolts and the LH and RH timing chain guides.
    - Tighten to 10 Nm (89 lb-in).

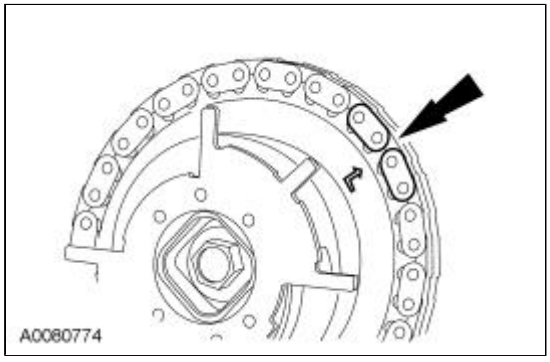


40. Position the lower end of the LH (inner) timing chain on the crankshaft sprocket, aligning the timing mark on the outer flange of the crankshaft sprocket with the single copper (marked) link on the chain.



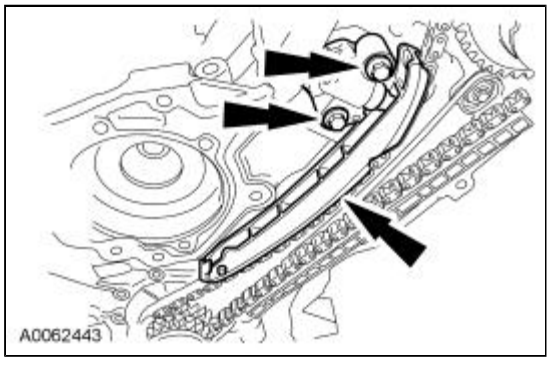
41. **NOTE:** Make sure the upper half of the timing chain is below the tensioner arm dowel.

    Position the timing chain on the VCT phaser sprocket with the timing mark positioned between the 2 copper (marked) chain links.

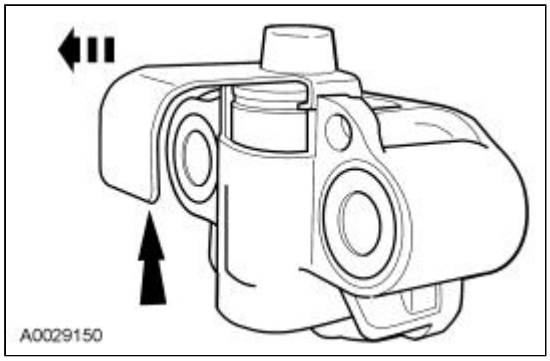


42. **NOTE:** The LH timing chain tensioner arm has a bump near the dowel hole for identification.

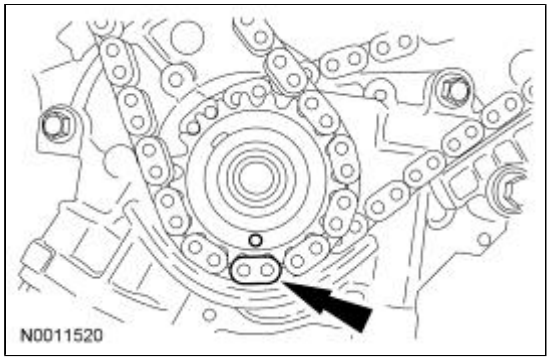
    Position the LH timing chain tensioner arm on the dowel pin and install the LH timing chain tensioner and bolts.
    - Tighten to 25 Nm (18 lb-ft).



43. Remove the retaining clip from the LH timing chain tensioner.

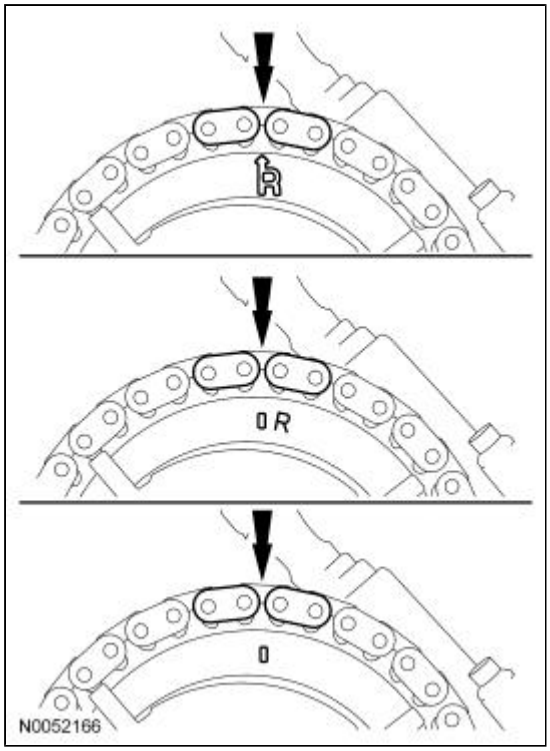


44. Position the lower end of the RH (outer) timing chain on the crankshaft sprocket, aligning the timing mark on the sprocket with the single copper (marked) chain link.



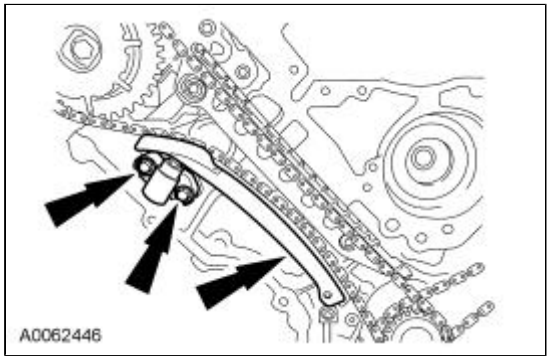
45. **NOTE:** The camshaft phaser and sprocket will be stamped with one of the illustrated timing marks for the RH camshaft.

    Position the RH timing chain on the VCT phaser sprocket with the timing mark positioned between the 2 copper (marked) chain links.

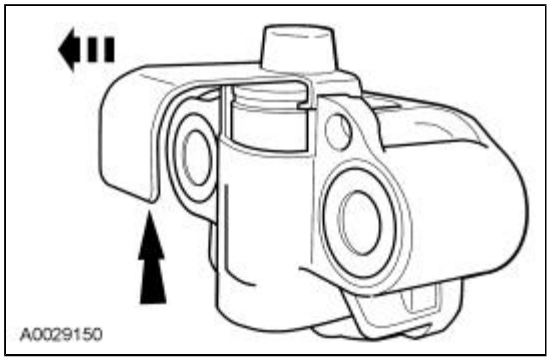


46. Position the RH timing chain tensioner arm on the dowel pin and install the RH timing chain tensioner and bolts.

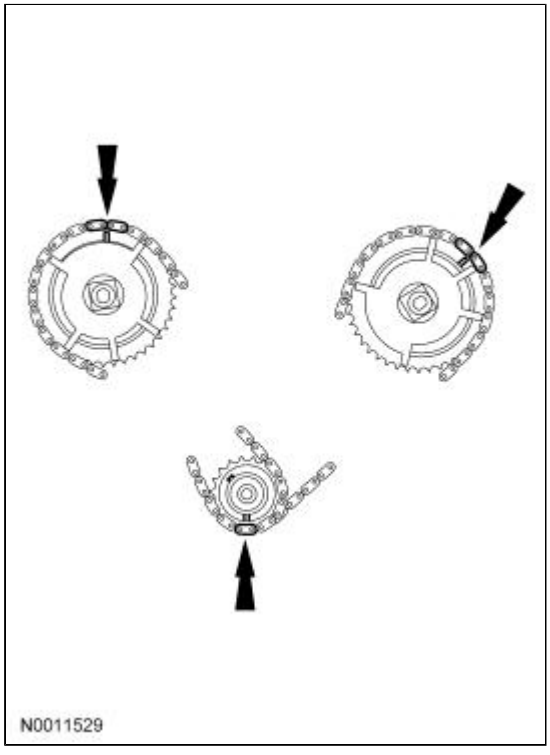
- Tighten to 25 Nm (18 lb-ft).



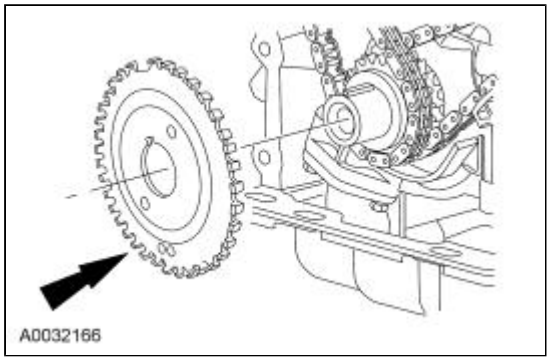
47. Remove the retaining clip from the RH timing chain tensioner.



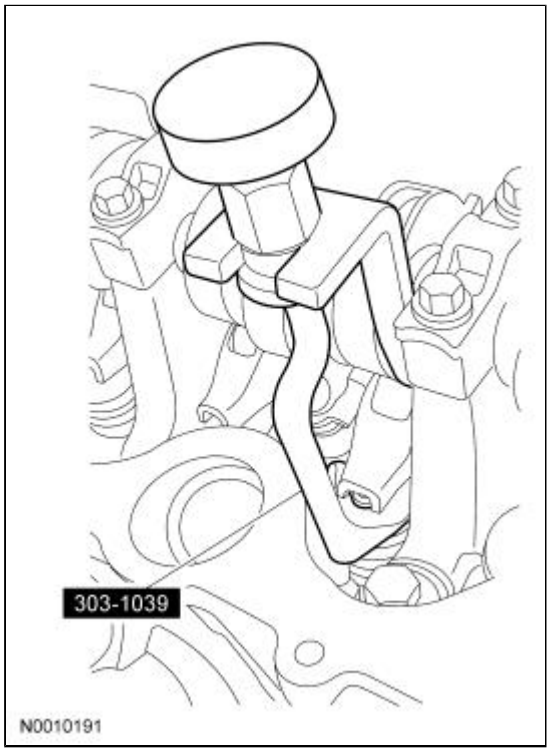
48. As a post-check, verify correct alignment of all timing marks.



49. Install the crankshaft sensor ring on the crankshaft.



50. Using the special tool, install all of the camshaft roller followers.
    - Lubricate the camshaft roller followers with clean engine oil prior to installation.

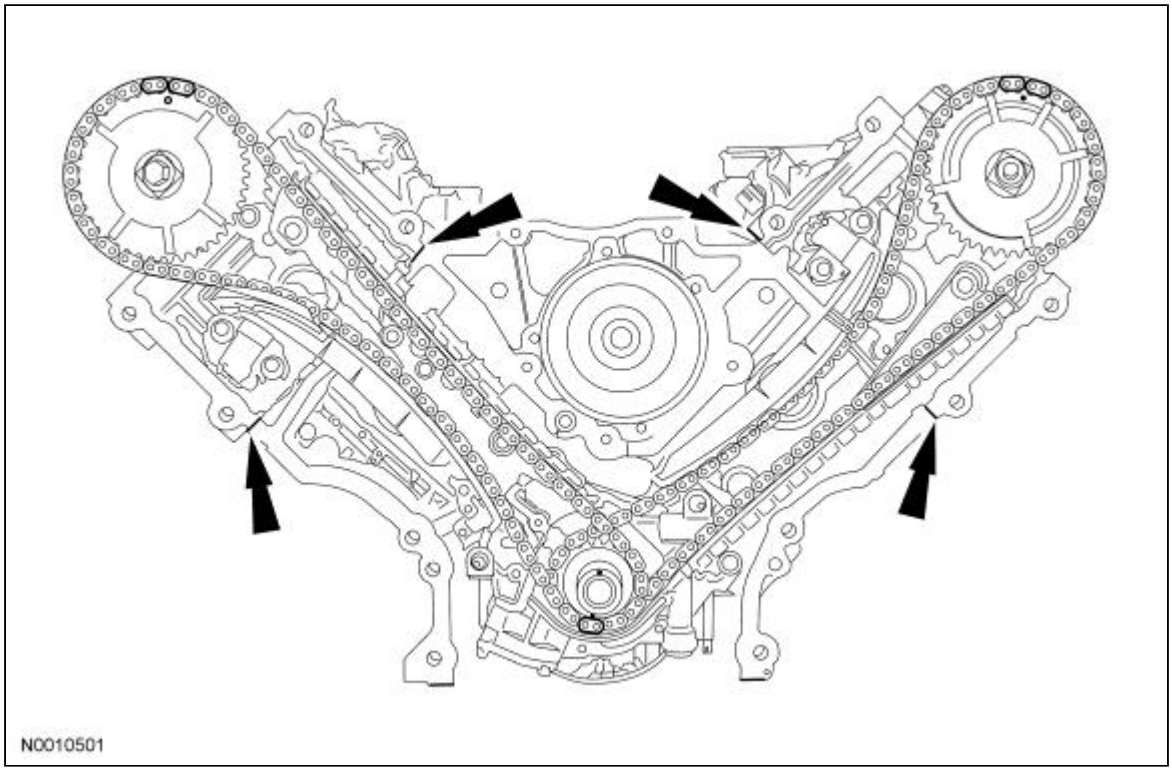


51. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

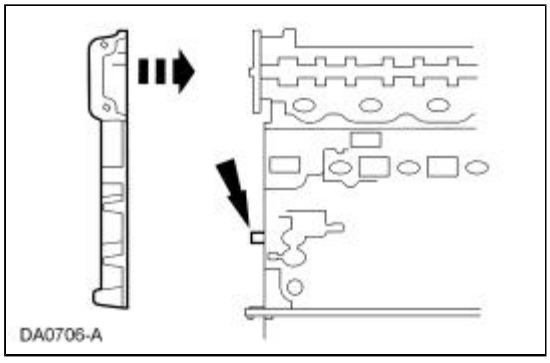
    NOTE: If the engine front cover is not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

    NOTE: Make sure that the engine front cover gasket are in place on the engine front cover before installation.

    Apply a bead of silicone gasket and sealant along the cylinder head-to-cylinder block surface at the locations shown.



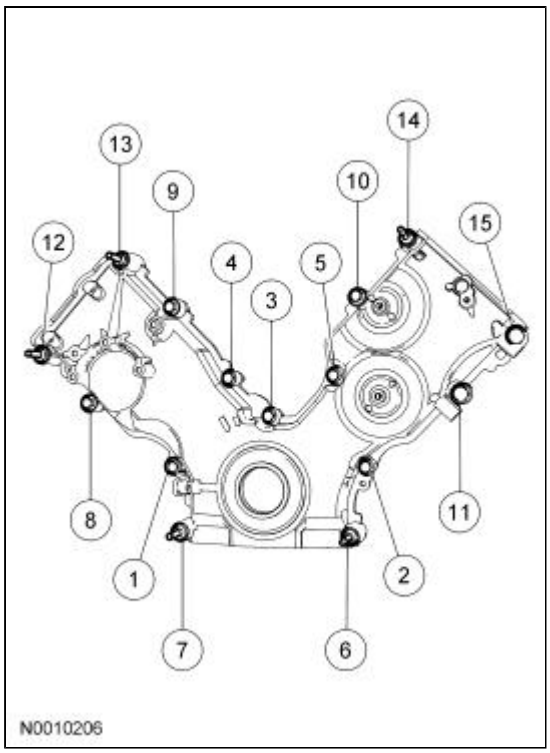
52. Install new engine front cover gaskets on the engine front cover. Position the engine front cover onto the dowels. Install the fasteners finger-tight.



53. Tighten the engine front cover fasteners in sequence in 2 stages.
Stage 1: Tighten fasteners 1 through 15 to 25 Nm (18 lb-ft).
Stage 2: Tighten fasteners 6 and 7 to 48 Nm (35 lb-ft).

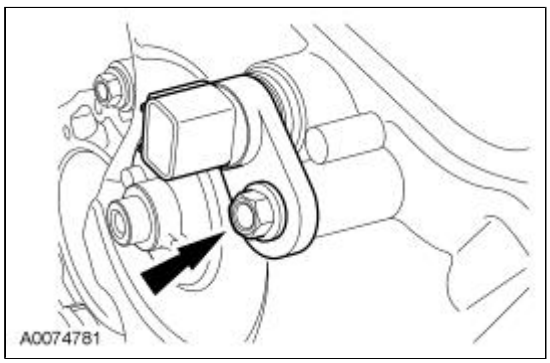
Item	Part Number	Description
1	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
2	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
3	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
4	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
5	N806177	Bolts, Hex Flange Head Pilot, M8 x 1.25 x 50
6	N808529	Stud, Hex Head Pilot, M10 x 1.5 x 1.5 x 103
7	N808529	Stud, Hex Head Pilot, M10 x 1.5 x 1.5 x 103
8	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
9	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
10	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50

11	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
12	W709573	Stud and Washer, Hex Head Pilot, M8 x 1.25 x 1.25 x 94
13	W709573	Stud and Washer, Hex Head Pilot, M8 x 1.25 x 1.25 x 94
14	W709573	Stud and Washer, Hex Head Pilot, M8 x 1.25 x 1.25 x 94
15	W706605	Bolt, Hex Head Pilot, M8 x 1.25 x 56



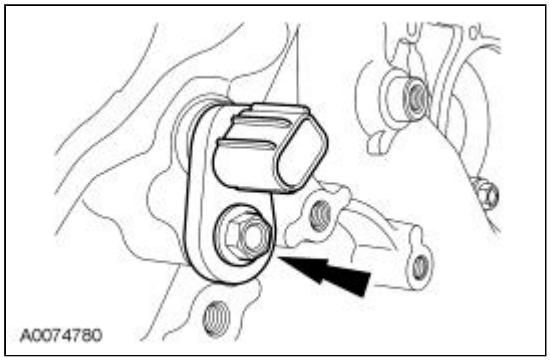
54. **NOTE:** Lubricate the O-ring seal with clean engine oil prior to installation.

    Install the LH camshaft position (CMP) sensor and the bolt.
    - Tighten to 10 Nm (89 lb-in).



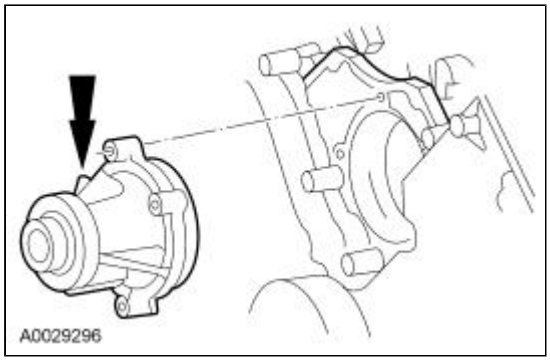
55. **NOTE:** Lubricate the O-ring seal with clean engine oil prior to installation.

    Install the RH CMP sensor and the bolt.
    - Tighten to 10 Nm (89 lb-in).

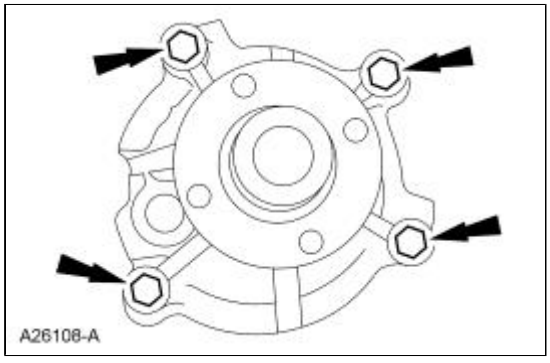


56. **CAUTION: Do not rotate the coolant pump housing once the coolant pump has been positioned in the cylinder block. Damage to the O-ring seal will occur.**

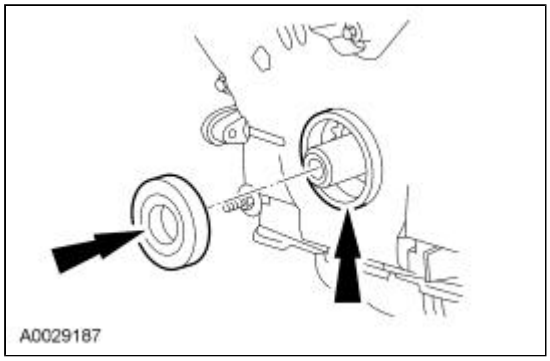
    Position the coolant pump and install the bolts loosely.
    - Lubricate the new O-ring seal using clean engine coolant and install the O-ring seal onto the coolant pump.



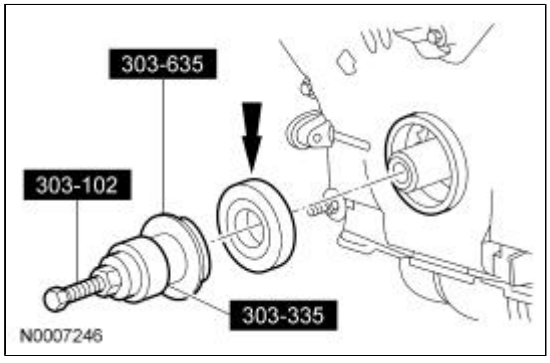
57. Tighten the 4 coolant pump bolts.
    - Tighten to 25 Nm (18 lb-ft).



58. Lubricate the engine front cover and the crankshaft front seal inner lip with clean engine oil.

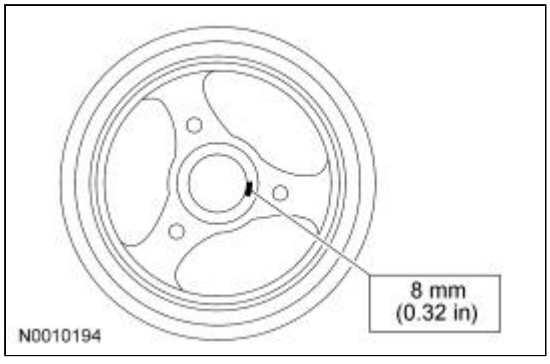


59. Using the special tools, install a new crankshaft front seal into the engine front cover.

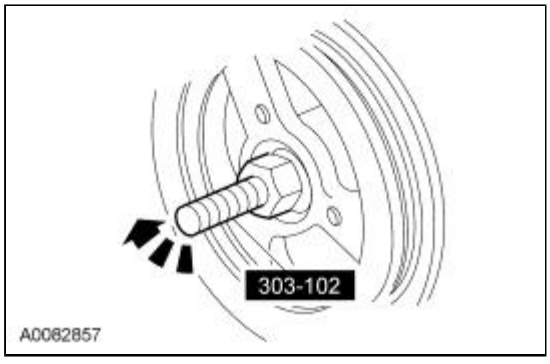


60. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

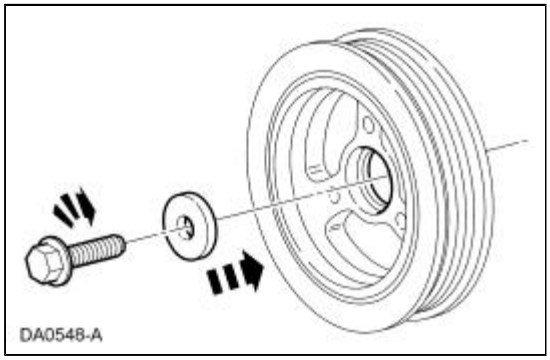
    Apply silicone gasket and sealant to the Woodruff key slot on the crankshaft pulley.



61. Use the special tool to install the crankshaft pulley.

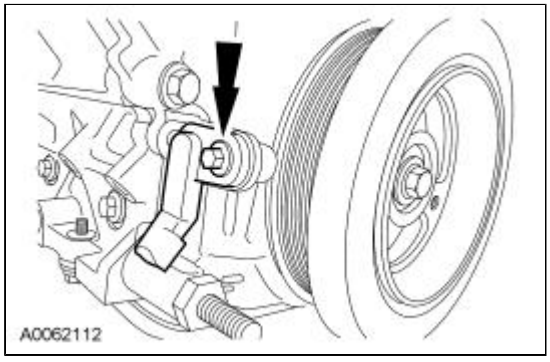


62. Tighten the new crankshaft pulley bolt in 4 stages.
    - Stage 1: Tighten to 90 Nm (66 lb-ft).
    - Stage 2: Loosen 360 degrees.
    - Stage 3: Tighten to 50 Nm (37 lb-ft).
    - Stage 4: Tighten an additional 90 degrees.

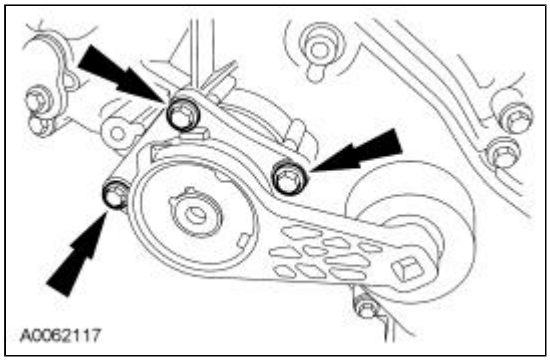


63. **NOTE:** Lubricate the O-ring seal with clean engine oil prior to installation.

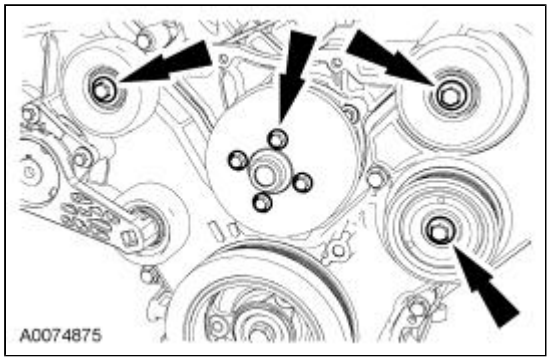
    Install the crankshaft position (CKP) sensor and the bolt.
    - Tighten to 10 Nm (89 lb-in).



64. Position the accessory drive belt tensioner and install the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).



65. Install the 3 accessory drive belt idler pulleys, the coolant pump pulley and the 7 bolts.
    - Tighten to 25 Nm (18 lb-ft).

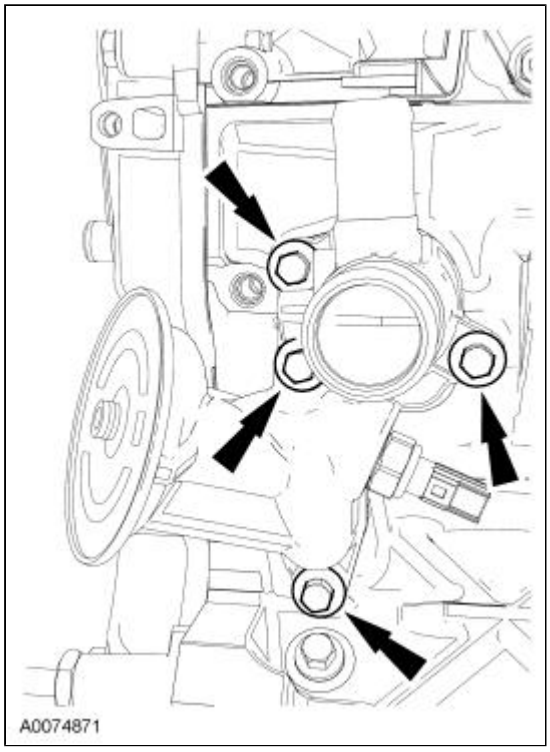


66. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

NOTE: Clean and inspect the mating surfaces, and install a new gasket.

Position the oil filter adapter and install the 4 bolts.

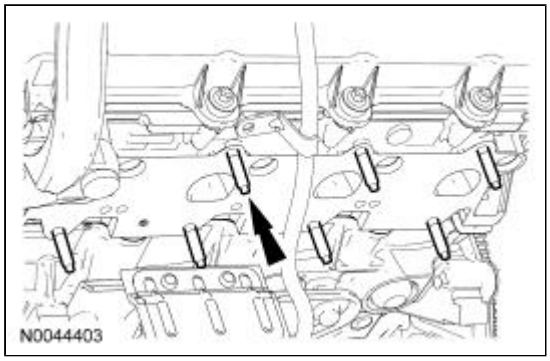
- Tighten to 25 Nm (18 lb-ft).



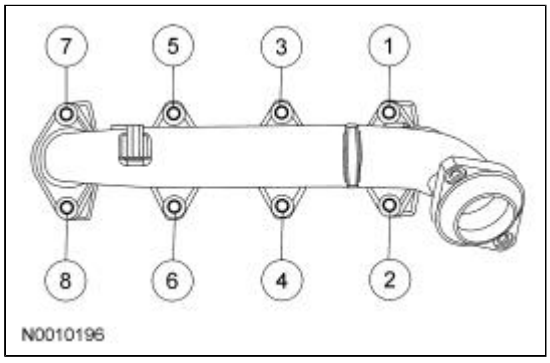
67. **NOTE:** LH shown, RH similar.

Install 16 new exhaust manifold studs.

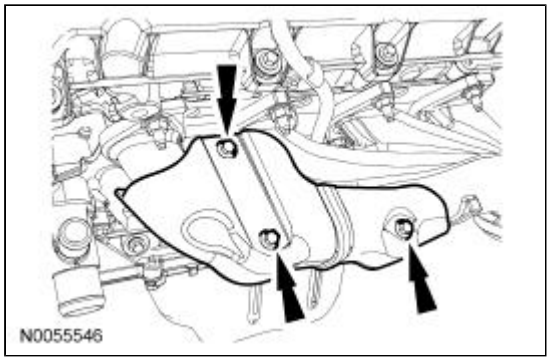
- Tighten to 12 Nm (9 lb-ft).



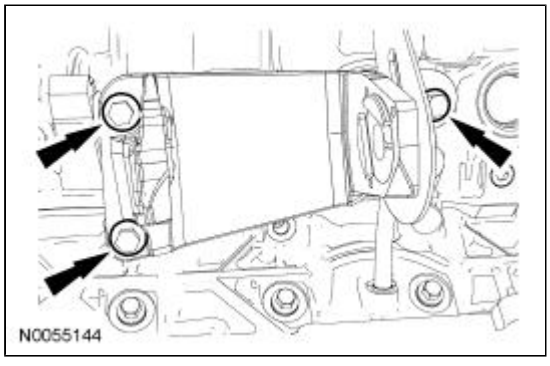
68. Position a new gasket, the LH exhaust manifold and tighten the 8 nuts in the sequence shown.
    - Tighten to 25 Nm (18 lb-ft).



69. Position the exhaust manifold heat shield and install the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

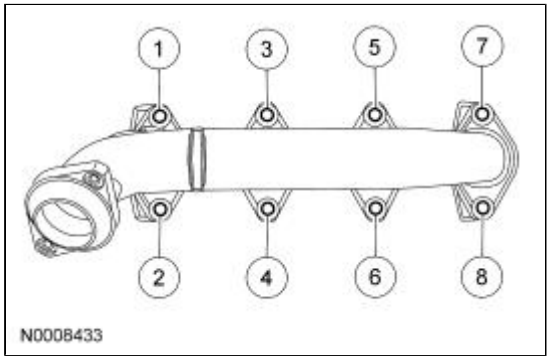


70. Position the LH engine support insulator-to-cylinder block bracket and install the 3 bolts.
    - Tighten to 63 Nm (46 lb-ft).

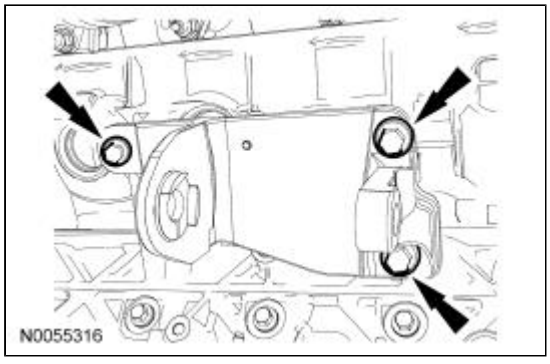


71. Position a new gasket, the RH exhaust manifold and tighten the 8 nuts in the sequence shown.

- Tighten to 25 Nm (18 lb-ft).



72. Position the RH engine support insulator-to-cylinder block bracket and install the 3 bolts.
    - Tighten to 63 Nm (46 lb-ft).

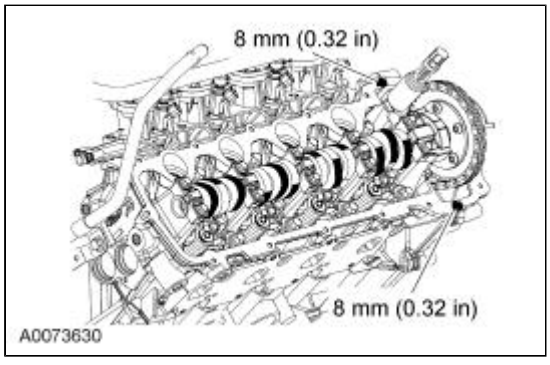


73. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    Clean the valve cover mating surface with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

74. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

    Apply silicone gasket and sealant in 2 places where the engine front cover meets the cylinder head.

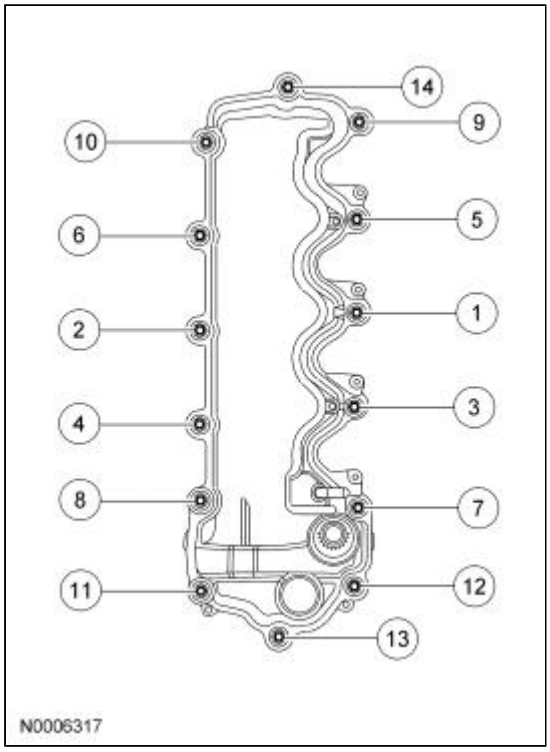


75. **CAUTION: When installing the valve cover, make sure to avoid damaging the VCT**

solenoid.

Position the RH valve cover and gasket on the cylinder head and tighten the bolts in the sequence shown.

- Tighten to 10 Nm (89 lb-in).

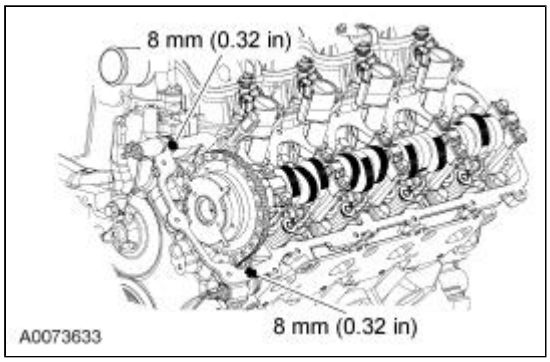


76. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    Clean the valve cover mating surface with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

77. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

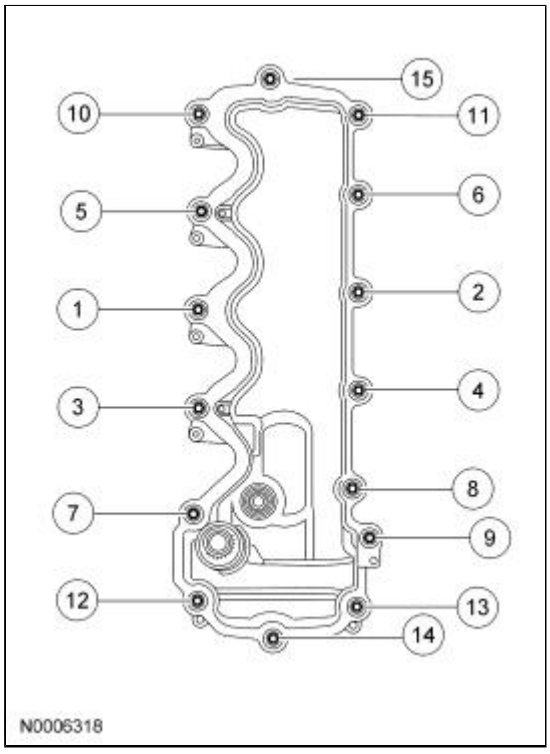
    Apply silicone gasket and sealant in 2 places where the engine front cover meets the cylinder head.



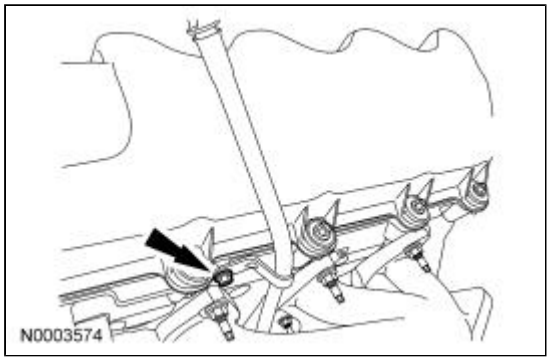
78. **CAUTION: When installing the valve cover, make sure to avoid damaging the VCT solenoid.**

Position the LH valve cover and gasket on the cylinder head and tighten the bolts in the sequence shown.

- Tighten to 10 Nm (89 lb-in).



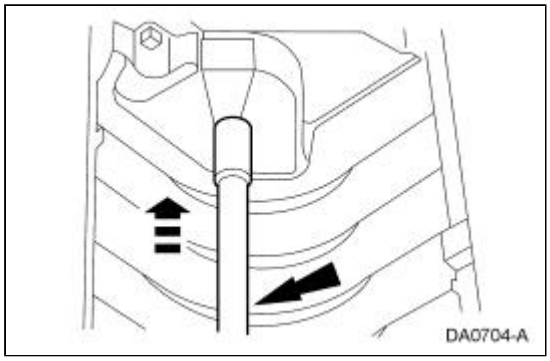
79. Install the oil level indicator tube and the bolt.
    - Install a new O-ring seal and lubricate the O-ring seal with clean engine oil prior to installation.
    - Tighten to 10 Nm (89 lb-in).



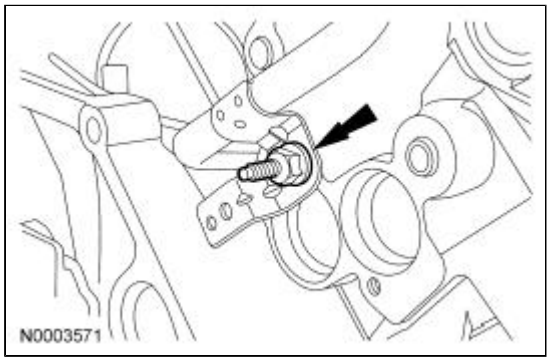
80. **NOTE:** Do not reuse the O-ring seals.

NOTE: Lubricate the O-ring seals with clean engine coolant prior to installation.

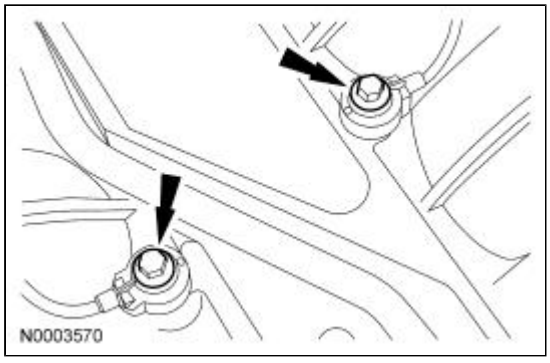
Slide the coolant tube forward with the new O-ring seals into the cylinder block.



81. Install the coolant tube stud bolt.
    - Tighten to 10 Nm (89 lb-in).



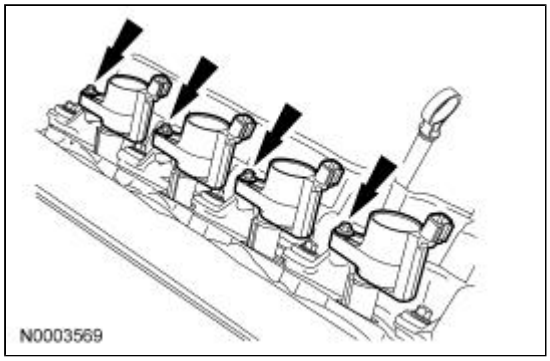
82. Install the 2 knock sensors (KS) and the bolts.
    - Tighten to 20 Nm (15 lb-ft).



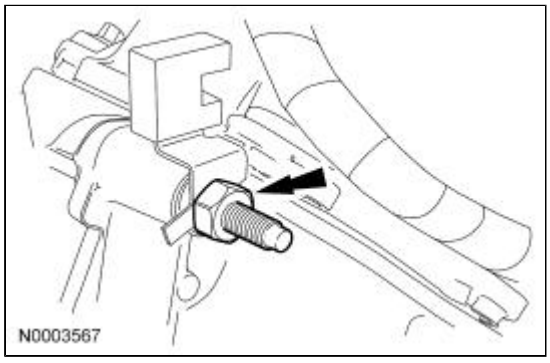
83. Position the electrical harness on the engine assembly and connect the engine wiring harness retainers to the valve cover studs.

84. **NOTE:** LH shown, RH similar.

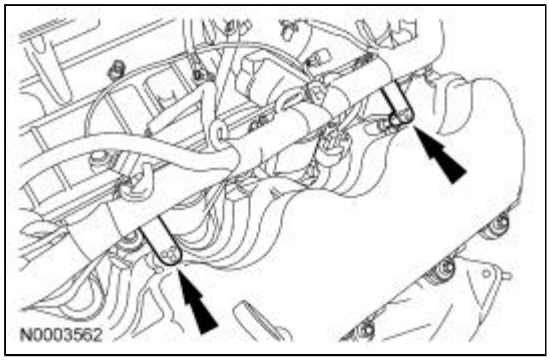
    Install the 8 ignition coils and the 8 bolts.
    - Tighten to 6 Nm (53 lb-in).



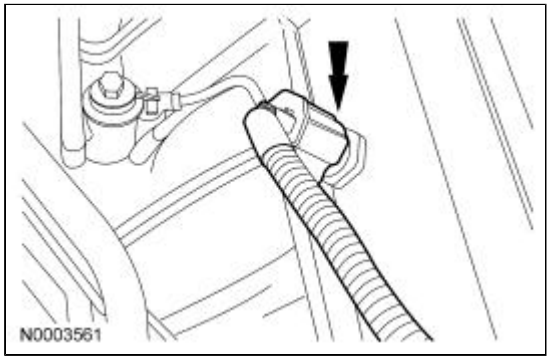
85. Install the LH radio ignition interference capacitor and the nut.
    - Tighten to 25 Nm (18 lb-ft).



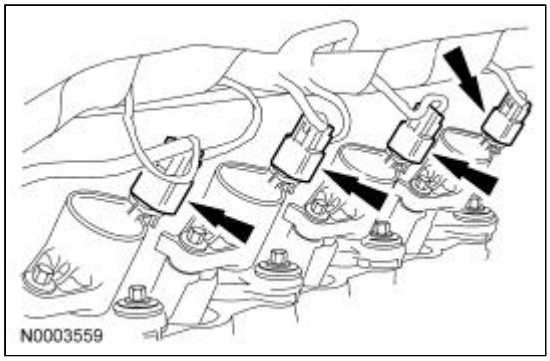
86. Connect the 2 engine wiring harness retainers to the LH valve cover studs.



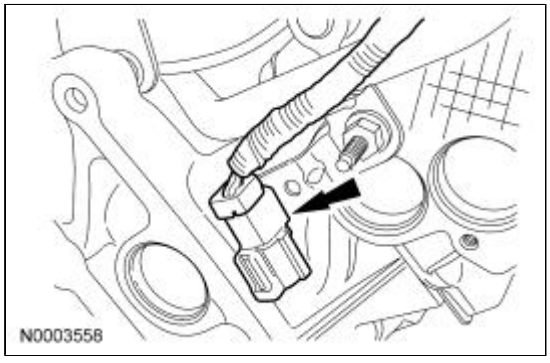
87. Connect the cylinder head temperature (CHT) sensor electrical connector.



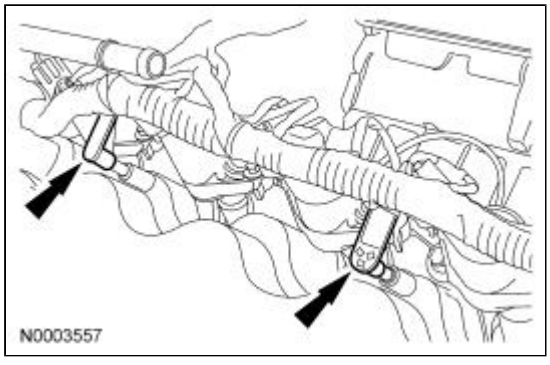
88. Connect the 4 RH ignition coil electrical connectors.



89. Connect the electrical connector retainer to the coolant tube.

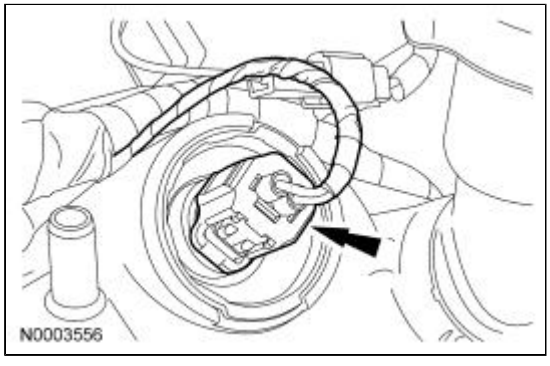


90. Connect the 2 engine wiring harness retainers from the RH valve cover studs.

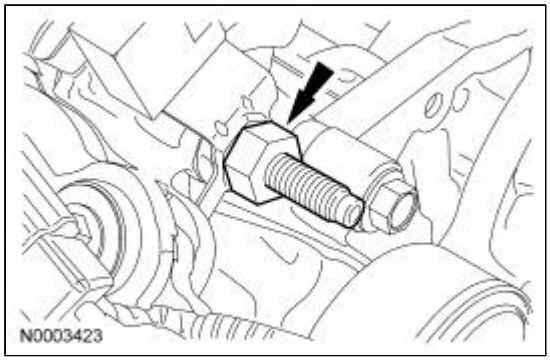


91. **NOTE:** RH shown, LH similar.

    Connect the RH and LH variable camshaft timing (VCT) solenoid electrical connector.

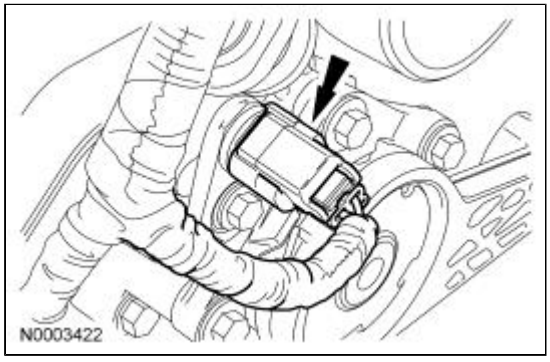


92. Install the RH radio ignition interference capacitor and the nut.
    - Tighten to 25 Nm (18 lb-ft).

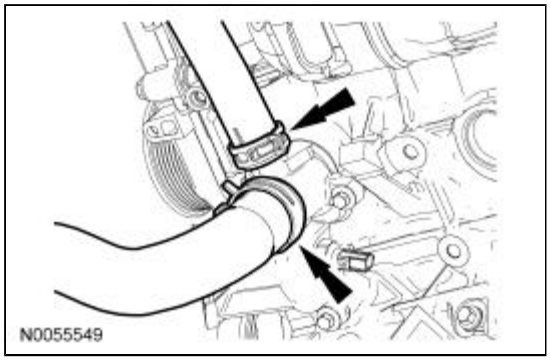


93. **NOTE:** RH shown, LH similar.

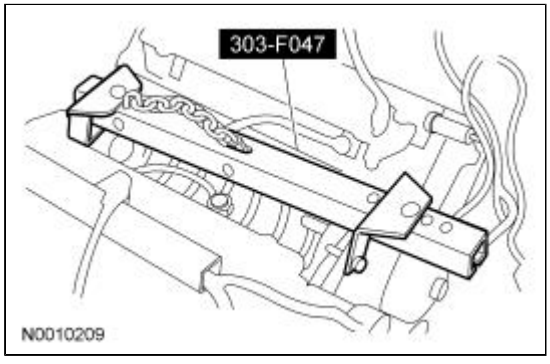
    Disconnect the RH and LH CMP sensor electrical connectors.



94. Connect the 2 coolant hoses to the oil filter adapter.



95. Install the special tool.



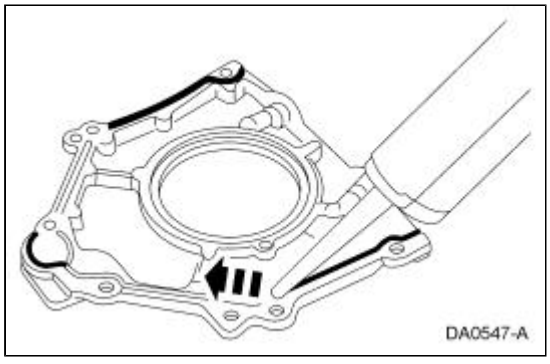
96. Using a suitable floor crane, remove the engine from the engine stand.

97. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the aluminum retainer plate. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

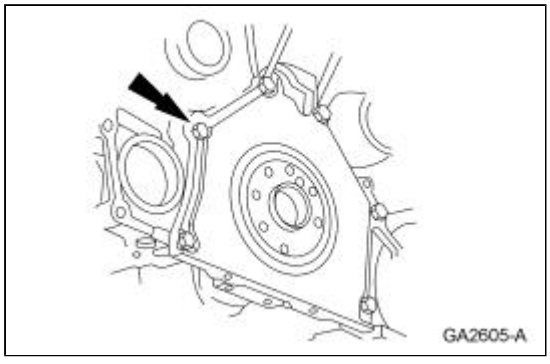
    Inspect the crankshaft rear seal retainer plate. Clean the mating surface for the rear seal retainer plate with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

98. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

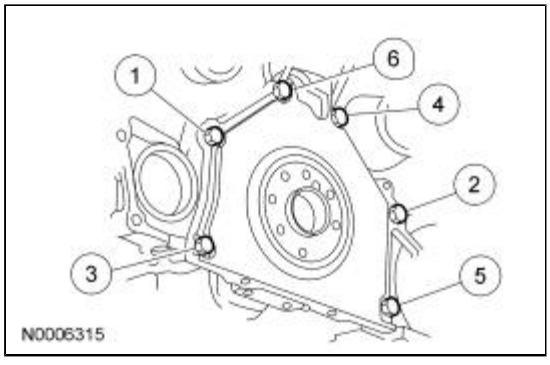
    Apply a 4 mm (0.16 in) bead of silicone gasket and sealant around the crankshaft rear seal retainer sealing surface.



99. Install the crankshaft rear seal retainer plate and loosely install the 6 bolts.



100. Tighten the bolts in the sequence shown.
    - Tighten to 10 Nm (89 lb-in).

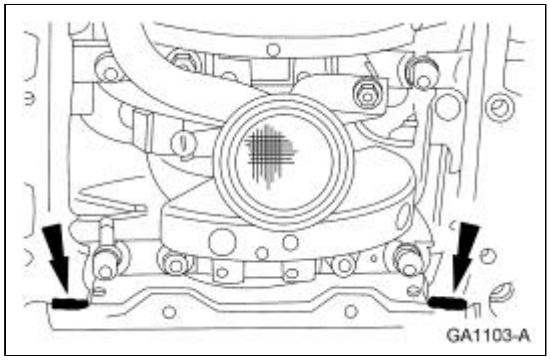


101. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

Inspect the oil pan. Clean the mating surface for the oil pan with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

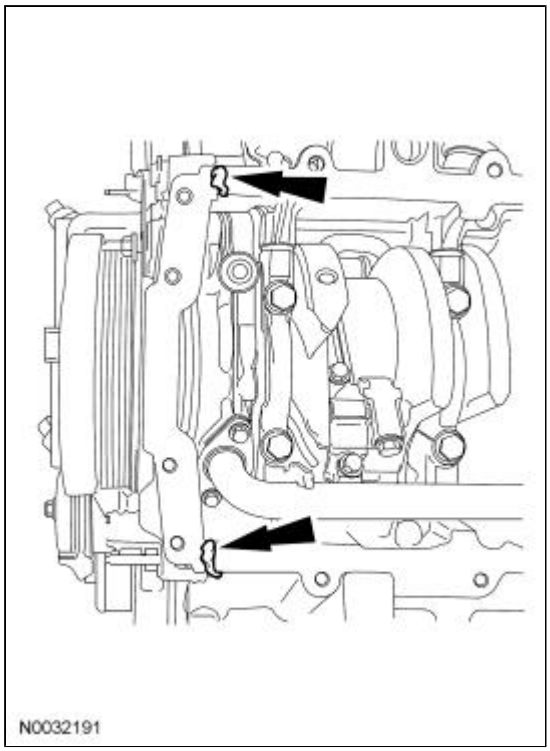
102. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

Apply silicone gasket and sealant at the crankshaft rear seal retainer plate-to-cylinder block sealing surface.

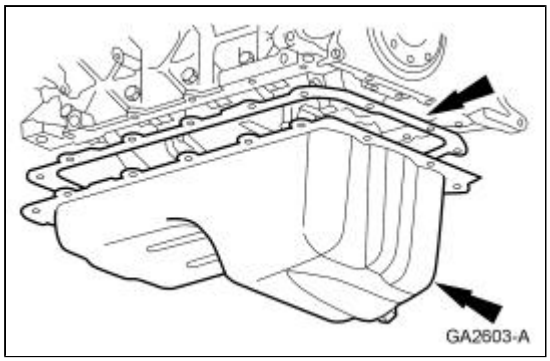


103. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

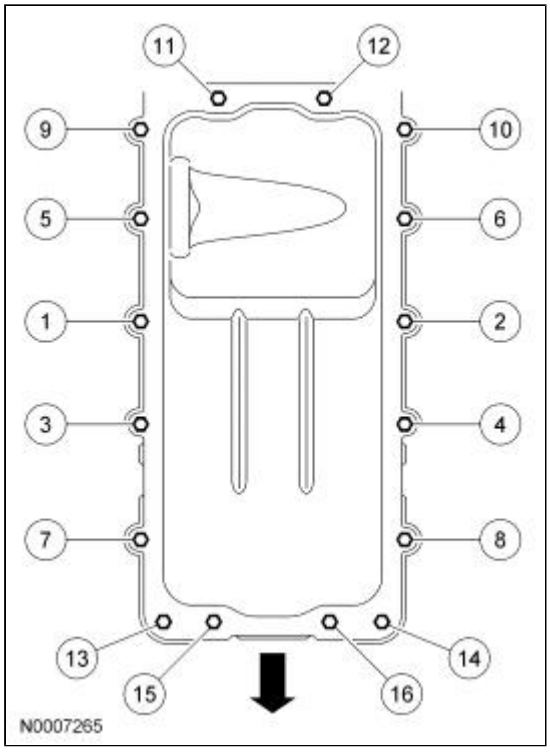
Apply silicone gasket and sealant at the engine front cover-to-cylinder block sealing surface.



104. Install the oil pan gasket and the oil pan and loosely install the bolts.

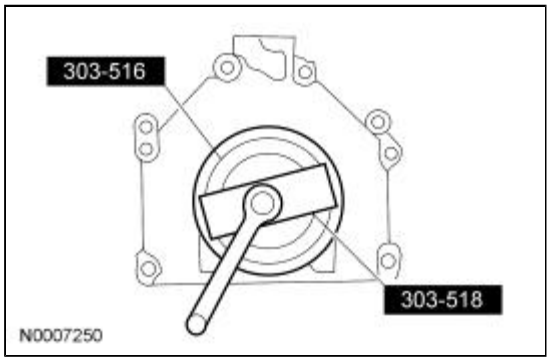


105. Tighten the bolts in 3 stages, in the sequence shown.
    - Stage 1: Tighten to 2 Nm (18 lb-in).
    - Stage 2: Tighten to 20 Nm (15 lb-ft).
    - Stage 3: Tighten an additional 60 degrees.

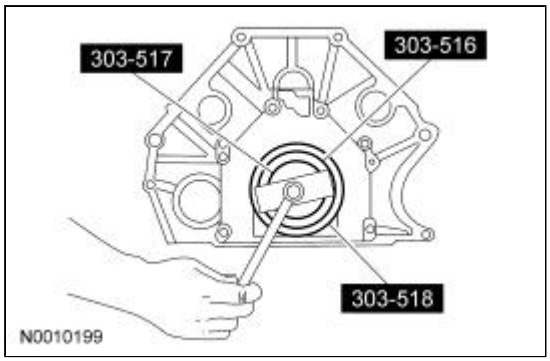


106. **NOTE:** Lubricate the inner lip of the crankshaft rear seal with clean engine oil.

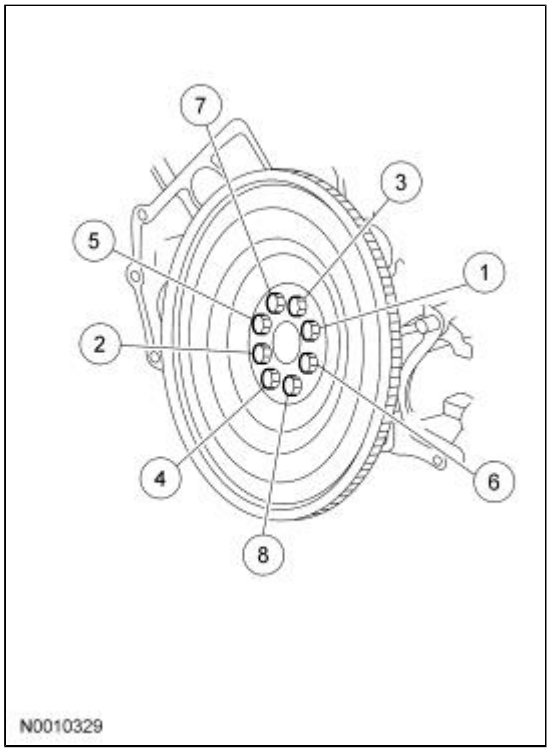
Using the special tools, install a new crankshaft rear seal.



107. Using the special tools, install a new crankshaft rear oil slinger.



108. Install the flexplate and the 8 bolts in the sequence shown.
    - Tighten to 80 Nm (59 lb-ft).



Engine

Printable View (865 KB)

Special Tool(s)

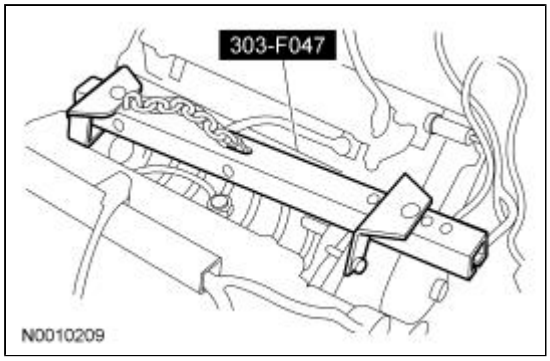
ST1377-A	Modular Engine Lift Bracket 303-F047 (014-00073) or equivalent

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A
Motorcraft Premium Gold Engine Coolant with Bittering Agent (US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color)	WSS-M97B51-A1
Threadlock 262 TA-26	WSK-M2G351-A6

1. Using a suitable floor crane, position the engine assembly into the vehicle.

2. Remove the special tool.

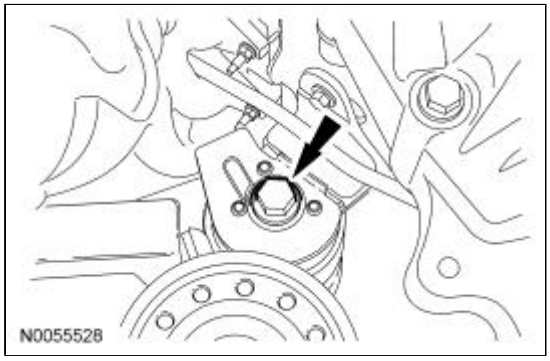


3. **CAUTION: Only use hand tools when installing the engine support insulator through bolt or damage to the engine support insulator-to-cylinder block bracket can occur.**

   NOTE: LH shown, RH similar.

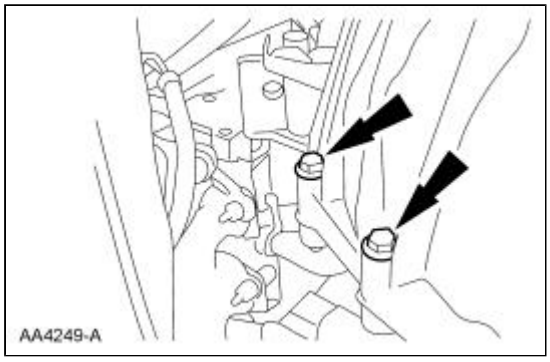
   Install the LH and RH engine support insulator bolts.
   - Apply Threadlock 262 to the bolt threads prior to installation.

- Tighten to 350 Nm (258 lb-ft).

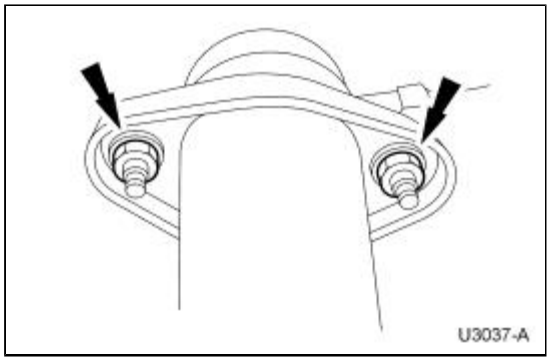


4. **NOTE:** Align the engine-to-transmission dowels before installing the engine-to-transmission bolts.

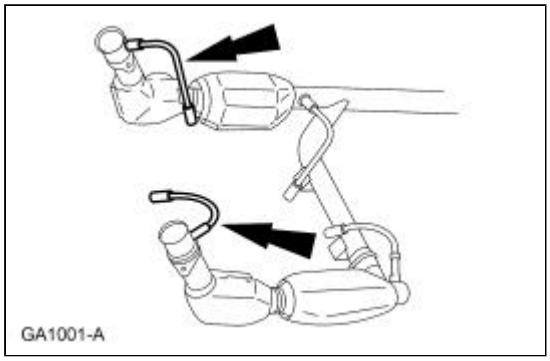
   Install the lower 5 transmission-to-engine bolts.
   - Tighten to 48 Nm (35 lb-ft).



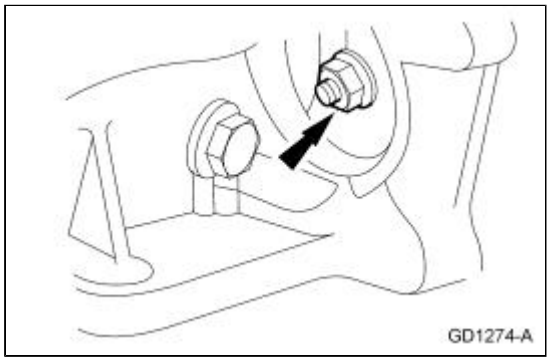
5. Install the 4 exhaust manifold-to-catalytic converter nuts.
   - Tighten to 40 Nm (30 lb-ft).



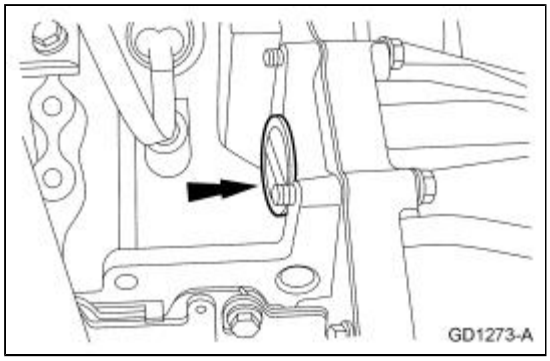
6. Connect the heated exhaust gas oxygen sensor (HO2S) electrical connectors.



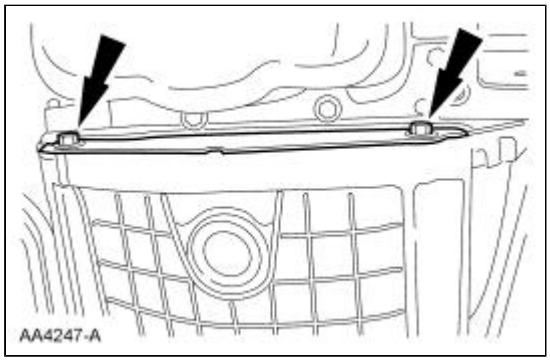
7. Install new torque converter-to-flexplate nuts.
    - Tighten to 35 Nm (26 lb-ft).



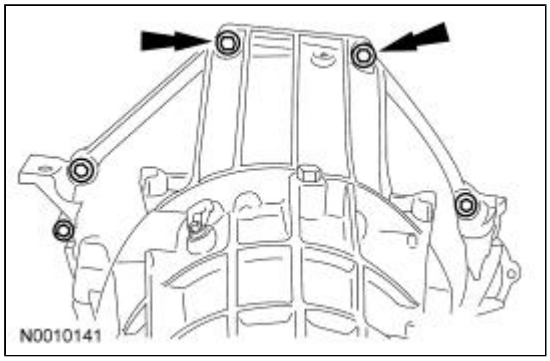
8. Install the cylinder block opening cover.



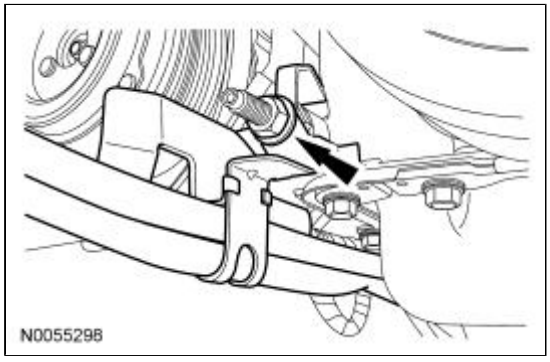
9. Install the flexplate inspection cover and the 2 bolts.
    - Tighten to 35 Nm (26 lb-ft).



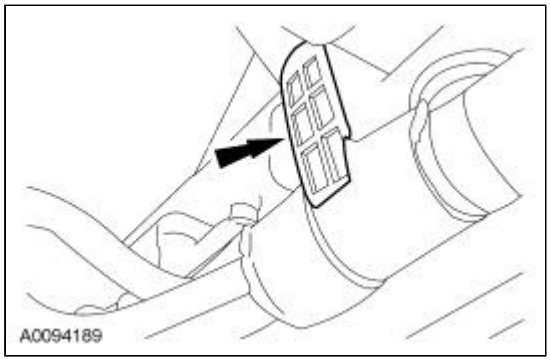
10. Install the upper 2 transmission-to-engine bolts.
    - Tighten to 48 Nm (35 lb-ft).



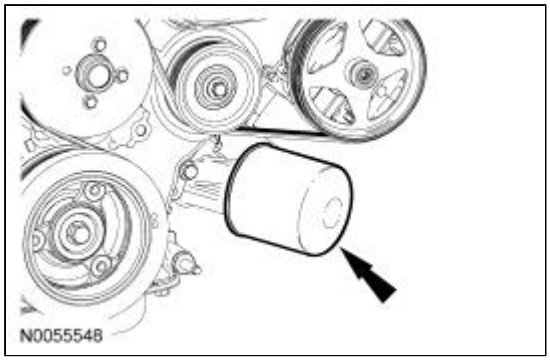
11. Position the starter wiring harness and transmission fluid cooler tube support brackets and install the nut.
    - Tighten to 10 Nm (89 lb-in).



12. Connect the starter wiring harness retainer.

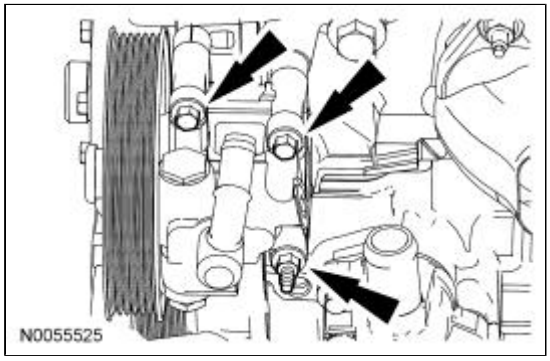


13. Install a new oil filter.
    - Tighten to 15 Nm (11 lb-ft).

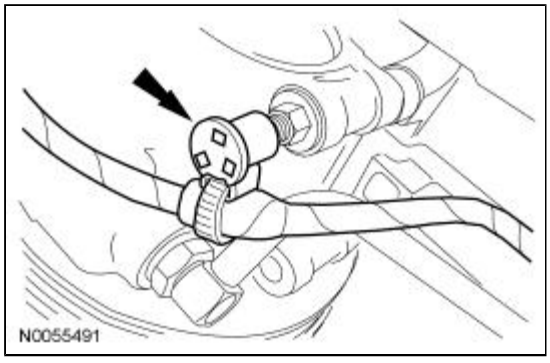


14. Position the power steering pump and install the stud bolt and the 2 bolts.

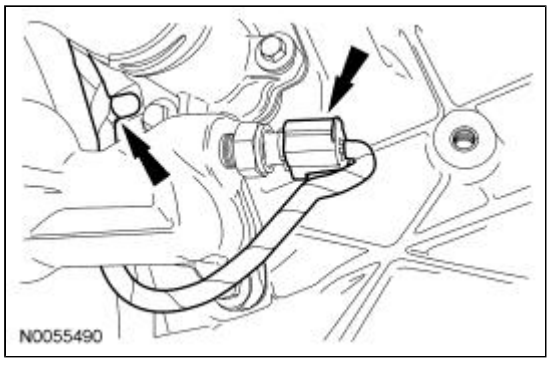
- Tighten to 25 Nm (18 lb-ft).



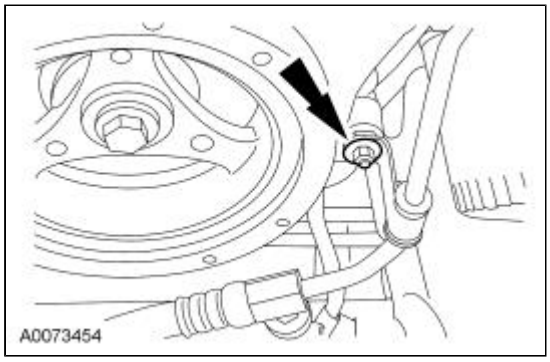
15. Connect the wiring harness position retainer to the power steering pump stud bolt.



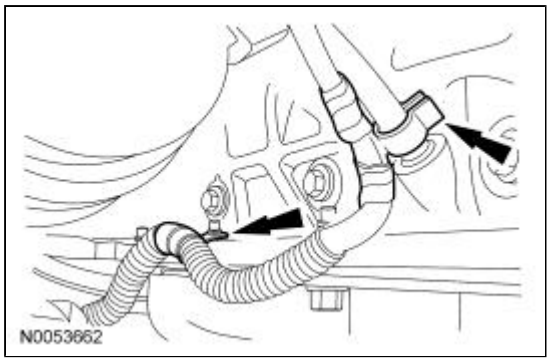
16. Connect the wiring harness position retainer and the engine oil pressure (EOP) switch electrical connector.



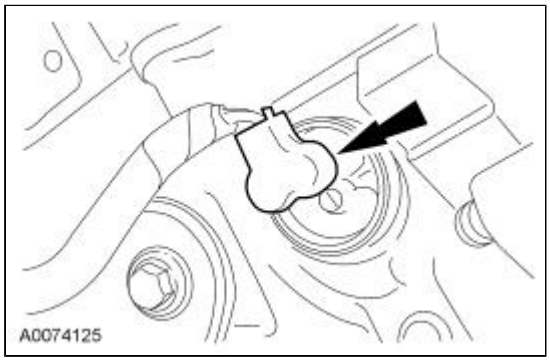
17. Install the power steering pump support bracket and the nut.
    - Tighten to 10 Nm (89 lb-in).



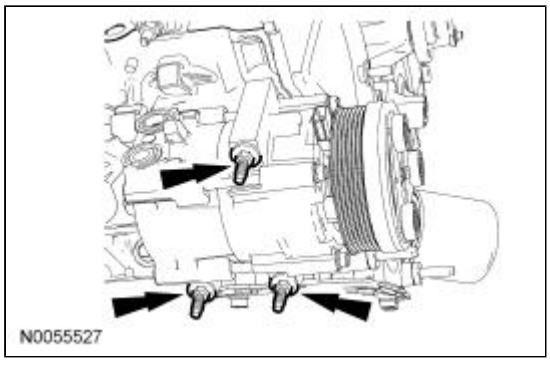
18. If equipped, connect the block heater wiring harness retainers.



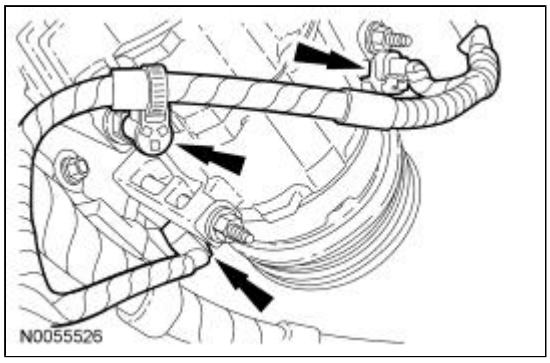
19. If equipped, connect the block heater electrical connector.



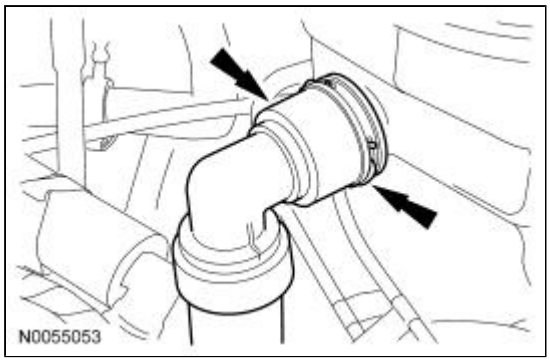
20. Position the A/C compressor and install the 3 stud bolts.
    - Tighten to 25 Nm (18 lb-ft).



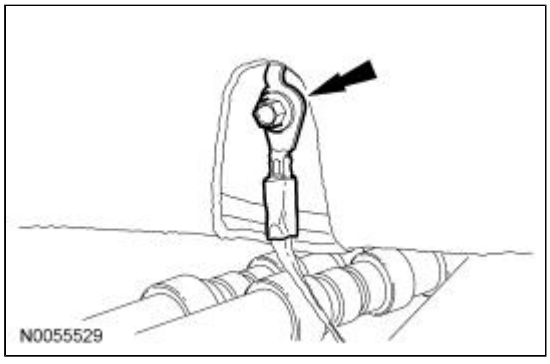
21. Connect the wiring harness position retainer and the crankshaft position (CKP) sensor and A/C compressor electrical connectors.



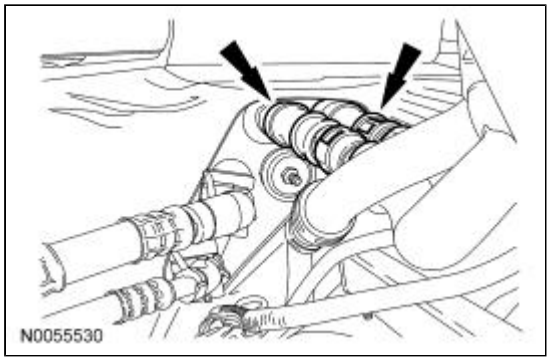
22. Install the clip and connect the degas bottle coolant outlet hose quick connect coupling.



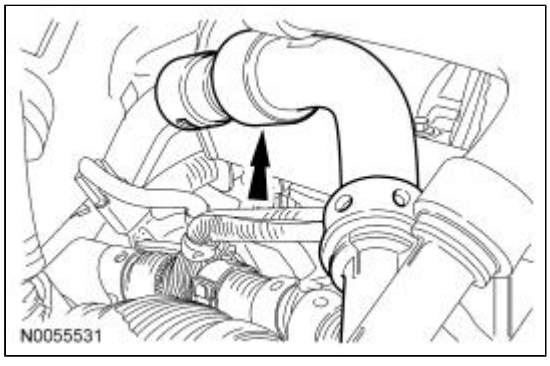
23. Position the ground cable and install the bolt.
    - Tighten to 10 Nm (89 lb-in).



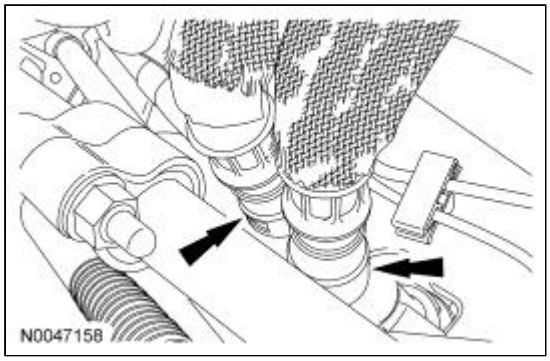
24. Position the 2 heater coolant hoses and connect the quick connect couplings.



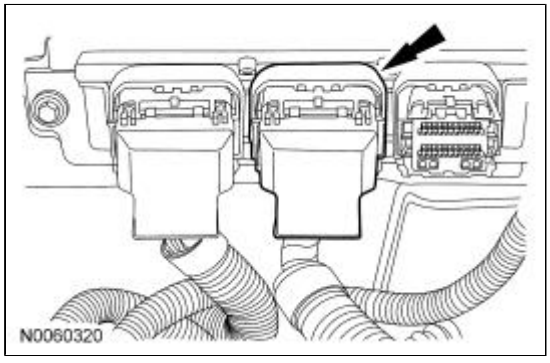
25. Connect the heater coolant hose quick connect coupling.



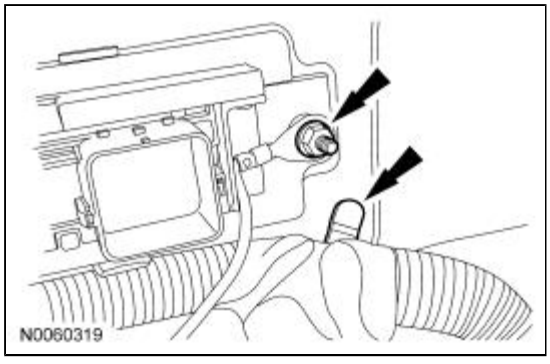
26. If equipped, connect the 2 auxiliary heat coolant hose quick connect couplings.



27. Connect the powertrain control module (PCM) electrical connector.



28. Connect the wiring harness retainer and ground cable and install the nut.
    - Tighten to 10 Nm (89 lb-in).



29. Install the accessory drive belt.

30. Install the bypass tube. For additional information, refer to Section 303-03 .

31. Install the cooling module. For additional information, refer to Section 303-03 .

32. If servicing the engine on a four wheel drive (4WD) vehicle, install the front drive shaft. For additional information, refer to Section 205-01 .

33. Install the starter. For additional information, refer to Section 303-06 .

34. Install the hood.

35. Fill the crankcase with clean engine oil.

36. Fill and bleed the engine cooling system. For additional information, refer to Section 303-03 .

37. Fill and bleed the power steering system. For additional information, refer to Section 211-00 .

Hydraulic Chain Tensioner Retaining Clip 1L3Z-6P250-AA	—

All cylinder heads

1. **CAUTION: Make sure all coolant residue and foreign material are cleaned from the block surface and cylinder bore.**

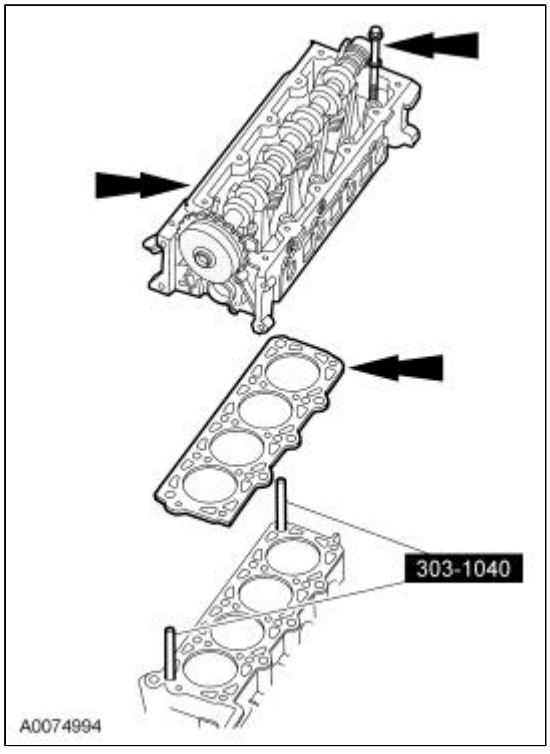
   CAUTION: The use of sealing aids (aviation cement, copper spray, and glue) is not permitted. The gasket must be installed dry.

   CAUTION: The cylinder head bolts must be discarded and new bolts installed. They are tighten-to-yield designed and cannot be reused.

   NOTE: Do not turn the crankshaft until instructed to do so.

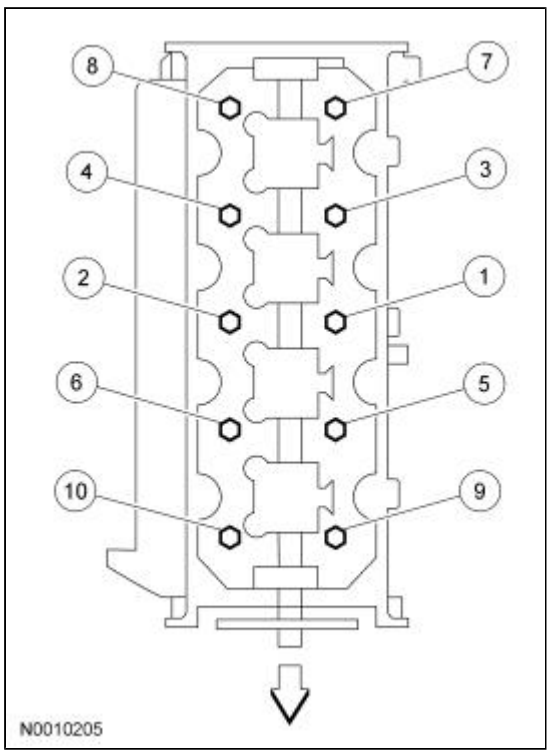
   NOTE: LH shown, RH similar.

   Using the special tools, position the cylinder head gaskets and cylinder heads over the dowels and install the cylinder head bolts loosely.



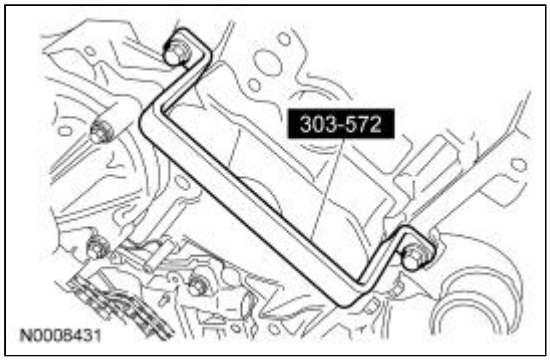
2. **NOTE:** RH shown, LH similar.

   Tighten the bolts in 3 stages, in the sequence shown.
   - Stage 1: Tighten to 40 Nm (30 lb-ft).
   - Stage 2: Tighten an additional 90 degrees.
   - Stage 3: Tighten an additional 90 degrees.

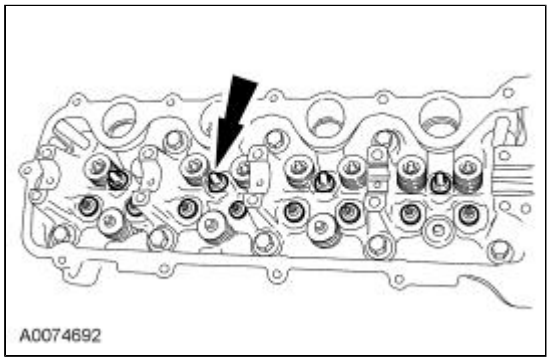


LH cylinder head

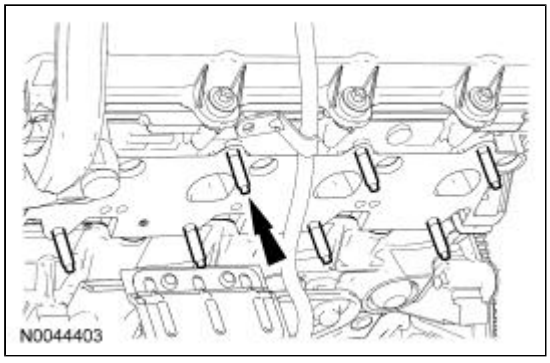
3. Remove the special tool from the LH cylinder head.



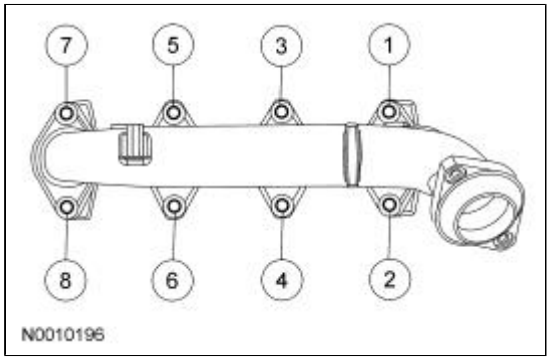
4. Install the hydraulic lash adjusters into the LH cylinder head.
    - Lubricate the hydraulic lash adjusters with clean engine oil prior to installation.



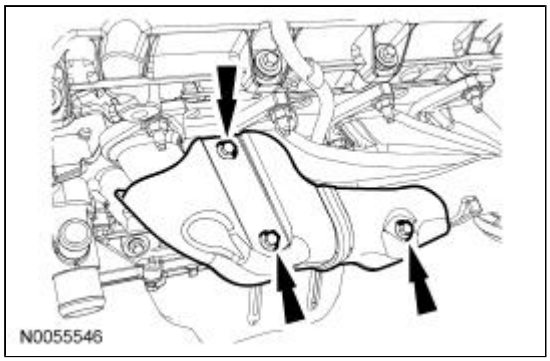
5. Install 8 new exhaust manifold studs.
    - Tighten to 12 Nm (9 lb-ft).



6. Position a new gasket, the LH exhaust manifold and tighten the 8 new nuts in the sequence shown.
    - Tighten to 25 Nm (18 lb-ft).

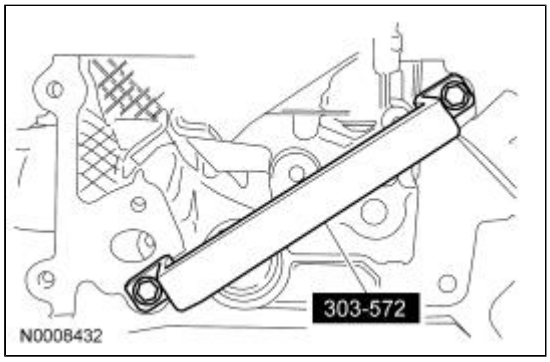


7. Position the exhaust manifold heat shield and install the 3 bolts.

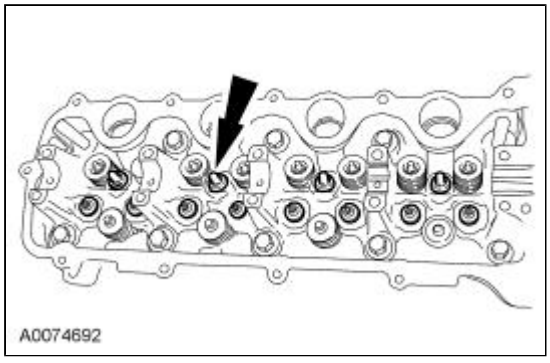


RH cylinder head

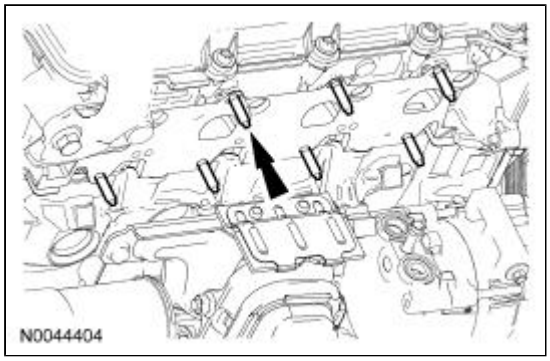
8. Remove the special tool from the RH cylinder head.



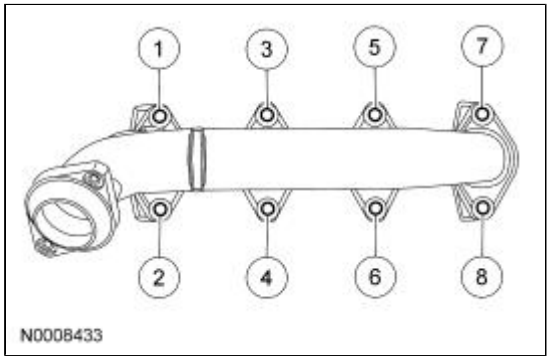
9. Install the hydraulic lash adjusters into the RH cylinder head.
    - Lubricate the hydraulic lash adjusters with clean engine oil prior to installation.



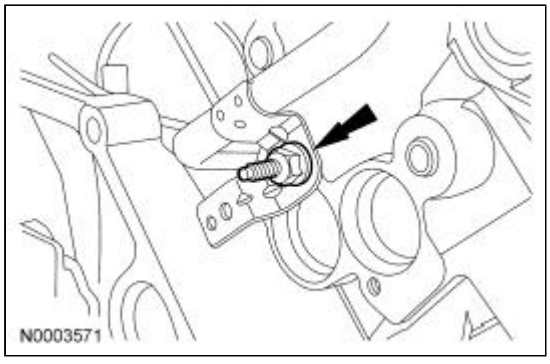
10. Install 8 new exhaust manifold studs.
    - Tighten to 12 Nm (9 lb-ft).



11. Position a new gasket, the RH exhaust manifold and tighten the 8 new nuts in the sequence shown.
    - Tighten to 25 Nm (18 lb-ft).



12. Install the coolant tube and the stud bolt.
    - Tighten to 10 Nm (89 lb-in).

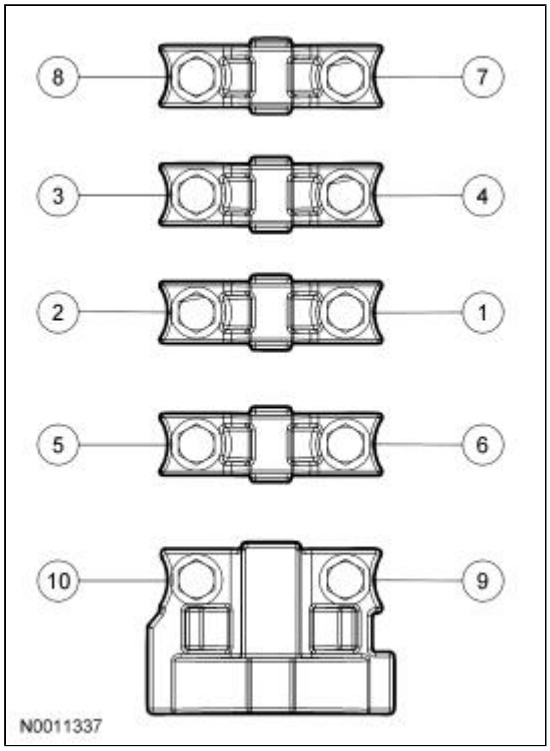


All cylinder heads

13. Install the LH and RH camshafts.
    - Lubricate the camshaft and camshaft journals with clean engine oil prior to installation.

14. **NOTE:** LH shown, RH similar.

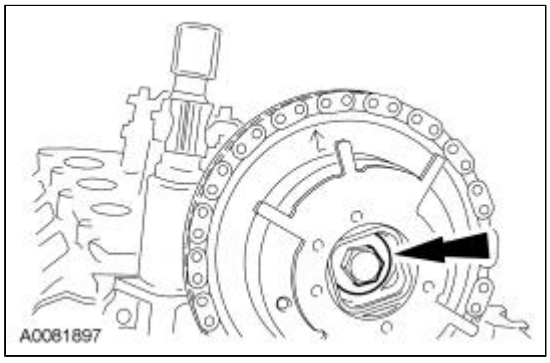
    Install the LH and RH camshaft bearing caps in their original locations.
    - Lubricate the camshaft bearing caps with clean engine oil.
    - Position the front camshaft bearing cap.
    - Position the remaining camshaft bearing caps.
    - Install the bolts loosely.
    - Tighten to 10 Nm (89 lb-in) in the sequence shown.



15. **CAUTION: Damage to the variable camshaft timing (VCT) phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    NOTE: LH shown, RH similar.

    Install the VCT phaser sprockets and new VCT phaser sprocket bolts finger tight.

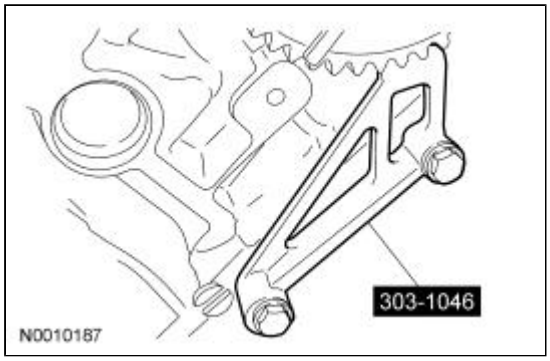


16. **CAUTION: Damage to the VCT phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    CAUTION: Only use hand tools to remove the VCT phaser sprocket assembly or damage may occur to the camshaft or VCT phaser sprocket.

    NOTE: LH shown, RH similar.

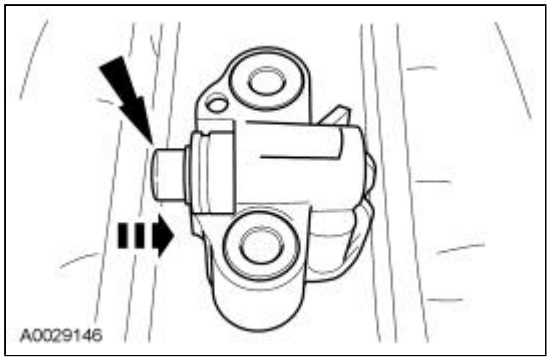
    Using the special tool, tighten the LH and RH VCT phaser sprocket bolts in 2 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.



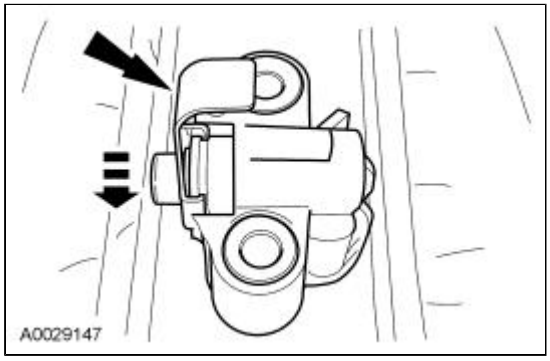
17. **CAUTION: Timing chain procedures must be followed exactly or damage to valves and pistons will result.**

    CAUTION: Prior to installation, inspect the tensioner-sealing bead for seal integrity. If cracks, tears, separation from the tensioner body or permanent compression of the seal bead is observed, install a new tensioner.

    Compress the tensioner plunger, using a vise.

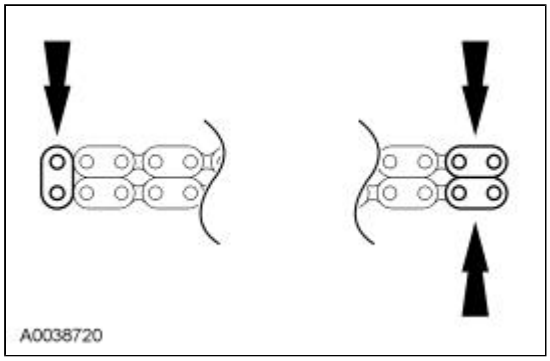


18. Install a retaining clip on the tensioner to hold the plunger in during installation.

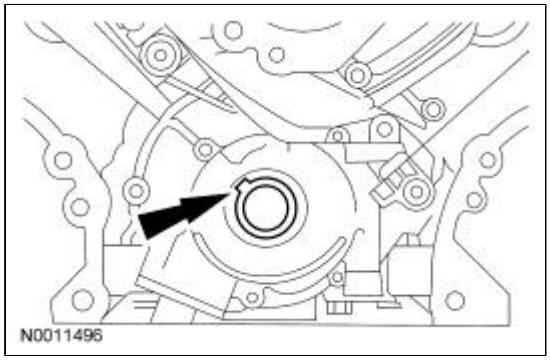


19. Remove the tensioner from the vise.

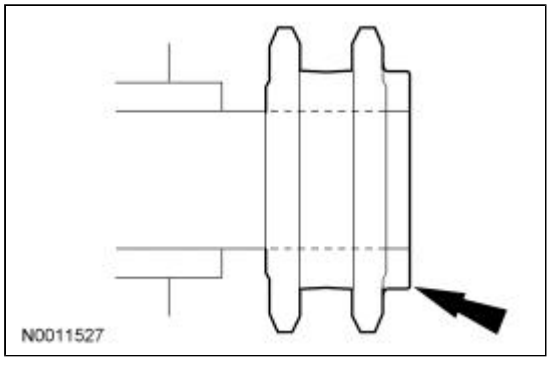
20. If the copper links are not visible, mark 2 links on one end and 1 link on the other end, and use as timing marks.



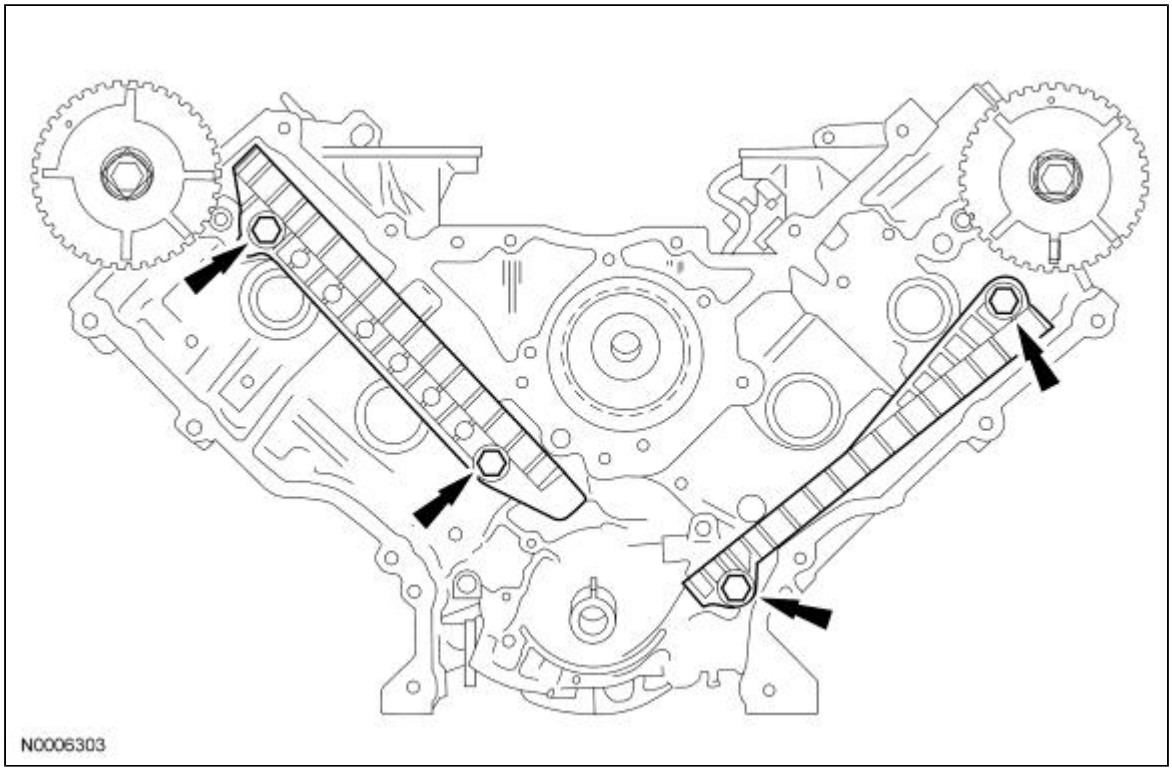
21. Position the crankshaft keyway at the 11 o'clock position.



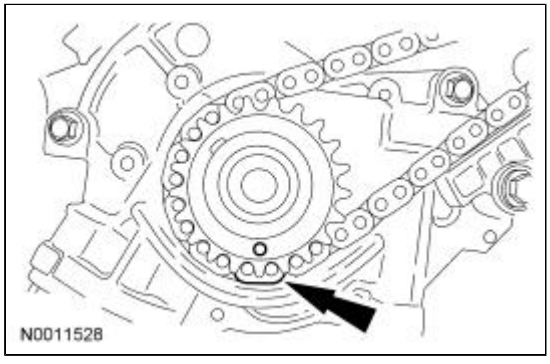
22. Install the crankshaft sprocket, making sure the flange faces forward.



23. Install the 4 bolts and the LH and RH timing chain guides.
    - Tighten to 10 Nm (89 lb-in).

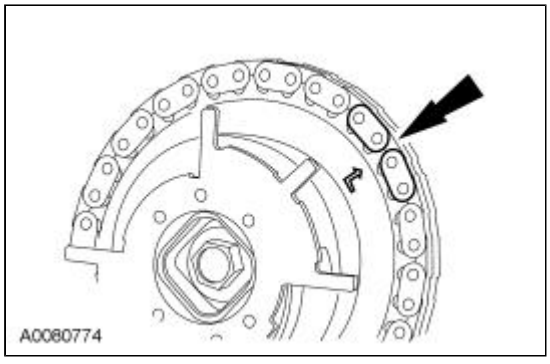


24. Position the lower end of the LH (inner) timing chain on the crankshaft sprocket, aligning the timing mark on the outer flange of the crankshaft sprocket with the single copper (marked) link on the chain.



25. **NOTE:** Make sure the upper half of the timing chain is below the tensioner arm dowel.

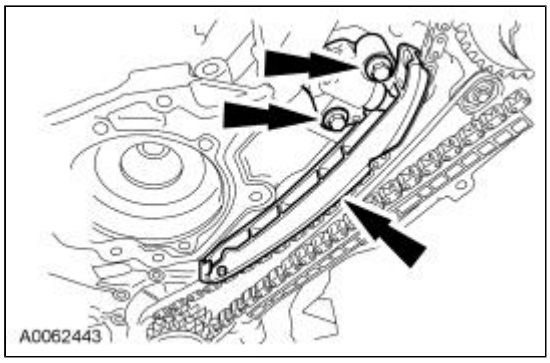
    Position the timing chain on the VCT phaser sprocket with the timing mark positioned between the 2 copper (marked) chain links.



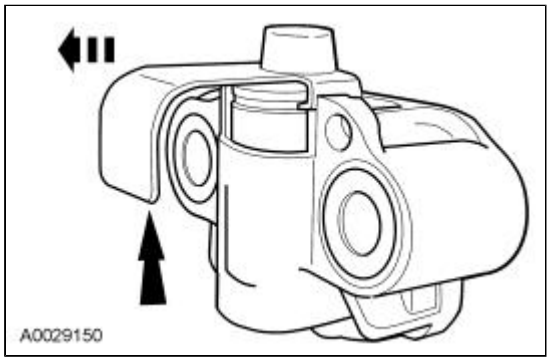
26. **NOTE:** The LH timing chain tensioner arm has a bump near the dowel hole for identification.

Position the LH timing chain tensioner arm on the dowel pin and install the LH timing chain tensioner and bolts.

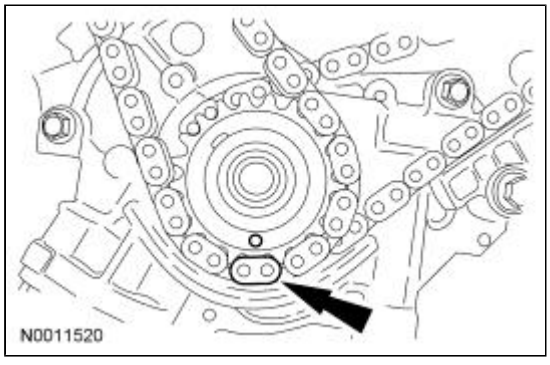
- Tighten to 25 Nm (18 lb-ft).



27. Remove the retaining clip from the LH timing chain tensioner.

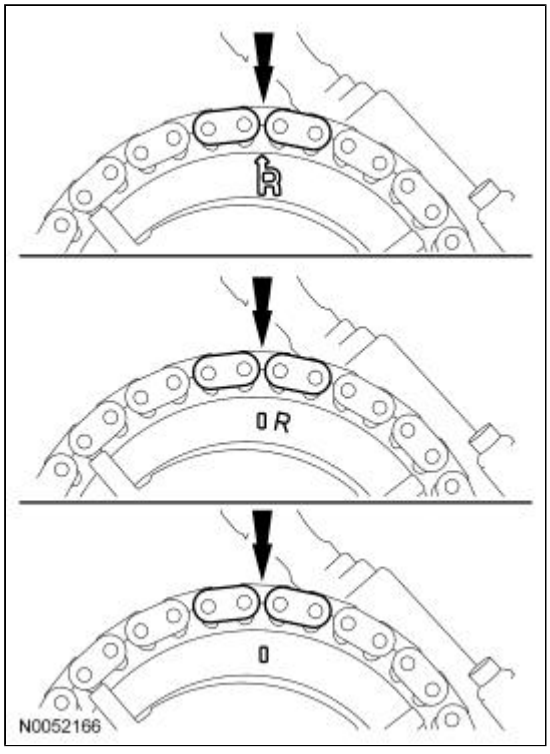


28. Position the lower end of the RH (outer) timing chain on the crankshaft sprocket, aligning the timing mark on the sprocket with the single copper (marked) chain link.

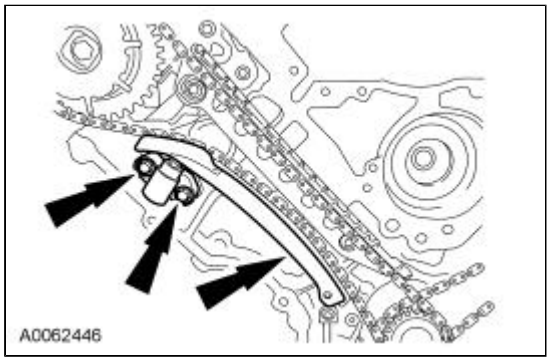


29. **NOTE:** The camshaft phaser and sprocket will be stamped with one of the illustrated timing marks for the RH camshaft.

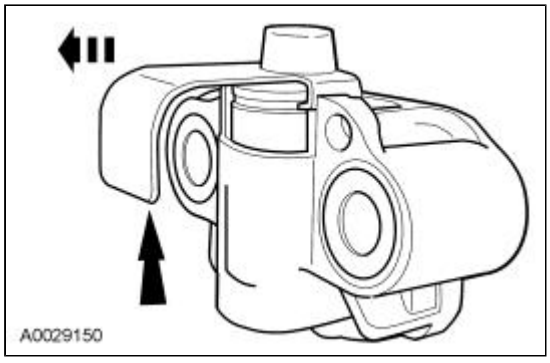
    Position the RH timing chain on the VCT phaser sprocket with the timing mark positioned between the 2 copper (marked) chain links.



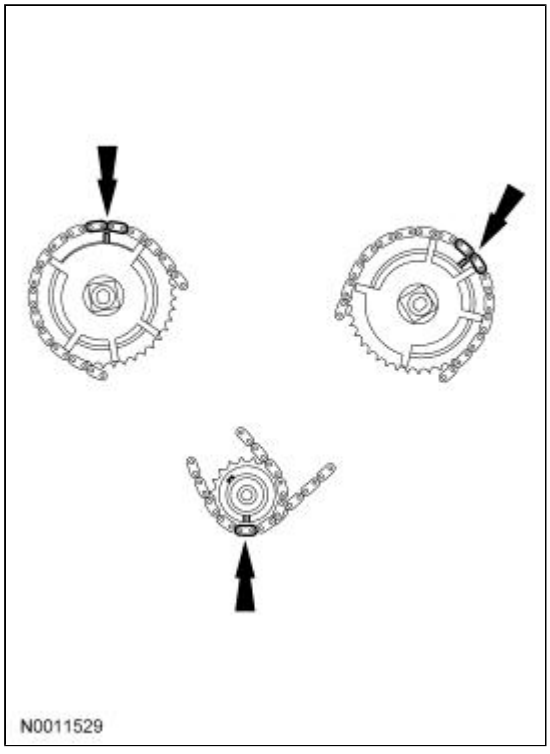
30. Position the RH timing chain tensioner arm on the dowel pin and install the RH timing chain tensioner and bolts.
    - Tighten to 25 Nm (18 lb-ft).



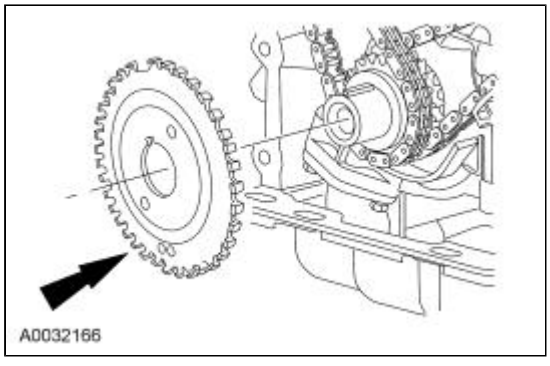
31. Remove the retaining clip from the RH timing chain tensioner.



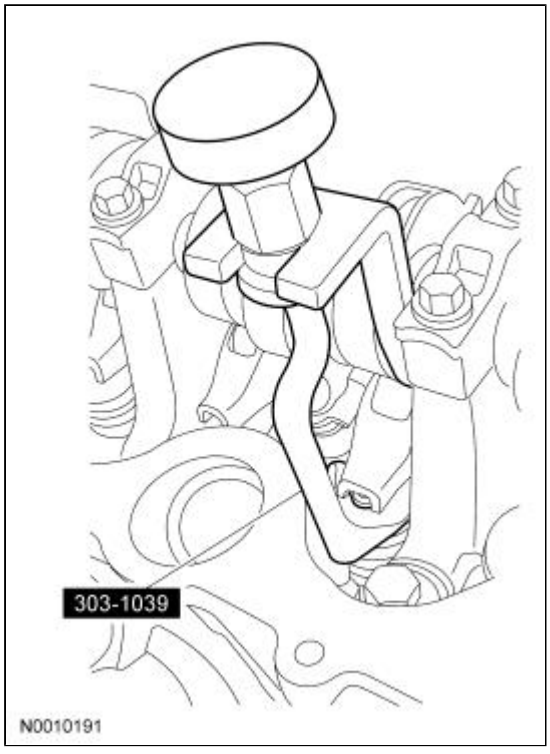
32. As a post-check, verify correct alignment of all timing marks.



33. Install the crankshaft sensor ring on the crankshaft.



34. Using the special tool, install all of the camshaft roller followers.
    - Lubricate the camshaft roller followers with clean engine oil prior to installation.

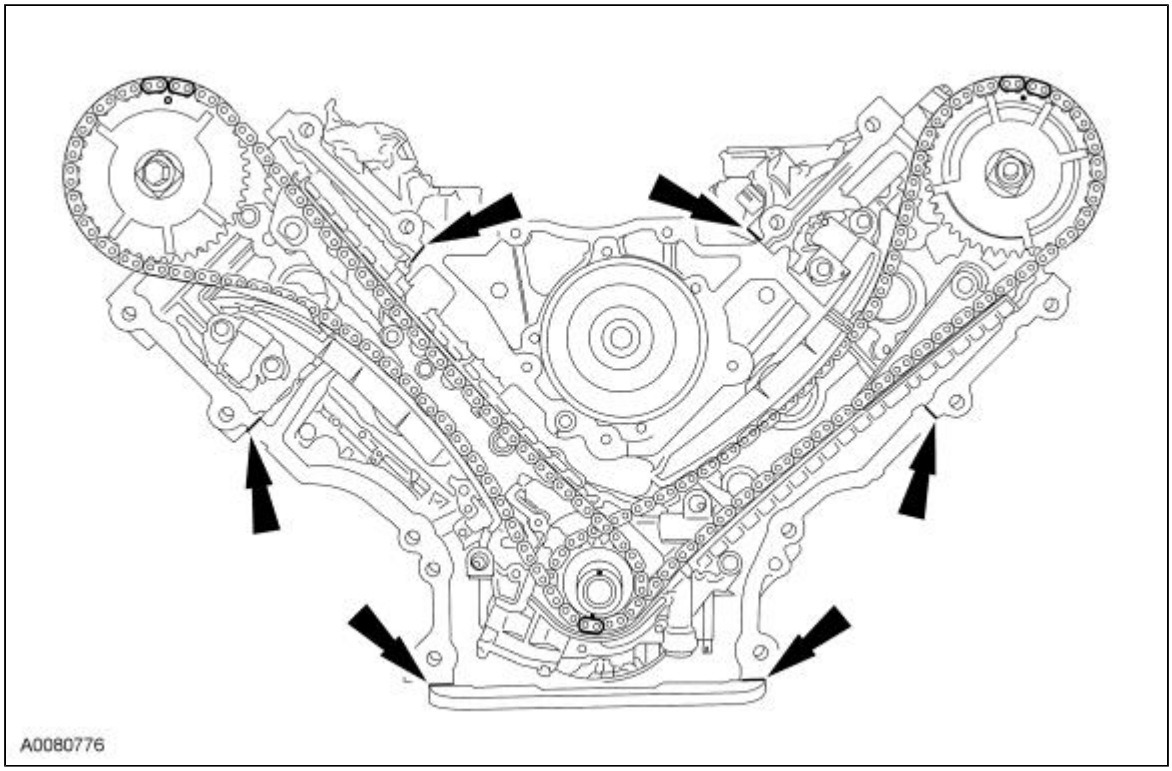


35. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

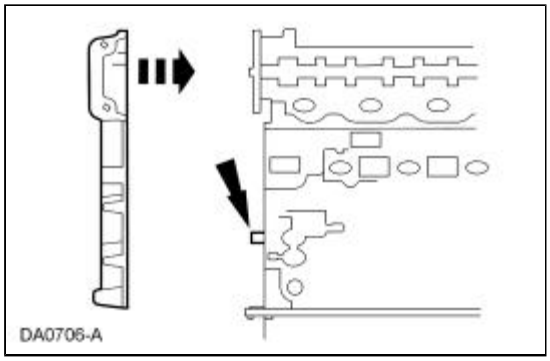
    NOTE: If the engine front cover is not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

    NOTE: Make sure that the engine front cover gasket is in place on the engine front cover before installation.

    Apply a bead of silicone gasket and sealant along the cylinder head-to-cylinder block surface and the oil pan-to-cylinder block surface, at the locations shown.



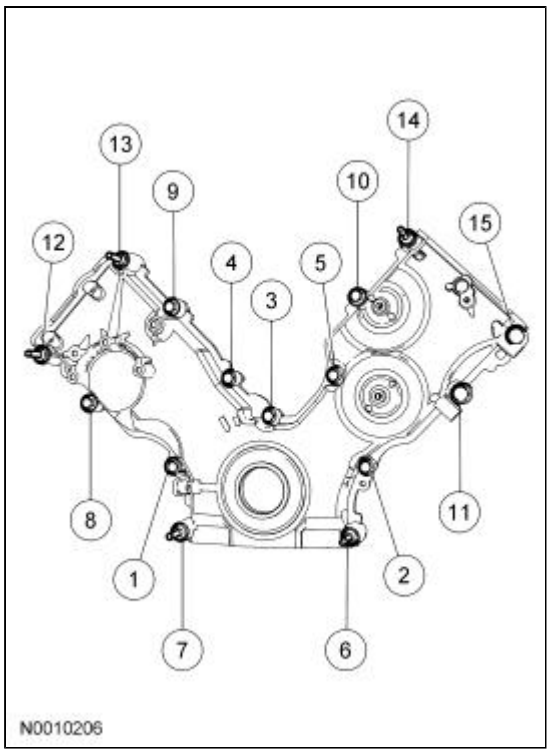
36. Install a new engine front cover gasket on the engine front cover. Position the engine front cover onto the dowels. Install the fasteners finger-tight.



37. Tighten the engine front cover fasteners in sequence in 2 stages.
Stage 1: Tighten fasteners 1 through 15 to 25 Nm (18 lb-ft).
Stage 2: Tighten fasteners 6 and 7 to 48 Nm (35 lb-ft).

Item	Part Number	Description
1	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
2	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
3	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
4	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
5	N806177	Bolts, Hex Flange Head Pilot, M8 x 1.25 x 50
6	N808529	Stud, Hex Head Pilot, M10 x 1.5 x 1.5 x 103
7	N808529	Stud, Hex Head Pilot, M10 x 1.5 x 1.5 x 103
8	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
9	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
10	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50

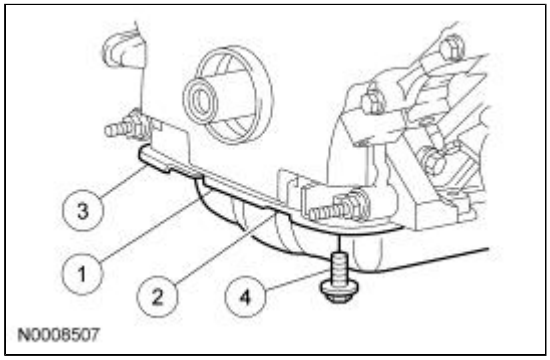
11	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
12	W709573	Stud and Washer, Hex Head Pilot, M8 x 1.25 x 1.25 x 94
13	W709573	Stud and Washer, Hex Head Pilot, M8 x 1.25 x 1.25 x 94
14	W709573	Stud and Washer, Hex Head Pilot, M8 x 1.25 x 1.25 x 94
15	W706605	Bolt, Hex Head Pilot, M8 x 1.25 x 56



38. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    Clean the valve cover mating surface with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

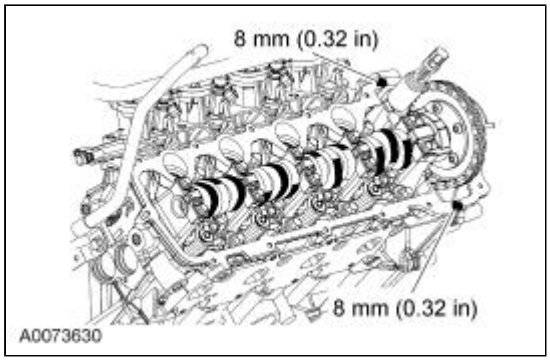
39. Install the 4 front oil pan bolts in the sequence shown in 2 stages.
    - Stage 1: Tighten to 20 Nm (15 lb-ft).
    - Stage 2: Tighten an additional 60 degrees.



40. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer.

Failure to follow this procedure can cause future oil leakage.

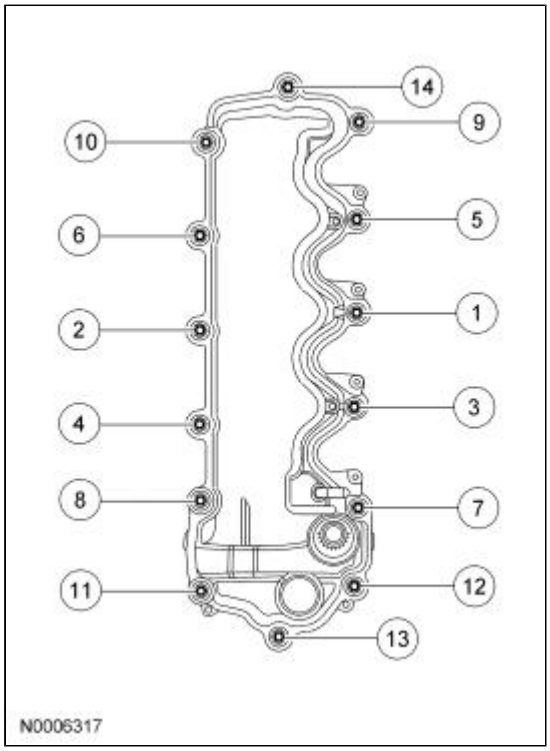
Apply silicone gasket and sealant in 2 places where the engine front cover meets the cylinder head.



41. **CAUTION: When installing the valve cover, make sure to avoid damaging the VCT solenoid.**

Position the RH valve cover and gasket on the cylinder head and tighten the bolts in the sequence shown.

- Tighten to 10 Nm (89 lb-in).



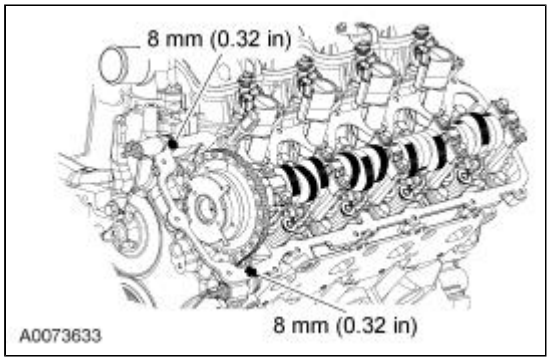
42. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

Clean the valve cover mating surface with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

43. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Follow the directions on the

packaging. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

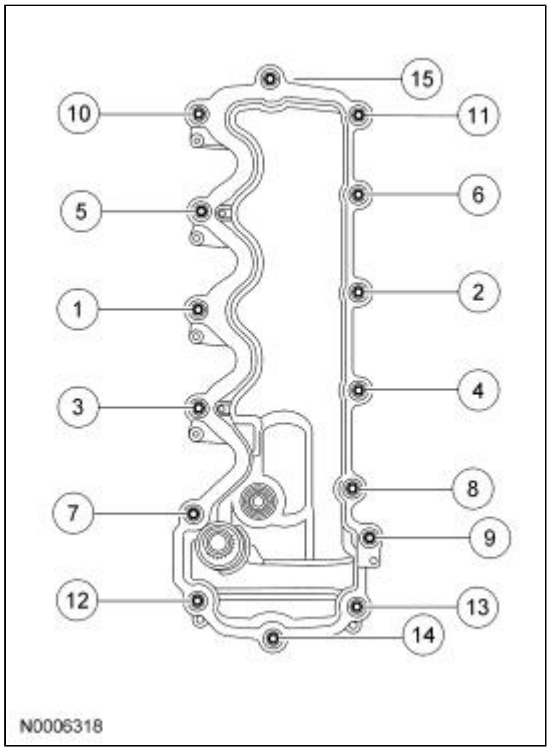
Apply silicone gasket and sealant in 2 places where the engine front cover meets the cylinder head.



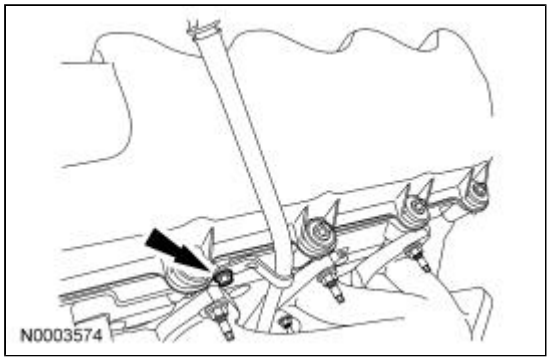
44. **CAUTION: When installing the valve cover, make sure to avoid damaging the VCT solenoid.**

Position the LH valve cover and gasket on the cylinder head and tighten the bolts in the sequence shown.

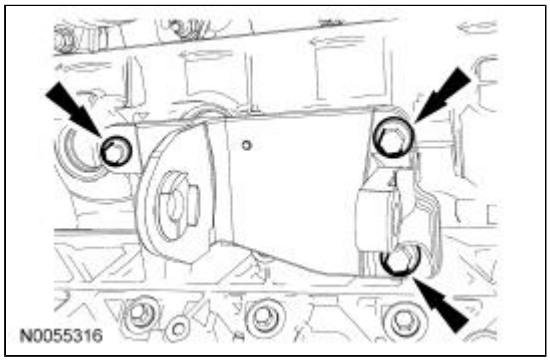
- Tighten to 10 Nm (89 lb-in).



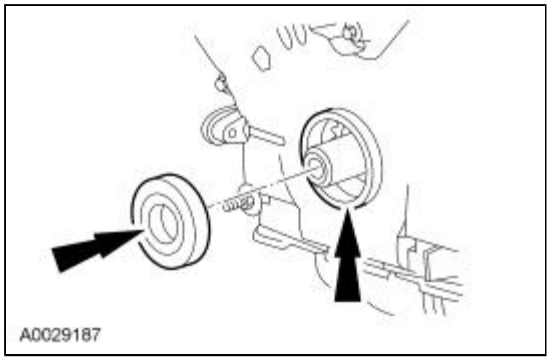
45. Install the oil level indicator tube and the bolt.
    - Install a new O-ring seal and lubricate the O-ring seal with clean engine oil prior to installation.
    - Tighten to 10 Nm (89 lb-in).



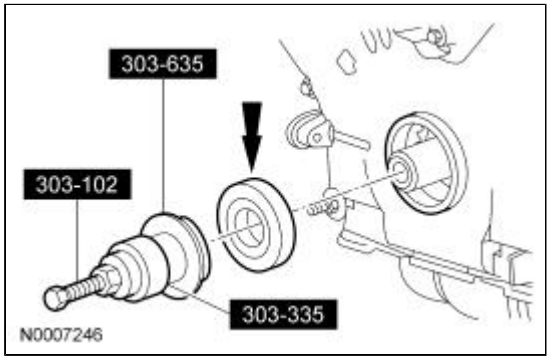
46. Position the RH engine support insulator and install the 3 bolts.
    - Tighten to 63 Nm (46 lb-ft).



47. Lubricate the engine front cover and the crankshaft front seal inner lip with clean engine oil.

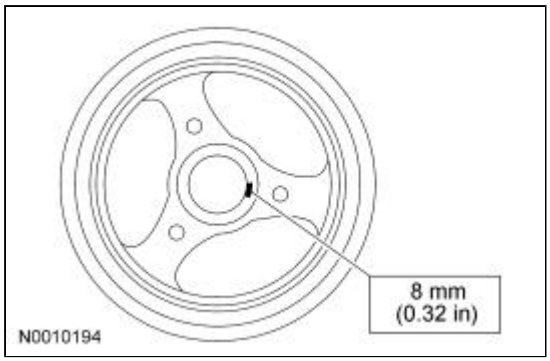


48. Using the special tools, install a new crankshaft front seal into the engine front cover.

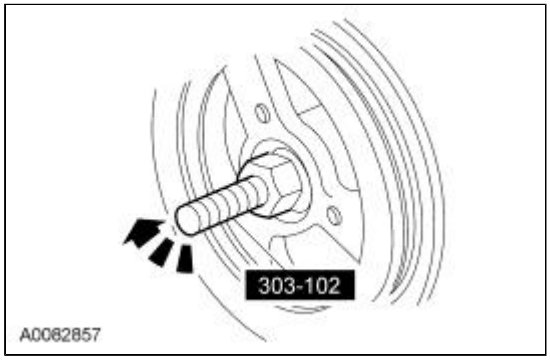


49. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

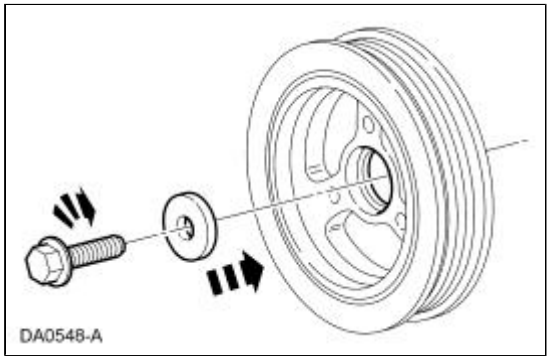
Apply silicone gasket and sealant to the Woodruff key slot on the crankshaft pulley.



50. Using the special tool, install the crankshaft pulley.

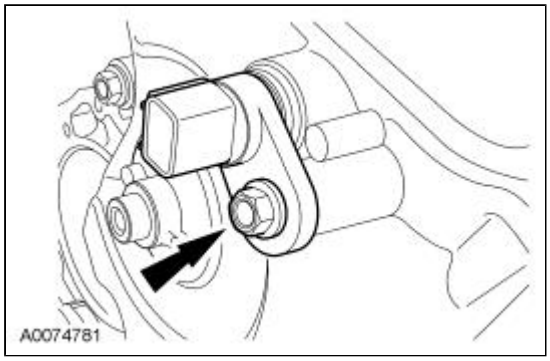


51. Tighten the new crankshaft pulley bolt in 4 stages.
    - Stage 1: Tighten to 90 Nm (66 lb-ft).
    - Stage 2: Loosen 360 degrees.
    - Stage 3: Tighten to 50 Nm (37 lb-ft).
    - Stage 4: Tighten an additional 90 degrees.



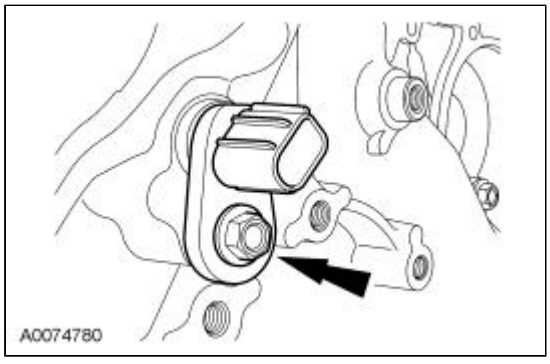
52. **NOTE:** Lubricate the O-ring seal with clean engine oil prior to installation.

    Install the LH camshaft position (CMP) sensor and the bolt.
    - Tighten to 10 Nm (89 lb-in).



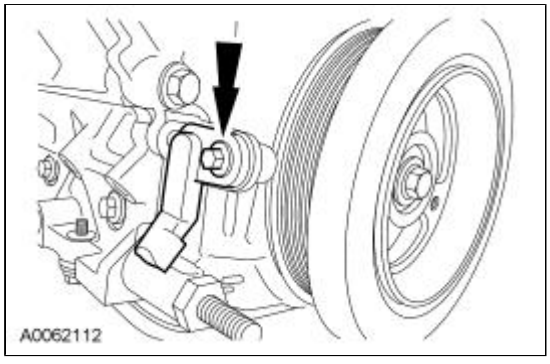
53. **NOTE:** Lubricate the O-ring seal with clean engine oil prior to installation.

    Install the RH CMP sensor and the bolt.
    - Tighten to 10 Nm (89 lb-in).

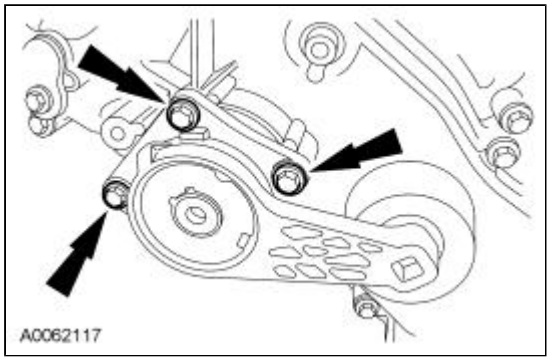


54. **NOTE:** Lubricate the O-ring seal with clean engine oil prior to installation.

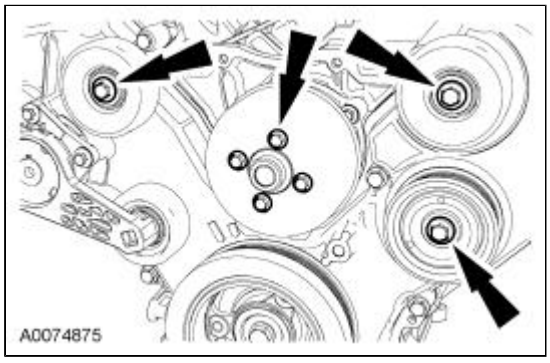
    Position the crankshaft position (CKP) sensor and the bolt.
    - Tighten to 10 Nm (89 lb-in).



55. Position the accessory drive belt tensioner and install the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).



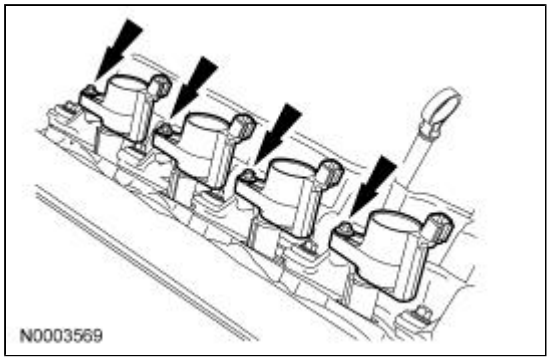
56. Install the 3 accessory drive belt idler pulleys, the coolant pump pulley and the 7 bolts.
    - Tighten to 25 Nm (18 lb-ft).



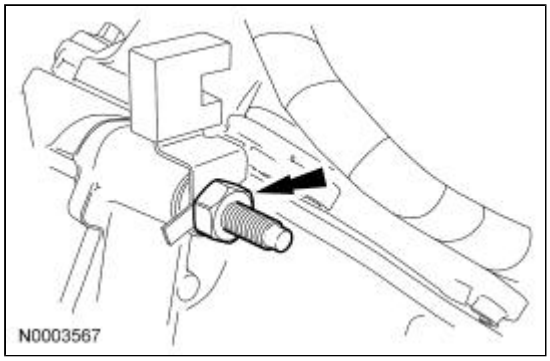
57. Position the electrical harness on the engine assembly and connect the engine wiring harness retainers to the valve cover studs.

58. **NOTE:** LH shown, RH similar.

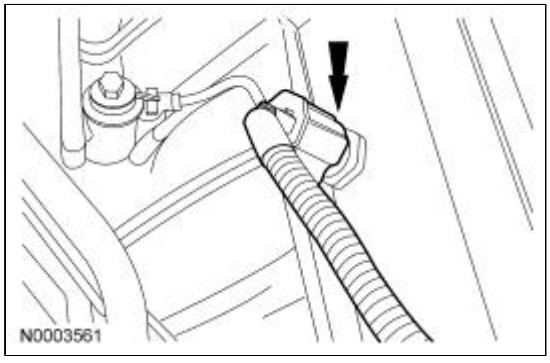
    Install the 8 ignition coils and the 8 bolts.
    - Tighten to 6 Nm (53 lb-in).



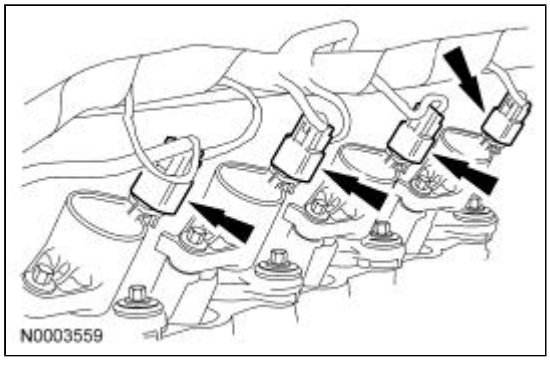
59. Install the LH radio ignition interference capacitor and the nut.
    - Tighten to 25 Nm (18 lb-ft).



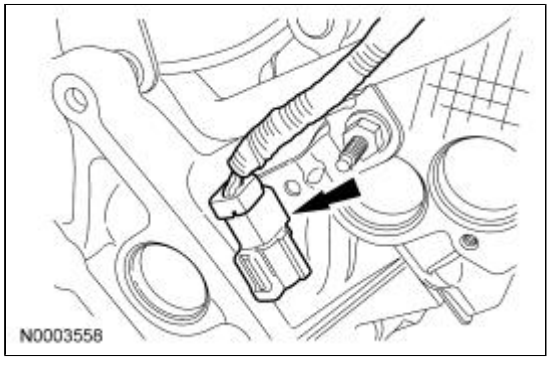
60. Connect the cylinder head temperature (CHT) sensor electrical connector.



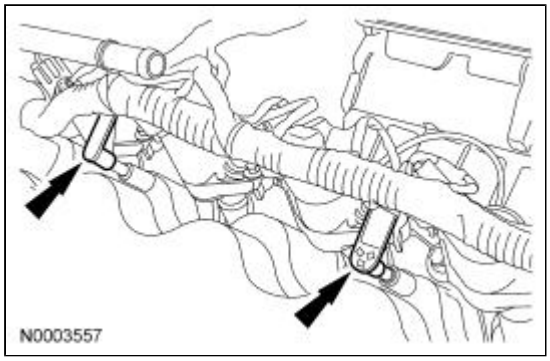
61. Connect the 4 RH ignition coil electrical connectors.



62. Connect the electrical connector retainer to the coolant tube.

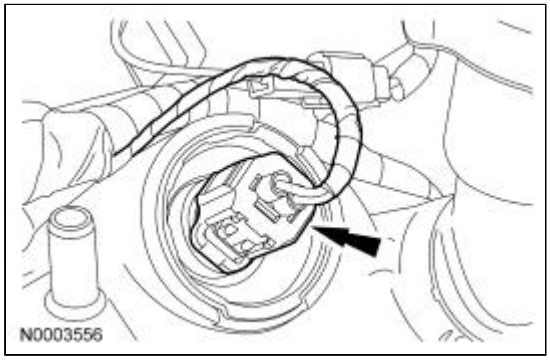


63. Connect the 2 engine wiring harness retainers from the RH valve cover studs.

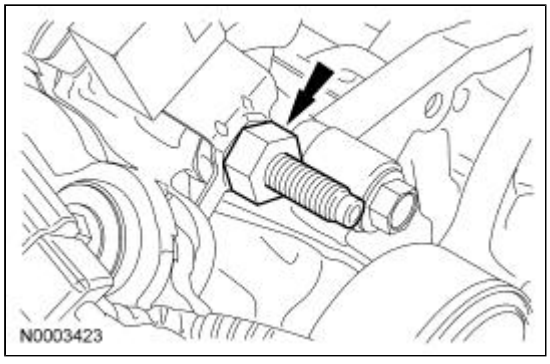


64. **NOTE:** RH shown, LH similar.

    Connect the RH and LH VCT solenoid electrical connectors.

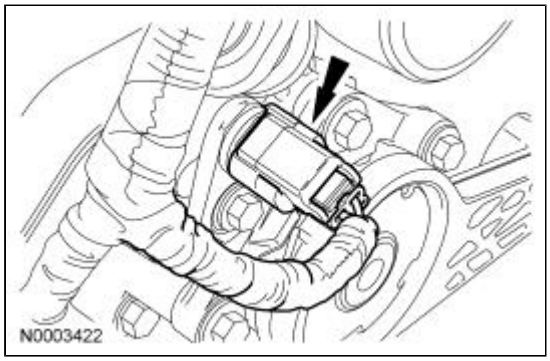


65. Install the RH radio ignition interference capacitor and the stud bolt.
    - Tighten to 25 Nm (18 lb-ft).



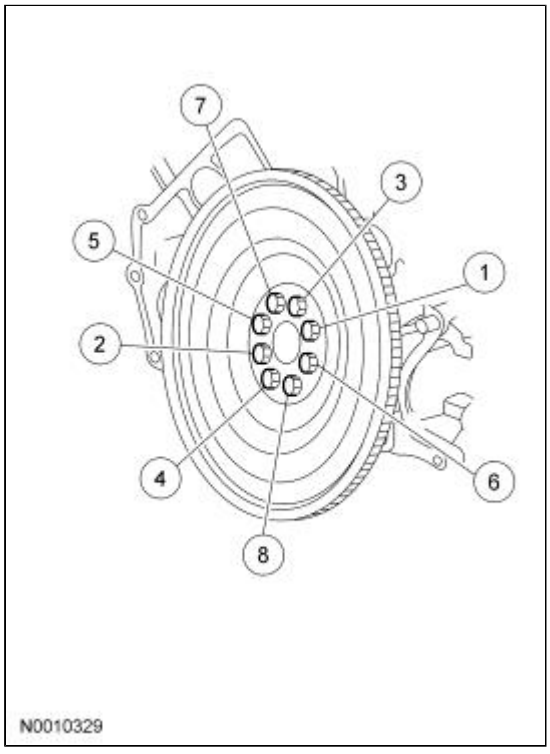
66. **NOTE:** RH shown, LH similar.

    Connect the RH and LH CMP sensor electrical connectors.



67. Using a suitable floor crane, remove the engine from the engine stand.

68. Install the flexplate and the 8 bolts in the sequence shown.
    - Tighten to 80 Nm (59 lb-ft).



69. Install the engine. For additional information, refer to Engine in the Installation portion of this section.

Engine Cooling

Printable View (467 KB)

CAUTION: Vehicle cooling systems are filled with Motorcraft Premium Gold Engine Coolant with Bittering Agent (US only) VC-7-B (US), CVC-7-A (Canada); or equivalent (yellow color) meeting Ford specification WSS-M97B51-A1. Always fill the cooling system with the same type of coolant that was drained from the system. Do not mix coolant types.

The cooling system consists of the following components:

- Block heater
- Bypass tube
- Degas bottle
- Degas bottle cap
- Fan blade
- Electronic fan clutch
- Fan shroud
- Radiator
- Radiator draincock
- Upper and lower radiator hoses
- Bypass coolant hose
- Coolant pump
- Coolant thermostat

The coolant pump:

- circulates the coolant.

The coolant thermostat:

- controls coolant temperature.
- allows quicker engine warm-up.

The degas bottle:

- holds surplus coolant when hot.
- de-aerates the system reducing hot spots.
- is the location for service fill.
- allows coolant expansion and system pressurization.
- replenishes coolant to the system.

The fan blade:

- draws air through the radiator to help cool the system coolant.

The fan clutch:

- is an electronically controlled clutch that controls the fan speed.

The radiator:

- cannot be serviced. Install a new radiator.
- allows excess heat to be transferred to the air.

The optional block heater:

- electrical heating element is installed in the core plug opening.
    - uses a standard 110V electrical supply
- keeps the engine coolant warm during cold weather.

CAUTION: Engine coolant provides freeze protection, boil protection, cooling efficiency and corrosion protection to the engine and cooling components. In order to obtain these protections, the engine coolant must be maintained at the correct concentration and fluid level in the degas bottle.

When adding engine coolant, use a 50/50 mixture of engine coolant and distilled water.

To maintain the integrity of the coolant and the cooling system:

- Add Motorcraft Premium Gold Engine Coolant. Use the same type of coolant that is present in the system. Do not mix coolant types.
- Do not add orange-colored Motorcraft Specialty Orange Engine Coolant. Mixing coolants may degrade the coolant's protection rating.
- Do not add alcohol, methanol or brine or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.
- Do not mix with recycled coolant. Use of such a coolant may harm the engine and cooling system components.

Coolant Flow Diagram, Expedition and Navigator without Auxiliary Heater

Inspection and Verification

WARNING: Never remove the pressure relief cap under any conditions while the engine is operating or hot. Failure to follow these instructions could result in personal injury or damage to the cooling system or engine. To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the pressure relief cap. Wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly. Step back while the pressure is released from the cooling system. When you are certain all the pressure has been released, (with a cloth) turn and remove the pressure relief cap. Failure to follow these instructions may result in personal injury.

CAUTION: The engine cooling system is filled with Motorcraft Premium Gold Engine Coolant with Bittering Agent (US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color) meeting Ford specification WSS-M97B51-A1. Do not mix coolant types.

NOTE: Vehicles equipped with a degas bottle system have the pressure relief cap on the degas bottle and no radiator cap. Vehicles equipped with a coolant expansion tank system have the pressure relief cap on the radiator.

1. Verify the customer concern.
2. Visually check the engine coolant level at the degas bottle or coolant expansion tank when the system is cold.
3. Make sure the pressure relief cap is installed correctly.
4. Record any cooling system diagnostic trouble codes (DTCs) retrieved.
5. **NOTE:** Take note of any coolant odor or steam coming from cooling system components.

   If the system coolant is filled correctly and no DTCs associated with fail-safe cooling are retrieved, verify the customer's concern by operating the engine to duplicate the condition.
6. **NOTE:** Refer to the coolant flow diagram in the Description and Operation, Engine Cooling portion of this section.

   Inspect to determine if any of the following mechanical or electrical concerns apply.

Visual Inspection Chart

Mechanical	Electrical
• Leaks or weeps at: ▪ Hoses ▪ Tubes ▪ Clamp joints ▪ Quick connect couplings (if equipped) ▪ Gaskets ▪ O-Rings ▪ Thermostat housing ▪ Radiator ▪ Pressure relief cap ▪ Coolant pump ▪ Heater core (wet floor or coolant odor in vehicle) ▪ Heater control valve ▪ Heated throttle body or heated throttle body adapter (if equipped) ▪ Coolant crossover manifold assembly (if equipped) ▪ Oil cooler (if equipped) ▪ Degas bottle (if equipped) ▪ Coolant expansion tank (if equipped) ▪ Heated positive crankcase ventilation (PCV) (if equipped) ▪ Fuel pressure regulator Clayton bowl (if equipped) ▪ Cylinder block core plugs ▪ Cylinder head core plugs (if equipped) ▪ Block heater (if equipped)	• Inoperative or damaged: ▪ Electric cooling fan (if equipped) ▪ Electronically actuated fan clutch ▪ Electronically actuated fan clutch controller ▪ Wiring, connectors, relays or modules ▪ Engine coolant temperature (ECT) sensor (if equipped) ▪ Cylinder head temperature (CHT) sensor ▪ Intake air temperature (IAT) sensor ▪ Mass air flow (MAF) sensor ▪ Vehicle speed sensor (VSS)

Visual Inspection Chart

Mechanical	Electrical
• Cracked or damaged: ▪ Hoses	

▪ Tubes ▪ Hose clamps ▪ Heater control valve (if equipped) ▪ Thermostat housing ▪ Radiator ▪ Pressure relief cap ▪ Cooling fan ▪ Fan clutch (if equipped) ▪ Coolant pump ▪ Degas bottle (if equipped) ▪ Coolant expansion tank (if equipped) ▪ Oil cooler (if equipped) ▪ Coolant crossover manifold assembly (if equipped) ▪ Cylinder block core plugs ▪ Cylinder head core plugs (if equipped) ▪ Block heater (if equipped) • Restricted airflow through the A/C condenser/radiator • Drive belt loose, worn or installed incorrectly • Broken or weak drive belt tensioner • Excessive white or light gray exhaust smoke (may have burnt coolant odor) • Coolant in engine oil • Engine oil in coolant • Coolant in automatic transmission fluid (if equipped) • Automatic transmission fluid (if equipped) in coolant	

7. If the inspection reveals an obvious concern that can be readily identified, repair it as necessary. Test the system for normal operation.

8. Inspect the coolant condition.
    1. Inspect the coolant color.
        - If Motorcraft Premium Gold Engine Coolant with Bittering Agent (US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color) meeting Ford specification WSS-M97B51-A1 has a clear or pale yellow color, this indicates higher water content than required.
        - **NOTE:** If Cooling System Stop Leak Pellets VC-6 or equivalent meeting Ford specification WSS-M99B37-B6 are used, darkening of the Motorcraft Premium Coolant from yellow to golden tan will occur.

          Dark brown could indicate unauthorized stop leak may have been used. Use Cooling System Stop Leak Pellets VC-6 or equivalent meeting Ford specification WSS-M99B37-B6.
        - A light or reddish brown color indicates that rust may be present in the cooling system. Flush the system and refill with the correct mixture of distilled water and Premium Gold Engine Coolant.
        - An iridescent sheen on top of the coolant could indicate a trace of oil is entering the system. For information on engine diagnosis, refer to Section 303-00.
        - A milky brown color may indicate that engine oil is entering the cooling system. Pressure test the cooling system. Refer to component tests in this section. If engine oil is suspected, the cause of the leak may be internal to the engine. Refer to Section 303-00.
        - A red, orange or light green colored sheen on top of the coolant may indicate that transmission fluid is entering the cooling system. The cause may be a leaky radiator. Pressure test the cooling system. Refer to the component tests in this section.
    2. If the engine coolant appearance is acceptable, test the engine coolant freezing point range with the Battery/Anti-Freeze Tester. The freezing point should be in the range -45°C to -23°C (-50°F to -10°F). If the vehicle is driven in cold climates less than -36°C (-34°F), it may be necessary to increase the coolant concentration to get adequate freeze protection. Recommended coolant concentration is 50/50 ethylene glycol to distilled water.
        - Maximum coolant concentration is 60/40 for cold weather areas.
        - Minimum coolant concentration is 40/60 for warm weather areas.

3. Adjust coolant range and level if necessary:
    - If coolant is low, add specified coolant mixture only.
    - If the engine coolant tests too weak, remove some of the engine coolant and add straight engine coolant until the readings are within acceptable levels.
    - If the engine coolant tests strong, remove some of the engine coolant and add straight distilled water until the readings are within acceptable levels.

9. If the concern remains after the inspection, determine the symptom(s). GO to Symptom Chart .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Loss of coolant	• Coolant hoses or tubes • Hose clamps • Coolant pump O-ring seal or gasket • Thermostat O-ring seal or gasket • Thermostat housing • Radiator • Transmission fluid cooler (in radiator) (if equipped) (may leak internally or externally) • Degas bottle (if equipped) • Coolant expansion tank (if equipped) • Pressure relief cap • Coolant pump leaking from weep hole • Auxiliary coolant pump (if equipped) • Heater core • Heater control valve (if equipped) • Coolant crossover manifold assembly (if equipped) • Engine gaskets (may leak internally or externally) • Oil cooler (if equipped) (may leak internally or externally) • Heated throttle body or heated throttle body adapter (if equipped) • Heated positive crankcase ventilation (PCV) (if equipped) • Fuel pressure regulator coolant bowl (if equipped) • Cylinder block core plugs • Cylinder head core plugs (if equipped) • Block heater (if equipped)	• Go To Pinpoint Test A .
• The engine	• Low coolant level	• Go To Pinpoint Test B .

overheats	• External engine coolant leak • Airlock in system • Pressure relief cap installation • Restricted airflow through the A/C condenser/radiator • Internal engine coolant leak • Coolant condition/concentration • Accessory drive components • Non-OEM engine enhancement components • Electric cooling fan (if equipped) • Mechanical cooling fan (if equipped) • Mechanical cooling fan clutch (if equipped) • Radiator • Thermostat • Engine coolant temperature indicator system (gauge) • Engine coolant temperature (ECT) sensor (if equipped) • Cylinder head temperature (CHT) sensor (if equipped) • Heater core • Coolant pump • Coolant flow restriction	
• The engine does not reach normal operating temperature	• Low coolant level • Thermostat • Mechanical fan clutch always engaged • Engine coolant temperature indicator system (gauge) • ECT sensor (if equipped) • CHT sensor (if equipped)	• Go To Pinpoint Test C .
• The block heater does not operate correctly	• Block heater power cable • Block heater	• CHECK continuity in all 3 power cable circuits. If any circuit measures greater than 5 ohms, INSTALL a new power cable. • INSTALL a new block heater.
• The electric cooling fan(s) or electronically controlled fan clutch is inoperative in one or more speeds or	• Wiring • Relays • Fuses • Fan control module • Cooling fan motor(s) • Cooling fan resistor(s) • Electric fan clutch	• REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

does not operate correctly (if equipped)		
• The electric cooling fan(s) stays on all the time (if equipped)	• Wiring • Relays	• REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual
• Noisy electric cooling fan operation (if equipped)	• Foreign material contamination • Fan motor • Fan blade detached from fan motor	• REMOVE the foreign material from the cooling fan and shroud. TEST the system for normal operation. If still noisy, INSTALL a new cooling fan assembly. • INSTALL a new cooling fan assembly.
• Noisy mechanical fan operation (if equipped)	• Fan clutch	• CARRY OUT the Fan Clutch Test — Minimum Speed Requirement component test.

Pinpoint Tests

Pinpoint Test A: Loss of Coolant

Possible Causes

- Coolant hoses or tubes
- Hose clamps
- Thermostat O-ring seal or gasket
- Coolant pump O-ring seal or gasket
- Thermostat housing
- Heater control valve (if equipped)
- Radiator
- Transmission fluid cooler (in radiator) (if equipped)
- Pressure relief cap
- Coolant pump leaking from weep hole
- Auxiliary coolant pump (if equipped)
- Heater core
- Heated throttle body or heated throttle body adapter (if equipped)
- Coolant crossover manifold assembly (if equipped)
- Engine gaskets
- Oil cooler (if equipped)
- Degas bottle (if equipped)
- Coolant expansion tank (if equipped)
- Heated positive crankcase ventilation (PCV) (if equipped)
- Fuel pressure regulator coolant bowl (if equipped)
- Cylinder block core plugs
- Cylinder head core plugs (if equipped)
- Block heater (if equipped)

PINPOINT TEST A: LOSS OF COOLANT

WARNING: Never remove the pressure relief cap under any conditions while the engine is operating or hot. Failure to follow these instructions could result in personal injury or damage to the cooling system or engine. To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the pressure relief cap. Wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly. Step back while the pressure is released from the cooling system. When you are certain all the pressure has been released, (with a cloth) turn and remove the pressure relief cap. Failure to follow these instructions may result in personal injury.

Test Step	Result / Action to Take
A1 CARRY OUT INSPECTION AND VERIFICATION • Carry out the Inspection and Verification procedure in this section. • **Were any concerns found?**	**Yes** REPAIR as needed. TEST the system for normal operation. **No** GO to A2.
A2 CHECK THE ENGINE COOLANT LEVEL **NOTE:** Allow the engine to cool before checking the engine coolant level. • Key in OFF position. • Visually inspect the engine coolant level at the degas bottle or the coolant expansion tank. • **Is the engine coolant level within specifications?**	**Yes** GO to A3. **No** ADJUST the engine coolant level as necessary. GO to A3
A3 PRESSURE TEST THE ENGINE COOLING SYSTEM • Pressure test the engine cooling system. Refer to Component Tests, Cooling System Pressure Test in this section. • **Does the engine cooling system leak?**	**Yes** REPAIR or INSTALL new components. TEST the system for normal operation. **No** If the vehicle is equipped with a coolant expansion tank, GO to A4. If the vehicle is equipped with a degas bottle, GO to A5.
A4 CHECK THE PRESSURE RELIEF CAP • Carry out the pressure relief cap pressure test. Refer to Component Test, Pressure Relief Cap Pressure Test in this section. • **Is the pressure relief cap OK?**	**Yes** GO to A5. **No** INSTALL a new pressure relief cap. TEST the system for normal operation.
A5 CHECK THE ENGINE COOLANT FOR AN INTERNAL LEAK • Inspect the engine coolant in the degas bottle or coolant expansion tank for signs of engine oil or transmission fluid. • **Is engine oil or transmission fluid evident in the coolant?**	**Yes** If engine oil is evident, GO to Section 303-00 for engine diagnosis. If transmission fluid is evident, INSTALL a new radiator. REPAIR the transmission as necessary. Refer to the appropriate section in Group 307 for the procedure.. TEST the system for normal

	operation. **No** GO to A6 .
A6 CHECK THE COOLING SYSTEM FOR COMBUSTION GASES	
• **NOTE:** Use U-View® Combustion Leak Tester part number 560000 or equivalent. • Using a cooling system combustion gas leak tester, following the instructions supplied with the tester, check the coolant for combustion gases. • **Are combustion gases present?**	**Yes** GO to Section 303-00 for engine diagnosis. **No** GO to A7 .
A7 CHECK THE ENGINE OIL AND TRANSMISSION FLUID FOR COOLANT	
• Remove the oil level indicators from the engine and the transmission. • **Is coolant evident in the oil or transmission fluid?**	**Yes** If coolant is in the engine oil, GO to Section 303-00 . If coolant is in the transmission fluid, INSTALL a new radiator. REPAIR the transmission as necessary. Refer to the appropriate section in Group 307 for the procedure.. **No** The cooling system is operational.

Pinpoint Test B: The Engine Overheats

Possible Causes

- Low coolant level
- External engine coolant leak
- Airlock in system
- Pressure relief cap installation
- Restricted airflow through the A/C condenser/radiator
- Internal engine coolant leak
- Coolant condition/concentration
- Accessory drive components
- Non-OEM engine enhancement components
- Electric cooling fan (if equipped)
- Mechanical cooling fan blade (if equipped)
- Mechanical cooling fan clutch (if equipped)
- Engine coolant temperature indicator system (gauge)
- Engine coolant temperature (ECT) sensor (if equipped)
- Cylinder head temperature (CHT) sensor (if equipped)
- Heater core
- Coolant pump
- Coolant flow restriction

PINPOINT TEST B: THE ENGINE OVERHEATS

WARNING: Never remove the pressure relief cap under any conditions while the engine is operating or hot. Failure to follow these instructions could result in personal injury or damage to

the cooling system or engine. To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the pressure relief cap. Wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly. Step back while the pressure is released from the cooling system. When you are certain all the pressure has been released, (with a cloth) turn and remove the pressure relief cap. Failure to follow these instructions may result in personal injury.

Test Step	Result / Action to Take
B1 CARRY OUT INSPECTION AND VERIFICATION • Carry out the inspection and verification procedure in this section. • **Were any concerns found?**	**Yes** REPAIR as needed. TEST the system for normal operation. **No** GO to B2.
B2 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCs) • **NOTE:** Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for correct scan tool hook-up procedure. • Check for DTCs P1299 or P1285. • **Is DTC P1299 or P1285 present?**	**Yes** GO to B3. **No** CHECK the engine coolant temperature gauge operation. REFER to Section 413-01.
B3 CHECK FOR AN AIRFLOW OBSTRUCTION • Check the radiator or A/C condenser for an obstruction such as leaves or cardboard. • **Is an obstruction present?**	**Yes** REMOVE the obstruction. TEST the system for normal operation. **No** GO to B4.
B4 CHECK THE ENGINE COOLANT LEVEL **NOTE:** Allow the engine to cool before checking the coolant level. • Key in OFF position. • Visually check the engine coolant level in the degas bottle or coolant expansion tank. • **Is the engine coolant level within specification?**	**Yes** GO to B5. **No** ADJUST the engine coolant level as necessary. GO to B5.
B5 PRESSURE TEST THE ENGINE COOLING SYSTEM • Pressure test the engine cooling system. Refer to Component Tests, Cooling System Pressure Test in this section. • **Does the engine cooling system leak?**	**Yes** REPAIR or INSTALL new components. TEST the system for normal operation. **No** Vehicles equipped with an expansion tank, GO to B6. Vehicles equipped with a degas bottle, GO to B7.
B6 CHECK THE PRESSURE RELIEF CAP • Carry out the pressure relief cap pressure test. Refer to Component Test, Pressure Relief Cap Pressure Test in this section. • **Is the pressure relief cap OK?**	**Yes** GO to B7. **No** INSTALL a new pressure relief cap. TEST the system for normal operation.

B7 CHECK COOLANT CONDITION	
• Check the coolant for dirt, rust or contamination and check the coolant concentration. • **Is the coolant condition OK?**	**Yes** Vehicles equipped with an electric cooling fan, GO to B8 . Vehicles equipped with a mechanical cooling fan, GO to B9 . **No** FLUSH the engine cooling system. REFER to Cooling System Flushing in this section. TEST the system for normal operation.
B8 CHECK THE ELECTRIC COOLING FAN OPERATION	
• Start the engine. • Place the climate control function selector in the MAX A/C position and the blower motor switch in the HI position. • **Did the electric cooling fan operate?**	**Yes** If the vehicle is also equipped with a mechanical cooling fan, GO to B9 . Otherwise, GO to B10 . **No** CARRY OUT the electric cooling fan diagnostic procedure. REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.
B9 CHECK THE MECHANICAL COOLING FAN OPERATION	
• Key in OFF position. • If the vehicle is equipped with a viscous fan clutch, carry out the Fan Clutch Tests in the Component Tests portion of this section. If the vehicle is equipped with an electronically actuated fan clutch, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. • **Is the cooling fan operation OK?**	**Yes** GO to B9 . **No** INSTALL a new fan clutch. TEST the system for normal operation.
B10 CHECK THE COOLANT PUMP OPERATION	
• Start the engine. • Allow the engine to run for 10 minutes (hot side thermostat equipped vehicles) or 30 minutes (cold side equipped vehicles). Place the climate control function selector in the MAX HEAT position. Feel the heater outlet hose. • **Is the heater outlet hose hot?**	**Yes** GO to B11 . **No** INSTALL a new water pump. TEST the system for normal operation.
B11 CHECK THE THERMOSTAT OPERATION	
• Start the engine. • Allow the engine to run for 10 minutes (hot side thermostat equipped vehicles) or 30 minutes (cold side thermostat equipped vehicles). Feel the upper radiator hose (hot side thermostat equipped vehicles) or the lower radiator hose (cold side thermostat equipped vehicles). • **Is the upper (hot side thermostat equipped vehicles) or lower (cold side equipped vehicles) radiator hose hot?**	**Yes** CHECK the engine coolant temperature gauge operation. REFER to Section 413-01 . **No** GO to B12 .
B12 VISUALLY INSPECT THE THERMOSTAT	
• Carry out the Thermostat Visual Inspection in the Component Tests portion of this section. • **Is the thermostat damaged?**	**Yes** INSTALL a new thermostat. TEST the system for normal operation.

	No INSTALL a new thermostat. TEST the system for normal operation. If the engine still overheats, INSTALL a new radiator. TEST the system for normal operation.

Pinpoint Test C: The Engine Does Not Reach Normal Operating Temperature

Possible Causes

- Low coolant level
- Thermostat
- Engine coolant temperature (ECT) indicator system (gauge)
- ECT sensor
- Cylinder head temperature (CHT) sensor
- Engine cooling fan

PINPOINT TEST C: THE ENGINE DOES NOT REACH NORMAL OPERATING TEMPERATURE

WARNING: Never remove the pressure relief cap under any conditions while the engine is operating or hot. Failure to follow these instructions could result in personal injury or damage to the cooling system or engine. To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the pressure relief cap. Wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly. Step back while the pressure is released from the cooling system. When you are certain all the pressure has been released, (with a cloth) turn and remove the pressure relief cap. Failure to follow these instructions may result in personal injury.

Test Step	Result / Action to Take
C1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCs) P0125 or P0128	
NOTE: Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for correct scan tool hook-up procedure. • Check for DTCs P0125 or P0128. • **Is DTC code P0125 or P0128 present?**	**Yes** If the vehicle is equipped with an electric cooling fan, GO to C2 . If the vehicle is equipped with a mechanical cooling fan, GO to C3 . **No** If an inoperative engine coolant temperature gauge is suspected, CHECK the engine coolant temperature gauge operation. REFER to Section 413-01 . If an inoperative climate control system is suspected, CHECK the climate control system operation. REFER to Section 412-00 .
C2 CHECK THE ELECTRIC COOLING FAN OPERATION	
• Allow the engine to cool. • Make sure the A/C switch is OFF (if equipped). • Start the engine. • Check the electric cooling fan. • **Is the electric cooling fan on all the time?**	**Yes** DIAGNOSE the electric cooling fan operation. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** If the vehicle is also equipped with a

	mechanical cooling fan, GO to C3 . Otherwise, GO to C4 .
C3 CHECK THE MECHANICAL COOLING FAN OPERATION	
• Carry out the cooling fan clutch component tests. For a mechanical cooling fan clutch, refer to Component Tests in this section. For an electronic cooling fan clutch, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. • **Is the cooling fan clutch OK?**	**Yes** GO to C4 . **No** INSTALL a new cooling fan clutch. TEST the system for normal operation.
C4 CHECK THE COOLANT LEVEL	
• **NOTE:** Allow the engine to cool before checking the coolant level. • Visually check the engine coolant level in the degas bottle or coolant expansion tank. • **Is the engine coolant level within specification?**	**Yes** INSTALL a new thermostat. TEST the system for normal operation. **No** Go To Pinpoint Test A to diagnose a coolant leak.

Component Tests

Cooling System Pressure Test — Degas Bottle Systems

WARNING: Never remove the pressure relief cap under any conditions while the engine is operating or hot. Failure to follow these instructions could result in personal injury or damage to the cooling system or engine. To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the pressure relief cap. Wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly. Step back while the pressure is released from the cooling system. When you are certain all the pressure has been released, (with a cloth) turn and remove the pressure relief cap. Failure to follow these instructions may result in personal injury.

NOTE: Vehicles equipped with a degas bottle system have the pressure relief cap on the degas bottle and no radiator cap. Vehicles equipped with a coolant expansion tank system have the pressure relief cap on the radiator.

1. Turn the engine OFF.
2. Check the engine coolant level. Adjust the coolant level as necessary.
3. Attach the Radiator/Heater Core Pressure Tester to the degas bottle nipple and overflow hose. Install a pressure test pump to the quick-connect fitting of the test adapter.
4. **CAUTION: Do not pressurize the cooling system beyond the maximum pressure listed in the specifications table in this section.**

   NOTE: If the plunger of the pressure tester is depressed too fast, an erroneous pressure reading will result.

   Slowly depress the plunger of the pressure test pump until the pressure gauge reading stops increasing and note the highest pressure reading obtained. If the pressure reading exceeds the maximum cap pressure listed in the specifications table, install a new pressure relief cap.

5. If the system does not hold pressure, remove the pressure relief cap and wash in clean water to dislodge all the foreign material from the gasket. Check the sealing surface in the filler neck of the degas bottle for nicks or cuts. If the cooling system still does not hold the minimum pressure listed in the specifications table, install a new pressure relief cap and recheck the system

6. **NOTE:** If the pressure drops after a new pressure relief cap is installed, check for leaks at the engine-to-heater core hoses, engine-to-radiator hoses, radiator, heater core(s) and other system components and connections. Any leaks that are found must be corrected and the system rechecked.

   Pressurize the engine cooling system as described in Step 4 above. Observe the gauge reading for approximately 2 minutes. Pressure should not drop during this time. If the pressure drops within this time, inspect for leaks and repair as necessary.

7. If no leaks are found and the pressure drops, the leak may be internal to the radiator transmission cooler (if equipped). Inspect the coolant for transmission fluid and the transmission fluid for coolant. Repair as necessary.

8. If there is no contamination of the coolant or transmission fluid, the leak may be internal to the engine. Refer to Section 303-00 to diagnose the engine.

9. Release the system pressure by loosening the pressure relief cap. Check the coolant level and adjust as necessary.

Cooling System Pressure Test — Coolant Expansion Tank Systems

WARNING: Never remove the pressure relief cap under any conditions while the engine is operating or hot. Failure to follow these instructions could result in personal injury or damage to the cooling system or engine. To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the pressure relief cap. Wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly. Step back while the pressure is released from the cooling system. When you are certain all the pressure has been released, (with a cloth) turn and remove the pressure relief cap. Failure to follow these instructions may result in personal injury.

NOTE: Vehicles equipped with a degas bottle system have the pressure relief cap on the degas bottle and no radiator cap. Vehicles equipped with a coolant expansion tank system have the pressure relief cap on the radiator.

1. Turn the engine OFF.

2. Remove the pressure relief cap. Top off the radiator as needed. Fit the pressure tester to the radiator fill neck.

3. **CAUTION: Do not pressurize the cooling system beyond 138 kPa (20.0 psi).**

   NOTE: If the plunger of the pressure tester is depressed too fast, an incorrect pressure reading will result.

   Pump the cooling system to a maximum of 138 kPa (20.0 psi) and hold for 2 minutes. If the pressure drops within this time, inspect for leaks and repair as necessary.

4. If no leaks are found and the pressure drops, the leak may be internal to the radiator transmission cooler (if equipped). Inspect the coolant for transmission fluid and the transmission fluid for coolant. Repair as necessary.

5. If there is no contamination of the coolant or transmission fluid, the leak may be internal to the engine. Refer to Section 303-00 to diagnose the engine.

Pressure Relief Cap Pressure Test

1. Inspect the pressure relief cap and seals for damage or deterioration. Install a new pressure relief cap if necessary.

2. Fit the pressure relief cap to the Radiator/Heater Core Pressure Tester Kit using the correct adapter.

3. **NOTE:** If the plunger of the pressure tester is depressed too fast, an incorrect pressure reading will result.

   Slowly pump the pressure tester until the pressure gauge stops increasing and note the highest pressure reading. Release the pressure and repeat the test. Install a new pressure relief cap if the pressure is not within specification. Refer to the General Specifications chart in this section.

Thermostat

A new thermostat should be installed only after the following tests and checks have been carried out:

- Pinpoint Test A, B or C
- Thermostat Visual Inspection

Thermostat Visual Inspection

1. Remove the thermostat.

2. Examine the thermostat for signs of damage including:
   - Valve not fully seated (light visible through the valve
   - Foreign material lodged in the main valve
   - Bent or broken frame or flange
   - Bent or broken spring
   - Bent or broken valve or valve stem
   - Wax leaking from wax reservoir or a bulge in the reservoir
   - Any other damage or distortion

3. **NOTE:** If no damage is found during the inspection, do not attempt to open the thermostat using hot water or other heat sources. This method is not an accurate means to test the function of the thermostat and may damage the thermostat.

   If damage is found during the inspection, remove any foreign material or broken pieces and install a new thermostat.

4. If no damage is found during the inspection, continue troubleshooting the system concern. Go to the Symptom Chart for further instructions.

Thermostat Electrical Test

1. The thermostat monitor is designed to verify correct thermostat operation. The monitor will be executed once per drive cycle and has a monitor run duration of 300-800 seconds. If a malfunction occurs, diagnostic trouble code (DTC) P0125 or P0128 is set the malfunction

indicator lamp will be illuminated.

Radiator Leak Test, Removed From Vehicle

CAUTION: Never leak test an aluminum radiator in the same water that copper/brass radiators are tested in. Flux and caustic cleaners may be present in the cleaning tank and they will damage aluminum radiators.

NOTE: Always install plugs in the oil cooler fittings before leak testing or cleaning any radiator.

NOTE: Clean the radiator before leak testing to avoid contamination of tank.

1. Leak test the radiator in clean water with 138 kPa (20 psi) air pressure.

Fan Clutch Test

1. Turn the engine OFF and wait until the fan comes to a complete stop.

2. Spin the fan blade by hand. A light resistance should be felt. If there is no resistance or very high resistance, the minimum and maximum fan speeds must be checked. For an electronically actuated fan clutch, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. For a viscous fan clutch, carry out the following:

Fan Clutch Test — Minimum Speed Requirement

1. Use a suitable marker to mark the coolant pump or fan pulley and one of the fan blades.

2. Make sure the A/C is OFF, if equipped.

3. **WARNING: To avoid the possibility of personal injury or damage to the vehicle, do not operate the engine until the fan blade has been first examined for possible cracks and separation. Failure to follow these instructions may result in personal injury.**

   Start the engine and run it at approximately 2,000 rpm for 5 minutes or until there is a noticeable reduction in fan noise to allow the fan clutch to go into disengaged mode.

4. Aim a laser photo tachometer at the coolant pump or fan pulley. Run the engine to achieve 3,000 rpm at the coolant pump or fan pulley.

5. With the coolant pump or fan pulley at 3,000 rpm, aim the laser photo tachometer at the fan blade. Monitor and record fan speed.

6. The fan blade speed must be less than 1,500 rpm at 3,000 coolant pump rpm.

7. Turn the engine off.

8. If the fan blade speed was greater than 1,500 rpm, install a new fan clutch.

Fan Clutch Test — Maximum Speed Requirement

1. Use a suitable marker to mark the coolant pump or fan pulley and one of the fan blades.

2. Block off areas on each side of the radiator in the engine compartment, the front of the radiator grille and the bumper. Close the hood. This will raise the temperature of the air striking the fan clutch and should cause the fan blade to operate at maximum speed.

3. Place the climate control function selector switch in the MAX A/C position and the blower motor switch in the HI position, if equipped.

4. **WARNING: To avoid the possibility of personal injury or damage to the vehicle, do not operate the engine until the fan blade has been first examined for possible cracks and separation. Failure to follow these instructions may result in personal injury.**

   NOTE: Do not open the hood to check the coolant pump or fan pulley temperature. This will lower the temperature of the air reaching the fan clutch and void the test. Aim the infrared thermometer through the wheel well or from under the vehicle.

   Start the engine and run it at approximately 2,000 rpm until normal operating temperature has been achieved. Using an infrared thermometer, monitor the coolant pump or fan pulley. Run the engine until the coolant pump or fan pulley is at least 96°C (205°F).

5. **NOTE:** Do not open the hood to check the coolant pump or fan pulley or fan blade speed. This will lower the temperature of the air reaching the fan clutch and void the test. Aim the laser photo tachometer through the wheel well or from under the vehicle.

   Aim a laser photo tachometer at the coolant pump or fan pulley. Run the engine to achieve 3,000 rpm at the coolant pump or fan pulley.

6. With the coolant pump or fan pulley at 3,000 rpm, aim the laser photo tachometer at the fan blade. Monitor and record fan blade speed.

7. The fan blade speed must be greater than the specified rpm at 3,000 rpm coolant pump or fan pulley rpm. Refer to the specification table in this section for correct fan speed.

8. Open the hood and allow the engine to idle momentarily to lower engine temperature. Turn the engine off and remove the blocks from the radiator, grill and bumper.

9. If the fan blade speed is less than specified, install a new fan clutch.

Cooling System Draining, Filling and Bleeding

Printable View (94 KB)

Special Tool(s)

ST2618-A	RADKITPLUS 078-00497

Material

Item	Specification
Motorcraft Premium Gold Engine Coolant with Bittering Agent (US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color)	WSS-M97B51-A1

Draining

WARNING: To avoid personal injury, do not remove the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in personal injury.

CAUTION: The coolant must be recovered in a suitable, clean container for reuse. If the coolant is contaminated it must be recycled or disposed of correctly.

CAUTION: Vehicle cooling systems are filled with Motorcraft Premium Gold Engine Coolant. Always fill the cooling system with the same type of coolant that is present in the system. Do not mix coolant types.

NOTE: Less than 80% of the coolant capacity can be recovered with the engine in the vehicle. Dirty, rusty or contaminated coolant requires replacement.

1. Make sure the engine is cool.
2. Wrap a thick cloth around the coolant pressure relief cap on the degas bottle. Slowly turn the cap counterclockwise until the pressure begins to release.
3. Step back while the pressure releases.
4. When you are sure all the pressure has been released, use the cloth to turn and remove the cap.
5. Place a suitable container below the radiator draincock. Drain the coolant.
    - Tighten the radiator draincock when finished.

Filling and Bleeding with RADKITPLUS

1. Using the special tool, install the RADKITPLUS and follow the RADKITPLUS manufacturer's instructions to fill and bleed the cooling system.

Filling and Bleeding without RADKITPLUS

CAUTION: Vehicle cooling systems are filled with Motorcraft Premium Gold Engine Coolant. Always fill the cooling system with the same type of coolant that is present in the system. Do not mix coolant types.

CAUTION: Engine coolant provides freeze protection, boil protection, cooling efficiency and corrosion protection to the engine and cooling components. In order to obtain these protections, the engine coolant must be maintained at the correct concentration and fluid level.

When adding engine coolant, use a 50/50 mixture of distilled water and engine coolant.

To maintain the integrity of the coolant and the cooling system:

- **Do not add orange-colored Motorcraft Specialty Orange Engine Coolant. Mixing coolants may degrade the coolant's corrosion protection.**
- **Do not add alcohol, methanol or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.**
- **Do not mix with recycled coolant. Use of such coolant may harm the engine and cooling system components.**

1. Fill the radiator through the degas bottle until the coolant level is between the COOLANT FILL LEVEL marks.

2. On the electronic manual temperature control (EMTC), move the temperature blend selector to the full WARM position. On the electronic automatic temperature control (EATC), set the temperature to 32°C (90°F).

3. Run the engine at idle until it reaches normal operating temperature.

4. Add the correct coolant mixture to the degas bottle until the coolant level is at the upper COOLANT FILL LEVEL mark.

5. Turn the engine off and allow it to cool.

6. Repeat Steps 1 through 5 until the degas bottle level is correct, with the engine cool.

7. **CAUTION: If the air discharge remains cool and the engine coolant temperature gauge does not move, the engine coolant level is low in the engine and must be filled. Stop the engine, allow it to cool and fill the cooling system.**

   Select the maximum heater temperature and blower motor speed settings. Position the control to discharge air at the A/C vents.

8. Start the engine and allow it to idle until it reaches normal operating temperature. While the engine is idling, feel for hot air from the A/C vents.
   - Hot air should discharge from the A/C vents. The engine coolant temperature gauge

should maintain a stabilized reading in the middle of the NORMAL range and the upper radiator hose should feel hot to the touch.

9. Shut the engine off and allow it to cool.
10. Check the engine coolant level in the degas bottle and fill it as necessary.
11. Repeat Steps 7 through 10 as necessary.
12. Check the cooling system for leaks.
13. Install the pressure relief cap to the degas bottle.

Cooling System Flushing

Printable View (92 KB)

Special Tool(s)

ST2421-A	Coolant System Drain/Flush/Fill 164-R3673 or equivalent
 ST1167-A	Flush Kit 164-R3658
 ST1168-A	Drain Kit 164-R3662 or equivalent

Material

Item	Specification
Premium Cooling System Flush VC-1	ESR-M14P7-A

1. **WARNING: To avoid personal injury, do not remove the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in personal injury.**

   Drain the engine cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Remove the thermostat.

3. Install the thermostat housing without the thermostat.

4. **NOTE:** For additional information, refer to the cooling system Flush-All Operating Instructions for specific vehicle hook-up.

   Use cooling system Flush-All, Flush Kit Hardware Package and Drain kit to flush the engine and radiator.
   Use Premium Cooling System Flush.

5. Install the thermostat.

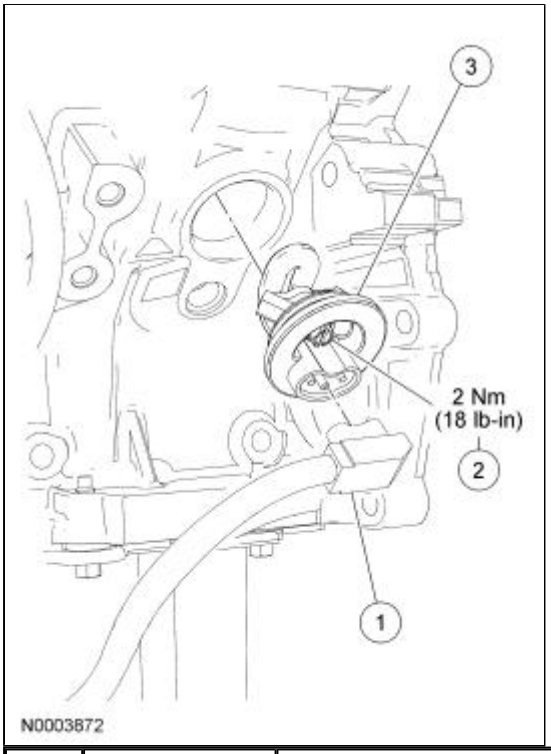
6. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Block Heater

Printable View (126 KB)

Material

Item	Specification
Motorcraft Premium Gold Engine Coolant with Bittering Agent (US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color)	WSS-M97B51-A1



Item	Part Number	Description
1	14A199	Block heater electrical connector
2	—	Block heater retaining screw (part of 6A051)
3	6A051	Block heater

Removal and Installation

1. Drain the engine cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. **CAUTION: Do not loosen the block heater retaining screw more than necessary for removal.**

   Loosen the block heater retaining screw and remove the block heater.
   - To install, tighten to 2 Nm (18 lb-in).

3. **NOTE:** Route the block heater power cable away from hot or rotating components, or damage to the cable can occur.

   NOTE: Lubricate the block heater O-ring seal with clean engine coolant prior to installation.

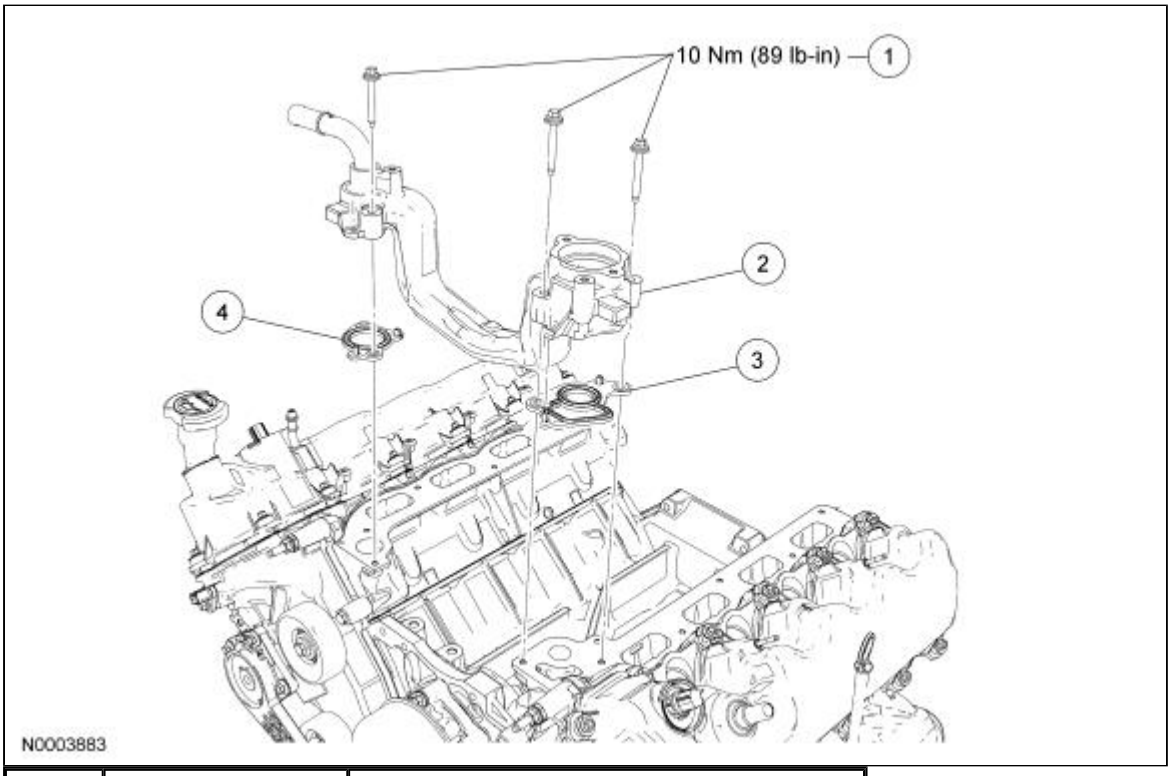
   To install, reverse the removal procedure.

Bypass Tube

Printable View (172 KB)

Material

Item	Specification
Motorcraft Metal Surface Prep ZC-31	—
Silicone Gasket Remover ZC-30	—



Item	Part Number	Description
1	W503282	Bypass tube bolts (3 required)
2	8C368	Bypass tube
3	8C388	Bypass tube gasket (LH)
4	8C387	Bypass tube gasket (RH)

Removal and Installation

1. Drain the engine cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Remove the intake manifold. For additional information, refer to Section 303-01 .

3. Remove the 3 bolts, the bypass tube, and discard the bypass tube gaskets.
   - To install, tighten to 10 Nm (89 lb-in).

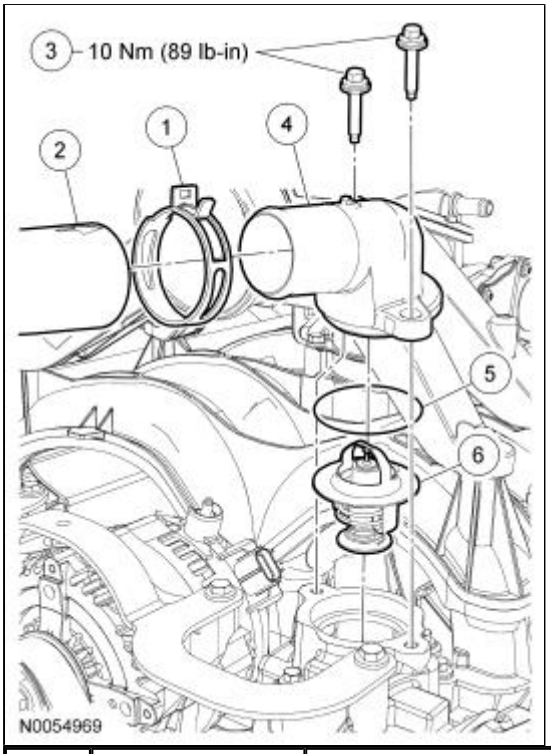
4. To install, reverse the removal procedure.
    - Inspect the mating surfaces and clean the sealing surfaces with metal surface prep and silicone gasket remover. Follow the directions on the packaging.
    - Install new bypass tube gaskets.

Thermostat and Thermostat Housing

Printable View (155 KB)

Material

Item	Specification
Motorcraft Metal Surface Prep ZC-31	—



Item	Part Number	Description
1	15161	Upper radiator hose clamp
2	8B274	Upper radiator hose
3	W503279	Thermostat housing bolts (2 required)
4	8594	Thermostat housing
5	N806807	Thermostat O-ring seal
6	8575	Thermostat

Removal and Installation

1. Drain the engine cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. If servicing the thermostat housing, disconnect the upper radiator hose from the thermostat housing.

3. Remove the 2 bolts, the thermostat housing and the thermostat. Discard the O-ring seal.
   - To install, tighten to 10 Nm (89 lb-in).

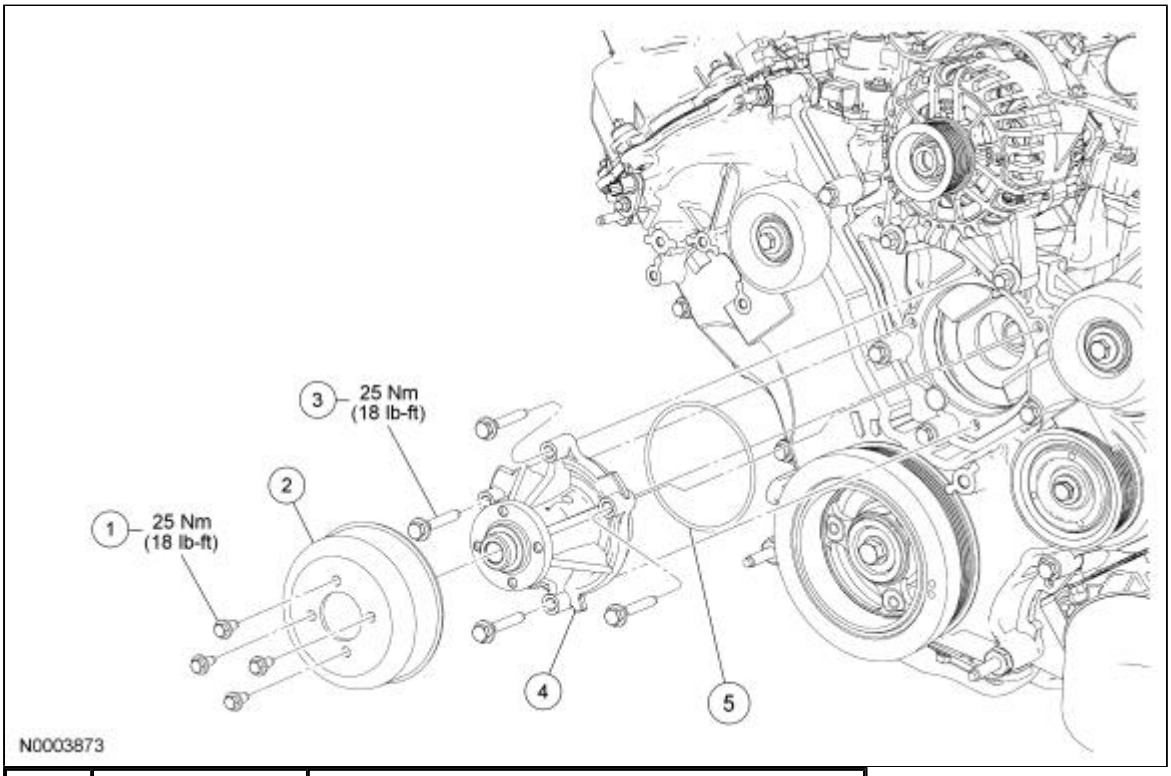
4. To install, reverse the removal procedure.
    - Inspect the mating surfaces. Clean the sealing surfaces with metal surface prep. Follow the directions on the packaging.
    - Install a new O-ring seal.

Coolant Pump

Printable View (268 KB)

Material

Item	Specification
Motorcraft Premium Gold Engine Coolant with Bittering Agent (US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color)	WSS-M97B51-A1
Motorcraft Metal Surface Prep ZC-31	—



Item	Part Number	Description
1	N806282	Coolant pump pulley bolt (4 required)
2	8A528	Coolant pump pulley
3	N808794	Coolant pump bolt (4 required)
4	8501	Coolant pump
5	391108	Coolant pump O-ring seal

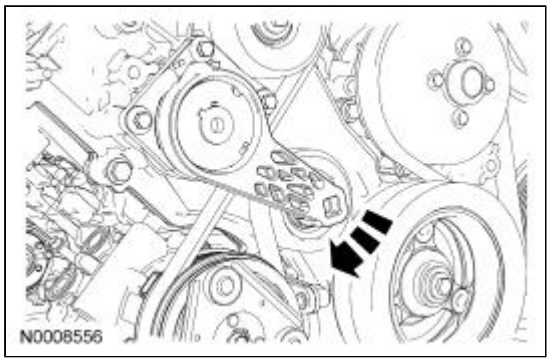
Removal and Installation

1. Drain the engine cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Remove the cooling fan. For additional information, refer to Cooling Fan in this section.

3. Loosen the 4 coolant pump pulley bolts.
    - To install, tighten to 25 Nm (18 lb-ft).

4. Rotate the belt tensioner clockwise and disconnect the accessory drive belt from the coolant pump pulley.



5. Remove the 4 bolts and the coolant pump pulley.

6. Remove the 4 bolts and the coolant pump. Discard the O-ring seal.
    - To install, tighten to 25 Nm (18 lb-ft).

7. To install, reverse the removal procedure.
    - Inspect the mating surfaces. Clean the sealing surfaces with metal surface prep. Follow the directions on the packaging.
    - Install a new O-ring seal. Lubricate the O-ring seal with clean engine coolant prior to installation.

Cooling Module

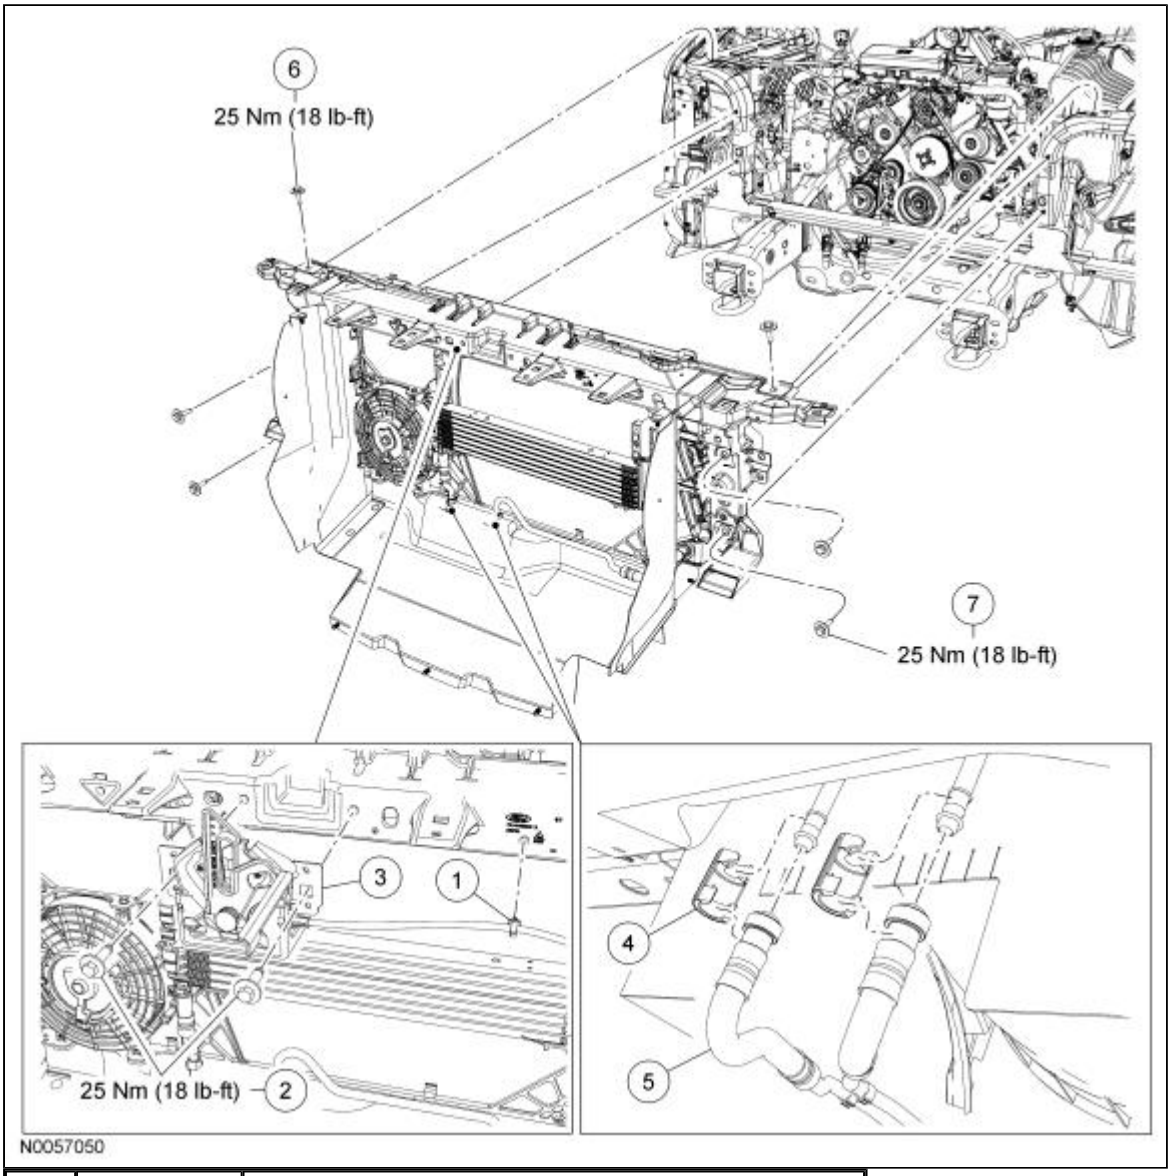
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B



Item	Part Number	Description
1	16B975	Hood latch assembly cable retainer
2	W711848	Hood latch assembly bolts (2 required)
3	6100	Hood latch assembly
4	7J801	Transmission fluid cooler tube secondary latches (2 required)
5	7H420	Transmission fluid cooler tube (2 required)
6	W701835	Cooling module upper bolt (2 required)
7	W701835	Cooling module front bolt (4 required)

Removal

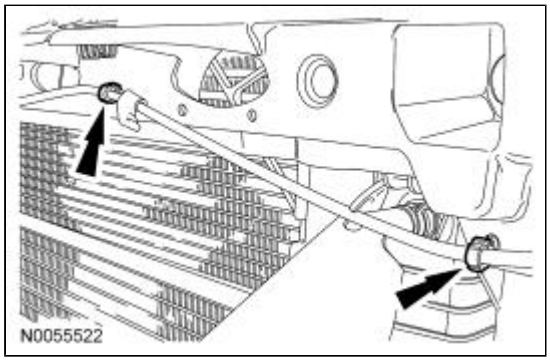
All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

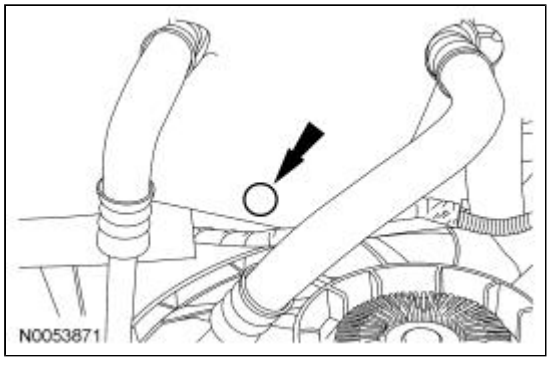
2. Drain the engine cooling system. For additional information, refer to Cooling System Draining.

Filling and Bleeding in this section.

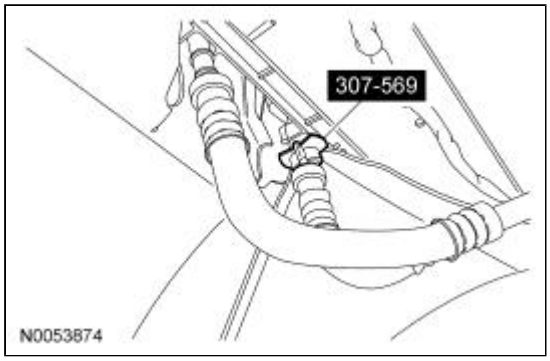
3. Recover the A/C system refrigerant. For additional information, refer to Section 412-00 .
4. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
5. Remove the RH and LH headlamp assemblies. For additional information, refer to Section 417-01 .
6. Remove the front fascia. For additional information, refer to Section 501-19 .
7. Remove the cooling fan shroud. For additional information, refer to Cooling Fan Shroud in this section.
8. Remove the 2 hood latch assembly bolts.
9. Disconnect the cable position retainers and position the hood latch assembly aside.



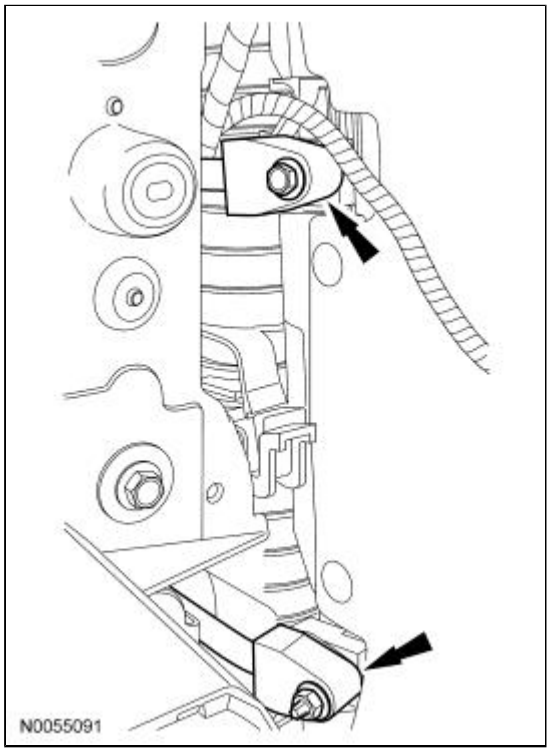
10. Remove the pushpin and move the air deflector aside.



11. Remove the transmission cooler tube secondary latches.
12. Using the special tool, disconnect the transmission fluid cooler tubes from the transmission fluid cooler hoses.

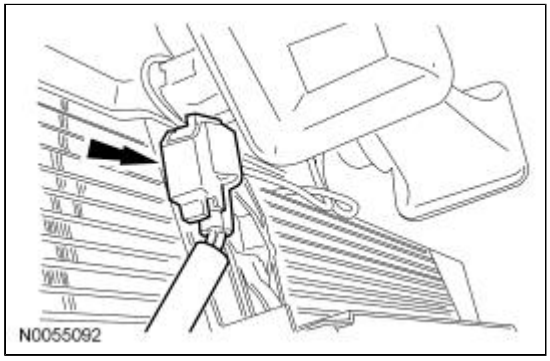


13. Remove the 2 condenser inlet fitting nuts and disconnect the 2 fittings.
    - Discard the O-ring seals.



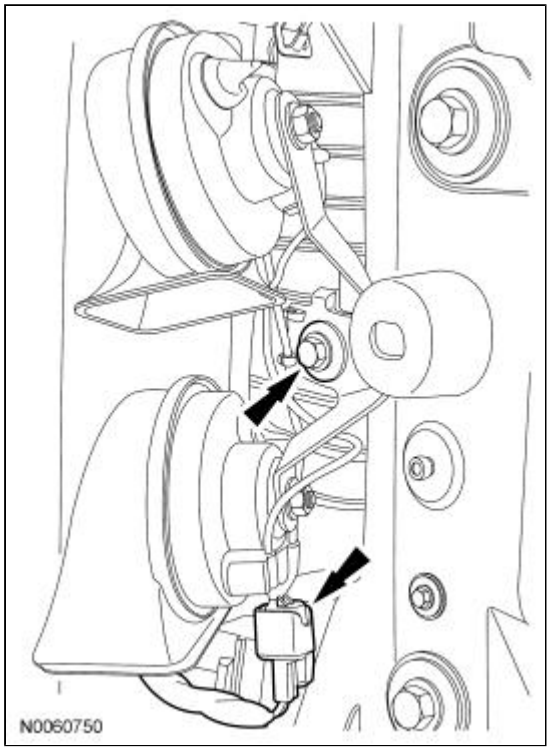
Expedition vehicles

14. Disconnect the horn electrical connector.



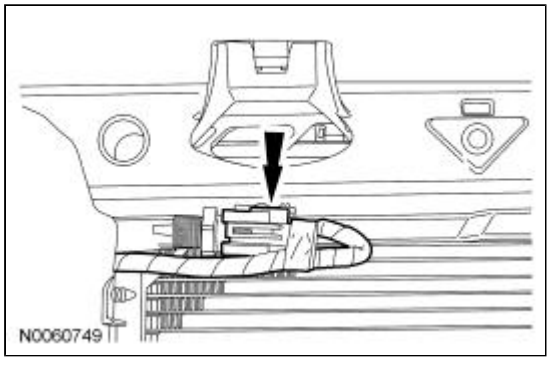
Navigator vehicles

15. Disconnect the electrical connector and remove the bolt and the horn assembly.



All vehicles

16. Disconnect the ambient temperature sensor electrical connector.



17. Remove the 6 radiator support bolts and remove the cooling module from the vehicle.

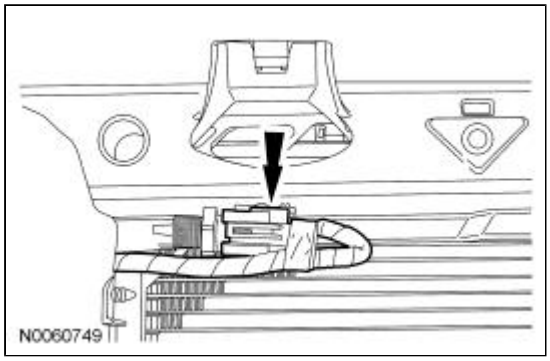
Installation

All vehicles

1. Position the cooling module in the vehicle.

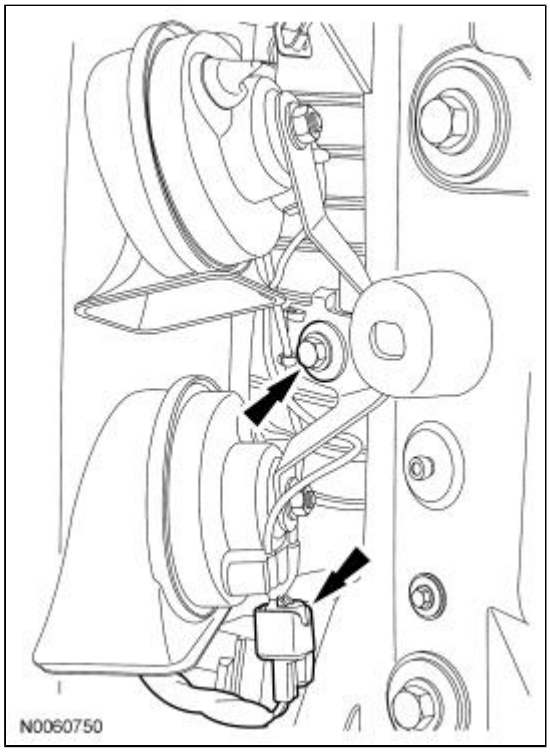
2. Install the 6 radiator support bolts.
    - Tighten to 25 Nm (18 lb-ft).

3. Connect the ambient temperature sensor electrical connector.



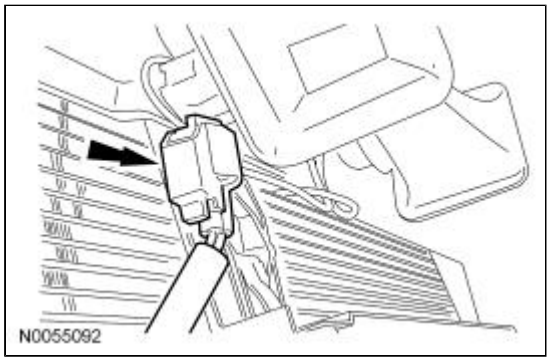
Navigator vehicles

4. Position the horn assembly and install the bolt and connect the electrical connector.
    - Tighten to 10 Nm (89 lb-in).



Expedition vehicles

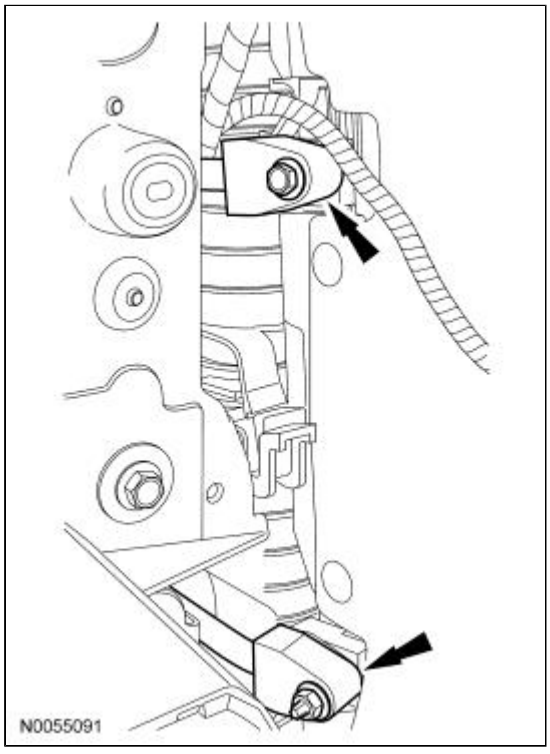
5. Connect the horn electrical connector.



All vehicles

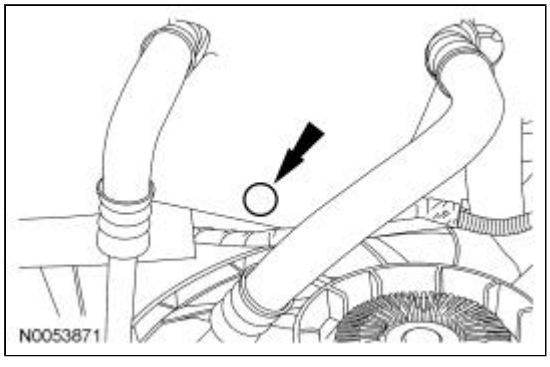
6. **NOTE:** Lubricate the new O-ring seals with PAG Refrigerant Compressor Oil prior to installation.

   Using new O-ring seals, connect the A/C fittings and install the 2 nuts.
   - Tighten to 8 Nm (71 lb-in).



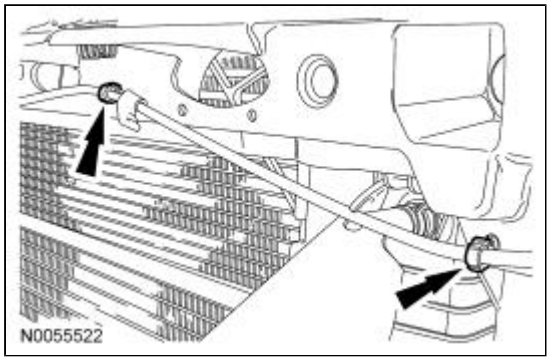
7. Connect the transmission fluid cooler tubes and install the secondary latches.

8. Position the air deflector and install the pushpin.



9. Position the hood latch assembly and install the 2 hood latch assembly bolts.
   - Tighten to 25 Nm (18 lb-ft).

10. Connect the hood latch cable position retainers.



11. Install the cooling fan shroud. For additional information, refer to Cooling Fan Shroud in this section.

12. Install the front fascia. For additional information, refer to Section 501-19 .

13. Install the RH and LH headlamp assemblies. For additional information, refer to Section 417-01 .

14. Connect the battery ground cable. For additional information, refer to Section 414-01 .

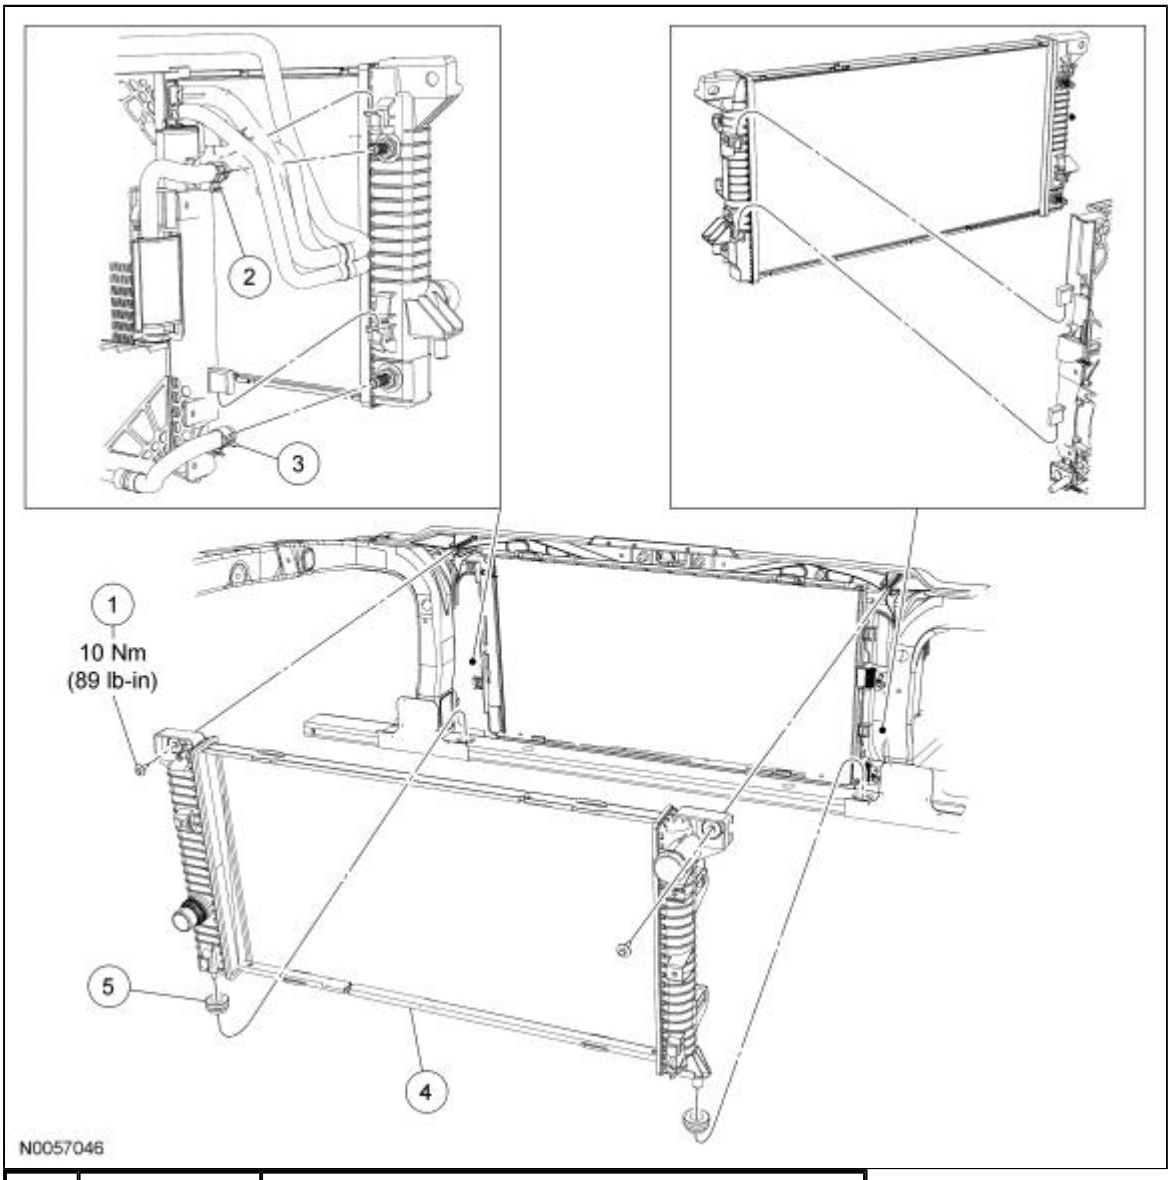
15. Fill and bleed the engine cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

16. Fill the transmission with fluid and verify correct operation. For additional information, refer to Section 307-01A or Section 307-01B .

17. Evacuate, leak test and charge the refrigerant system. For additional information, refer Section 412-00 .

Radiator

Printable View (381 KB)



Item	Part Number	Description
1	W503924	Radiator support bolt (2 required)
2	7F113	Transmission fluid cooler-to-radiator upper hose
3	7B028	Transmission fluid cooler-to-radiator lower hose
4	8005	Radiator
5	8B204	Radiator insulator (2 required)

Removal and Installation

All vehicles

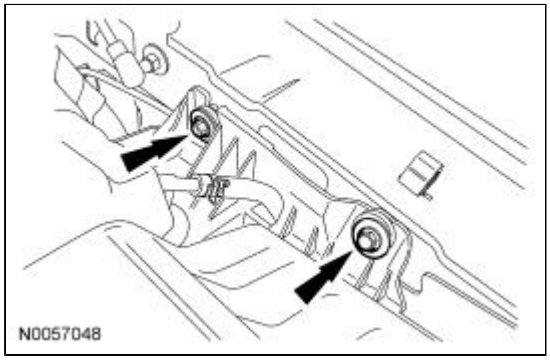
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the RH and LH headlamp assemblies. For additional information, refer to Section 417-01 .

3. Remove the cooling fan shroud. For additional information, refer to Cooling Fan Shroud in this section.

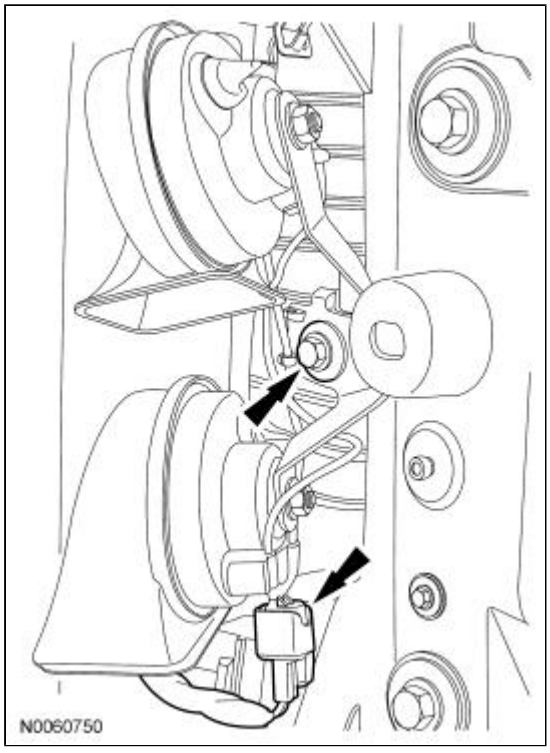
4. Remove the 2 radiator-to-radiator support bolts.
   - To install, tighten to 10 Nm (89 lb-in).

5. Remove the 2 bolts and position the degas bottle aside.
   - To install, tighten to 10 Nm (89 lb-in).



Navigator vehicles

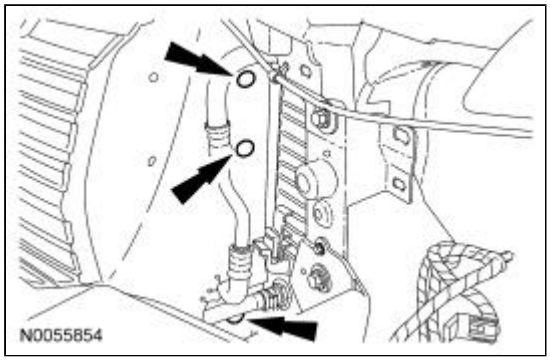
6. Disconnect the electrical connector and remove the bolt and the horn assembly.
   - To install, tighten to 10 Nm (89 lb-in).



All vehicles

7. **NOTE:** LH shown, RH similar.

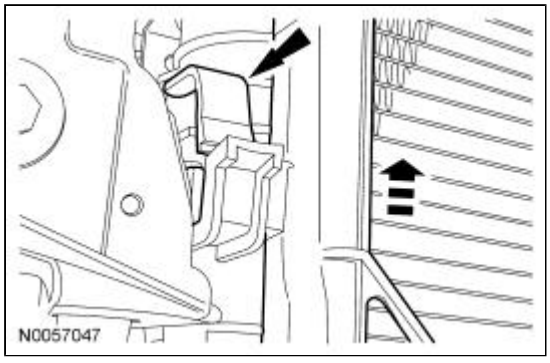
   Remove the 6 LH and RH air deflector-to-condenser core pin-type retainers.



8. Disconnect the 2 transmission fluid cooler-to-radiator hoses.

9. **NOTE:** The cooling module must be positioned rearward to raise and detach the 4 condenser mounts from the radiator.

   Depress the retaining tabs on the 2 lower condenser mounting brackets and raise the condenser assembly until the 4 condenser mounting brackets detach from the radiator.



10. Remove the radiator.

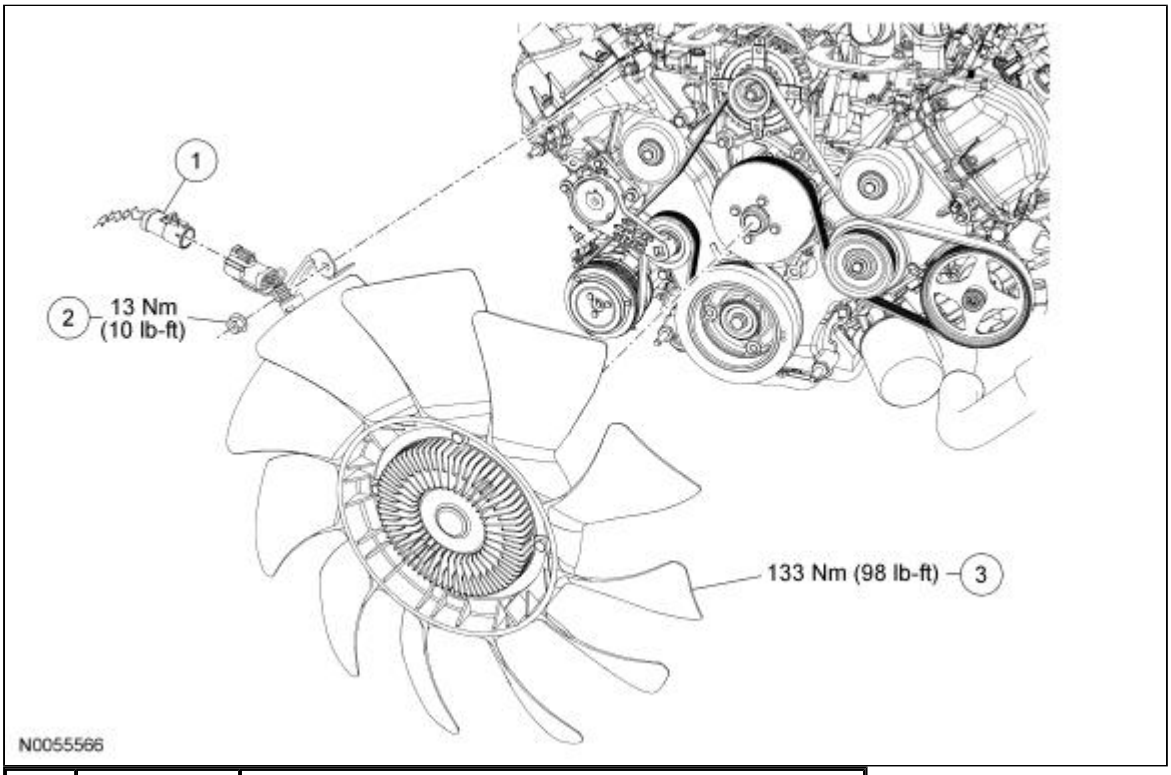
11. To install, reverse the removal procedure.
    - Fill the transmission fluid level. For additional information, refer to Section 307-01A or Section 307-01B .

Cooling Fan

Printable View (275 KB)

Special Tool(s)

 ST1500-A	Wrench, Fan Clutch Nut 303-214 (T83T-6312-B)
ST2133-A	Holding Wrench, Fan Pulley 303-239 (T84T-6312-C)



Item	Part Number	Description
1	—	Cooling fan electronic clutch electrical connector (part of 12B637)
2	W710417	Cooling fan electronic clutch wiring harness support bracket nut
3	8600	Cooling fan and clutch assembly

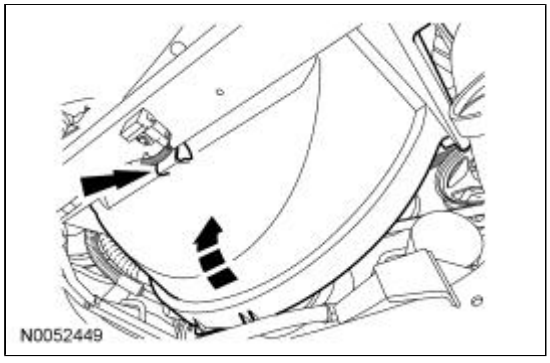
Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

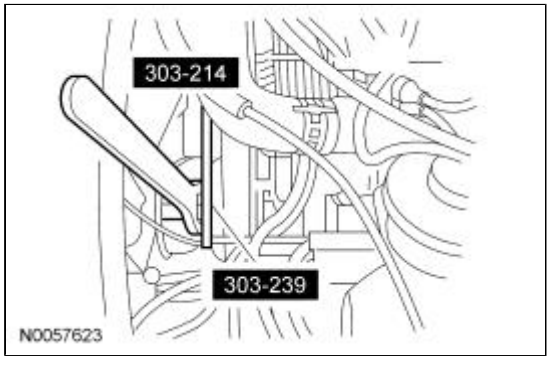
2. Disconnect the cooling fan electronic clutch electrical connector.

3. Remove the nut and the cooling fan electronic clutch harness support bracket from the stud bolt.
   - To install, tighten to 13 Nm (10 lb-ft).

4. Release the cooling fan shroud position tab and rotate the shroud upwards until the lower tab locks into position.



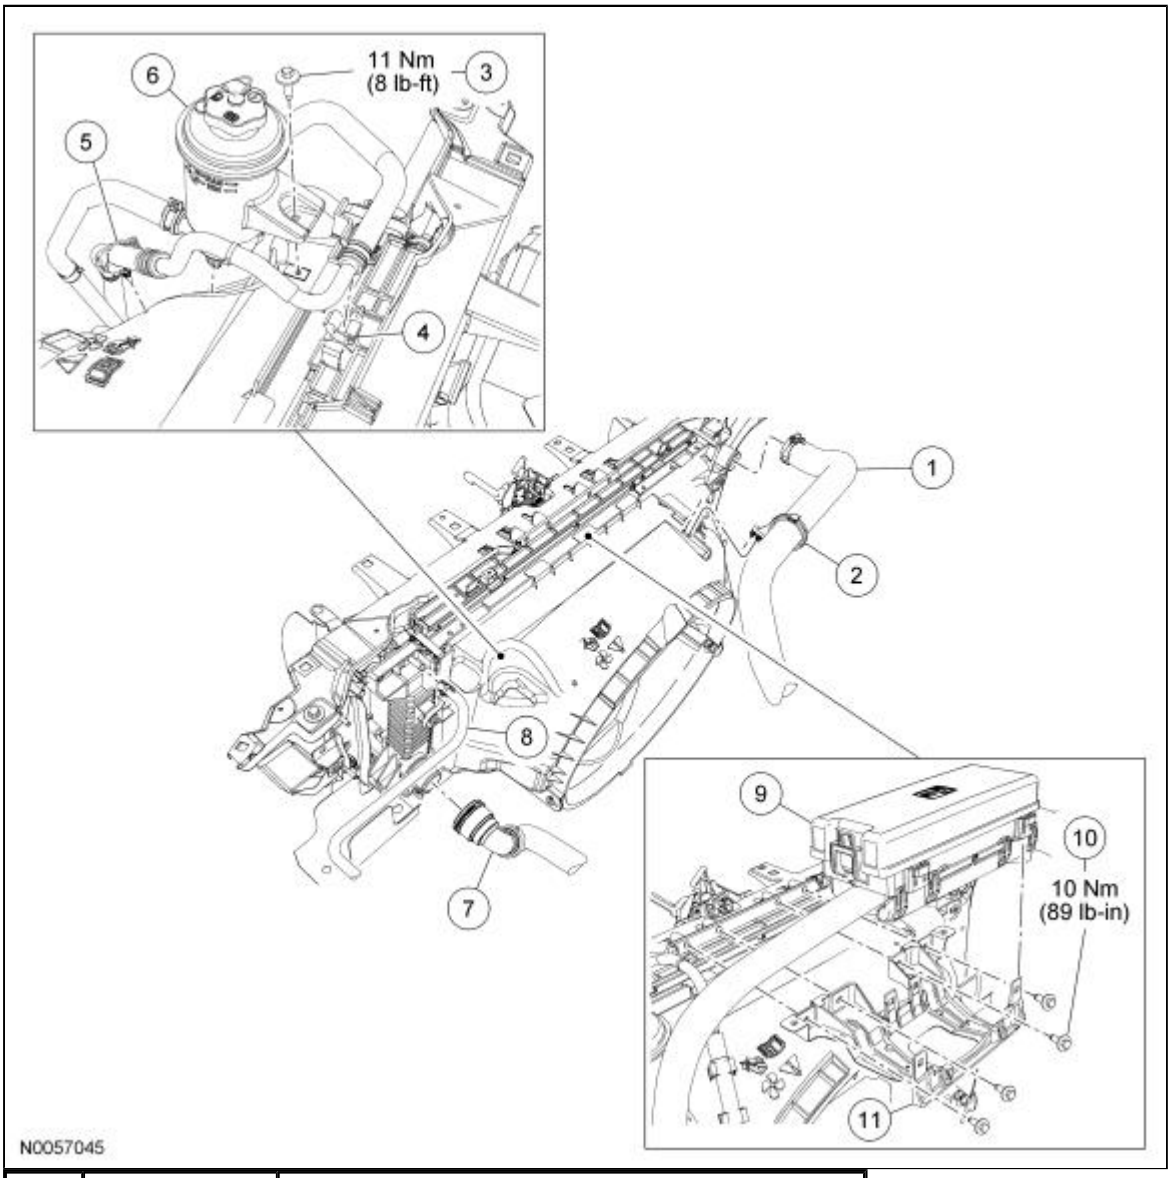
5. Using the special tools, remove the cooling fan and clutch assembly.
   - To install, tighten to 133 Nm (98 lb-ft).
   - If servicing the cooling fan or cooling fan clutch, refer to Cooling Fan and Cooling Fan Clutch in this section.



6. To install, reverse the removal procedure.

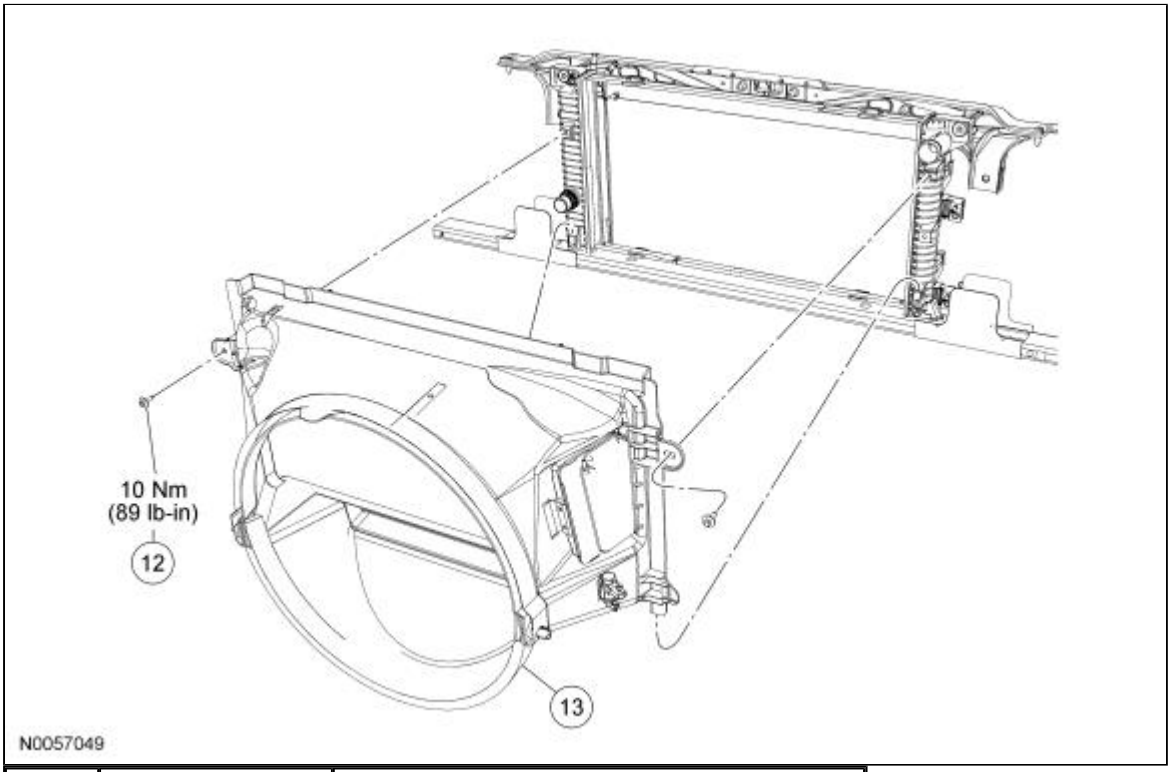
Cooling Fan Shroud

Printable View (629 KB)



Item	Part Number	Description
1	8B274	Upper radiator hose
2	8W287	Upper radiator hose retainer
3	W503924	Power steering fluid reservoir assembly bolt
4	3A005	Power steering hose position retainer
5	3A713	Power steering hose position retainer
6	3A697	Power steering fluid reservoir assembly
7	8B273	Lower radiator hose
8	8W005	Degas bottle inlet hose
9	14A067	Power distribution box (PDB)
10	W701842	PDB support bracket bolt (4 required)

11	180107	PDB support bracket



Item	Part Number	Description
12	W503924	Radiator shroud bolt (2 required)
13	8A247	Radiator shroud

Removal and Installation

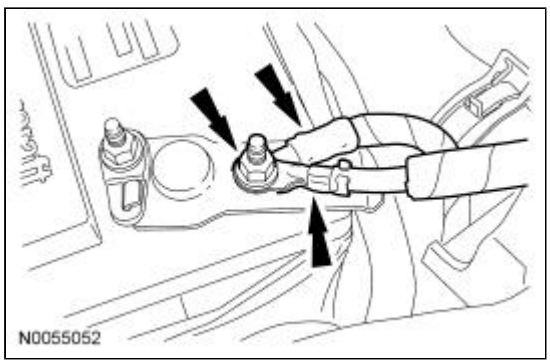
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

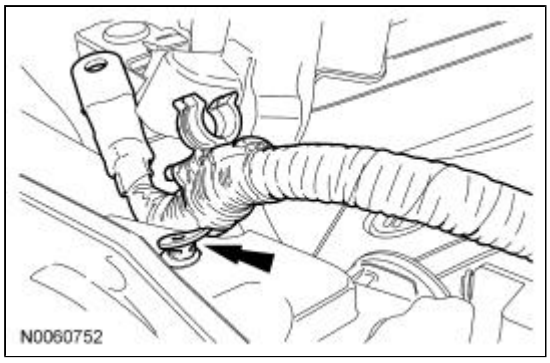
3. Drain the engine cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

4. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

5. Remove the nut and disconnect the electrical cables.
   - To install, tighten to 10 Nm (89 lb-in).



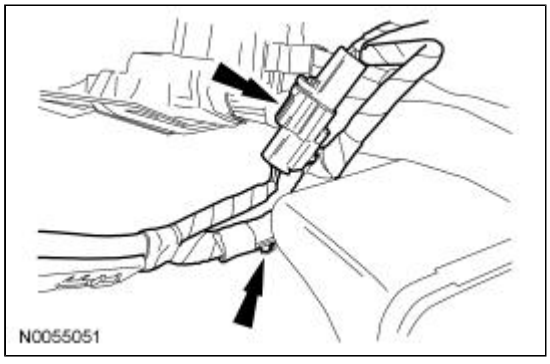
6. Disconnect the wiring harness retainer.



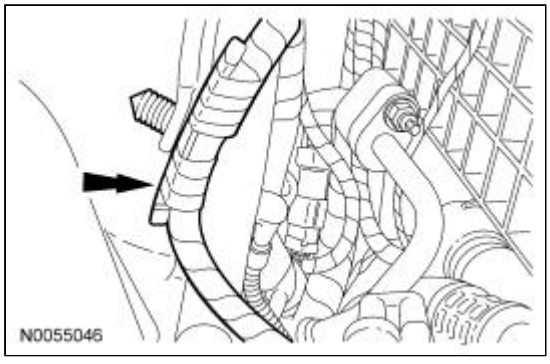
7. Disconnect the upper radiator hose from the radiator.

8. Disconnect the upper radiator hose position retainer from the cooling fan shroud.

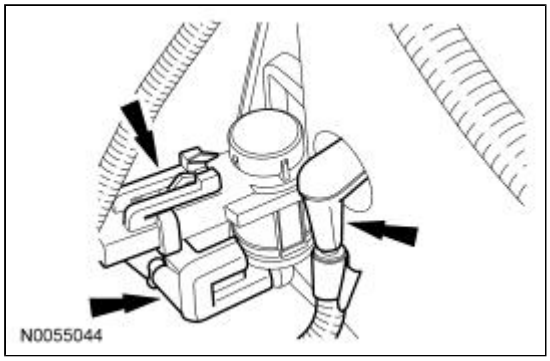
9. Disconnect the electrical connector and the wiring harness position retainer.



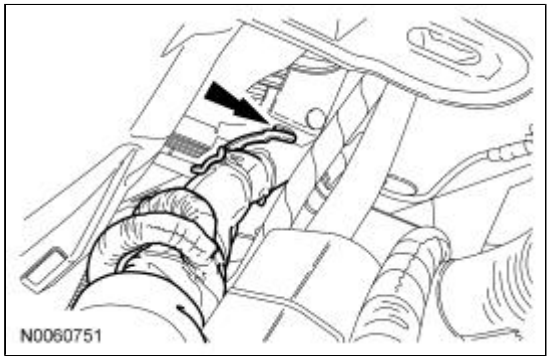
10. If equipped, disconnect the wiring harness position retainer from the vacuum reservoir.



11. If equipped, disconnect the vacuum connectors and the electrical connector on the LH side of the cooling fan shroud and remove the vacuum canister.

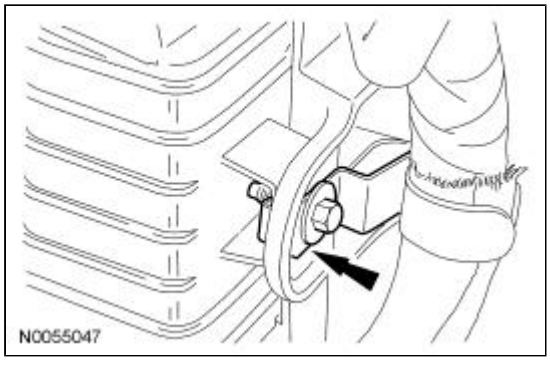


12. Disconnect the wiring harness retainer from the RH side of the radiator.



13. **NOTE:** LH shown, RH similar.

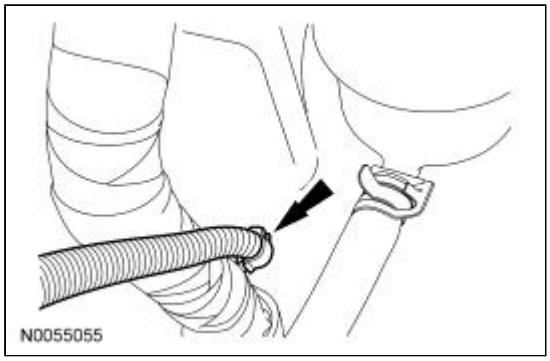
    Remove the 2 cooling fan shroud bolts and the wiring harness retainers.
    - To install, tighten to 10 Nm (89 lb-in).



14. Remove the 4 bolts and position the power distribution box (PDB) and support bracket aside.
    - **NOTE:** Hand start the 4 PDB support bracket bolts or damage to the radiator support can result.

      To install, tighten to 10 Nm (89 lb-in).

15. Disconnect the mass air flow (MAF) sensor electrical harness position retainer.

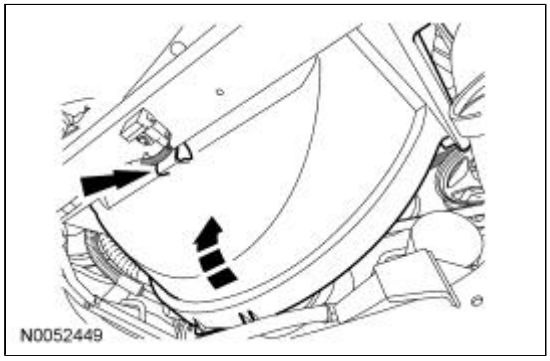


16. Disconnect the power steering fluid hose position retainers from the cooling shroud and radiator support.

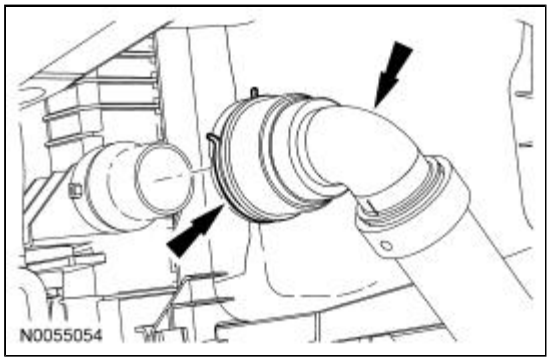
17. Remove the bolt and position the power steering reservoir aside.
    - To install, tighten to 11 Nm (8 lb-ft).

18. Disconnect the degas bottle coolant inlet hose from the radiator.

19. Release the lower cooling fan shroud position tab and rotate the lower cooling fan shroud upwards until the lower tab locks into position.



20. Remove the clip and disconnect the lower radiator hose quick connect coupling from the radiator.



21. Remove the cooling fan shroud.

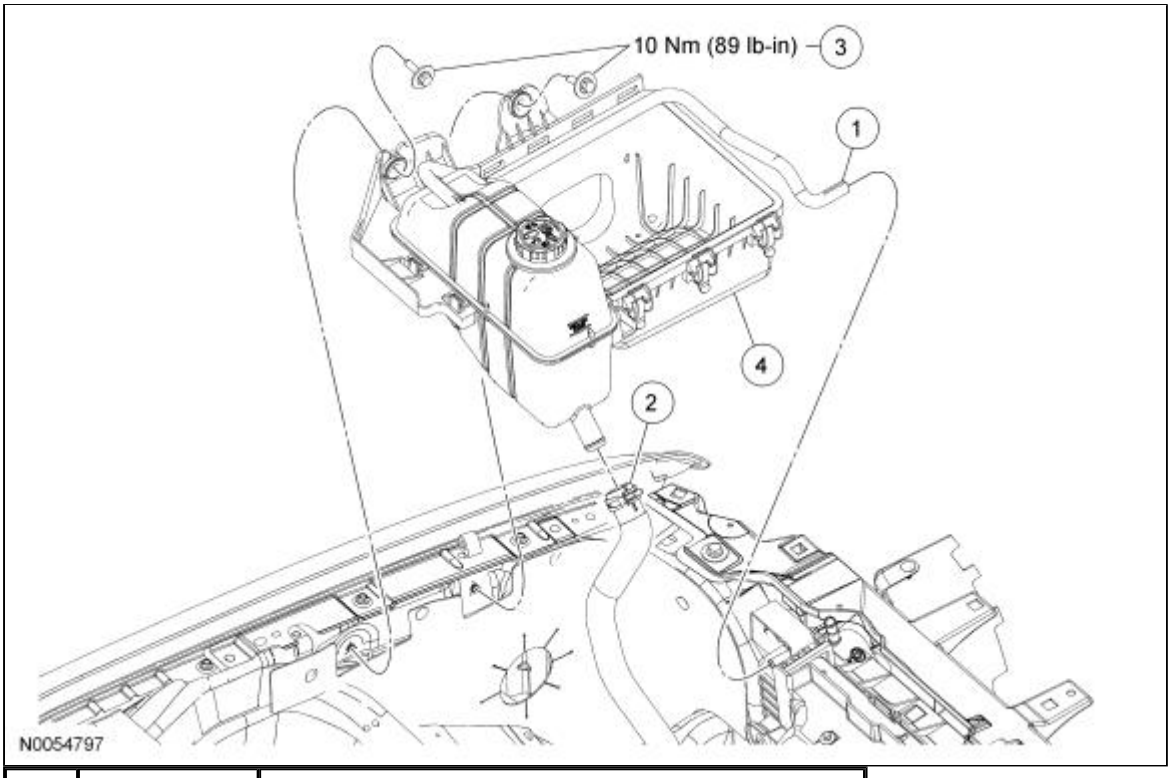
22. To install reverse the removal procedure.

Degas Bottle

Printable View (173 KB)

Material

Item	Specification
Motorcraft Premium Gold Engine Coolant with Bittering Agent (US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color)	WSS-M97B51-A1



Item	Part Number	Description
1	8W005	Upper degas bottle inlet hose
2	8C351	Lower degas bottle hose
3	N807658	Degas bottle bolts (2 required)
4	8A080	Degas bottle/lower air cleaner housing assembly

Removal and Installation

1. Drain the engine cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.
2. Remove the air cleaner element. For additional information, refer to Section 303-12 .
3. Disconnect the degas bottle inlet coolant hose from the radiato.

4. Remove the 2 bolts and the degas bottle/lower air cleaner housing assembly.
    - To install, tighten to 10 Nm (89 lb-in).

5. To install, reverse the removal procedure.

Sequential Multi-port Fuel Injection (SFI)

WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.

The fuel charging and controls system consists of the:

- throttle body.
- fuel injectors.
- fuel rail.

The fuel charging and controls system is:

- a sequential multi-port fuel injection (SFI) system.
- pulse width modulated (PWM).
- mass air flow (MAF) controlled.

Fuel is metered into each intake port in a sequential firing order. Fuel injectors pulse to follow engine firing order, in accordance with engine demand, on a tuned intake manifold.

The basic fuel requirement of the engine is determined from the data supplied to the powertrain control module (PCM) by the MAF sensor, which measures the amount of air being drawn into the engine.

The various sensors detect any changes in the operating conditions and send signals to the PCM. This permits the PCM to control the opening duration (pulse width) of the fuel injectors and maintain optimum exhaust emission control and engine performance for all operating conditions.

Throttle Body

CAUTION: Do not hold the throttle plate open with any object that could scratch the bore or plate while servicing or cleaning the throttle body.

The throttle body:

- controls air supply to the intake manifold by electronically positioning the throttle plate.
- is not adjustable.
- must be removed from the vehicle to be cleaned.

Refer to Throttle Body in this section.

Fuel Injectors

The fuel injectors:

- are electronically operated by the PCM.
- atomize the fuel as the fuel is delivered.
- each have an internal solenoid that opens a needle valve, which injects fuel into the intake port in

the cylinder head.
- are deposit resistant.

For removal and installation, refer to Fuel Rail and Fuel Injector — Exploded View and Fuel Rail in this section.

Fuel Rail

CAUTION: The fuel injectors and the fuel rail must be handled with extreme care to prevent damage to sealing areas and sensitive fuel-metering orifices.

The fuel rail:

- receives fuel from the fuel supply tube.
- delivers fuel to the fuel injectors.

For removal and installation, refer to Fuel Rail and Fuel Injector — Exploded View and Fuel Rail in this section.

Fuel Charging and Controls

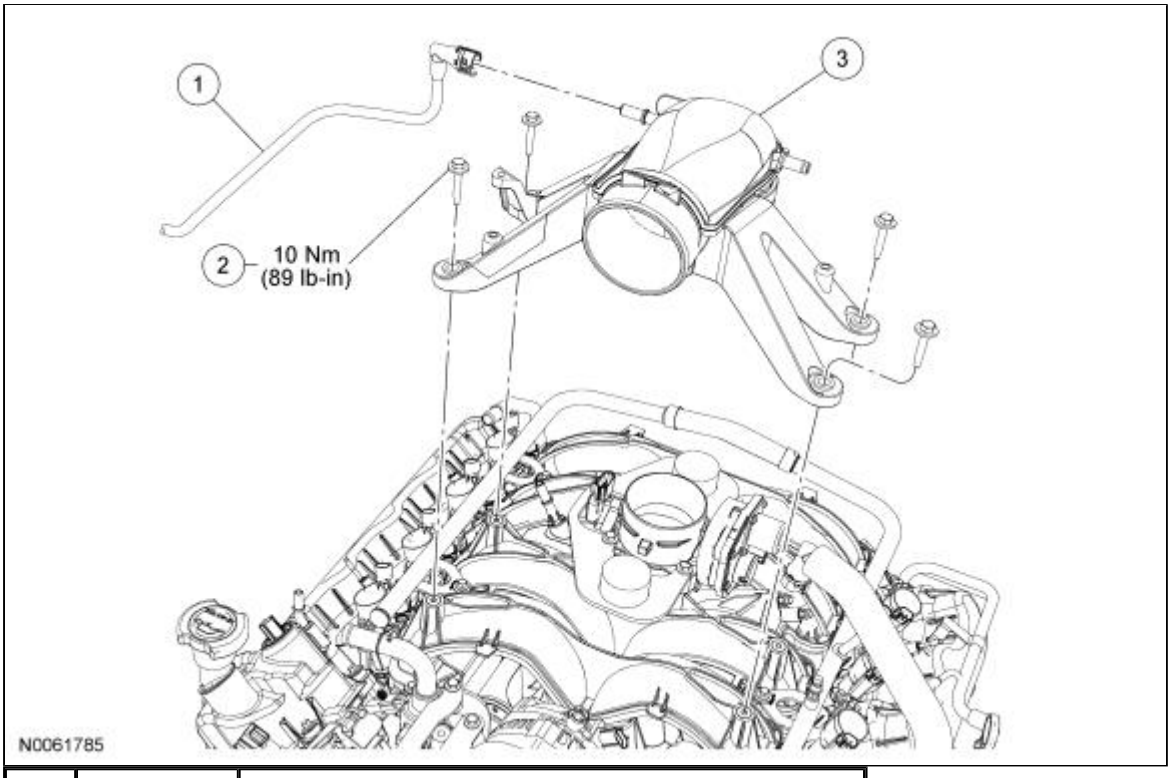
For driveability concerns, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Throttle Body

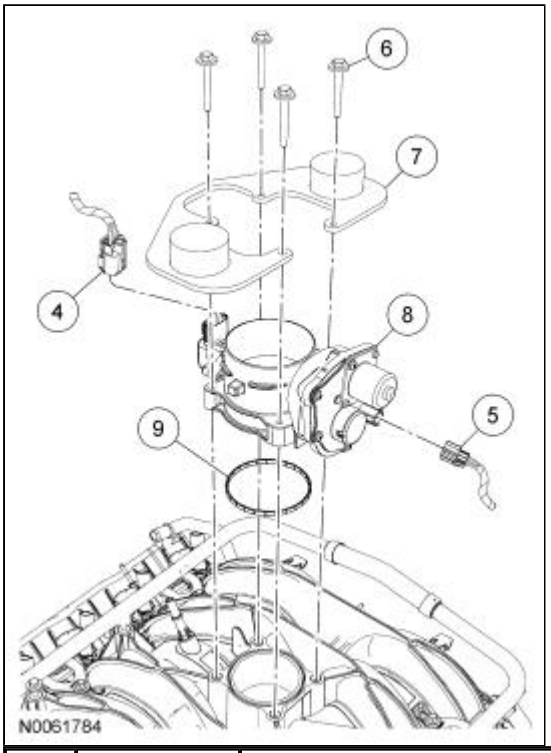
Printable View (331 KB)

Material

Item	Specification
Motorcraft Premium Gold Engine Coolant with Bittering Agent (US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color)	WSS-M97B51-A1



Item	Part Number	Description
1	6758	Crankcase ventilation tube
2	W505426	Air cleaner outlet pipe-to-throttle body (TB) adapter bolt (4 required)
3	9A589	Air cleaner outlet pipe-to-TB adapter



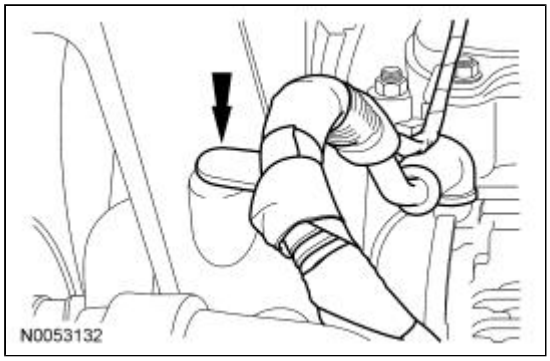
Item	Part Number	Description
4	—	Throttle position (TP) sensor electrical connector (part of 14A464)
5	—	Electronic throttle control electrical connector (part of 14A464)
6	W705438	TB bolt (4 required)
7	9J444	Vibration damper
8	9F991	TB
9	—	TB O-ring (part of 9F991)

Removal

WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and can be ignited. Failure to follow these instructions may result in personal injury.

CAUTION: The throttle body must be removed from the vehicle to be cleaned. Do not hold the throttle plate open with any object that could scratch the bore or plate while servicing or cleaning the throttle body.

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .
3. Disconnect the quick connect couplings and remove the crankcase vent tube. For additional information, refer to Section 310-00 .
4. Disconnect the generator wiring harness retainer from the air cleaner outlet pipe-to-throttle body (TB) adapter.



5. Remove the 4 bolts and position aside the air cleaner outlet tube-to-TB adapter.

6. Disconnect the electronic throttle control electrical connector.

7. Disconnect the throttle position (TP) sensor electrical connector.

8. Remove the 4 bolts and the vibration damper.

9. Remove the TB assembly.
    - Discard the TB O-ring seal.

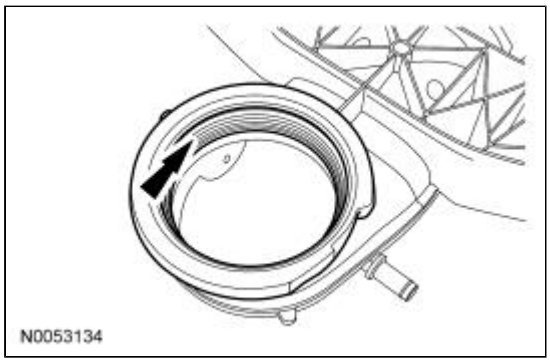
Installation

1. Using a new O-ring seal, position the TB and vibration damper and tighten the 4 bolts in 2 stages.
    - Stage 1: Tighten to 9 Nm (80 lb-in).
    - Stage 2: Tighten an additional 90 degrees.

2. Connect the TP sensor electrical connector.

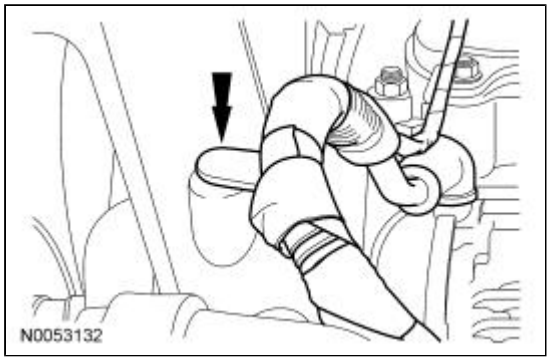
3. Connect the electronic throttle control electrical connector.

4. Lubricate the air cleaner outlet pipe-to-TB adapter seal with clean engine coolant prior to installation.



5. Position the air cleaner outlet pipe-to-TB adapter and install the 4 bolts.
    - Tighten to 10 Nm (89 lb-in).

6. Connect the generator wiring harness retainer to the air cleaner outlet tube-to-TB adapter.



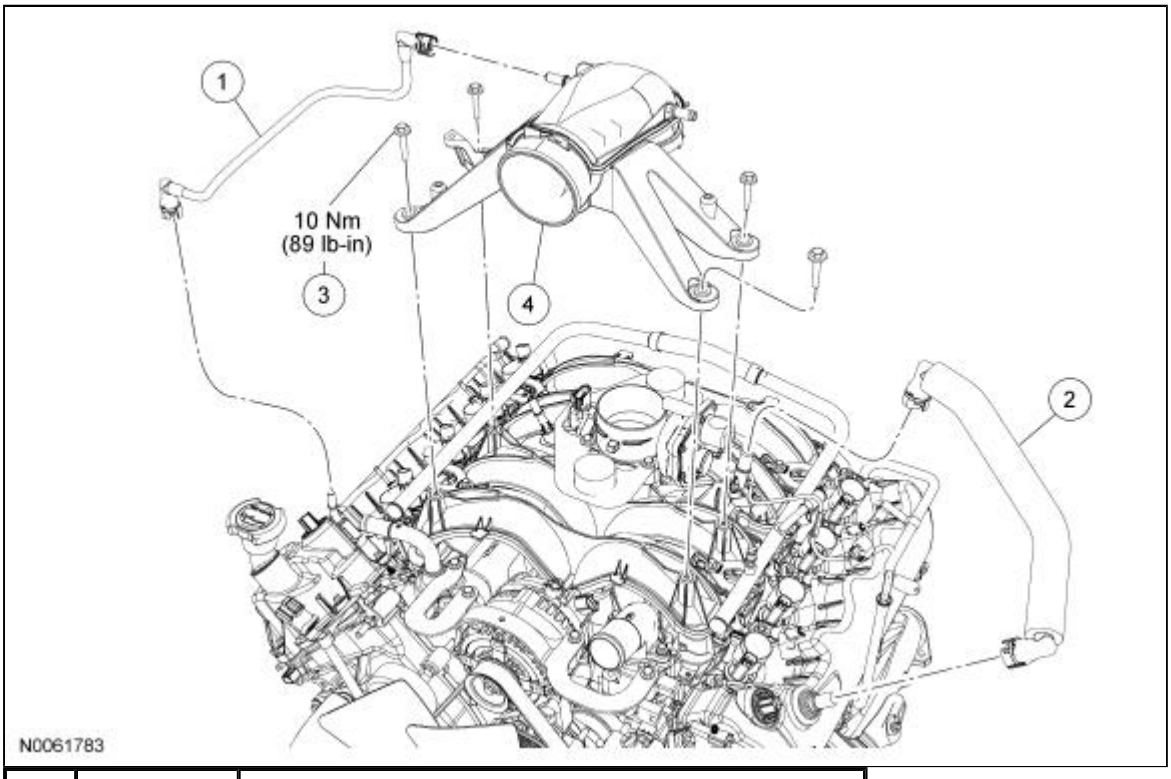
7. Position the crankcase vent tube and connect the quick connect couplings. For additional information, refer to Section 310-00 .

8. Install the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

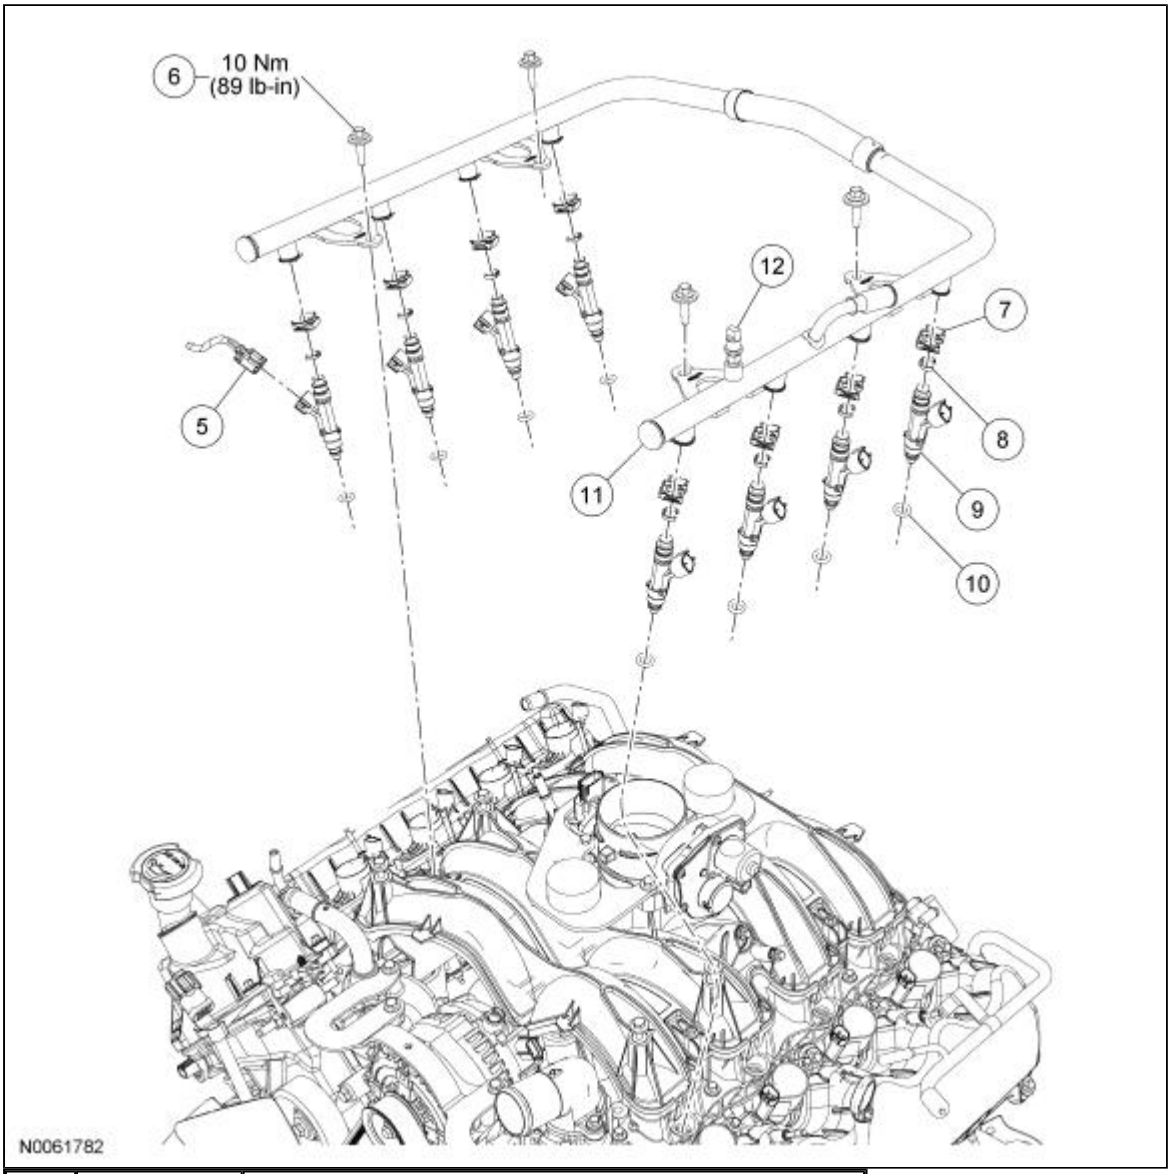
9. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Fuel Rail and Fuel Injector — Exploded View

Printable View (409 KB)



Item	Part Number	Description
1	6758	Crankcase ventilation tube
2	6K817	Positive crankcase ventilation (PCV) tube
3	W505426	Air cleaner outlet pipe-to-throttle body (TB) adapter bolt (4 required)
4	9A589	Air cleaner outlet pipe-to-TB adapter



Item	Part Number	Description
5	14A464	Fuel injector electrical connector (8 required) (part of 12B637)
6	W705438	Fuel rail bolt (4 required)
7	9C995	Fuel injector-to-fuel rail locking clip (8 required)
8	9229	Fuel injector-to-fuel rail O-ring (8 required)
9	9F593	Fuel injector (8 required)
10	9229	Fuel injector-to-intake manifold O-ring (8 required)
11	9F792	Fuel rail
12	—	Schrader valve port (part of 9F792)

Fuel Rail

Printable View (190 KB)

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A
Motorcraft Premium Gold Engine Coolant with Bittering Agent (US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color)	WSS-M97B51-A1

Removal

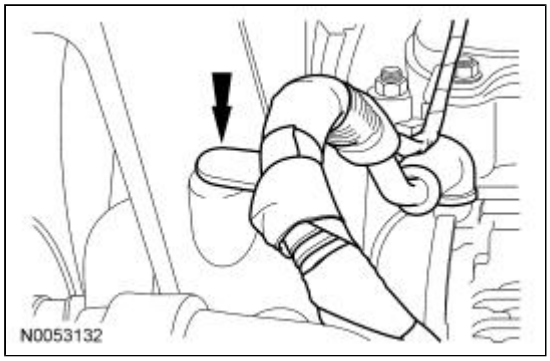
WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.

WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before working on or disconnecting any of the fuel tubes or fuel system components, the fuel system pressure must be relieved. Failure to follow these instructions may result in personal injury.

CAUTION: Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or tubes.

CAUTION: When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube.

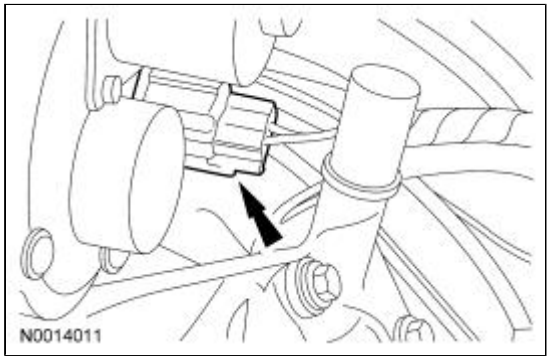
1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Disconnect the fuel supply tube spring lock coupling. For additional information, refer to Section 310-00 .
3. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .
4. Disconnect the quick connect couplings and remove the crankcase vent tube. For additional information, refer to Section 310-00 .
5. Disconnect the generator wiring harness retainer from the air cleaner outlet pipe-to-throttle body (TB) adapter.



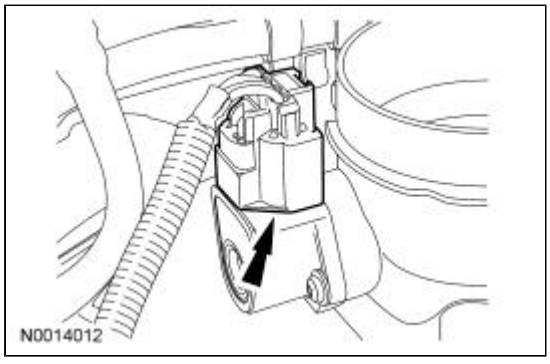
6. Remove the 4 bolts and the air cleaner outlet pipe-to-TB adapter.
    - Lubricate the air cleaner outlet pipe-to-TB adapter seal with clean engine coolant prior to installation.
    - To install, tighten to 10 Nm (89 lb-in).

7. Disconnect the quick connect couplings and remove the positive crankcase ventilation (PCV) tube. For additional information, refer to Section 310-00 .

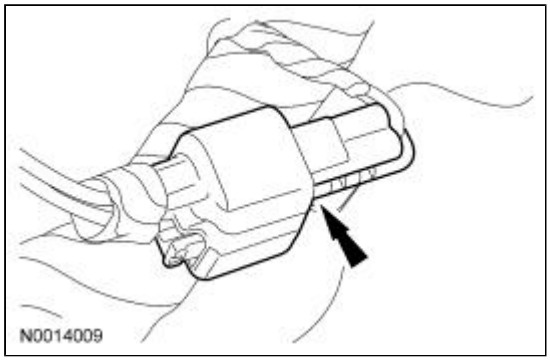
8. Disconnect the electronic throttle control electrical connector.



9. Disconnect the throttle position (TP) sensor electrical connector.



10. Disconnect the heated PCV intake fitting electrical connector.



11. Disconnect the 8 fuel injector electrical connectors.

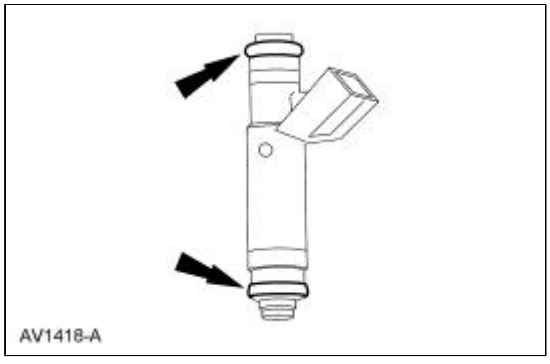
12. Remove the 4 fuel rail bolts.
    - To install, tighten to 10 Nm (89 lb-in).

13. Remove the fuel rail and fuel injectors as an assembly.

14. Remove the 8 fuel injector-to-fuel rail locking clips.

15. **CAUTION: Use O-ring seals that are made of special fuel-resistant material. Use of ordinary O-rings can cause the fuel system to leak. Do not reuse the O-ring seals. Lubricate the O-ring seals with clean engine oil prior to installation.**

    Separate the fuel injectors from the fuel rail.
    - Discard the O-ring seals.



16. To install, reverse the removal procedure.
    - Lubricate the new fuel injector O-ring seals with clean engine oil prior to installation.

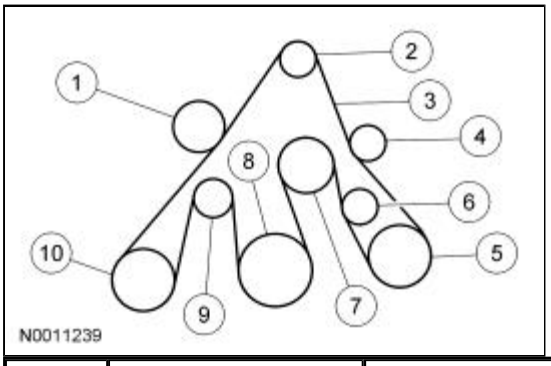
Accessory Drive

Printable View (97 KB)

Component Locations 5.4L



Item	Part Number	Description
1	19A216	Belt idler pulley
2	10344	Generator pulley
3	8620	Drive belt
4	19A216	Belt idler pulley
5	3A733	Power steering pump pulley
6	6C348	Belt idler pulley
7	8509	Coolant pump pulley
8	6312	Crankshaft pulley
9	6B209	Drive belt tensioner pulley
10	2E884	A/C compressor pulley

The accessory drive:

- has a single serpentine drive belt (6 ribs).
- has an automatic tensioner.
- is not adjustable.

Accessory Drive

Printable View (157 KB)

Inspection and Verification

CAUTION: Under no circumstances should the accessory drive belt, tensioner or pulleys be lubricated as potential damage to the belt material and tensioner damping mechanism will occur. Do not apply any fluids or belt dressing to the accessory drive belt or pulleys.

1. Verify the customer concern by operating the system.

2. Visually inspect for obvious signs of mechanical damage.

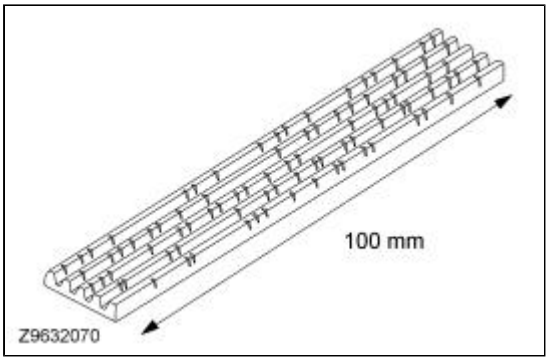
Visual Inspection Chart

Mechanical
• Drive belt cracking/chunking/wear • Belt/pulley contamination • Incorrectly routed belt • Pulley misalignment or excessive pulley runout • Loose or mislocated hardware • Incorrectly routed power steering tubes (rubbing)

3. Eliminate all other non-belt related noises that could cause belt misdiagnosis, such as A/C compressor engagement chirp, power steering cavitations at low temperatures, variable camshaft timing (VCT) tick or generator whine.

4. If a concern is found, correct the condition before proceeding to the next step.

V-Ribbed Serpentine Drive Belt With Cracks Across Ribs



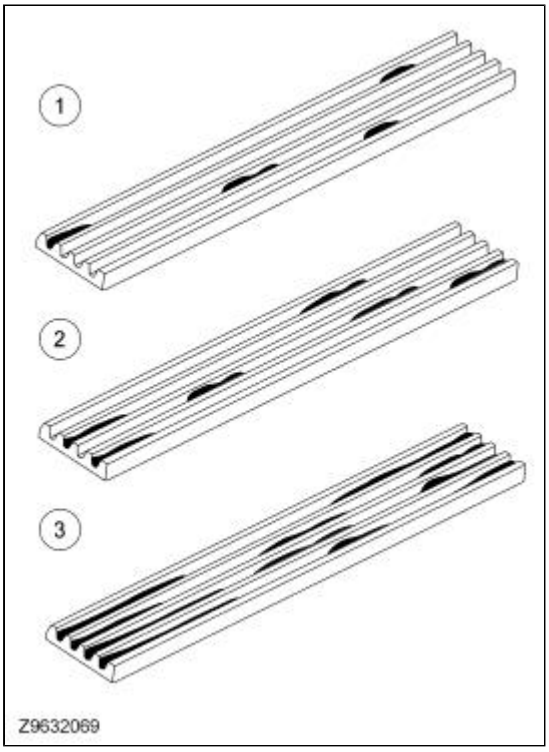
5. **NOTE:** Up to 15 cracks in a rib over a distance of 100 mm (4.0 in) can be considered acceptable. If damage exceeds the acceptable limit or any chunks are found to be missing from the ribs, a new belt must be installed.

   Check the belt for cracks. Up to 15 cracks in a rib over a distance of 100 mm (4.0 in) can be considered acceptable. If cracks exceed this standard, install a new belt.

6. The condition of the V-ribbed drive belt should be compared against the illustration and appropriate action taken.
    1. Small scattered deposits of rubber material. This is not a concern, therefore, installation of a new belt is not required.
    2. Longer deposit areas building up to 50% of the rib height. This is not considered a concern but it can result in excessive noise. If noise is apparent, install a new belt.
    3. Heavy deposits building up along the grooves resulting in a possible noise and belt stability concern. If heavy deposits are apparent, install a new belt.

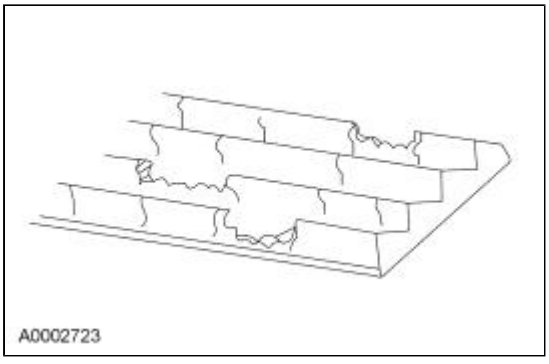
V-Ribbed Serpentine Belt With Piling

NOTE: Piling is an excessive buildup in the V-grooves of the belt.



7. There should be no chunks missing from the belt ribs. If the belt shows any evidence of this, install a new accessory drive belt.

V-Ribbed Serpentine Belt With Chunks of Rib Missing



8. If the concern is not visually evident, verify the symptom and GO to Symptom Chart .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Accessory drive belt cracking (over 15 cracks in a rib over a distance of 100 mm [4.0 in])	• Accessory drive belt	• INSPECT the accessory drive belt. REFER to Inspection and Verification in this section. INSTALL a new accessory drive belt as necessary.
• Accessory drive belt chunking	• Accessory drive belt	• INSPECT the accessory drive belt. REFER to Inspection and Verification in this section. INSTALL a new accessory drive belt as necessary.
• Accessory drive belt noise, squeal, chirping or flutter	• Defective/worn or incorrect accessory drive belt • Misaligned pulley (s) • Pulley runout • Damaged or worn accessories • Fluid contamination of accessory drive belt or pulleys	• REFER to Component Tests, Drive Belt, Noise/Flutter in this section. REPAIR or INSTALL new parts as necessary.
	• Damaged or worn accessory drive belt tensioner	• REFER to Component Tests, Belt Tensioner — Mechanical and Belt Tensioner — Dynamics in this section. INSTALL a new accessory drive belt tensioner as necessary.
• Premature accessory drive belt wear	• Defective accessory drive belt • Misaligned pulley (s) • Pulley runout • Damaged accessories • Incorrectly installed drive belt • Fluid contamination	• REFER to Component Tests, Drive Belt Noise/Flutter and Incorrect Drive Belt Installation in this section. REPAIR or INSTALL new parts as necessary.
• Accessory drive belt does not hold correct tension	• Accessory drive belt has excessive cracking, damage or is worn	• INSPECT the drive belt. REFER to Inspection and Verification in this section. INSTALL a new drive belt as necessary.
	• Drive belt tensioner worn or damaged	• CHECK the drive belt tensioner for damage and correct operation. REFER to the Component Tests, Belt Tensioner — Mechanical and Belt Tensioner — Dynamics in this section. INSTALL a new drive belt tensioner as

		necessary.
	• Incorrect accessory drive belt	• VERIFY the correct accessory drive belt is installed.
	• Accessory drive component failure	• CHECK the accessory drive components. INSTALL new components as necessary.
	• Accessory drive belt idler pulley bearing failure	• INSPECT the accessory drive belt idler pulley for freedom of rotation and damage. INSTALL a new accessory drive belt idler pulley as necessary.

Component Tests

Drive Belt — Noise/Flutter

Drive belt chirp occurs due to pulley misalignment or excessive pulley runout. It can be the result of a damaged or incorrectly aligned grooved pulley.

To correct, determine the area where the noise comes from. Check each of the pulleys in that area with a straightedge to the crankshaft pulley. Look for accessory pulleys out of position in the fore/aft direction or at an angle to the straightedge.

CAUTION: Do not apply any fluids or belt dressing to the accessory drive belt or pulleys.

Drive belt squeal may be an intermittent or constant noise that occurs when the drive belt slips on an accessory pulley under certain conditions.

A short intermittent squeal may occur during engine start-up and shut down or during very rapid engine acceleration and decelerations, such as:

- wide open throttle 1-2 and 2-3 shifts or 2-3 and 3-4 back out shifts on automatic transmissions.
- wide open throttle 1-2 and 2-3 shifts and any combination of rapid downshifting on manual transmissions.

These special short-term transient events are expected, and are due to the higher system inertias required to meet the electrical and cooling demands on today's vehicle systems. Constant or reoccurring drive belt squeal can occur:

- if the A/C discharge pressure goes above specifications:
  - the A/C system is overcharged.
  - the A/C condenser core airflow is blocked.
- if the A/C off equalized pressure (the common discharged and suction pressure that occurs after several minutes) exceeds specifications.
- if any of the accessories are damaged or have a worn or damaged bearing. All accessories should be rotatable by hand in the unloaded condition. If not, inspect the accessory.
- if there is evidence of fluid contamination on the accessory drive belt. When the drive belt has been exposed to fluid contamination during vehicle operation, such as leaks from the power steering system, A/C system or cooling system, clean all pulleys with soap and water, rinse with clean water and install a new accessory drive belt. If the drive belt has been exposed to fluids in a localized area during routine vehicle service, such as replacement of hoses or fluids, the drive belt and pulleys should be washed with soap and water immediately (prior to starting the engine), and rinsed with clean water.
- if the accessory drive belt is too long. A drive belt that is too long will allow the accessory drive belt tensioner arm to go all the way to the arm travel stop under certain load conditions, which will

release tension to the drive belt. If the accessory drive belt tensioner indicator is outside the normal installation wear range window, install a new accessory drive belt.

- **NOTE:** The accessory drive belt tensioner arm should rotate freely without binding.

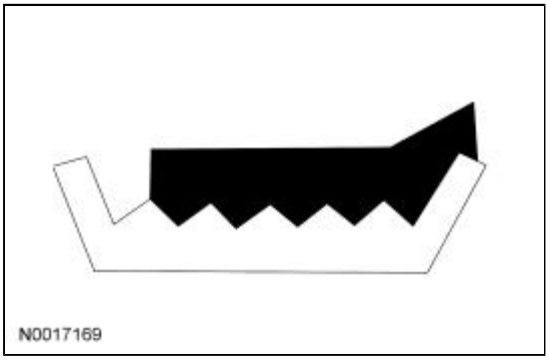
Install a new accessory drive belt tensioner if the drive belt tensioner is worn or damaged.

Drive Belt — Incorrect Installation

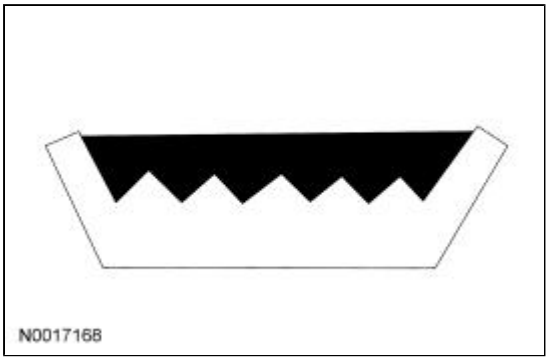
CAUTION: Incorrect accessory drive belt installation will cause excessive drive belt wear and can cause the drive belt to come off the pulleys.

Non-standard accessory drive belts can track differently or incorrectly. If an accessory drive belt tracks incorrectly, install a new accessory drive belt to avoid performance failure or loss of the drive belt.

Incorrect Installation



Correct Installation



With the engine running, check accessory drive belt tracking on all pulleys. If the edge of the accessory drive belt rides beyond the edge of the pulleys, noise and premature wear will occur. Make sure the accessory drive belt rides correctly on the pulley. If an accessory drive belt tracking condition exists, proceed with the following:

- Visually check the accessory drive belt tensioner for damage, especially the mounting pad surface. If the accessory drive belt tensioner is not installed correctly, the mounting surface pad will be out of position. This will result in chirp and squeal noises.
- With the engine running, visually observe the grooves in the pulleys (not the pulley flanges or the pulley forward faces) for excessive wobble. Install new components as necessary.
- Check all accessories, mounting brackets and the accessory drive belt tensioner for any interference that would prevent the component from mounting correctly. Correct any interference condition and recheck the accessory drive belt tracking.
- Tighten all accessories, mounting brackets and accessory drive belt tensioner retaining hardware to specification. Recheck the accessory drive belt tracking.

Belt Tensioner — Mechanical

The only mechanical check that needs to be made is a check for tensioner stick, grab or bind.

1. With the engine off, check routing of the accessory drive belt. Refer to the illustrations under Description and Operation in this section.

2. **NOTE:** The accessory drive belt tensioner spring is very strong and requires substantial force to release.

   Using a suitable, commercially available serpentine belt tensioner release tool, release the tension on the belt and detach the accessory drive belt in the area of the tensioner.

3. Using a suitable, commercially available serpentine belt tensioner release tool, move the tensioner from its relaxed position, through its full stroke and back to the relaxed position to make sure there is no stick, grab or bind, and to make sure that there is tension on the tensioner spring.

4. Rotate the tensioner pulley by hand and check for a binding, contaminated or seized condition. Install a new accessory drive belt tensioner if necessary.

5. Inspect the area surrounding the accessory drive belt tensioner for oil leaks or contamination and repair any leaks. Install a new accessory drive belt tensioner as necessary.

6. If the accessory drive belt tensioner meets the above criteria, proceed to testing the tensioner dynamically. If the accessory drive belt tensioner does not meet the above criteria, install a new tensioner.

Belt Tensioner — Dynamics

The accessory drive belt tensioner can be checked dynamically as follows:

1. With the engine running, observe the accessory drive belt tensioner movement. The accessory drive tensioner should move (respond) when the air conditioning clutch cycles (if equipped), or when the engine is accelerated rapidly. If the accessory drive belt tensioner movement is excessive without air conditioning clutch cycling or engine acceleration, check belt rideout. Excessive belt rideout (uneven depth of grooves in the belt) can cause excessive accessory drive belt tensioner movement. Check rideout condition by installing a new belt. If excessive accessory drive belt tensioner movement still exists, install a new accessory drive belt tensioner.

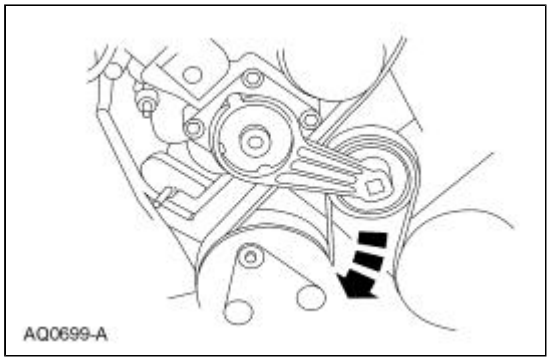
Accessory Drive Belt

Printable View (102 KB)

Removal and Installation

1. Rotate the accessory drive belt tensioner clockwise and remove the accessory drive belt.



2. **NOTE:** Make sure the drive belt is correctly installed on each pulley.

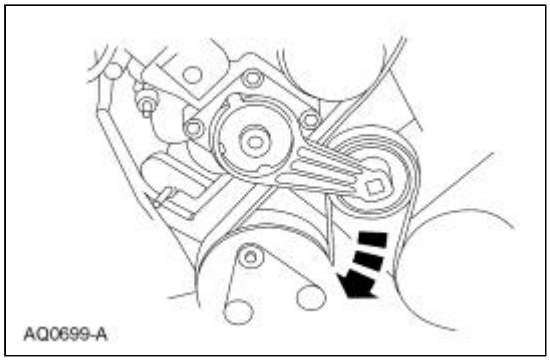
   To install, reverse the removal procedure.
   - Refer to Accessory Drive in Description and Operation for drive belt routing.

Accessory Drive Belt Tensioner

Printable View (86 KB)

Removal and Installation

1. Remove the cooling fan. For additional information, refer to Section 303-03 .
2. Rotate the accessory drive belt tensioner clockwise and remove the accessory drive belt from the A/C compressor pulley.



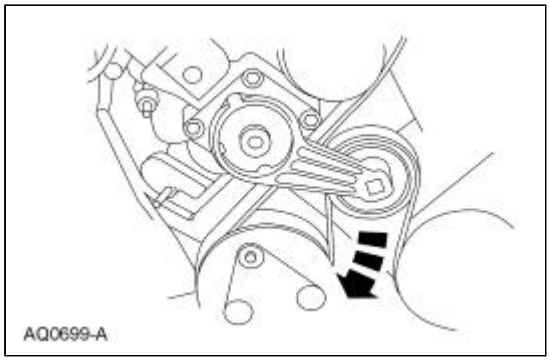
3. Remove the 3 bolts and the accessory drive belt tensioner.
   - To install, tighten to 25 Nm (18 lb-ft).
4. To install, reverse the removal procedure.

Accessory Drive Belt Idler Pulley

Printable View (86 KB)

Removal and Installation

1. Remove the cooling fan. For additional information, refer to Section 303-03 .
2. Rotate the accessory drive belt tensioner clockwise and remove the accessory drive belt from the A/C compressor pulley.



3. Remove the bolt and the accessory drive belt idler pulley.
   - To install, tighten to 25 Nm (18 lb-ft).
4. Repeat the previous step for each accessory drive belt idler pulley being serviced.
5. To install, reverse the removal procedure.

Starting System

Printable View (62 KB)

The starting system consists of the:

- starter motor.
- starter solenoid.
- starter drive.
- ignition switch.
- digital transmission range (TR) sensor.
- battery.

The function of the starting system is to crank the engine at a speed fast enough to permit the engine to start.

Inspection and Verification

WARNING: When servicing the starter motor or carrying out other underhood work in the vicinity of the starter motor, be aware that the heavy gauge battery input lead at the starter solenoid is "electrically hot" at all times. A protective cap or boot is provided over the terminal of this lead and must be installed after servicing. Failure to follow these instructions may result in personal injury.

WARNING: When working in the area of the starter motor, be careful to avoid touching hot exhaust components. Failure to follow these instructions may result in personal injury.

NOTE: When working on the starter system, make sure the anti-theft system is deactivated, if equipped.

1. Verify the customer concern by operating the starting system.
2. Visually inspect for obvious signs of mechanical and electrical damage. Refer to the following chart:

Visual Inspection Chart

Mechanical	Electrical
• Starter motor • Brackets • Starter motor bolts • Flexplate	• Battery • Failed power distribution box (PDB) fuse 40 (30A) • Circuitry • Loose or corroded connections

3. If the concern is not visually evident, determine the symptom. GO to Symptom Chart .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The engine does not crank and the relay clicks	• Battery • PDB fuse 40 (30A) • PDB • Starter motor/solenoid • Circuit	• Go To Pinpoint Test A .
• The engine does not crank and the relay does not click	• Powertrain control module (PCM) • Smart power distribution junction box (SPDJB) • PDB • Battery • Starter relay • Ignition switch • Circuit	• Go To Pinpoint Test B .
• The engine cranks slowly	• Battery • Starter motor/solenoid • Circuit	• Go To Pinpoint Test C .
• Unusual starter noise	• Starter mounting • Flexplate • Starter motor	• Go To Pinpoint Test D .
• The starter spins but the engine does not crank	• Starter motor • Damaged flexplate ring gear teeth	• INSPECT the starter motor mounting and engagement. INSTALL a new starter motor. REFER to Starter Motor in this section. • INSPECT the flexplate for damaged, missing or worn teeth. REPAIR as required.

Pinpoint Tests

Pinpoint Test A: The Engine Does Not Crank And The Relay Does Click

Refer to Wiring Diagrams Cell 20 , Starting System for schematic and connector information.

Normal Operation

In normal operation, when the ignition switch is placed in the start position voltage is supplied through circuit CDC35 (BU/WH) to the smart power distribution junction box (SPDJB). From the SPDJB, voltage is supplied through circuit CDC38 (WH/VT) to the starter relay coil located in the power distribution box (PDB). The starter relay coil is supplied ground from the powertrain control module (PCM) through circuit CDC12 (YE).

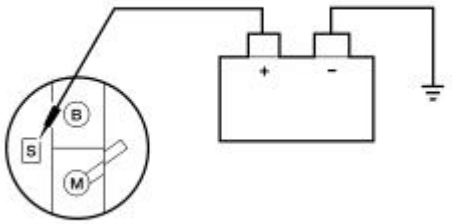
When the starter relay is energized, voltage supplied to the relay switch from PDB fuse 40 (30A) is sent to the starter motor solenoid through circuit CDC25 (BN/GN). Battery voltage is supplied to the starter motor through circuit SDC02 (RD) at all times.

Possible Causes

- Failed PDB fuse 40 (30A)
- An open in circuit CDC25 (BN/GN), SDC04 or SDC02 (RD)
- Starter motor relay
- Starter

PINPOINT TEST A: THE ENGINE DOES NOT CRANK AND THE RELAY DOES CLICK

Test Step	Result / Action to Take
A1 CHECK THE STARTER MOTOR GROUND • Measure the voltage between the battery positive post and the starter motor case.  AJ0281-A • **Is the voltage reading greater than 10 volts?**	**Yes** GO to A2 . **No** CLEAN the starter motor mounting flange and make sure the starter motor is correctly mounted. TEST the system for normal operation.
A2 CHECK THE VOLTAGE TO THE STARTER MOTOR SOLENOID • Measure the voltage between the starter motor solenoid positive terminal and ground.  J6079-A • **Is the voltage 10 volts or greater?**	**Yes** GO to A3 . **No** REPAIR circuit SDC02 (RD) for an open. TEST the system for normal operation.
A3 MANUALLY JUMP THE STARTER MOTOR • Connect one end of a fused (15A) jumper wire to the positive terminal of the battery and touch the other end to the starter solenoid S-terminal.	**Yes** GO to A4 . **No** INSTALL a new starter motor. REFER to Starter Motor in this section. TEST the system for normal operation.



J6080-A

- **Does the starter solenoid engage and the starter motor crank?**

A4 CHECK START INPUT TO THE STARTER MOTOR	
• Disconnect: Starter S-Connector. • Key in START position. • Measure the voltage at the starter motor solenoid S-terminal.  AJ0285-A • **Is the voltage reading greater than 10 volts?**	**Yes** CLEAN the starter solenoid S-terminal and connector. CHECK the wiring and the starter motor for a loose or intermittent connection. TEST the system for normal operation. **No** GO to A5 .
A5 CHECK THE BATTERY SUPPLY TO THE STARTER RELAY	
• Key in OFF position. • Disconnect: Starter Motor Relay. • Measure the voltage at starter relay connector pin 30.  N0053748 • **Is the voltage reading greater than 10 volts?**	**Yes** GO to A9 . **No** GO to A6 .
A6 CHECK PDB FUSE 40 (30A) FOR AN OPEN	
• Key in OFF position. • Disconnect: PDB Fuse 40 (30A). • Check fuse: PDB Fuse 40 (30A). • **Is PDB fuse 40 (30A) open?**	**Yes** GO to A7 . **No** GO to A8 .
A7 CHECK CIRCUIT CDC25 (BN/GN) FOR A SHORT TO GROUND	
• Disconnect: Starter Solenoid S-Connector. • Measure the resistance of circuit CDC25 (BN/GN)	**Yes** REPAIR circuit CDC25 (BN/GN)

between starter relay connector pin 87 and the starter solenoid S-connector.  N0053039 • **Is the resistance less than 10,000 ohms?**	for a short to ground. INSTALL a new PDB fuse 40 (30A). TEST the system for normal operation. **No** INSTALL a new PDB fuse 40 (30A). TEST the system for normal operation.
A8 CHECK CIRCUIT SDC04 (RD) FOR POWER SUPPLY TO THE PDB	
• Measure the voltage between the PDB power supply terminal, circuit SDC04 (RD) and ground.  N0053686 • **Is the voltage 10 volts or greater?**	**Yes** INSTALL a new PDB. **No** REPAIR circuit SDC04 (RD) for an open. TEST the system for normal operation.
A9 CHECK CIRCUIT CDC25 (BN/GN) FOR AN OPEN	
• Disconnect: Starter Solenoid S-Connector. • Measure the resistance of circuit CDC25 (BN/GN) between starter relay connector pin 87 and the starter solenoid S-connector.  N0053038 • **Is the resistance reading 5 ohms or less?**	**Yes** INSTALL a new starter relay. TEST the system for normal operation. **No** REPAIR circuit CDC25 (BN/GN) for an open. TEST the system for normal operation.

Pinpoint Test B: The Engine Does Not Crank And The Relay Does Not Click

Refer to Wiring Diagrams Cell 20 , Starting System for schematic and connector information.

Possible Causes

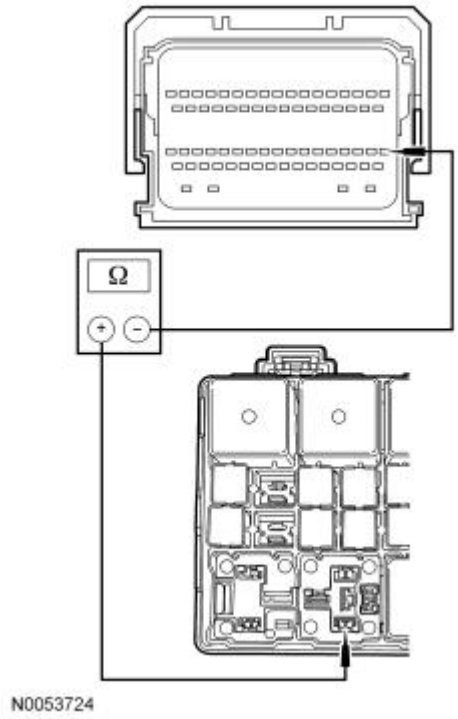
- Battery
- An open in circuit CDC38 (WH/VT), CDC12 (YE) or CDC35 (BU/WH)
- Powertrain control module (PCM)

- Smart power distribution junction box (SPDJB)
- Ignition switch
- Starter motor relay

PINPOINT TEST B: THE ENGINE DOES NOT CRANK AND THE RELAY DOES NOT CLICK

Test Step	Result / Action to Take
B1 CHECK THE BATTERY	
• Check the battery condition and charge. Refer to Section 414-00 . • **Is the battery OK?**	**Yes** GO to B2 . **No** CHARGE or INSTALL a new battery as required. TEST the system for normal operation.
B2 CHECK CIRCUIT CDC38 (WH/VT) FOR VOLTAGE	
• Disconnect: Starter Motor Relay. • Key in START position. • Measure the voltage between starter motor relay pin 85, circuit CDC38 (WH/VT) and ground while holding the key in the start position.  N0053751 • **Is the voltage greater than 10 volts?**	**Yes** GO to B6 . **No** GO to B3 .
B3 CHECK THE START INPUT FROM THE SPDJB	
• Key in START position. • Disconnect: SPDJB C2280A. • Measure the voltage at SPDJB C2280A pin 8 while holding the key in the start position.  N0053754 • **Is the voltage reading greater than 10 volts?**	**Yes** REPAIR circuit CDC38 (WH/VT) for an open. TEST the system for normal operation. **No** GO to B4 .
B4 CHECK THE START INPUT TO THE SPDJB	
• Key in START position. • Disconnect: SPDJB C2280H. • Measure the voltage at SPDJB C2280H pin 32 while	**Yes** INSTALL a new SPDJB. TEST the system for normal

holding the key in the start position.  N0053747 • **Is the voltage reading greater than 10 volts?**	operation. **No** GO to B5
B5 CHECK FOR START INPUT FROM THE IGNITION SWITCH	
• Key in START position. • Measure the voltage at ignition switch C250 pin 10, from the harness side, while holding the key in the start position.  N0053685 • **Is the voltage reading greater than 10 volts?**	**Yes** REPAIR circuit CDC35 (BU/WH) for an open. TEST the system for normal operation. **No** REFER to Section 211-05 for diagnosis and testing of the ignition switch.
B6 CHECK THE STARTER RELAY GROUND	
• Key in START position. • Disconnect: Starter Motor Relay. • Measure the resistance between starter relay connector pin 86, circuit CDC12 (YE) and ground while holding the key in the start position.  N0053061 • **Is the resistance reading 5 ohms or less?**	**Yes** INSTALL a new starter relay. TEST the system for normal operation. **No** GO to B7 .
B7 CHECK CIRCUIT CDC12 (YE) FOR AN OPEN	
• Disconnect: PCM C175B. • Measure the resistance between the starter relay connector pin 86, circuit CDC12 (YE) and PCM C175B pin 34.	**Yes** DIAGNOSE the PCM. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** REPAIR circuit CDC12 (YE) for an open. TEST the system for normal operation.



N0053724

- **Is the resistance reading 5 ohms or less?**

Pinpoint Test C: The Engine Cranks Slowly

Refer to Wiring Diagrams Cell 20 , Starting System for schematic and connector information.

Possible Causes

- Circuit CDC25 (RD)
- Ground circuit
- Starter motor

PINPOINT TEST C: THE ENGINE CRANKS SLOWLY

Test Step	Result / Action to Take
C1 CHECK THE VOLTAGE TO THE STARTER • Key in OFF position. • Measure the voltage between the starter motor solenoid positive terminal and ground.  J6079-A • **Is the voltage 12.0 volts or greater?**	**Yes** GO to C2 . **No** REPAIR circuit CDC25 (RD). CLEAN and TIGHTEN the connections at the battery terminals. TEST the system for normal operation.

C2 CHECK THE MOTOR GROUND CIRCUIT	
• Carry out the motor ground circuit test. Refer to Component Tests in this section. • **Is the ground OK?**	**Yes** INSTALL a new starter motor. TEST the system for normal operation. **No** REPAIR the ground circuit as necessary. TEST the system for normal operation.

Pinpoint Test D: Unusual Starter Noise

Possible Causes

- Starter motor mounting
- Starter motor mounting bolts
- Starter motor drive
- Flywheel or flexplate ring gear
- Starter motor

PINPOINT TEST D: UNUSUAL STARTER NOISE

Test Step	Result / Action to Take
D1 CHECK THE STARTER MOTOR MOUNTING	**Yes** GO to D2 . **No** REINSTALL the starter motor correctly. REFER to Starter Motor in this section.
• Inspect the starter motor mounting for cracks. • Check the starter motor mounting bolts for looseness. • **Is the starter motor mounted correctly?**	
D2 INSPECT THE STARTER MOTOR	**Yes** INSTALL a new starter motor. TEST the system for normal operation. **No** CHECK the starter drive. REFER to Component Tests, Starter Drive Test in this section. INSTALL a new starter motor. TEST the system for normal operation.
• Remove the starter motor. Refer to Starter Motor in this section. • Inspect the starter motor for damage. • **Is the starter motor damaged?**	

Component Tests

Starter Motor — Load Test

WARNING: When servicing the starter motor or carrying out other underhood work in the vicinity of the starter motor, be aware that the heavy gauge battery input lead at the starter solenoid is "electrically hot" at all times. Failure to follow these instructions may result in personal injury.

CAUTION: A protective cap or boot is provided over the battery input terminal on all car lines and must be installed after repair. Be sure to disconnect the battery ground cable before repairing the starter motor.

1. Before carrying out this test inspection, check the battery to determine its state of charge. Carry out a load test of the battery using the Starter, Alternator, Battery, Regulator and Electrical (SABRE) Tester. Refer to Section 414-00 for the test procedure.

2. Disconnect the ignition coil connector from the ignition coil.

3. Connect the SABRE tester to the vehicle using the amperage lead clipped around the positive battery cable.

4. Measure the amperage of the starter motor while activating the starting system.

5. A correctly operating starter motor will draw from 130 to 190 amps of current at room temperature.

Voltage Drop Tests

The following test procedures will be carried out with the starter motor on the vehicle.

Motor Feed Circuit

NOTE: Make all multimeter connections at the component terminal rather than the cable or wiring terminal.

1. Disconnect the ignition coil connector from the ignition coil.

2. Connect a remote starter switch between the starter solenoid S-terminal and the battery positive (+) post.

3. Connect the positive (+) lead of the 73 III Automotive Meter to the battery positive (+) post. Connect the negative (-) lead of the multimeter to the starter solenoid M-terminal.

4. Engage the remote starter switch. The multimeter reading should be 0.5 volt or less.

5. If the voltage at the M-terminal is greater than 0.5 volt, move the multimeter negative (-) lead to the starter solenoid B-terminal and repeat the test.

6. If the voltage reading at the B-terminal is less than 0.5 volt, the problem is either in the connections at the starter solenoid or the starter solenoid.

7. Remove the wires at the starter solenoid B-, S- and M-terminals. Clean the connections and install the cables. Repeat Steps 1 through 5 above. If the reading is still higher than 0.5 volt at the M-terminal and 0.5 volt or lower at the B-terminal, the problem is in the starter solenoid. Install a new starter motor. Refer to Starter Motor in this section.

8. If the voltage taken at the starter solenoid B-terminal is greater than 0.5 volt, the problem is either the positive (+) battery cable connection or the positive (+) battery cable.

Motor Ground Circuit

NOTE: Make all multimeter connections at the component terminal rather than the cable or wiring terminal.

A slow cranking condition can be caused by resistance in the ground or return portion of the cranking circuit. Check the voltage drop in the ground circuit as follows:

1. Disconnect the ignition coil connector from the ignition coil.

2. Connect a remote starter switch between the starter solenoid S-terminal and the battery positive (+) terminal.

3. Connect the positive (+) lead of a 73 III Automotive Meter to the starter motor housing. The connection must be clean and free of rust or grease. Connect the negative (-) lead to the negative (-) battery terminal.

4. Engage the remote starter switch and read the voltage. The reading should be 0.5 volt or less.

5. If the voltage drop is greater than 0.5 volt, clean the negative (-) battery cable connections at the battery and chassis. Also, clean the engine ground cable connection at the cable mounting bracket. If the voltage drop is still excessive, repair or install a new battery ground cable.

Starter Drive Test

1. Remove the starter motor. Refer to Starter Motor in this section.

2. Secure the starter motor in a vise.

3. Connect the battery ground cable of a fully charged battery to the case of the starter motor.

4. **CAUTION: Do not leave the positive lead of the battery connected to the starter motor S-terminal for more than 10 seconds.**

   Touch the positive lead from the battery to the S-terminal and verify that the starter drive ejects.

5. Remove the positive lead from the starter motor. The ejected starter drive should return to its original position.

6. If the starter drive does not eject and return to position, install a new starter motor.

7. Check the starter drive. It should turn freely in one direction, and positively engage to the armature when turned in the opposite direction. If not as specified, install a new starter motor.

No Load Test

The starter No Load Test will identify open or shorted windings and a possible rubbing starter motor armature or bent starter motor armature shaft.

1. **WARNING: Make sure that the starter motor is securely mounted on a bench because the starter motor may move or jump when it is energized. Failure to follow these instructions may result in personal injury.**

   Connect a fully charged battery, a Starter, Alternator, Battery, Regulator and Electrical (SABRE) Tester and a remote starter switch to the starter motor. Connect the remote starter switch between the battery positive (+) post and the starter motor S-terminal. Connect the starter motor B-terminal to the battery positive (+) post. Connect the SABRE positive (+) terminal and negative (-) terminal to the corresponding battery post. Make sure that the battery and starter motor are grounded.

2. Engage the remote starter switch.

3. The starter motor should eject the starter drive and run smoothly. If the starter motor does not run smoothly, install a new starter motor.

4. While the starter motor is running, check the voltmeter and ammeter.
5. The amperage should be no more than 84 amps.
6. If the amperage is higher than 84 amps, install a new starter motor.

Starter Motor

11	11000	Starter motor

Removal

WARNING: When carrying out maintenance on the starting system, be aware that the heavy gauge leads are connected directly to the battery. Make sure the protective caps are in place when maintenance is completed. Failure to follow these instructions may result in personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Remove the starter terminal cover and remove the nut and the solenoid S-terminal electrical connection.
4. Remove the nut and the solenoid B-terminal electrical connection.
5. Remove the nut and the starter battery ground cable from the stud.
6. Remove the 2 bolts, the stud bolt and the starter motor.

Installation

1. Position the starter and install the 2 bolts and the stud bolt in 3 stages.
   - Stage 1: Install the 2 starter bolts and the stud bolt finger tight.
   - Stage 2: Tighten the upper bolt to 25 Nm (18 lb-ft).
   - Stage 3: Tighten the lower bolt and stud bolt to 25 Nm (18 lb-ft).
2. Position the starter battery ground cable onto the stud and install the nut.
   - Tighten to 25 Nm (18 lb-ft).
3. Connect the solenoid B-terminal electrical connection and install the nut.
   - Tighten to 12 Nm (9 lb-ft).
4. Connect the solenoid S-terminal electrical connection and install the nut and the starter terminal cover.
   - Tighten to 6 Nm (53 lb-in).
5. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Engine Ignition

Printable View (63 KB)

The electronic ignition system is a coil-on-plug ignition system. The coil-on-plug ignition system consists of the:

- crankshaft position (CKP) sensor.
- ignition coils.
- spark plugs.

The CKP sensor:

- is a variable reluctance sensor.
- is triggered by a 36-minus-1 tooth sensor ring mounted on the crankshaft.
- provides base timing and crankshaft speed (rpm) to the powertrain control module (PCM).

The 8 separate ignition coils:

- change low voltage signals from the PCM to high voltage pulses.
- produce the high voltage pulses to the spark plugs.
- are connected directly to each spark plug.

The spark plugs:

- change high voltage pulses into a spark which ignites the fuel and air mixture.
- originally equipped on the vehicle have a platinum-enhanced active electrode for long life.

Engine Ignition

Ignition Coil-On-Plug

Printable View (79 KB)

Material

Item	Specification
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Disconnect the ignition coil electrical connector.
3. Remove the bolt and the ignition coil.
   - Remove the ignition coil, using a twisting motion while pulling up on the ignition coil.
   - To install, tighten to 6 Nm (53 lb-in).
4. **NOTE:** Verify that the ignition coil spring is correctly located inside the ignition coil boot and that there is no damage to the tip of the boot.

   To install, reverse the removal procedure.
   - Apply a light coat of dielectric compound to the inside of the ignition coil boots.

Spark Plugs

Printable View (80 KB)

Removal and Installation

1. Remove the ignition coil-on-plug. For additional information, refer to Ignition Coil-On-Plug in this section.

2. **CAUTION: Do not remove the spark plugs when the engine is hot or cold soaked. Spark plug thread or cylinder head damage can occur. Make sure the engine is warm (hand touch after cooling down) prior to spark plug removal.**

   CAUTION: Only use hand tools when removing or installing the spark plugs or damage can occur to the cylinder head or spark plug.

   NOTE: Use compressed air to remove any foreign material from the spark plug well before removing the spark plugs.

   NOTE: If an original spark plug is used, make sure it is installed in the same cylinder from which it was taken. New spark plugs can be used in any cylinder.

   Remove the spark plugs.
   - To install, tighten to 34 Nm (25 lb-ft).

3. Inspect the spark plugs. Install new spark plugs as necessary. For additional information, refer to Section 303-00 .

4. To install, reverse the removal procedure.

Engine Emission Control

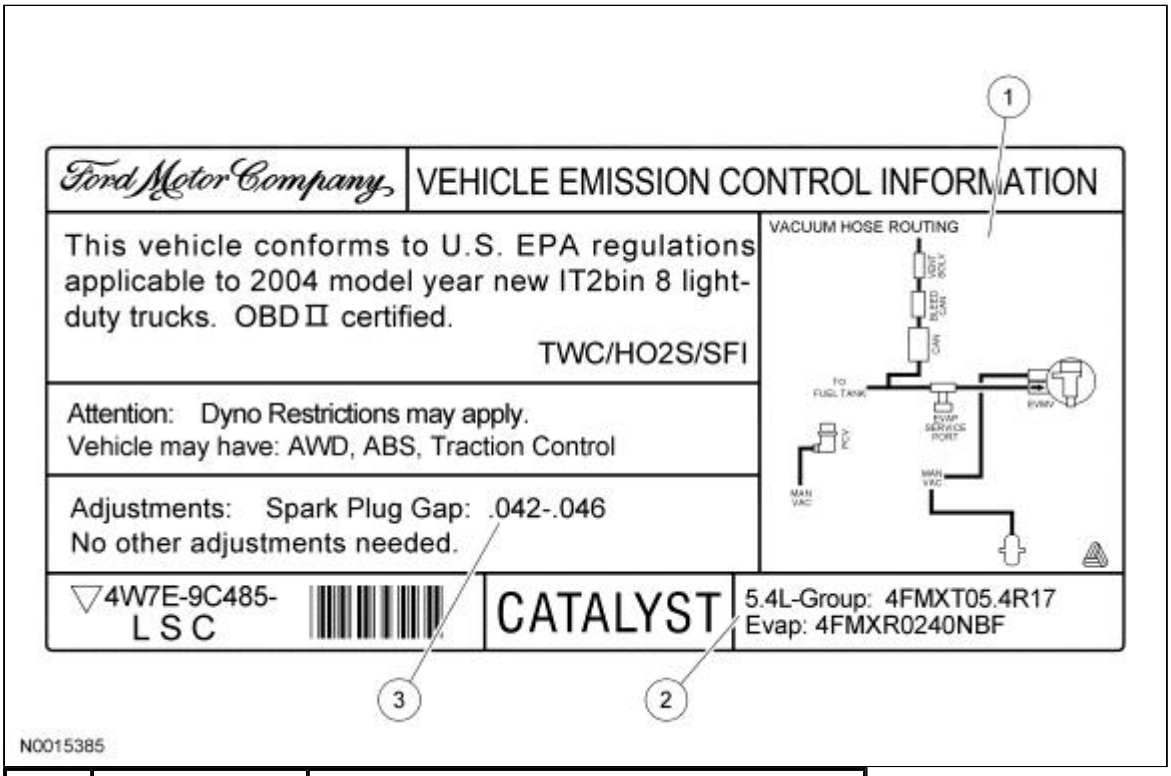
Printable View (137 KB)

CAUTION: Do not remove any part of the engine emission control system. Operating the engine without the engine emission control system will reduce fuel economy and engine ventilation. This will weaken engine performance and shorten engine life.

The engine emission control system consists of the:

- positive crankcase ventilation (PCV) system.

Typical Vehicle Emission Control Information (VECI) Decal



Item	Part Number	Description
1	—	Engine vacuum hose routing (typical)
2	—	Engine type
3	—	Spark plug gap specifications

The Vehicle Emission Control Information (VECI) decal shows:

- components of the emission control system.
- the correct vacuum hose routing.
- the color stripe of the vacuum hoses.

Refer to Section 100-01 .

The heated PCV system uses intake manifold vacuum to ventilate the crankcase and return the fumes to

the intake manifold for combustion.

The PCV valve:

- controls the amount of ventilating air and blow-by gases going to the intake manifold.
- is an integral part of the LH valve cover.
- is not serviceable.

The PCV heater element:

- heats the ventilating air and blow-by gases going to the intake manifold.

Engine Emission Control

2	—	Heated PCV heater element electrical connector (part of 14A624)
3	W505416	PCV heater element bolt (2 required)
4	9F624	PCV heater element
5	—	PCV heater element O-ring seal (part of 9F624)

Removal

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Disconnect the positive crankcase ventilation (PCV) heater element electrical connector.

3. Disconnect the quick connect couplings and remove the PCV tube. For additional information, refer to Section 310-00 .

4. Remove the 2 bolts and the PCV heater element.
    - Discard the O-ring seal.

Installation

1. **NOTE:** Lubricate the O-ring seal with clean engine oil prior to installation.

   Using a new O-ring seal, install the PCV heater element and the 2 bolts.
    - Tighten to 6 Nm (53 lb-in).

2. Position the PCV tube and connect the quick connect couplings. For additional information, refer to Section 310-00 .

3. Connect the PCV heater element electrical connector.

4. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Air Cleaner Element

Printable View (80 KB)

Removal

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Disconnect the air cleaner outlet pipe from the air cleaner cover.
   - To install, tighten the clamps to 4 Nm (35 lb-in).
3. Disconnect the mass air flow (MAF) sensor electrical connector.
4. Release the retaining clips and position the air cleaner cover aside.
5. Remove the air cleaner element.

Installation

1. **CAUTION: The air cleaner element must be fully seated into the air cleaner housing. Failure to do so will result in unusual engine noise.**

   To install, reverse the removal procedure.

Air Cleaner

Printable View (63 KB)

Removal and Installation

1. The air cleaner housing is an integral part of the degas bottle and cannot be serviced separately. For additional information, refer to Section 303-03 .

Air Cleaner Outlet Pipe

Printable View (111 KB)

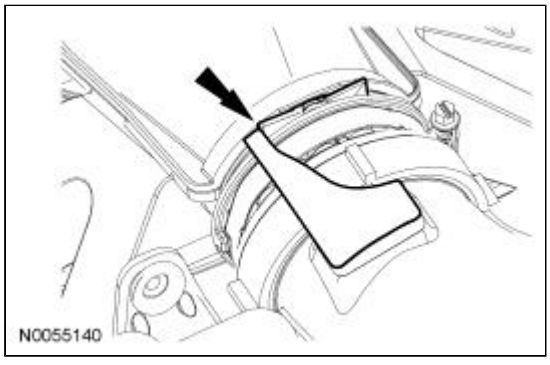
Removal

1. Remove the 2 bolts and the engine appearance cover.
2. Loosen the 2 air cleaner outlet pipe clamps.
3. Remove the air cleaner outlet pipe.

Installation

1. **CAUTION: The air cleaner intake pipe should be securely sealed to prevent unusual engine noise.**

   Position the air cleaner outlet pipe with the alignment indicator positioned as shown and tighten the 2 clamps.
   - Tighten to 4 Nm (35 lb-in).



2. Position the engine appearance cover and install the 2 bolts.
   - Tighten to 5 Nm (44 lb-in).

EVAP canister assembly bracket-to-EVAP canister bolts	6	—	53

Evaporative Emissions

Printable View (79 KB)

The evaporative emissions (EVAP) system:

- prevents hydrocarbon emissions from reaching the atmosphere.
- stores fuel vapors in the EVAP canister that are generated during vehicle operation or hot soak, until they can be consumed by the engine during normal engine operation.
- routes the stored fuel vapors to the engine during engine operation.
- is controlled by the powertrain control module (PCM), which uses various sensor inputs to calculate the desired amount of purge flow. The PCM regulates the purge flow, induced by the application of intake manifold vacuum, by varying the duty cycle applied to the EVAP canister purge valve.

The fuel vapors are routed:

- from the fuel tank through the fuel vapor/grade vent valves.
- to the EVAP canister through a vapor line.
- to the engine when the EVAP canister purge valve is opened by the PCM.

The fuel tank pressure (FTP) sensor:

- monitors the pressure levels in the fuel tank.
- communicates the pressure reading to the PCM during the OBD II leak test.

The EVAP canister:

- is located in front of the fuel tank.
- contains activated carbon.
- stores fuel vapors.

The fuel tank filler cap:

- relieves system vacuum below 3.8 kPa (15.26 inches H_2O).

The canister vent solenoid:

- is normally open.
- seals the evaporative emissions system for the OBD II leak and pressure tests.
- is mounted to the EVAP canister.
- is repaired through removal/replacement of the canister vent solenoid and dust separator assembly. The canister vent solenoid must not be serviced separately from the canister vent solenoid and dust separator assembly.

The EVAP canister purge valve:

- is normally closed.
- regulates the purging of the EVAP canister.
- is controlled by the PCM.

Evaporative Emissions

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Evaporative Emission System Leak Test

Printable View (92 KB)

Special Tool(s)

ST2817-A	VACUTEC Smoke Machine Fuel EVAP Emissions System Tester 218-0002 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Phase 1 — Leak Verification

1. Using the scan tool, run the evaporative emissions (EVAP) system test.
2. **NOTE:** Some small leaks may not be detected using the EVAP system test. If the system has passed the test but a leak is still suspected, then proceed to Phase 2.

   If the EVAP system failed the EVAP system test then proceed to Phase 2.

Phase 2 — System Leak Check

1. Disconnect the upper fuel vapor tube quick connect coupling from the EVAP canister purge valve. For additional information, refer to Section 310-00 .
2. Connect the smoke machine emissions tester to the upper EVAP canister purge valve fitting. For additional information, refer to the manufacturer's instruction.
3. **NOTE:** In the scan tool, the EVAP canister purge valve is referred to as the EVMV.

   Using the scan tool, turn on the EVAP canister purge valve.
4. **CAUTION: The canister vent solenoid must not be energized for more than 9 minutes at one time. Once the canister vent solenoid is energized and de-energized, adequate time must be allowed for the component to cool adequately. Failure to allow the component to cool may create a false failure in the diagnostics, causing unnecessary repairs.**

   Using the scan tool, close the canister vent solenoid.
5. Introduce smoke from the smoke machine emissions tester into the EVAP system. For additional information, refer to the manufacturer's instructions.
6. Use the halogen light provided with the smoke machine emissions tester to look for smoke coming from the EVAP system. This will indicate a leak point.

7. Repair any leaks as necessary.
8. Repeat the leak test until the system passes.

Evaporative Emission Repair Verification Drive Cycle

Printable View (62 KB)

Evaporative Emission Canister

Printable View (84 KB)

Removal and Installation

WARNING: The evaporative emissions system contains fuel vapor and condensed fuel vapor. Although not present in large quantities, it still presents the danger of explosion or fire. Disconnect the battery ground cable from the battery to minimize the possibility of an electrical spark occurring, possibly causing a fire or explosion if fuel vapor or liquid fuel are present in the area. Failure to follow these instructions can result in personal injury.

WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.

NOTE: The evaporative emission canister vent solenoid and dust separator are an assembly.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Disconnect the EVAP canister vent solenoid electrical jumper from the wiring harness.
4. Disconnect the fuel tank pressure sensor and vapor tube assembly-to-EVAP canister quick connect coupling. For additional information, refer to Section 310-00 .
5. Disconnect the EVAP canister purge valve vapor tube-to-EVAP canister quick connect coupling. For additional information, refer to Section 310-00 .
6. Disconnect the fresh air tube-to-canister vent solenoid and dust separator assembly quick connect coupling. For additional information, refer to Section 310-00 .
7. Remove the EVAP canister assembly bracket-to-frame rail bolt in the rear.
   - Tighten to 20 Nm (15 lb-ft).
8. Remove the EVAP canister assembly bracket-to-frame rail bolt in the front.
   - Tighten to 20 Nm (15 lb-ft).
9. Remove the EVAP canister assembly bracket and exhaust Y-pipe-dual catalytic converter heat shield-to-transmission crossmember bolt and remove the EVAP canister assembly from the vehicle.
   - Tighten to 20 Nm (15 lb-ft).
10. **NOTE:** Lowering the corner of the EVAP canister assembly bracket will aid in disconnecting the EVAP canister vent solenoid electrical connector.

    Disconnect the EVAP canister vent solenoid electrical connector.
11. Remove the EVAP canister-to-EVAP canister assembly bracket bolts.
    - Tighten to 6 Nm (53 lb-in).

12. Remove the EVAP canister assembly from the EVAP canister assembly bracket.

13. Remove the canister vent solenoid and dust separator assembly from the EVAP canister.

14. To install, reverse the removal procedure.
    - Leak test the system. For additional information, refer to Evaporative Emission System Leak Test in this section.
    - Carry out the evaporative emissions repair verification drive cycle. For additional information, refer to Evaporative Emission Repair Verification Drive Cycle in this section.

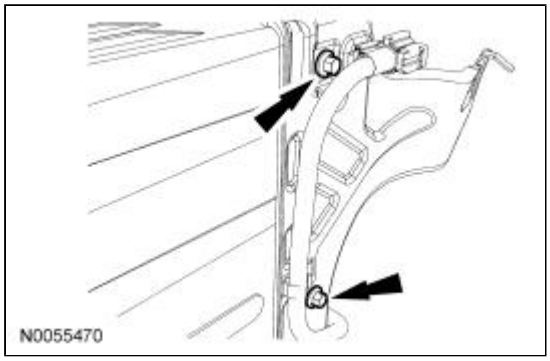
3. Disconnect the EVAP canister vent solenoid electrical jumper from the wiring harness.
4. Disconnect the fuel tank pressure sensor and vapor tube assembly-to-EVAP canister quick connect coupling. For additional information, refer to Section 310-00 .
5. Disconnect the EVAP canister purge valve vapor tube-to-EVAP canister quick connect coupling. For additional information, refer to Section 310-00 .
6. Disconnect the fresh air tube-to-canister vent solenoid and dust separator assembly quick connect coupling. For additional information, refer to Section 310-00 .
7. Remove the EVAP canister assembly bracket-to-frame rail bolt in the rear.
   - Tighten to 20 Nm (15 lb-ft).
8. Remove the EVAP canister assembly bracket-to-frame rail bolt in the front.
   - Tighten to 20 Nm (15 lb-ft).
9. Remove the EVAP canister assembly bracket and exhaust Y-pipe-dual catalytic converter heat shield-to-transmission crossmember bolt and remove the EVAP canister assembly from the vehicle.
   - Tighten to 20 Nm (15 lb-ft).
10. **NOTE:** Lowering the corner of the EVAP canister assembly bracket will aid in disconnecting the EVAP canister vent solenoid electrical connector.

    Disconnect the EVAP canister vent solenoid electrical connector.
11. Remove the EVAP canister-to-EVAP canister assembly bracket bolts in the front of the canister.
    - Tighten to 6 Nm (53 lb-in).



12. Remove the canister vent solenoid and dust separator assembly from the EVAP canister.

13. To install, reverse the removal procedure.
    - Leak test the system. For additional information, refer to Evaporative Emission System Leak Test in this section.
    - Carry out the evaporative emissions repair verification drive cycle. For additional information, refer to Evaporative Emission Repair Verification Drive Cycle in this section.

Dust Separator

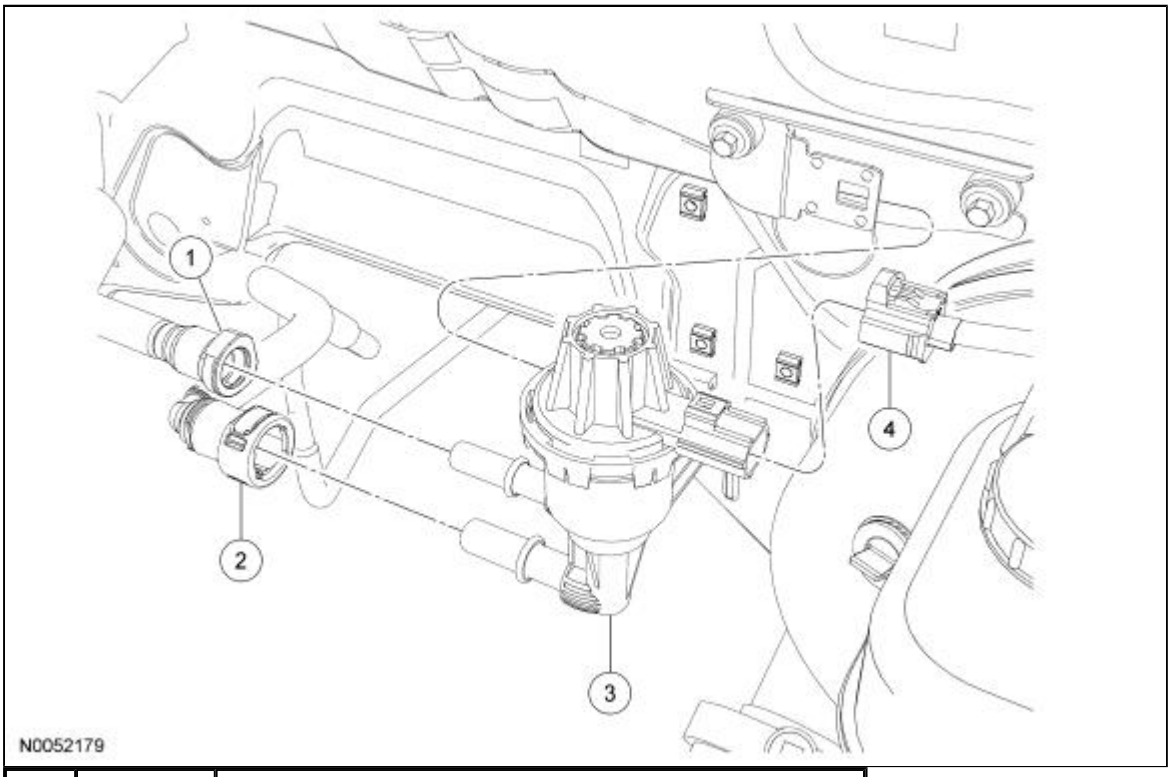
Printable View (78 KB)

1. **NOTE:** The evaporative emission canister vent solenoid and dust separator are an assembly. This assembly is removed with the evaporative emission canister vent solenoid.

   Refer to Evaporative Emission Canister Vent Solenoid in this section.

Evaporative Emission Canister Purge Valve

Printable View (199 KB)



Item	Part Number	Description
1	—	Intake manifold-to-evaporative emission (EVAP) canister purge valve vapor tube quick connect coupling (part of 9D289)
2	—	EVAP canister-to-EVAP canister purge valve vapor tube quick connect coupling (part of 9J337)
3	9G641	EVAP canister purge valve
4	—	EVAP canister purge valve electrical connector (part of 12B637)

Removal and Installation

WARNING: The evaporative emissions system contains fuel vapor and condensed fuel vapor. Although not present in large quantities, it still presents the danger of explosion or fire. Disconnect the battery ground cable from the battery to minimize the possibility of an electrical spark occurring, possibly causing a fire or explosion if fuel vapor or liquid fuel are present in the area. Failure to follow these instructions can result in personal injury.

WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.

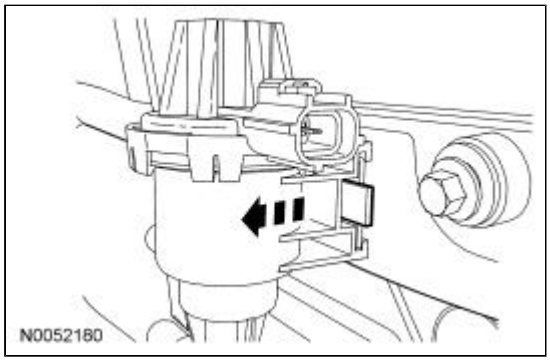
1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

2. Disconnect the evaporative emissions (EVAP) canister purge valve electrical connector.

3. Disconnect the intake manifold-to-EVAP canister purge valve vapor tube quick connect coupling. For additional information, refer to Section 310-00 .

4. Disconnect the EVAP canister-to-EVAP canister purge valve vapor tube quick connect coupling. For additional information, refer to Section 310-00 .

5. Pull the EVAP canister purge valve release tab and slide the EVAP canister purge valve off the bracket.

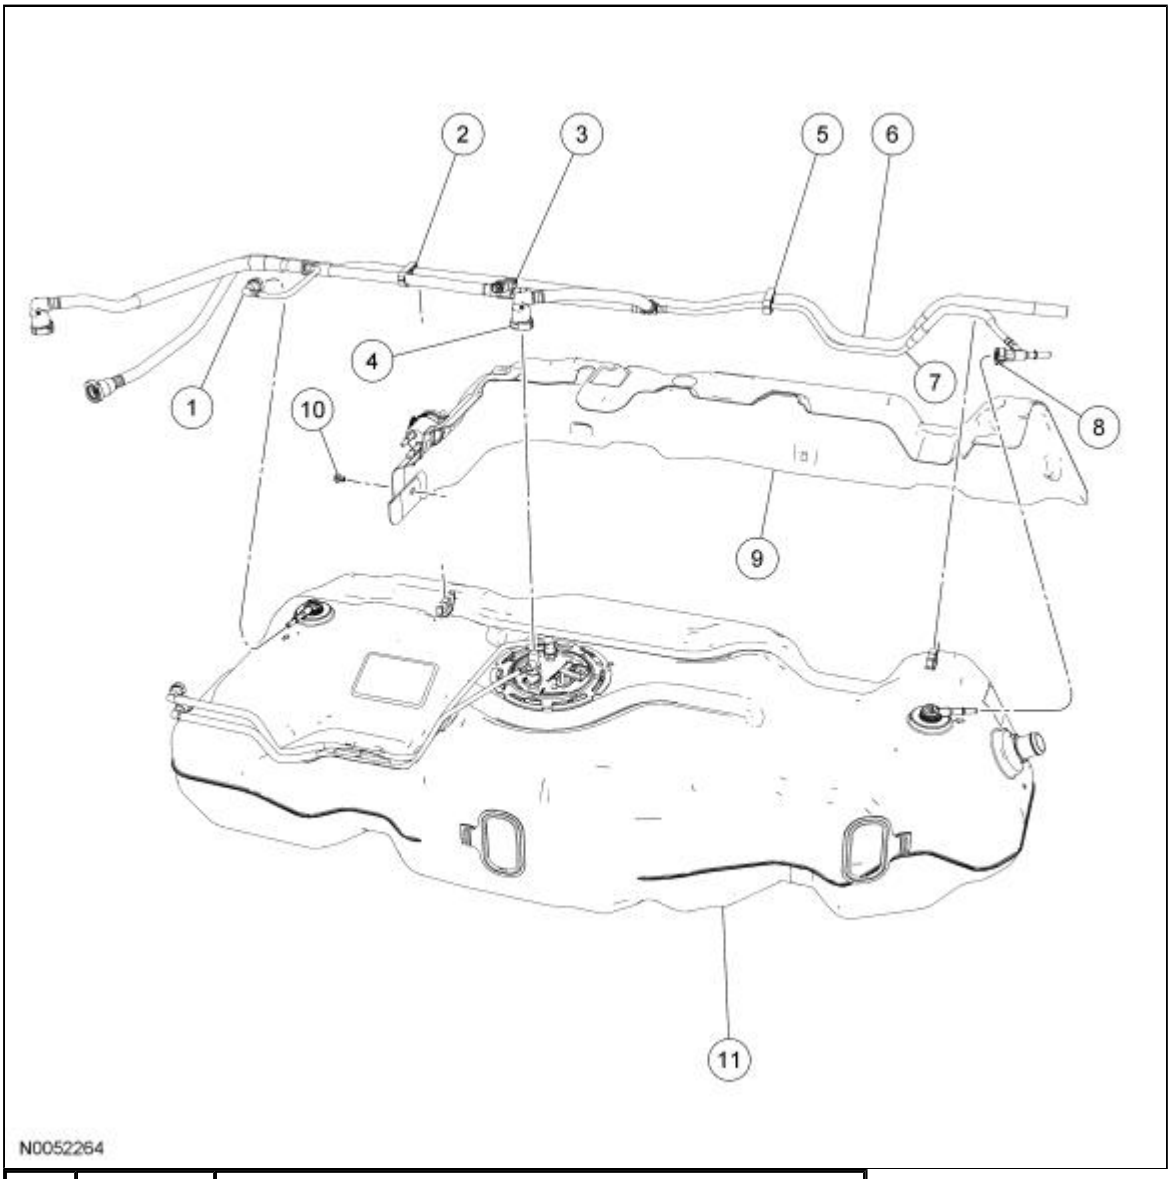


6. To install, reverse the removal procedure.
    - Leak test the system. For additional information, refer to Evaporative Emission System Leak Test in this section.
    - Carry out the evaporative emissions repair verification drive cycle. For additional information, refer to Evaporative Emission Repair Verification Drive Cycle in this section.

Fuel Tank Pressure Sensor

Printable View (264 KB)

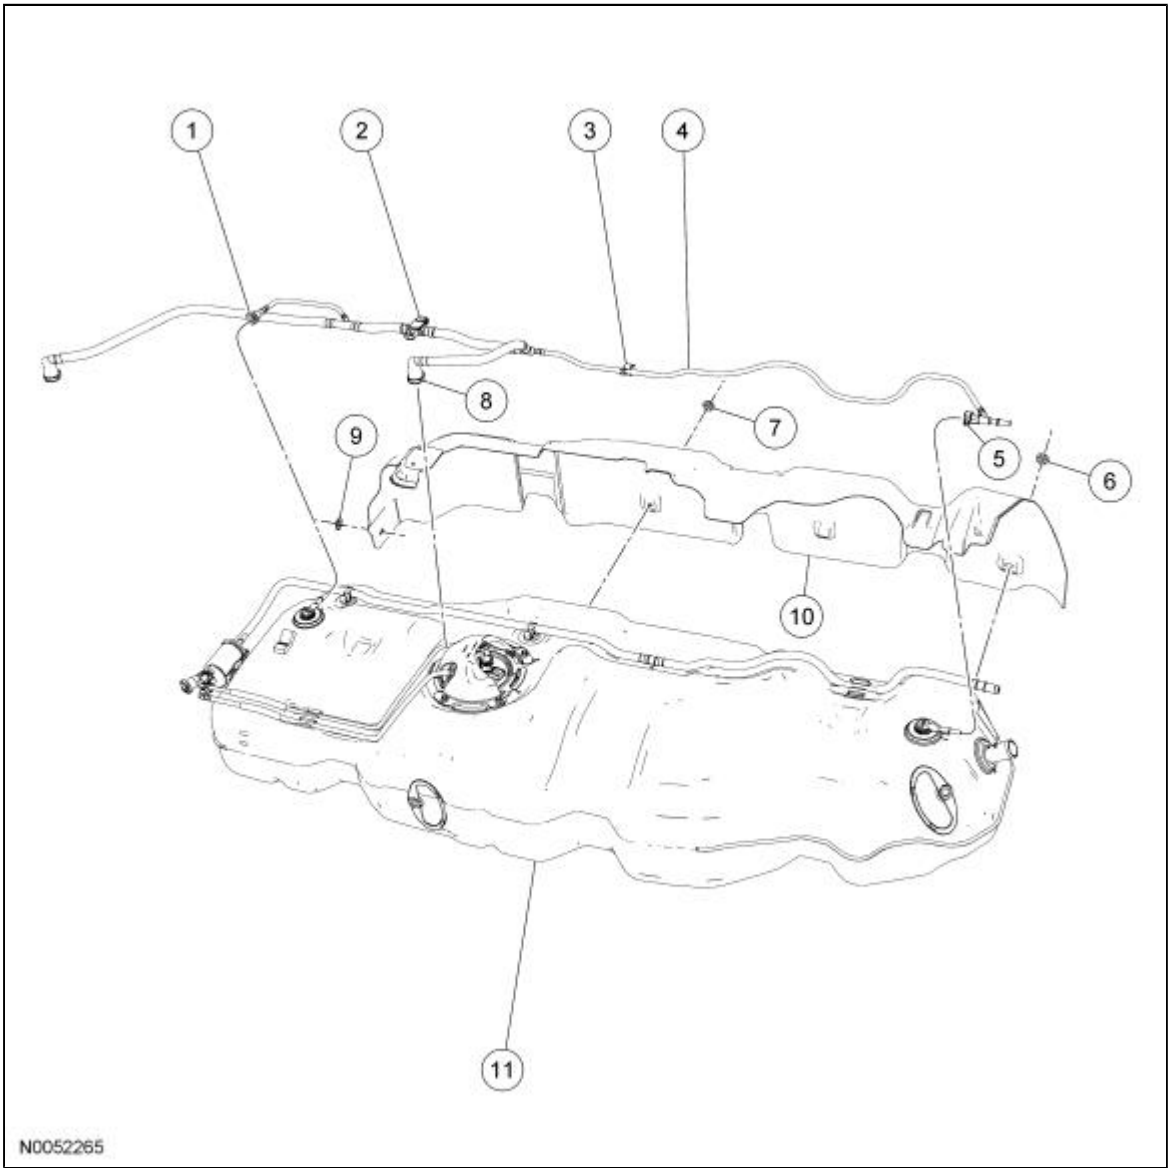
106L (28 Gallon) Fuel Tank



Item	Part Number	Description
1	—	Fuel tank pressure sensor and vapor tube assembly-to-fuel vapor/grade vent valve quick connect coupling (part of 9G271)
2	—	Retainer (part of 9G271)
3	—	Fuel tank pressure sensor (part of 9G271)
4	—	Fuel tank pressure sensor and vapor tube assembly-to-fuel pump module quick connect coupling (part of 9G271)
5	—	Retainer (part of 9G271)

6	9G271	Fuel tank pressure sensor and vapor tube assembly (part of 9G271)
7	—	Fresh air tube (part of 9G271)
8	—	Fuel tank pressure sensor and vapor tube assembly-to-fuel vapor/grade vent valve quick connect coupling (part of 9G271)
9	9A032	Heat shield
10	9K111	Heat shield retainer
11	9002	Fuel tank

125L (33 Gallon) Fuel Tank



N0052265

Item	Part Number	Description
1	—	Fuel tank pressure sensor and vapor tube assembly-to-fuel vapor/grade vent valve quick connect coupling (part of 9G271)
2	—	Fuel tank pressure sensor (part of 9G271)

3	—	Retainer
4	9G271	Fuel tank pressure sensor and vapor tube assembly
5	—	Fuel tank pressure sensor and vapor tube assembly-to-fuel vapor/grade vent valve quick connect coupling (part of 9G271)
6	—	Heat shield retainer
7	—	Heat shield retainer
8	—	Fuel tank pressure sensor and vapor tube assembly-to-fuel pump module quick connect coupling (part of 9G271)
9	—	Heat shield retainer
10	9A032	Heat shield
11	9002	Fuel tank

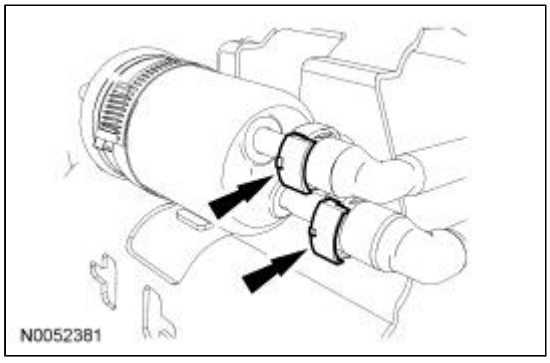
Removal and Installation

All fuel tanks

1. Remove the fuel tank. For additional information, refer to Section 310-01 .

106 L (28 gal.) fuel tank

2. Disconnect the supply and return fuel tubes quick connect couplings from the fuel filter. For additional information refer to Section 310-00 .



All fuel tanks

3. Remove the fuel tank heat shield retainer(s) and remove the fuel tank heat shield.

4. Disconnect the fuel tank pressure sensor and vapor tube assembly-to-fuel vapor/grade vent valves quick connect couplings. For additional information, refer to Section 310-00 .

5. Disconnect the fuel tank pressure sensor and vapor tube assembly-to-fuel pump module quick connect coupling. For additional information, refer to Section 310-00 .

106 L (28 gal.) fuel tank

6. **NOTE:** For the 106 L (28 gal.) fuel tank the fuel tank pressure sensor and vapor tube assembly and fresh air tube are serviced as an assembly.

   Remove the fuel tank pressure sensor and vapor tube assembly with the fresh air tube from the fuel tank.

125 L (33 gal.) fuel tank

7. Remove the fuel tank pressure sensor and vapor tube assembly from the fuel tank.

All fuel tanks

8. To install, reverse the removal procedure.
    - Leak test the system. For additional information, refer to Evaporative Emission System Leak Test in this section.
    - Carry out the evaporative emission repair verification drive cycle. For additional information, refer to Evaporative Emission Repair Verification Drive Cycle in this section.

General Specifications

Item	Specification
Lubricants and Chemicals	
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada) or equivalent	WSS-M2C930-A
High Temperature Nickel Anti-Seize Lubricant XL-2 (US); CXG-2-B (Canada)	ESE-M12A4-A
Penetrating and Lock Lubricant XL-1 (US); CXC-51-A (Canada)	—

Torque Specifications

Description	Nm	lb-ft	lb-in
A/C compressor bolts	25	18	—
Camshaft position (CMP) sensor bolt	10	—	89
Crankshaft position (CKP) sensor bolt	10	—	89
Cylinder head temperature (CHT) sensor	10	—	89
Catalyst monitor sensor	46	34	—
Heated oxygen sensor (H2OS)	46	34	—
Knock sensor (KS) bolt	20	15	—
Mass air flow (MAF) sensor bolts	7	—	62
Charge motion control valve (CMCV) bolts	10	—	89
CMCV stud	10	—	89
Powertrain control module (PCM) bolts	7	—	62
Throttle position (TP) sensor screws	3	—	27
Variable camshaft timing (VCT) oil control solenoid bolt	5	—	44

Electronic Engine Controls

Printable View (67 KB)

The electronic engine controls consist of the following:

- Powertrain control module (PCM)
- Throttle position (TP) sensor
- Cylinder head temperature (CHT) sensor
- Camshaft position (CMP) sensor
- Crankshaft position (CKP) sensor
- Mass air flow (MAF) sensor
- Heated oxygen sensors (HO2S)
- Catalyst monitor sensors
- Knock sensor (KS)
- Charge motion control valve (CMCV)
- Variable camshaft timing (VCT) oil control solenoid

The PCM carries out the following functions:

- accepts input from various engine sensors to compute the fuel flow rate necessary to maintain a prescribed air/fuel ratio throughout the entire engine operational range.
- outputs a command to the fuel injectors to meter the appropriate quantity of fuel.

The TP sensor:

- sends the PCM a signal indicating the throttle plate angle.
- is the main input to the PCM from the driver.

The CHT sensor:

- is mounted into the wall of the cylinder head and is not connected to any coolant passages.
- sends the PCM a signal indicating cylinder head temperature.
    - if the temperature exceeds approximately 121°C (250°F), the PCM disables half of the fuel injectors at a time. The PCM will alternate which fuel injectors are disabled every 32 engine cycles. The cylinders that are not being fuel injected act as air pumps to aid in engine cooling.
    - if the temperature exceeds approximately 166°C (330°F), the PCM disables all of the fuel injectors until the engine temperature drops below approximately 154°C (310°F).

The CMP sensor:

- sends the PCM a signal indicating camshaft position used for fuel synchronization.

The CKP sensor:

- sends the PCM a signal indicating crankshaft position.
- is essential for calculating spark timing.

The MAF sensor:

- uses a hot wire sensing element to measure the amount of air entering the engine. Air passing

over the hot wire causes it to cool.

The HO2S:

- creates a voltage signal dependent on exhaust oxygen content.
- provides feedback information to the PCM used to calculate fuel delivery.

The catalyst monitor sensors:

- monitors oxygen content after it flows through the catalytic converter.
- provides a voltage to the PCM used to calculate catalytic converter integrity.

The KS:

- is used to detect engine detonation.
- sends a voltage signal to the PCM.
- is able to provide a signal which retards the ignition timing, as necessary.

The CMCV:

- improves the upper rpm power.

The variable camshaft timing (VCT) oil control solenoid:

- The VCT oil control solenoid is an electrically controlled hydraulic valve that directs engine oil to the variable camshaft. Once the PCM transmits a signal, the solenoid moves a valve spool, directing oil into the camshaft phaser cavity. This action changes valve timing by either inducing an advance or retard condition. The camshaft is, thereby repositioned in relation to crankshaft timing and allows for optimum engine performance and lower emissions.

Electronic Engine Controls

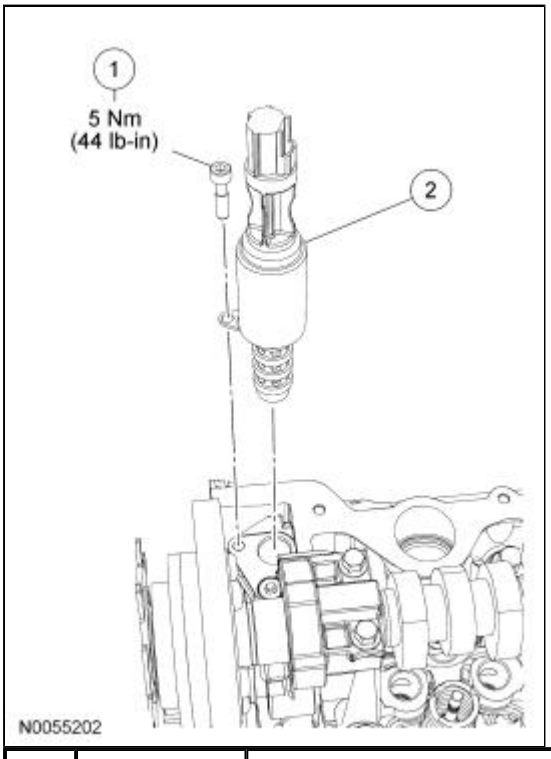
Printable View (62 KB)

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Variable Camshaft Timing (VCT) Oil Control Solenoid

Printable View (123 KB)

NOTE: LH shown, RH similar.



Item	Part Number	Description
1	6C260	Variable camshaft timing (VCT) oil control solenoid bolt
2	6C297	VCT oil control solenoid

Removal and Installation

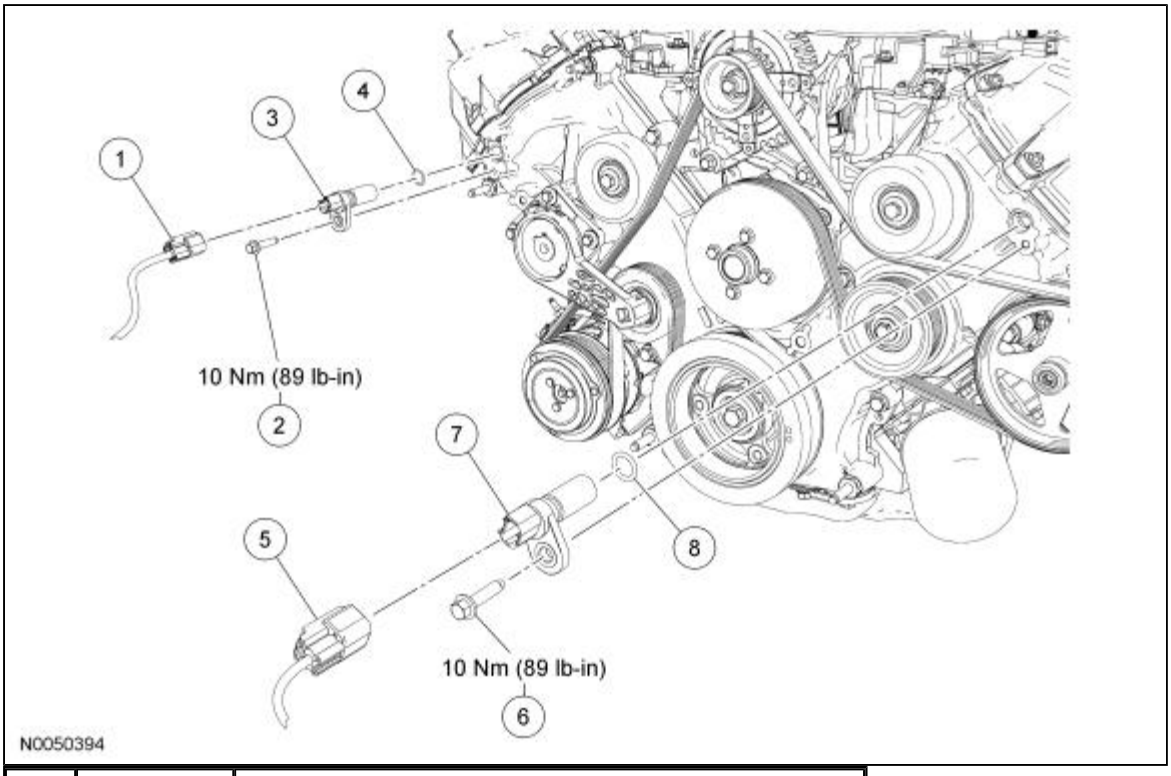
1. Remove the valve cover. For additional information, refer to Section 303-01 .
2. Remove the bolt and the variable camshaft timing (VCT) oil control solenoid.
   - To install, tighten to 5 Nm (44 lb-in).
3. To install, reverse the removal procedure.

Camshaft Position (CMP) Sensor

Printable View (204 KB)

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A



Item	Part Number	Description
1	—	RH camshaft position (CMP) sensor electrical connector (part of 12B637)
2	N806155	RH CMP sensor bolt
3	6B288	RH CMP sensor
4	—	RH CMP sensor O-ring seal (part of 6B288)
5	—	LH CMP sensor electrical connector (part of 12B637)
6	N806155	LH CMP sensor bolt
7	6B288	LH CMP sensor
8	—	LH CMP sensor O-ring seal (part of 6B288)

Removal and Installation

LH camshaft position (CMP) sensor

1. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

All CMP sensors

2. Disconnect the CMP sensor electrical connector.

3. Remove the bolt and the CMP sensor.
    - To install, tighten to 10 Nm (89 lb-in).
    - Lubricate the O-ring seal with clean engine oil prior to installation.

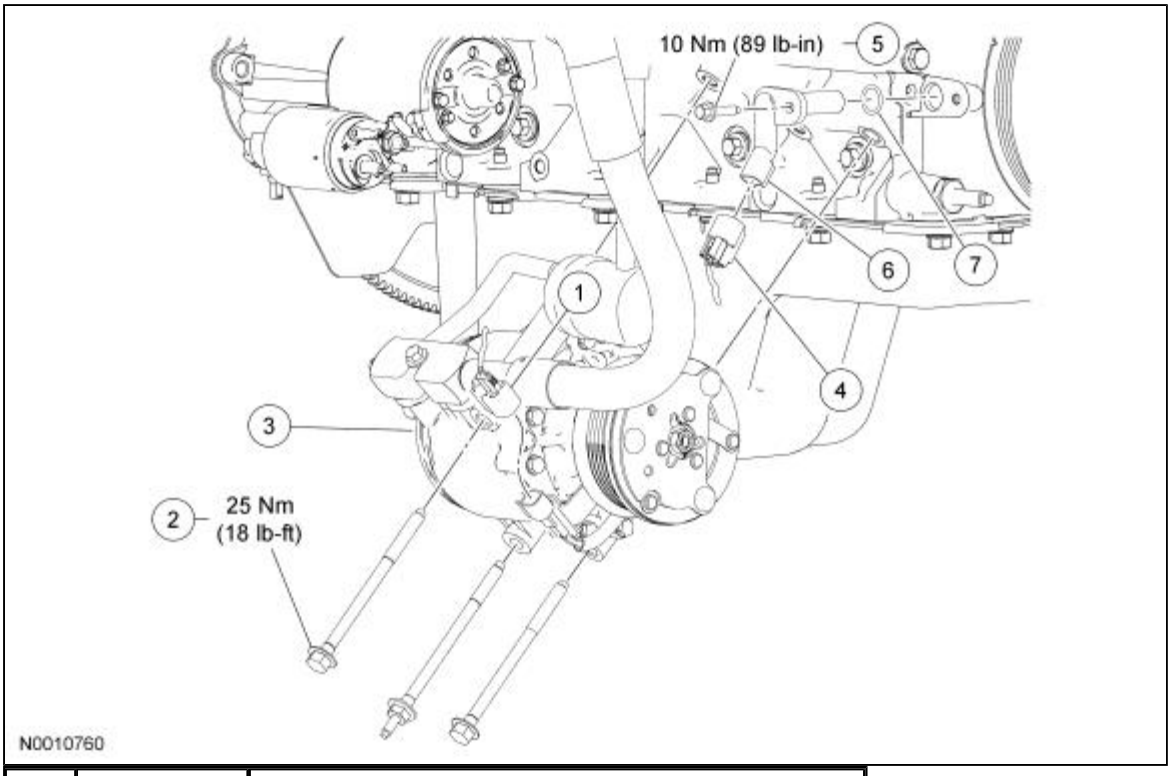
4. To install, reverse the removal procedure.

Crankshaft Position (CKP) Sensor

Printable View (153 KB)

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A



Item	Part Number	Description
1	19703	A/C compressor electrical connector
2	N806184	A/C compressor bolt (3 required)
3	19703	A/C compressor
4	14A464	Crankshaft position (CKP) sensor electrical connector
5	N806155	CKP sensor bolt
6	6C315	CKP sensor
7	—	CKP sensor O-ring seal

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the accessory drive belt. For additional information, refer to Section 303-05 .

3. Disconnect the A/C compressor electrical connector.

4. Remove the 3 bolts and position the A/C compressor aside.
   - To install, tighten to 25 Nm (18 lb-ft).

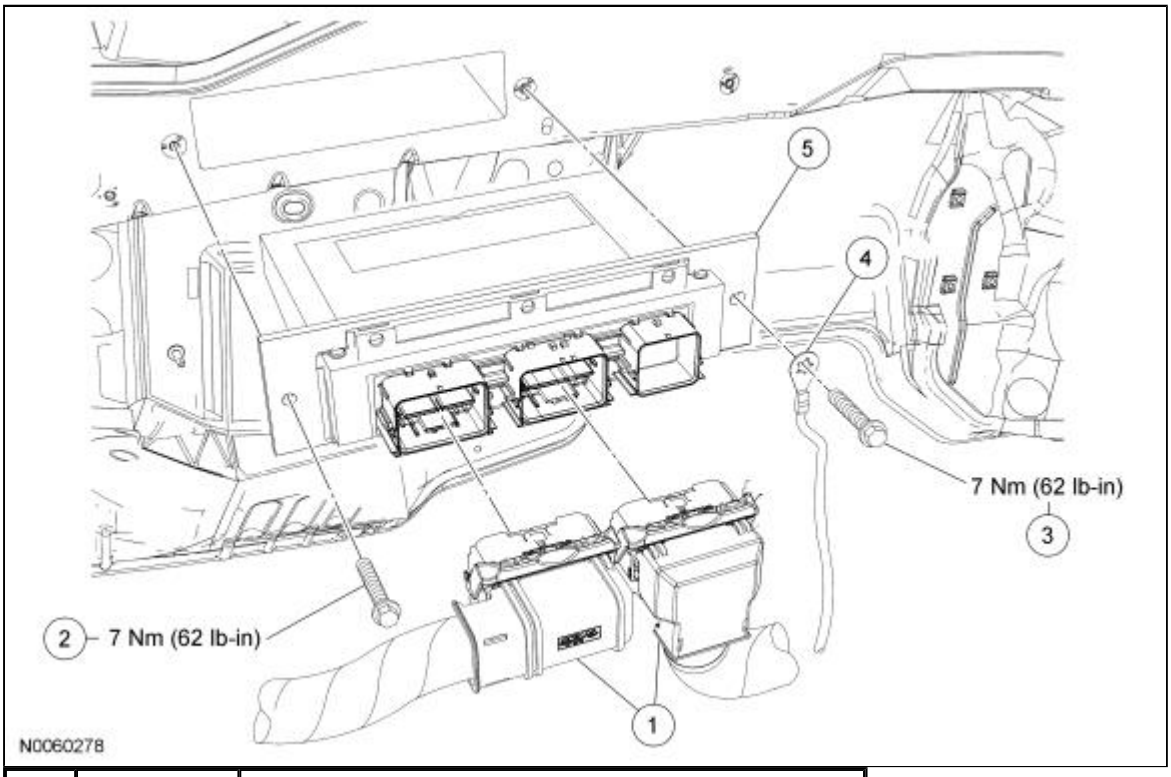
5. Disconnect the crankshaft position (CKP) sensor electrical connector.

6. Remove the bolt and the CKP sensor.
   - To install, tighten to 10 Nm (89 lb-in).
   - Lubricate the O-ring seal with clean engine oil prior to installation.

7. To install, reverse the removal procedure.

Powertrain Control Module (PCM)

Printable View (200 KB)



Item	Part Number	Description
1	14A464	Powertrain control module (PCM) electrical connectors (2 required)
2	W505428	PCM bolt
3	W505428	PCM bolt
4	W505428	Ground cable
5	AAA1001	PCM

Removal and Installation

1. Retrieve the module configuration. Carry out the module configuration retrieval steps of the Programmable Module Installation procedure. For additional information, refer to Section 418-01
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Disconnect the 2 PCM electrical connectors.
4. Remove the 2 bolts and the ground cable.
   - To install, tighten to 7 Nm (62 lb-in).
5. Remove the PCM.
6. To install, reverse the removal procedure.

Installation

1. Install the PCM.

2. Position the ground cable and install the 2 bolts.
   - Tighten to 7 Nm (62 lb-in).

3. Connect the 3 PCM electrical connectors.

4. Connect the battery ground cable. For additional information, refer to Section 414-01 .

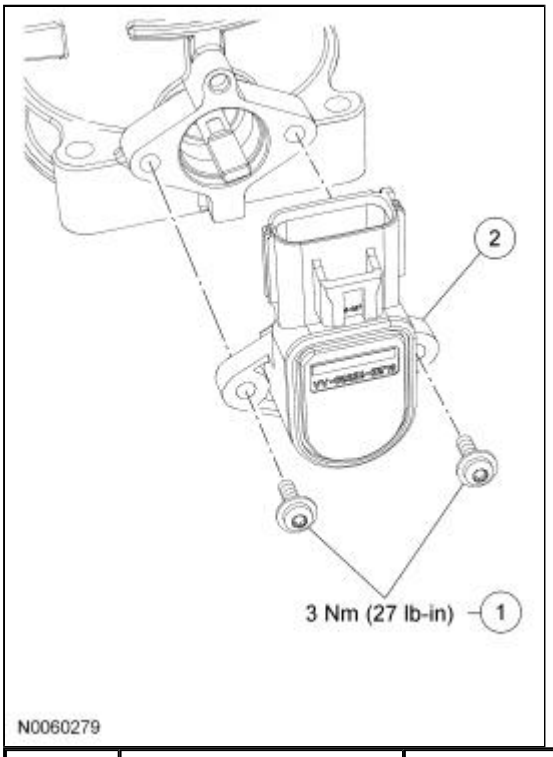
5. **NOTE:** When a new PCM is installed, the air bag warning indicator will illuminate when the ignition switch is ON. The warning indicator will remain on until PCM configuration is restored

   NOTE: Clear all restraints control module (RCM) continuous diagnostic trouble codes (DTCs) after Programmable Module Installation procedure has been completed on the PCM.

   Restore the module configuration. Carry out the module configuration restore steps of the Programmable Module Installation procedure. For additional information, refer to Section 418-01

Throttle Position (TP) Sensor

Printable View (120 KB)



Item	Part Number	Description
1	W707535	TP screws (2 required)
2	9E928	TP sensor

Removal

1. Remove the throttle body (TB). For additional information, refer to Section 303-04 .
